## A.7 Institutional support

### Universities, colleges and TAFE offering courses relevant to organic agriculture

Charles Sturt University
Leeds Parade
PO Box 883
Orange NSW 2800
Phone: 1800 334 733
Email: inquiry@csu.edu.au
Website: www.csu.edu.au/campus/orange

Relevant courses offered:

- Master of Sustainable Agriculture
- Graduate Diploma in Sustainable Agriculture
- Graduate Certificate in Sustainable Agriculture
- Bachelor of Land Management (Ecological Agriculture)
- Advanced Diploma of Land Management (Ecological Agriculture)

Murrumbidgee Rural Studies Centre
Yanco Agricultural Institute
Yanco NSW 2703
Phone: 02 6951 2696

and

CB Alexander Agricultural College Tocal
Paterson NSW 2421
Phone: 02 4939 8888

Relevant courses offered:

- organic and biodynamic courses in conjunction with local groups

### TAFE NSW Web: http://www.tafensw.edu.au

Relevant courses offered:

- Organic Farming nos. 652 and 653

### Government

- NSW Department of Primary Industries:

  Robyn Neeson, Yanco Agricultural Institute

  Phone: 02 6951 2611

  Karen O'Malley, Bathurst Agricultural Research Station

  Phone: 02 6330 1200

  Scott Seaman, Bathurst Agricultural Research Station

  Phone: 02 6330 1209

- Department of Natural Resources and Environment, Victoria:

  Viv Burnett Agriculture Victoria, Rutherglen
  Phone: 02 6030 4500

- Tasmanian Department of Primary Industries and Water (DPIW)

  Louise Mills, PO Box 44
  HOBART TAS 7001
  Phone: 03 6233 4038

- Queensland Department of Primary Industries and Fisheries
  Phone: 13 25 23
- Primary Industries and Resources South Australia
  http://www.safoodcentre.com/industry/pages/sector/
- Northern Territory Department of Business, Industry and Resource Management
  http://www.primaryindustry.nt.gov.au/
- Australian Government Department of Agriculture, Fisheries and Forestry
  http://www.affa.gov.au/content/output.cfm?ObjectID=D2C48F86-BA1A-11A1-A2200060A1B01861
- Australian Quarantine and Inspection Service
  Ian Lyall, Manager, Organic and Biodynamic Program—phone 02 6271 6638 or 0417 667 040

### NSW government assistance

***Department of State and Regional Development***

Website: <http://www.business.nsw.gov.au/>
Office locations: <http://www.business.nsw.gov.au/help.asp?cid=251>

***Primex***

Primex is the international export marketing arm of NSW Department of Primary Industries, providing international access to the highest quality commodities of New South Wales. Primex works closely with local producers and international buyers to encourage partnerships in a broad range of commodities.

Primex, NSW Department of Primary Industries
PO Box K220
Haymarket NSW 1240
Phone: 02 8289 3999
Email: agsell@agric.nsw.gov.au

### Federal government assistance

***The New Industries Development Program and Agribiz***

The New Industries Development Program helps people in the agricultural, processed food, fisheries and forestry industries turn innovative business ideas into competitive, profitable and sustainable commercial ventures. Agribiz encourages and supports Australian agribusinesses as they commercialise new products, services and technologies. For more information check the website < http://www.daff.gov.au/agriculture-food/nidp-agribiz >.

***Austrade and TradeStart***

Austrade and TradeStart offer a package of free services designed to help small and medium-sized Australian companies develop their business overseas and make their first export sale. The TradeStart program gives Australian businesses the best possible start to exporting, providing a wide range of free services to new exporters, including advice and information about getting into exporting, export coaching, and assistance on the ground in foreign markets.

To find out more about TradeStart and what the export advisors and Austrade's international network offer, go to < http://www.austrade.gov.au/Home3618/default.aspx >.

### Farmer information group

Kondinin Group
8 Fitzhardinge St
Wagga Wagga NSW 2650
Phone: 02 6921 4047
Web: http://www.kondinin.com.au

## Appendix B Farming inputs

The following information comes from the National Standard for Organic and Biodynamic Produce (Edition 3.3, 1 July 2007. AQIS, Canberra.)

***Requirements for use***

*General principles*

i. Where inputs are required they should be used with care and with the knowledge that even permitted inputs can be subject to misuse and may alter the soil and/or water ecosystems or the farming environment.

ii. Use of any product has the potential to introduce unwanted residues and contaminants.

*Standards*

1. A developed organic or biodynamic farm must operate within a closed input system to the maximum extent possible.
2. External farming inputs must be kept to a minimum and applied only on an 'as needs' basis.
3. Inputs must not be used as a permanent measure to support a poorly designed or badly managed system. Non-essential use of inputs is counter to organic and biodynamic farming principles. The approved certifying organisation must give approval for their ongoing use.
4. The following lists are subject to review, and inclusion of a material does not imply that it is safe in all circumstances. Any additions or changes to the lists will be made where it can be demonstrated that they satisfy the requirements of this Standard.
5. Liquid preparations, including products of the sea must be used with care as some preparations can be easily applied in concentrated forms and in high quantities.
6. The use of trace elements must be on the basis of a demonstrated deficiency.
7. Use of any input must be based on an assessment of need and with knowledge of the origin and/or analyses of the material for contaminants.
8. The use of any materials/inputs will be recorded in the farm diary or logbook and repeated use must be justifiable.
9. Federal, state/territory and local laws must be adhered to at all times …

## Permitted materials for soil fertilising and conditioning

| Substances | Specific conditions/ restrictions |
|---|---|
| Animal manures | Application must be composted or followed by at least two green manure crops in cropping system. |
| Blood and bone, fish meal, hoof and horn meal, or other waste products from livestock processing | Following application, uptake of such products by livestock does not form part of the animals diet. |
| Compost | Should be produced in accordance with Australian Standard 4454-1999 or recognised equivalent system. |
| Minerals and trace elements from natural sources, including:<br>• calcium (dolomite, gypsum, lime)<br>• clay (bentonite, kaolin, attapulgite)<br>• magnesium<br>• phosphate (rock phosphate, phosphatic guano)<br>• potash (rock and sulphate potash)<br>• elemental sulphur | Must not be chemically treated to promote water solubility |
| Epson salt—magnesium sulphate) | None |
| Microbiological, biological and botanical preparations | Products derived from genetic modification technology are prohibited |
| Mined carbon-based products | Peat to be used for plant propagation only |
| Naturally occurring biological organisms (e.g. worms) and their by-products | None |
| Plant by-products | From chemically untreated sources only |
| Perlite | For potting/seedling mixes only |
| Sawdust, bark and wood waste | From chemically untreated sources only |
| Seaweed or algae preparations | None |
| Straw | From chemically untreated sources only |
| Trace elements and natural chelates, (e.g. ligno) sulphonates and those using the natural chelating agents (e.g. citric, maleic and other di-/tri-acids) | Not synthetically chelated elements |
| Vermiculite | For use in potting/seedling mixes only |
| Wood ash | From chemically untreated sources only |
| Zeolites | None |

## Permitted materials for plant pest and disease control

Where wetting agents are required, caution needs to be exercised with commercial formulations as these may contain substances prohibited under this Standard. Acceptable wetting agents include some seaweed products, plant products (including oils) and natural soaps.

### *Plant pest control*

| Substances | Specific conditions/ restrictions |
|---|---|
| Ayurvedic preparations | None |
| Baits for fruit fly | Substances as required by regulation. Baits must be fully enclosed within traps. |
| Boric acid | None |
| Biological controls | Naturally occurring cultured organisms (e.g. Bacillus thuringiensis) |
| Diatomaceous earth and naturally occurring chitin products | None |
| Essential oils, plant oils and extracts | None |
| Homeopathic preparations | None |
| Hydrogen Peroxide | None |
| Iron (III) phosphate | None |
| Light mineral oils, such as paraffin | None |
| Lime | None |
| Natural acids (e.g. vinegar) | None |
| Natural plant extracts excluding tobacco | Obtained by infusion and made by the farmer without additional concentration |
| Pheromones | None |
| Potassium permanganate | None |
| Pyrethrum | Extracted from Chrysanthemum cinerariaefolium |
| Quassia | Extracted from Quassia armara |
| Rotenone | Extracted from Derris elliptica |
| Ryania | Extracted from Ryania speciosa |
| Seaweed, seaweed meal, seaweed extracts | None |
| Sea salts and salty water | None |
| Sodium bicarbonate | None |
| Sterilised insect males | Need recognised by certification organisation where other controls are not available. |
| Stone meal | None |
| Vegetable oils | None |

### *Plant disease control*

| Substances | Specific conditions/ restrictions |
|---|---|
| Ayurvedic preparations | None |
| Biological controls | Naturally occurring cultured organisms only |
| Copper (e.g. Bordeaux and Burgundy mixture) | Hydroxide is the preferred form, Bordeaux only on dormant tissue. Annual copper application must be less than 8kg/ha. |
| Essential oils, plant oils and extracts | None |
| Granulose virus preparations | Need recognised by certification organisation. |
| Homeopathic preparations | None |
| Light mineral oils (such as paraffin) | None |
| Lime | None |
| Lime-sulphur | None |
| Natural plant extracts excluding tobacco | Obtained by infusion and/or made by the farmer without additional concentration |
| Potassium permanganate | None |
| Potassium soap (soft soap) | None |
| Propolis | None |
| Seaweed, seaweed meal, seaweed extracts | None |
| Sea salts and salty water | None |
| Skim milk or skim milk powder | None |
| Sodium bicarbonate | None |
| Sodium silicate (water-glass) | None |
| Sulphur | In wettable or dry form only |
| Vegetable oils | None |
| Vinegar | None |

### *Permitted materials for livestock pest and disease control*

Where wetting agents are required, caution needs to be exercised with commercial formulations as these may contain substances prohibited under this Standard. Acceptable wetting agents include some seaweed products, plant products (including oils) and natural soaps.

### *Livestock pest control*

| Substances | Specific conditions/restrictions |
|---|---|
| Ayurvedic preparations | None |
| Biological controls | Naturally occurring organisms and cultured organisms |
| Boric acid | None |
| Clay | None |
| Diatomaceous earth | None |
| Essential oils, plant oils and extracts | None |
| Garlic oil, garlic extract or crushed garlic | None |
| Homeopathic preparations | None |
| Hydrogen peroxide | None |
| Natural plant extracts obtained by infusion | Excluding tobacco |
| Magnesium sulphate (Epsom salts) | None |
| Methylated spirits | None |
| Monosodium fluorosilicate | None |
| Potassium permanganate | None |
| Pyrethrum | Extracted from *Chrysanthemum cinerariaefolium* |
| Quassia | Extracted from *Quassia armara* |
| Rotenone | Extracted from *Derris elliptica* |
| Sea salts and salty water | None |
| Seaweed, seaweed meal, seaweed extracts | None |
| Sodium Bicarbonate | None |
| Sulphur | None |
| Vinegar (e.g. cider) | None |

***Livestock disease control***

| Substances | Specific conditions/ restrictions |
|---|---|
| Ayurvedic preparations | None |
| Calcium salts | None |
| Charcoal | None |
| Clay | None |
| Copper sulphate | None |
| Diatomaceous earth and naturally occurring chitin products | None |
| Essential oils, plant oils and extracts | None |
| Homeopathic preparations | None |
| Hydrogen peroxide | None |
| Natural plant extracts obtained by infusion | Excluding tobacco |
| Magnesium sulphate (Epsom salts) | None |
| Methylated spirits | None |
| Potassium permanganate | None |
| Sea salts and salty water | None |
| Seaweed, seaweed meal, seaweed extracts | None |
| Sodium bicarbonate | None |
| Trace elements | To correct identified deficiencies only |
| Vaccines | May be used only for a specific disease, which is known to exist on the organic farm or neighbouring farms and which threatens livestock health and which cannot be effectively controlled by other management practices. Vaccines must not contain genetically modified ingredients or by-products. |
| Vitamins | Natural sources only |
| Vinegar (e.g. cider) | None |
| Zinc sulphate | None |

## Substances permitted for sanitation, storage and handling

1. Operators will select cleaners, sanitisers, and disinfectants based on avoidance of residual contamination, rapid biodegradability, low toxicity, worker safety, and a life-cycle impact of their manufacture, use, and disposal.
2. Endocrine disrupting, ozone depleting, and trihalomethane-forming compounds used in sanitation chemicals are prohibited.
3. Substances Permitted as Sanitation treatments include:
   - Alkali carbonates
   - Bleach (not to exceed 10% solution)
   - Biodegradable detergents (e.g. low in phosphate and rapidly degradable)
   - Caustic potash and caustic soda
   - Ethyl alcohol
   - Hydrogen peroxide
   - Iodine (non-elemental, not to exceed 5% solution e.g. iodophors)
   - Lime
   - Lye
   - Natural acids (e.g. vinegar, lactic, phosphoric)
   - Potassium permanganate (not to exceed 1% solution)
   - Soaps
   - Sodium bicarbonate
   - Sodium borate
   - Isopropyl alcohol
4. The use of any of the above substances will be followed by a thorough rinse of the area/equipment using potable water.
5. Cleaning and sanitising chemicals will be used and stored in such a manner so as to avoid cross-contamination to organic and bio-dynamic produce.

***Substances permitted as post-harvest/storage treatments***

| Treatments | Substances/conditions |
|---|---|
| Controlled atmosphere | Carbon dioxide<br>Oxygen<br>Nitrogen<br>Ozone |
| Peracetic acid | Approval for use required |
| Ethylene gas | Ripening of bananas only) |
| Pest control | Physical barriers<br>Temperature control<br>Diatomaceous earth<br>Rodenticides*<br>Sticky boards<br>Biological controls<br>Electric barriers or grids<br>Sound<br>Light |
| Waxing of citrus fruit | Export only—using natural wax |

* *Must be enclosed outside processing area and used only where other methods have proved ineffective. Containers must be positioned so that there is no potential for contamination with products complying with this Standard. Containers must be inspected regularly and dead rodents removed. The operator must maintain records on volume and use of rodenticides.*

# Going Organic

## Organic Vegetable Production

### A conversion package

By Robyn Neeson

Publication no. 07/137. Project no. DAN-188A

This information is for producers wishing to convert to organic production and for producers already involved in organic production but keen to diversify their production. It provides a framework for organic conversion and diversification and suggests possible strategies and pathways for moving forward.

This valuable information will help make the transition to organic production or to diversified organic production a smooth one.

Organic products are the fastest growing food sector worldwide. Growth of new farms, products and consumers has been steadily increasing over the last 20 years. In the last 10 years the rate of growth has consistently increased in all of the advanced economies.

Market analysts forecast annual growth rates between 10% and 30% around the world. The United States Department of Agriculture expects the organic industry to be worth US$100 billion by 2010 in America, Europe and Japan.

Major international food corporations are developing organic product lines.

The Australian organic sector is worth between $250 - $400 million per annum at retail level and demand outstrips supply. Domestic production is increasing at between 6 -15% per annum and consumption is growing at between 25-40%—the balance is imported. Australia is one of the world's leading grain exporters but organic grain is imported to meet the shortfall in production. Rising domestic and overseas demand for Australian organic products is prompting more conventional farmers and processors to consider and adopt organic systems.

Our business is about new products and services and better ways of producing them. Most of the information we produce can be downloaded for free from our website: www.rirdc.gov.au.

RIRDC books can be purchased by phoning 02 6271 4100 or online at: www.rirdc.gov.au/eshop.

# INSECT PESTS

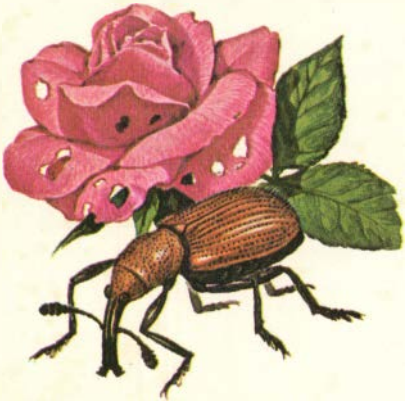
by GEORGE S. FICHTER

M.Sc., Entomology
North Carolina State College
Raleigh, North Carolina

Under the Editorship of
HERBERT S. ZIM, Ph.D.

Illustrated by
NICHOLAS STREKALOVSKY



A GOLDEN NATURE GUIDE

GOLDEN PRESS • NEW YORK
Western Publishing Company, Inc.
Racine, Wisconsin

# FOREWORD

Despite modern technology, man still depends wholly on the products of nature for survival. Hence the battle to control insect pests is a never-ending necessity.

This book describes more than 350 pests that are found in middle North America. The illustrations, skillfully rendered by Nicholas Strekalovsky, will help identify the pest, its life stages, and the kind of damage it does. The best times and methods of control are suggested, but as these vary locally, get the advice of an entomologist or an agricultural agent before attempting major controls. The pest groupings in this book are based on where usual damage occurs. At times when they are abundant, however, pests become less selective. A field pest then, for example, may become bothersome in gardens. Insecticides are the best means to get immediate results, but remember: insecticides are poisonous. Follow directions and heed all precautions on the label.

A number of people gave advice and assistance in the preparation of this book. These included Dr. J. F. Gates Clarke and his staff at the U.S. National Museum. Also of great help were Robert H. Nelson and members of the Entomological Society of America. Dr. Jean L. Laffoon was especially helpful, as were Dr. George Anastos, Dr. R. M. Baranowski, Dr. Ralph Crabill, Dr. Richard L. Doutt, Dr. Richard C. Froeschner, Dr. Herbert W. Levi, Dr. Franklin B. Lewis, and Dr. Howard V. Weems.

**AN INTRODUCTION TO INSECT PESTS** ..... 4
Number of insects, relatives, and development.

**CONTROLLING INSECTS** ..... 10
Natural, biological, mechanical, chemical, and new methods.

**HOUSEHOLD PESTS** ..... 24

**INSECTS THAT BITE OR STING** ..... 38

**PESTS OF PETS, POULTRY, AND LIVESTOCK** .. 48

**INSECT PESTS OF VEGETABLE CROPS** ..... 61

**PESTS OF FLOWERS AND SHRUBS** ..... 86

**FIELD AND FORAGE CROP PESTS** ..... 98

**PESTS OF FRUITS AND FRUIT TREES** .....120

**PESTS OF FOREST AND SHADE TREES** .....139

**INSECT PESTS OF STORED PRODUCTS** .....146

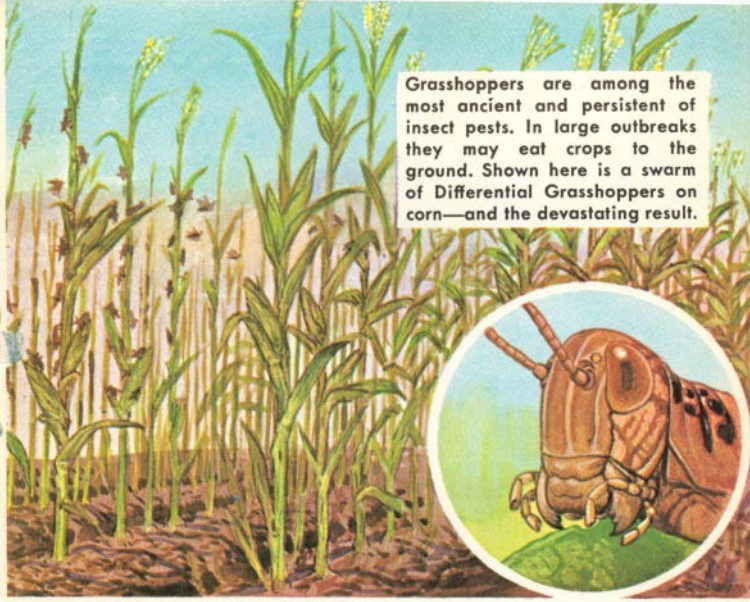
**SCIENTIFIC NAMES** .....154

**INDEX** .....157

## INTRODUCTION TO INSECT PESTS

Insects exist in enormous numbers. The average insect population per square mile is estimated to be equal to the total world population of people, and in severe outbreaks a pest species far exceeds its normal numbers. In one fly infestation, experts estimated 15,000 flies per cow. Billions of hungry grasshoppers may darken the sky and devour all vegetation in their path.

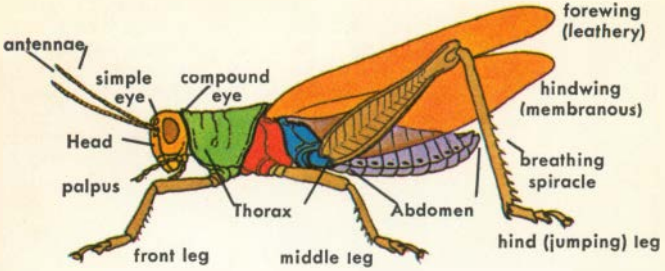
Insect destruction of crops in the United States ranges from 4 billion to 15 billion dollars annually. Damage to cotton by one insect, the Boll Weevil, amounts to more than 300 million dollars a year. Termites consume about 100 million dollars' worth of wood structures, while forest insects destroy more wood than do forest fires. Insect damage cancels out the total year's efforts of about one million workers.



Grasshoppers are among the most ancient and persistent of insect pests. In large outbreaks they may eat crops to the ground. Shown here is a swarm of Differential Grasshoppers on corn—and the devastating result.

Fortunately, less than one percent of the nearly one million insect species are pests of man, his domestic animals, and useful plants. Of the 100,000 insect species that occur in the United States, only about 600 are considered serious pests.

Damage done by insect pests is easy to appraise. The value of beneficial species is harder to estimate. Bees, wasps, flies, butterflies, and other insects pollinate flowers that provide us with fruits and vegetables. Honey, wax, and silk are important commercial products obtained from insects. Some insect species are vital links in the food chains of fishes, birds, and other animals. Other insects are parasites or predators of damaging pests or are scavengers of animal and vegetable debris. Control measures used against harmful insects must be weighed carefully to determine the ultimate effect on all living things, including man.



**PARTS OF A TYPICAL INSECT**

**INSECTS AND THEIR CLOSE RELATIVES** are arthropods, or "jointed-legged" animals, a large group that includes more than 85 percent of the known species of animals. About 90 percent of all the arthropods are insects. An insect's body has three distinct regions—head, thorax, and abdomen. Attached to its thorax are three pairs of legs, and in most species, two pairs of wings. Its head bears a pair of antennae. This combination of features distinguishes insects (class Insecta) from such closely related land animals as spiders, ticks, mites, centipedes, and millipedes.

The largest groups of insects are called *orders*. Sixteen orders of insects that include important pest species are summarized on page 7, as are the identifying characteristics of the other arthropod classes.

Orders are divided into *families* and the families into *genera* and *species*. An insect's scientific name usually consists of two words, its genus and species. The scientific names of the pests in this book are listed on pages 154–156. The common names used in the text are those approved by the Entomological Society of America.

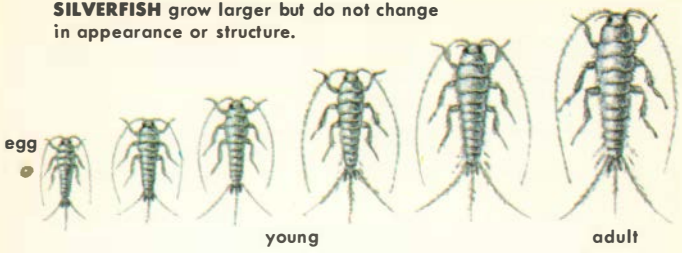
## MAJOR ORDERS OF INSECTS

| CLASS | NAME OF ORDER | COMMON EXAMPLES | WINGS, MOUTHPARTS |
|---|---|---|---|
| INSECTA | Thysanura | silverfish, firebrats | wingless; chewing |
| | Collembola | springtails | wingless; chewing |
| | Orthoptera | grasshoppers, crickets, cockroaches | 2 prs. wings or wingless; chewing |
| | Dermaptera | earwings | 2 prs. wings or wingless; chewing |
| | Isoptera | termites | 2 prs. wings or wingless; chewing |
| | Psocoptera | barklice, booklice | 2 prs. wings or wingless; chewing |
| | Mallophaga | chewing lice | wingless; chewing |
| | Anoplura | sucking lice | 2 prs. wings or wingless; piercing-sucking |
| | Thysanoptera | thrips | 2 prs. wings or wingless; rasping-sucking |
| | Homoptera | aphids, leafhoppers scales, mealybugs | 2 prs. wings or wingless; piercing-sucking |
| | Hemiptera | bed bugs, stink bugs, chinch bugs | wingless; piercing-sucking |
| | Coleoptera | beetles, weevils | 2 prs. wings or wingless; chewing |
| | Lepidoptera | moths, butterflies | 2 prs. wings; chewing (larvae), sucking, or siphoning (adults) |
| | Hymenoptera | wasps, bees, ants sawflies | 2 prs. wings or wingless; chewing |
| | Diptera | mosquitoes, flies, gnats | 1 pr. wings; chewing (larvae), piercing-sucking, or sponging (adults) |
| | Siphonaptera | fleas | wingless; chewing (larvae), piercing-sucking (adults) |

### CLASSES OF OTHER ARTHROPOD PESTS

| | | |
|---|---|---|
| **ARACHNIDA** | spiders, ticks, mites, scorpions | 4 prs. legs; 2 body regions—cephalothorax and abdomen; no antennae; chewing or sucking mouthparts |
| **CHILOPODA** | centipedes | 1 pr. of legs per body segment; 1 pr. of antennae; 2 body regions—head, trunk; body flattened; chewing mouthparts |
| **DIPLOPODA** | millipedes | 2 prs. of legs per apparent body segment; 1 pr. of antennae; 2 body regions—head, trunk; body rounded; chewing mouthparts |

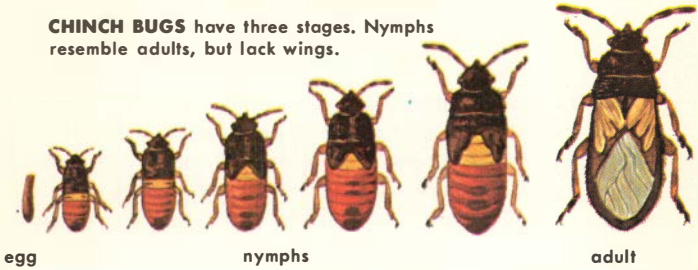
**SILVERFISH** grow larger but do not change in appearance or structure.



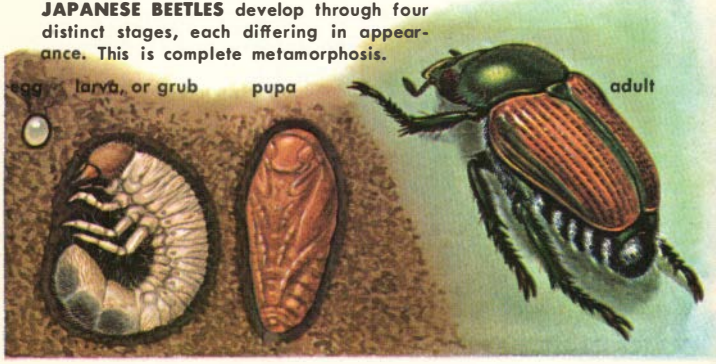
**INSECT DEVELOPMENT** An insect pest can be controlled most easily at a specific stage of its life history, sometimes not the one in which it does its greatest damage. Destroying the insect's eggs is often the most effective control measure. But to do this you must know where and when the female lays her eggs. Hence life histories are emphasized in this book.

Nymphs are young insects that, as soon as they hatch, resemble miniature adults. If the adult has wings, wing buds soon appear on the nymph's thorax. These grow each time the nymph sheds, or molts, and by the time the insect is mature, the wings are fully developed.

Nymphs are active. They commonly live in the same place and have the same feeding habits as the adults. True bugs, grasshoppers, cockroaches, and lice are among the insects that have a nymph stage. These change (metamorphose) gradually through three developmental stages—egg, nymph, and adult. This type of metamorphosis is called simple. Primitive insects, such as silverfish and springtails, also develop by a simple metamorphosis, but there are almost no changes in their structure as they grow, only an increase in size. Nymphs of some aquatic insects are called naiads; they differ considerably from adults in appearance and habits but change from naiads directly into adults.



**CHINCH BUGS** have three stages. Nymphs resemble adults, but lack wings.



**JAPANESE BEETLES** develop through four distinct stages, each differing in appearance. This is complete metamorphosis.

More kinds of insects develop through a complete metamorphosis. The insect changes in appearance and habits from one stage to the next through four distinct stages—egg, larva, pupa, and adult. The egg hatches into a larva, an active, feeding stage. The mature larva forms a pupa, a resting, or nonfeeding, stage from which the insect emerges as an adult. Caterpillars are the crawling larvae of butterflies and moths. They have chewing mouthparts. Some are major pests of plants and stored products. The adults have sucking, or nectar-feeding, mouthparts and never do damage. Maggots are the larvae of flies; grubs, the larvae of beetles.

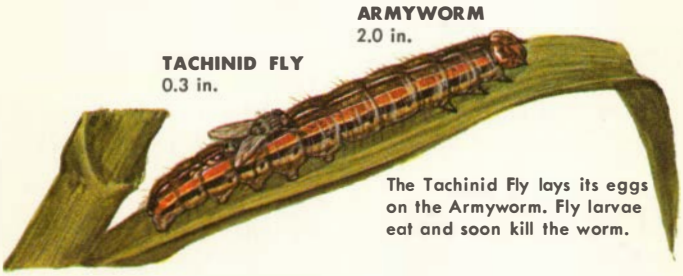
## CONTROLLING INSECTS

Insects become pests when they damage crops, destroy products, transmit diseases, are annoying, or in other ways conflict with man's needs or interests. In man's continuous battle against insect pests through the centuries, no insect species has ever been eradicated, though some have been reduced in number, at least temporarily. At the same time, other pest species have actually become more abundant and are now a greater problem because man has provided increasingly favorable conditions for them. The modern one-crop system of agriculture often supplies food for an insect pest in large quantity over many square miles. As new crop plants were introduced from other countries, their insect pests often came with them, but not the predatory species that kept the pests under control in their homeland. Some varieties of crops are more susceptible to pests than were the original wild plants, which over the years developed a degree of resistance to insect attack.

**NATURAL CONTROLS** ordinarily keep insect populations in balance. Weather factors, such as temperature and rainfall, limit the distribution of an insect species, as do such geographic barriers as large bodies of water, deserts, or mountain ranges.

Toads, lizards, frogs, moles, and shrews are among the many animals that feed mainly on insects. Some birds may eat their own weight in insects every day. Predatory insects usually feed on whatever insects are available. Larvae of parasitic insects develop in the eggs, young, or adults of other insects. Virus, fungus, and bacterial diseases also help hold insect populations in check. Man has often upset these natural balances.

Because insect-eating birds tend to eat the most available insects, they are especially helpful in controlling pests in outbreaks.



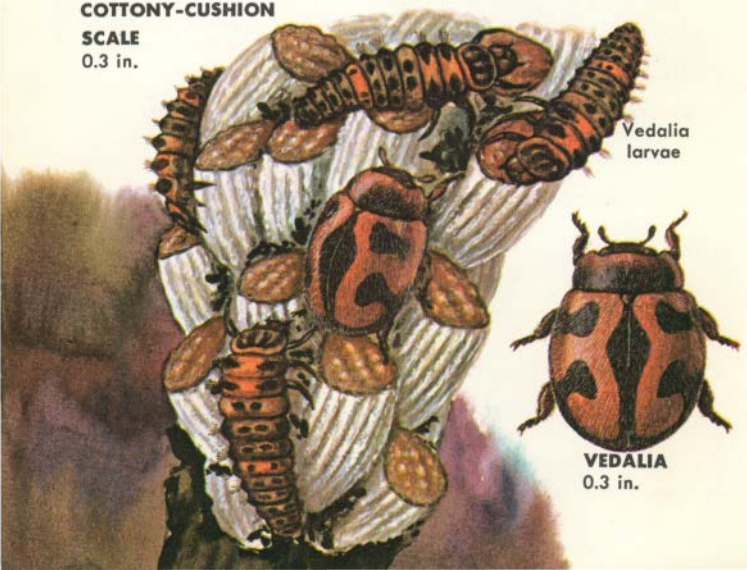
The Tachinid Fly lays its eggs on the Armyworm. Fly larvae eat and soon kill the worm.

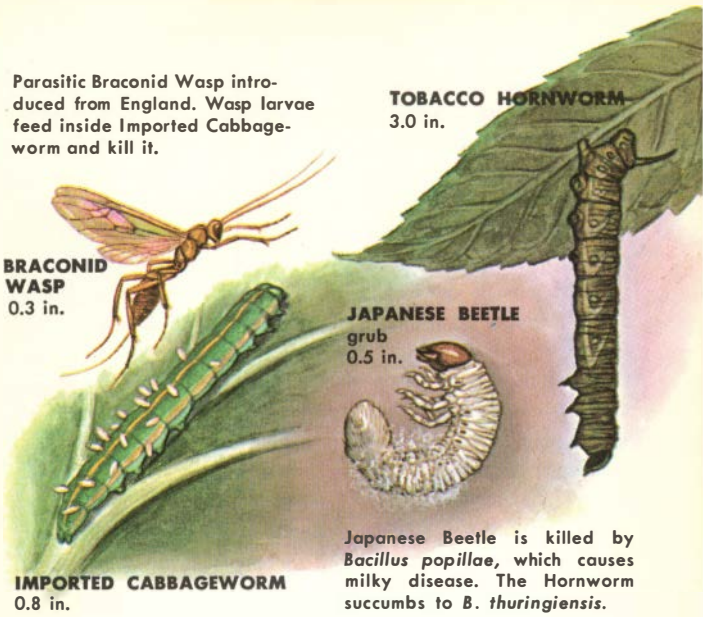
Braconid wasps lay eggs in aphids or other insects. Larvae develop inside.

These tiny rove beetles feed on maggots. The larvae also burrow into pupae.

**BIOLOGICAL CONTROL** is the purposeful use of natural predators, parasites, or diseases to kill or reduce the population of a pest species. This method has been effective principally in combating insect pests introduced from foreign countries without their natural enemies. Biological controls are not usually practical for home gardens or similar small areas. They are used most successfully in orchards and groves or where large-scale crop plantings are repeated year after year on the same land. Usually the control species is at first bred artificially so that it can be introduced in large numbers. More than two dozen cases of effective large-scale control of insect pests have been achieved by this method.

Damage to citrus by the Cottony-cushion Scale in California was virtually eliminated by the introduction of Vedalia, an Australian lady beetle. Later, grove





owners began to spray their trees to kill aphids. At the same time they killed the Vedalia beetles, causing an outbreak of Cottony-cushion Scale again. The use of bacteria causing milky disease that kills grubs of the Japanese Beetle is another example of successful biological control. Gambusias and other top-feeding minnows are effective in the control of mosquito larvae. Interestingly, the Chrysolina Beetle was introduced to western United States from Australia to halt the spread of the Klamath weed.

Biological controls do not eliminate a pest species completely. They only reduce the population and thus keep the damage low. But biological controls are usually self-generating, so a control species, once established, continues to reproduce and to remain effective.

**PHYSICAL AND MECHANICAL CONTROLS** are the simplest, most obvious, and at times most effective: witness the old-fashioned fly swatter. Pests of stored products are commonly destroyed by heat or cold. Few can survive long in a temperature of 120 degrees F. or higher. Cold either kills or stops activity. Draining off standing water to eliminate breeding places is a standard mosquito control method, while many plant pests are killed by flooding. Lights are used to attract some kinds of pests, which may then be electrocuted on charged screens. Pests that collect in large numbers may be lured to baits or caught in ditches. The gardener who picks Japanese Beetles off his roses by hand uses an effective method for small areas.

**CULTURAL CONTROL** is an inexpensive method of checking or preventing damage by insect pests by combining mechanical or physical controls with a knowledge of the pest's life history. Crop rotation prevents the build-up of a pest population that feeds on one kind of plant. Burying stalks, weeds, and other residues after harvest destroys eggs, pupae, or hibernating larvae and adults. Similarly, early or late plowing may destroy a particular life stage of a pest. Planting and harvesting can sometimes be timed to escape periods of egg laying or of pest abundance. Varieties of plants resistant to particular pests can be planted. Healthy, vigorously growing plants can withstand insect attacks better than those that are weak or diseased. Likewise, animals in good health are not as greatly disturbed by pests.

Golden Regent, a resistant variety of sweet corn.

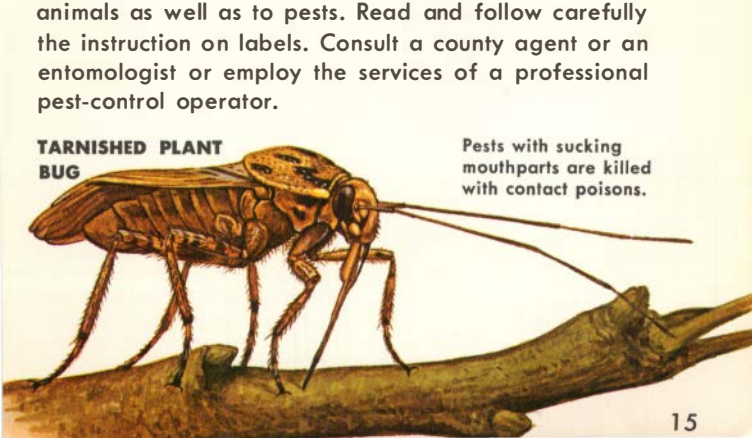
Spancross, a variety susceptible to Corn Earworm.

Stomach poisons are used mainly to kill pests with chewing mouthparts.

**INSECTICIDES** are poisons used to kill insect pests. Their great advantage is speed. Biological control methods, while safer and longer lasting, may require several seasons to become effective.

More than 350 million pounds of insecticides are sold annually in the United States. Their use increases agricultural yields by an average of about 25 percent and in many cases prevents complete crop losses. Insecticides are highly important, too, in the control of pests that are annoying or are disease carriers.

Most insecticides are dangerous to people and other animals as well as to pests. Read and follow carefully the instruction on labels. Consult a county agent or an entomologist or employ the services of a professional pest-control operator.



Pests with sucking mouthparts are killed with contact poisons.

**APPLICATIONS** of insecticides are rarely made full strength. *Dusts* are dry mixtures of from 0.1 percent to 25 percent of the poison mixed with fine particles of an inactive material, such as talc. *Wettable powders* are dusts that form a suspension in water for spraying; the powder may consist of from 10 to 95 percent insecticide. *Emulsifiable concentrates,* the most common formulation for applying insecticides, consist of oil or a similar organic solvent containing the insecticide and an emulsifier that aids the mixing of the droplets of oil and insecticide in water. The components may separate on standing but can be remixed by shaking. *Special solvents,* such as kerosene, pine oil, and other liquids of organic compounds, are used with the water-insoluble organic insecticides. Most solvents are toxic to plants, are inflammable, and may damage wallpaper, tile, and other materials. For all applications, follow printed directions with care.

**SPRAYERS** use a pump to build up air pressure that forces the liquid insecticide from the nozzle. The size of the nozzle opening creates either a foglike mist or a steady stream.

**DUSTERS** are powered by hand or by motor and use either a fan or compressed air to force out the dust in a cloud.

**AEROSOL BOMBS,** the most common household applicators, consist of an insecticide dissolved in a liquefied gas under high pressure. A fine mist is produced when these are allowed to escape from a small opening. Aerosols are convenient but are relatively expensive.

Bean beetles and their larvae (p. 76) feed on the underside of leaves. They can be reached with insecticide dusts.

**STOMACH POISONS** are used principally to kill insects with chewing mouthparts. They may be sprayed or dusted directly on the insect's food or may be mixed with baits to attract the pests. To be useful a stomach poison must kill fairly quickly, as the pest is already doing damage when it takes in the insecticide. Too heavy an application of these chemicals may kill the plants. The residues are poisonous to man and domestic animals. Contact insecticides (p. 18) act as stomach poisons if eaten. Arsenic compounds are the most common inorganic stomach poisons. *Paris green* (calcium acetoarsenite) was the first chemical insecticide used successfully on a large scale. *Lead arsenate, white arsenic* (arsenious oxide), *sodium arsenate,* and *calcium arsenate* are other arsenic stomach poisons. Fluorine compounds that act as stomach poisons are *sodium fluosilicate, sodium fluoride,* and *sodium fluoaluminate* (cryolite). *Thallium sulfate,* highly poisonous, is mixed with food to make ant baits. Do not store any insecticide where children can reach it. Make certain the containers are properly labeled and marked POISON.

**CONTACT INSECTICIDES** are sprayed or dusted directly on pests or are spread where pests will pick them up. They are especially useful in controlling insects with piercing-sucking mouthparts. All contact poisons act as stomach poisons (p. 17) if eaten. Most of them are also poisonous to people and animals and thus are a serious hazard if not used as directed. In excess amounts many contact insecticides are poisonous to plants. Some are used as fumigants. Always read the label before even opening the insecticide container. When in doubt about how to use an insecticide safely and most effectively, ask the advice of your dealer or of a county or agricultural agent.

Most of the many thousands of tradenamed insecticide formulations belong in the contact-insecticide group. These are divided into the following groups—*inorganics, natural organics* or *plant poisons, synthetics,* and *oils*. Each of these groups is described separately on the following pages. Most of the contact insecticides now used have appeared since the World War II development of DDT, the first widely used synthetic organic insecticide.

**INORGANIC CONTACT INSECTICIDES,** consisting mainly of *sulfur dusts,* mixtures of *lime* and *sulfur,* or *sulfur compounds,* were the first contact poisons used on a large scale and still rank among the most important. *Sulfur dust* is one of the main chemical controls for mites, for the crawling stages of scales, and for some kinds of caterpillars. Finely ground sulfur is usable as a wettable powder for spray applications. *Lime-sulfur solution* is a liquid, soluble in water. Lime-sulfur is also dehydrated and sold in concentrated powder form. It is used to control plant pests such as scales and also as a dip for cattle, sheep, and other livestock. *Bordeaux mixture* is a combination of copper sulfate and lime in water. In addition to their use as insecticides, sulfur and sulfur compounds are valued as fungicides. In hot weather, heavy applications of sulfur will burn foliage and fruit and so must be applied sparingly.

**NATURAL ORGANICS** were the earliest compounds used in killing insect pests. With the exception of nicotine, highly toxic to man and other mammals, they are the least dangerous of the insecticides to use on food plants or in the house.

*Nicotine* is obtained from the waste leaves of tobacco plants and waste tobacco products. It is used principally as *nicotine sulfate*, with a 40-percent nicotine content. The 40-percent concentrate is ordinarily diluted in 800 to 1,000 parts of water (about one teaspoon to a gallon) and is applied as a spray to kill aphids or other soft-bodied insects. Nicotine sulfate is used also as a stock dip for control of mites, ticks, and lice. Finely ground tobacco stems and leaves are used as a dust or burned as a fumigant. Nicotine may be added to aerosol formulations.

Tobacco plant, source of highly toxic nicotine

*Pyrethrum* comes from the flowers of several species of chrysanthemums. It is produced commercially from a species grown in East Africa. Fast-acting pyrethrins are the "knockdown" agents in most household sprays, with slower-acting DDT or other synthetics actually killing the insect. *Allethrin*, produced synthetically, is much the same as pyrethrum in action.

*Rotenone* is obtained from the dried and ground roots of the South American cubé and from the roots of two species of derris that grow in the East Indies. As prepared for an insecticide, rotenone is relatively nontoxic to humans, but as an insecticide it acts both as a stomach and as a contact poison. Another use of rotenone by biologists is as a poison to eliminate trash fish in lakes and ponds.

Other botanicals, or natural-organic contact insecticides, include *ryania*, produced from the pulverized stems and roots of a South American plant. Ryania is less toxic to mammals than rotenone and so is recommended for food plants where residues might be a problem. *Sabadilla*, which also has low toxicity, is made by grinding the seeds of a lily-family plant of Venezuela.

**SYNTHETIC ORGANIC CONTACT INSECTICIDES** are the most important group of chemicals used today in the control of insect pests. There are two groups: chlorinated hydrocarbons and organo-phosphates.

## CHLORINATED HYDROCARBONS

*DDT* is the leader in the chlorinated hydrocarbon group. Though first synthesized in 1874, DDT was not recognized as an insecticide until World War II, when its initial large-scale use halted a typhus epidemic spread by lice in Italy. It was later valuable during the war years in the control of flies and mosquitoes and came into widespread use in the control of agricultural and household pests after the war. DDT is highly effective in killing many kinds of insects but is relatively nontoxic to aphids, spider mites, and some other species. Some cockroaches, flies, and other insects have developed resistance to DDT. When an insect comes in contact with DDT, it first appears to lose control of its voluntary actions; later it becomes paralyzed. Death comes slowly, sometimes several days later. DDT has a rather low toxicity to man and other vertebrates but may be stored in the fatty tissues of the body and cause death months later when the fat reserves are utilized.

DDT is applied as a dust, wettable powder, water emulsion, or in an oil base. Vertebrates absorb the oil-base DDT most rapidly. DDT is insoluble in water. Its residues may remain effective outdoors for many months or even years, indoors for even longer. *Methoxychlor*, related to DDT, is effective against the Mexican Bean Beetle and works more rapidly in killing the House Fly. *TDE* (or DDD), also a relative of DDT, is commonly used in mosquito control because it is less toxic than DDT to vertebrates. TDE is also less poisonous to insects, however.

*Benzene hexachloride* (BHC), also in the chlorinated-hydrocarbon group, was discovered as a useful insecticide about the same time as DDT. BHC kills faster than DDT and is commonly used in the control of crop pests. It has a distinctive musty odor and sometimes taints food. BHC is usually used as a dust or a wettable powder. *Lindane* is BHC that differs only in the arrangement of its atoms, but as it lacks the objectionable heavy odor, it is used more commonly in houses. Though its residual life is shorter than DDT's, lindane is about twice as toxic to many insects and apparently is not stored in the body tissues. *Toxaphene*, insoluble in water but soluble in many organic solvents, is an excellent insect killer but is also poisonous to vertebrates. Toxaphene is one of the most common insecticides for controlling pests of cotton.

*Chlordane, dieldrin, aldrin, endrin,* and *heptachlor* form another group of closely related chlorinated hydrocarbons. All are insoluble in water but are soluble in many organic solvents.

Scales may be killed with organo-phosphate sprays (below and p. 86). Use these insecticides with great care.

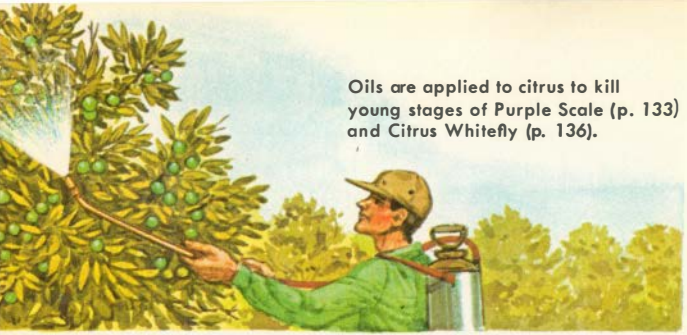
They are also used in dust or pellet form, particularly as soil poisons for the control of termites and ants. They are highly effective insect killers and are residual. They are also poisonous to vertebrates, including man and other mammals.

## ORGANO-PHOSPHATES

The organo-phosphate group of contact insecticides stems from chemical research just before World War II, when some of these compounds were developed as poisonous gases for use in warfare. Most of them are extremely lethal to man and animals as well as to insects. They can be taken into the body through the mouth or the skin or by inhaling their fumes. Residues on foods are a source of danger. Because these insecticides are very poisonous, they must be handled with the greatest care.

*Parathion,* a brownish-yellow liquid with a garlic odor, is too poisonous for household use or for applying near livestock and pets, but it is widely used on fruit and vegetable crops. Residues disappear rapidly. *Demeton,* about as poisonous as parathion, acts as a systemic poison, being absorbed by the tissues of the plant. It kills pests that feed on the plant's juices without affecting predators and pollinators. *TEPP,* even more poisonous than parathion, decomposes rapidly and leaves no residue. It is used regularly on food crops.

*Malathion,* most commonly used organo-phosphate, is not highly toxic to vertebrates. Malathion will kill many insect species that have developed a resistance to the insecticides of the DDT and chlordane groups. *Diazinon, DDVP, ronnel,* and *dicapthon* are other organo-phosphates that are excellent insect killers. DDVP is the most highly toxic of these chemicals to man and animals.



Oils are applied to citrus to kill young stages of Purple Scale (p. 133) and Citrus Whitefly (p. 136).

**OILS,** principally petroleum but also some animal and vegetable oils, serve as carriers for insecticides or may be used as insecticides themselves. *Dormant oils,* rather heavy and semirefined, are applied in late winter or early spring to trees or shrubs that are not in foliage to kill scales, mites, eggs, and some larvae. *Summer oils* are lighter and more highly refined, hence less damaging to plants; they are used to control aphids, scale insects, and mealybugs. As the oils themselves are toxic to plants if applied full strength, they are mixed with water by adding an emulsifier, such as soap. This distributes the oil evenly as small droplets. Oil baths may be used to kill such parasites as fleas, lice, ticks, and mites on domestic animals and pets. Formulations that require shaking with a small amount of water before final mixing are called *miscible* oils. An *emulsible*-oil formulation can be poured directly into the water.

**FUMIGANTS** are gases used to kill insects in enclosures, as in buildings or containers, in the soil, or under such temporary covers as tarpaulins and tents. Many fumigants are inflammable. Nearly all fumigants are more poisonous to man than to the insects and should be used only by a professional pest-control operator. Their advantage is their penetration to all parts of buildings, into stored products or plants. They leave no residue. *Carbon disulfide* (carbon bisulfide), highly inflammable, is used mainly as a soil fumigant for ants, termites, and grubs. For indoor use it may be mixed with carbon tetrachloride to reduce the danger of fire or explosion. *Dichloropropene* and *dichloropropane* are also used as soil fumigants. *Hydrogen cyanide,* which has a distinctive nutty odor and is deadly poisonous, is used to fumigate mills and warehouses or fruit trees under tents. *Methyl bromide,* a noninflammable fumigant, is valued because of its power to penetrate tightly packed materials. *Paradichlorobenzene* ("para" crystals) and *naphthalene* (both sold as mothballs) vaporize slowly and act as a fumigant and a repellent.

**REPELLENTS** are chemicals that by their odor or taste prevent insect attacks. They are used mainly to protect man, animals, or stored products; less commonly, plants. Some repellents are poisonous if touched, eaten, or breathed. *Mothballs* are repellents that protect clothes from insect damage. Creosote is used as a barrier against crawling insects, while *smoke screens* ward off flies and mosquitoes. Among the most successful of dozens of repellent chemicals are *diethyl toluamide, dimethyl phthalate,* and *ethyl hexanediol.* These organic chemicals are diluted with oils and disguised with perfumes. They are sold under many tradenames. Most will repel insects for one to five hours.

**NEW METHODS** of combating insect pests are being developed every year. Some are useful only in large-scale control programs, others in home and garden. Among the most promising are *sterilants* that render insects incapable of reproducing. This method was first used with success to control the Screw-worm. Millions of males, sterilized by radiation, were released in areas of infestation to mate with females, which then produced infertile eggs. *Hormones* are used to cause an insect to pass from one stage of its development to the next irrespective of season. Thus, pupae can be made to transform into adults in midwinter or larvae may be made to pupate before they are full grown. Insect hormones are apparently harmless to other living things. Also safe are such *nontoxic insecticides* as finely ground silica, which abrades the outer covering from an insect and causes it to dry up, or desiccate, as its body fluids escape.

The soil in seed beds can be fumigated by releasing methyl-bromide gas under plastic cover.

**ODOROUS HOUSE ANTS,** widespread in U.S., give off a sweet odor when crushed. Travel definite trails to find food.

**ARGENTINE ANTS** are common in southern U.S.; worst ant pests in houses. Prefer sweets but eat all foods. Bite, do not sting.

## HOUSEHOLD PESTS

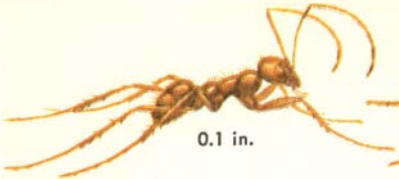
Insect pests may destroy the timbers of a house, tunnel into furniture and fabrics, or raid the contents of the kitchen, from the spice cabinet to the garbage pail. Some kinds bite, sting, or transmit diseases. Others are simply annoying, uninvited guests.

The basic step in controlling household pests is to keep them out. Screen windows and doors, seal cracks, and remove debris in which pests can hide or multiply. If pest infestations are heavy, persistent, or unexplainable, services of a professional pest-control operator may be necessary. Make certain the man employed represents a licensed, bonded organization.

Many pests can be recognized and controlled without expert help. Since insecticides are poisonous and will be used where there are people, pets, and food, follow carefully the directions given on the label.

**THIEF ANTS** often live in other ant nests and feed on larvae. They prefer cheese, meats, or other greasy food.

**PHARAOH ANTS** also like meat. May nest in walls and then invade all parts of house. Poison baits are best control method.



**CRAZY ANTS,** native to India but now widespread, run "crazily" on their long legs. They eat meat, greasy foods, and sweets.

**CORNFIELD ANTS** are the common "red ants" of northern states. Nest mounds often numerous on lawns. Invade houses.

**ANTS** live in colonies in the ground, in the foundations or walls of buildings, beneath bark or stones. A colony contains numerous workers (sterile females), one to several queens, and a few males during part of the year. Workers do not have wings, but males and females are winged at swarming time. Males die after mating, and the queens drop their wings and find a place to start a colony. After mating, queens remain fertile, living as long as 25 years. Queens are usually several times larger than workers, which attend their every need. Ants belong to same insect order as bees and wasps. They have elbowed antennae and a thin waist, distinguishing them from termites (p. 26).

The most effective control is to destroy the nest if it can be found. Chemical barriers, using a residual contact insecticide, can be placed around foundations of buildings. Workers will carry poisoned baits to the colony and thus kill even the queen.

**SOUTHERN FIRE ANTS** occur in warm parts of U.S. Often nest near buildings. Invade houses. Stings are painful.

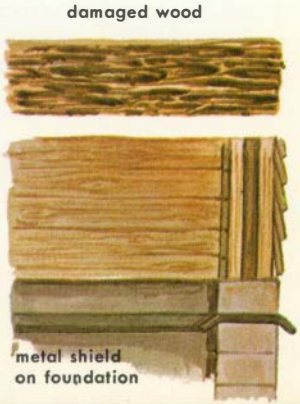
**BLACK CARPENTER ANTS** excavate galleries and nest in wood. They enter houses to get sweets. Bite but do not sting.

**TERMITES** are primitive social insects, more closely related to cockroaches (p. 28) than to ants (p. 25). A colony consists of numerous whitish, wingless, blind *workers;* a lesser number of *soldiers,* with large brownish heads equipped with powerful jaws or with a bellows-shaped snout that expels a sticky or odorous fluid; and *reproductives,* the king and queen. Additional winged males and females are produced for swarming, which takes place in spring or after rains in warm weather. After a short flight they break off their wings and mate. Each mated pair then crawls off in search of a suitable place to establish a new colony.

More than 50 species of termites occur in the U.S. Their spread as far north as Minnesota in recent years is attributed to increased use of central heating in buildings, enabling them to survive winters. Nearly all U.S. species live in the soil; many of the more than 2,000 species of the tropics build aboveground nests.

Termites eat wood but cannot absorb it until the cellulose is converted into soluble substances by protozoans that live in the termite's digestive tract. Neither animal is able to survive alone.

termite tubes up foundation



**SUBTERRANEAN TERMITES** live in colonies in soil, and workers travel through tunnels or mud tubes to the wood above. Fungi that grow in moist, dark tunnels are eaten by termites, supplying protein and vitamins.

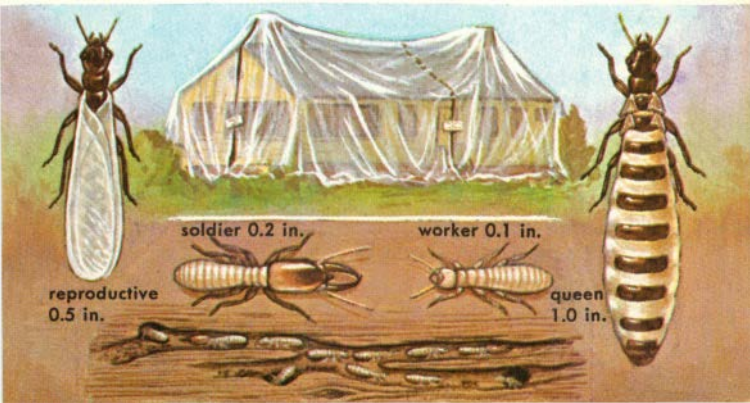
Swarming flights or mud tubes up a foundation are evidence of a termite infestation. In late stages, floors sag as eaten-out beams crumble.

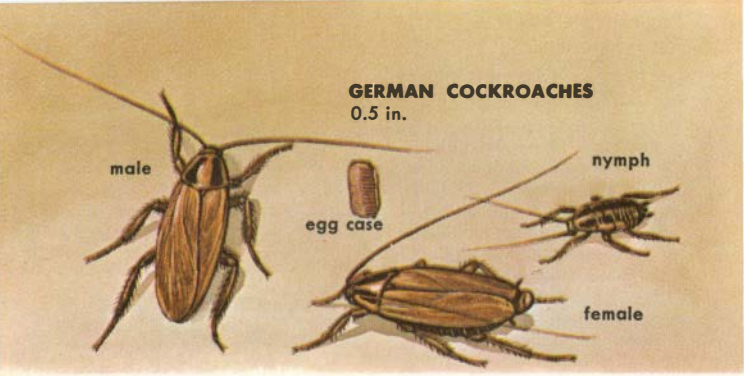
To control, no wood of a building should touch soil. Preventive measures should be taken as a building is being constructed. Place metal shields between the foundation and sills and allow air to circulate under buildings. Because of the special equipment needed, use a professional pest-control operator, especially in treating a building already erected. He will force penetrating insecticide into the wood or foundation, treat the soil beneath buildings, or use a fumigant. Inspect regularly to detect renewed activity.

worker 0.2 in. reproductive 0.5 in.

**DRYWOOD TERMITES** are prevalent in the southwestern U.S. No contact with soil is necessary. Often they invade a house at roof level and may infest furniture or books. Piles of brownish, seedlike excrement pellets pushed from tunnels are signs of their presence. Preventing entry is not economical. Control, which should be done only by experts, consists of forcing insecticide into tunnels. Poison is spread as workers groom each other. House or infested object may be fumigated, but this does not prevent reinfestation.

**EASTERN SUBTERRANEAN TERMITE**



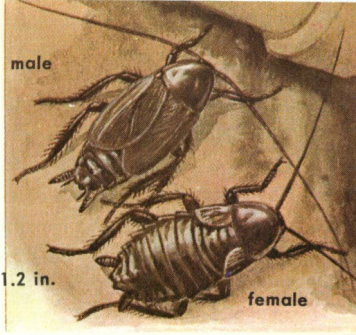


**COCKROACHES** feed on a great variety of foods—meats, cheeses, sweets, and starches, including the starch in clothing or in the glue of book bindings and stamps: When very abundant, they may also eat human hair, skin, and nails. Cockroaches secrete a sticky, odorous fluid that may be left on foods or materials. Fortunately, cockroaches appear to be only incidental carriers of diseases.

Most of the more than 3,000 species of cockroaches live in the tropics or subtropics. About 55 occur in the U.S.; only four species are common household pests.

Normally cockroaches are active only at night. They develop by a gradual metamorphosis—egg, nymph, and adult. Egg cases contain two rows of eggs, and the nymphs escape through a seam along the side. Nymphs look like adults but lack wings and may be a lighter color. After a period of growth and several molts they become adults. The time required for them to mature varies with the species and also with the season and the region. Temperature and moisture as well as food are important factors in their development.

The best permanent control for cockroaches is eliminating accessibility of foods which they eat.



**GERMAN COCKROACHES,** or Croton Bugs, are common in U.S., especially in northern states. Dark stripes on shield behind head are distinguishing. Both sexes winged and active.

German Cockroaches commonly enter houses in bags or boxes from grocery stores. They tend to cluster in warm, moist places, as around hot-water pipes, and stay hidden when not feeding.

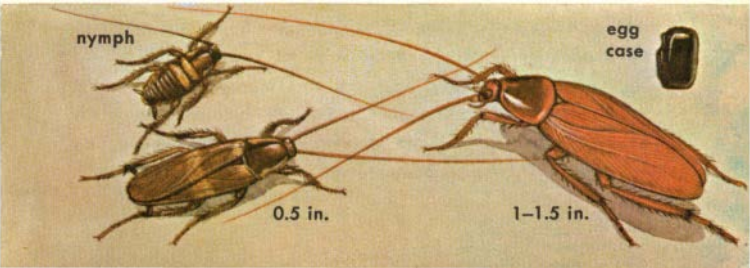
Females carry the egg capsule, containing 24 to 48 eggs, until hatching time. Nymphs may emerge while the capsule is still attached to the female.

In most areas German Cockroaches are resistant to DDT, chlordane, and other chlorinated hydrocarbons. They can be controlled with organo-phosphates, such as malathion.

**ORIENTAL COCKROACHES,** also called Black Beetles or Water Bugs, are most sluggish of domestic cockroaches. Females have short useless wings and are slightly larger than males. Commonly infest damp basements. Contact-insecticide barrier around a foundation blocks entry of these cockroaches and other crawling pests.

**BROWN-BANDED COCKROACH** has two light bands across the base of its wings. Unlike other cockroaches, it is as common in the bedroom as in the kitchen, requiring warmth but not as much moisture. Control is difficult because these cockroaches are found so widely through the house. The most effective way to reach them is with fumigants, keeping room or house closed for several hours.

**AMERICAN COCKROACHES** are the largest cockroaches in the U.S. Both sexes are winged, their flight gliding and fluttery. The female deposits her egg capsule soon after it forms, sometimes gluing it to a surface. In the South these cockroaches are common outdoors, where they live under bark or in vegetation. They can be controlled with contact insecticides or lured to poison baits.



**CLOTHES MOTH** larvae feed on woolen fabrics, feathers, fur, mohair, and other animal products such as dried milk and meals. The adult moths, commonly called "millers," do not eat, and unlike most other moths, are not attracted to lights.

Material likely to be attacked should be cleaned and exposed frequently to light. Brushing clothes dislodges the eggs and larvae. Storage of furs at a temperature of 45 degrees or cooler prevents development of moths or will kill them if the temperature is raised and lowered several times during the storage period. Items can be sprayed with residual contact insecticides or washables rinsed in an insecticide solution. These treatments kill the insects as they feed. Mild fumigants such as paradichlorobenzene crystals or naphthalene flakes discourage moth attacks. These insecticides will also kill moths already in the fabrics but are effective only when used in tight containers or closets. An infestation may persist and spread from larvae that feed and develop on lint in cracks in the floor, beneath baseboards, or in vents. In heavy infestations an entire house may be fumigated. This should be done only by a professional exterminator.

**DERMESTID BEETLES** are pests of fabrics and upholstered furniture and also infest cured meats, meals, cheeses, hides, hair, flour or other grain products, and spices. They are serious pests in museums. Outdoors they are valuable as scavengers. Larvae of dermestid beetles are more active than the larvae of clothes moths. Adults fly in daytime. They commonly feed on the pollen of flowers and also breed outdoors. Treatments effective for clothes moths also control carpet beetles. In both cases, good housekeeping to eliminate breeding places is the most important preventive.

**WEBBING CLOTHES MOTHS** are common fabric pests that occur throughout the world. Females lay eggs about 0.02 of an inch long (barely visible), either singly or in small groups, sticking them to the threads of fabrics. Eggs hatch in a few days to several weeks, depending on temperature and humidity. The larvae are so tiny they can crawl between the woven threads of fabrics. They spin a silky webbing or tunnel as they feed, sometimes moving to another spot if their food runs short. Damage is most common under collars, in cuffs, or in other dark areas of garments. Full-grown larvae spin a silken cocoon from which they emerge as adults in three to six weeks.

eggs, larvae and cocoons on fabric.

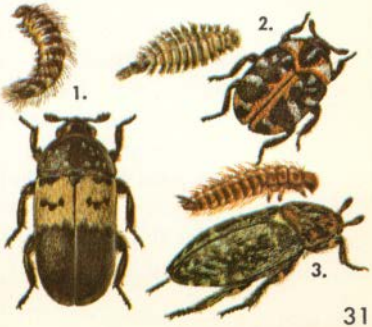
**CASEMAKING CLOTHES MOTH** larvae spin a case of silk and fabric, carrying it with them as they feed. The case splits and the "V" of the split is filled in as the larva grows. Common in northern states. Plaster Bagworms of southern states build a portable case of bits of plaster or fabric woven into the silk of the case.

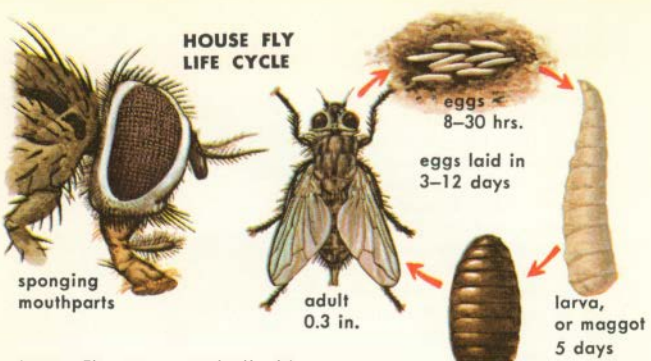
**CASEMAKING CLOTHES MOTH**

**PLASTER BAGWORM**

**CARPET BEETLES,** also called Buffalo Beetles, are dermestids that infest woolen fabrics, feathers, and other animal products. Related pests include the larger Hide Beetle and the Larder Beetle. Hides and skins are treated with arsenic powders or similar stomach poisons. Cheese, cured meats, and other fatty foods should be kept in tight containers or under refrigeration.

1. **LARDER BEETLE,** 0.3 in.; 2. **CARPET BEETLE,** 0.2 in.; 3. **HIDE BEETLE,** 0.3 in.





House Fly can eat only liquids. It salivates on solids to dissolve them, then sponges up liquid.

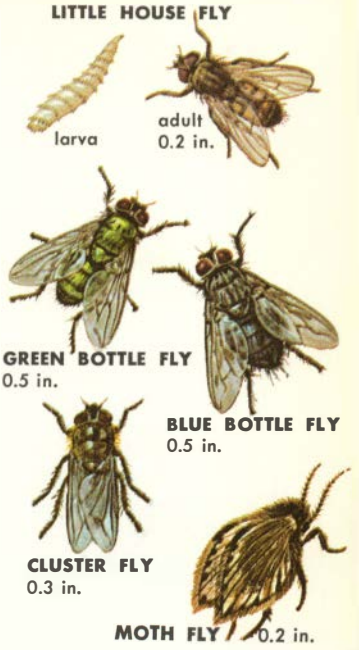
**HOUSE FLIES** are bothersome, dangerous pests, transmitting diseases and parasites from the filth in which they breed to the foods man eats. Females may lay half a dozen or more clusters of 100 to 150 eggs in a season. In favorable conditions a life cycle is completed in about two weeks but may take many months in cold weather. Winter is ordinarily passed in the larva or pupa stage, but adults may overwinter in warm niches. Disposal of garbage, manure, sewage, and similar decaying or fermenting wastes in which the flies breed and the maggots develop is most important. Windows and doors should be fitted with tight screens. Flies that enter can be killed with aerosol sprays. Walls, sills, and screens can be treated with residual surface sprays. As flies in most areas are resistant to DDT, other contact insecticides must be substituted. Poison baits (mixtures of syrup- or sugar-water with an insecticide) are effective in places that cannot be screened or where sprays cannot be used because of danger of contamination.

**LITTLE HOUSE FLIES** are smaller and more slender than the House Fly. They hover or fly back and forth without settling on food. The similar, closely related Latrine Fly breeds in human excrement. Maggots of both have a flattened, spiny body.

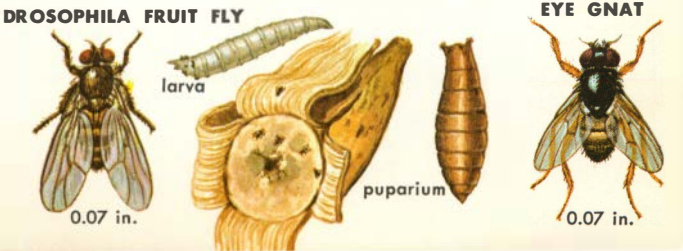
**BLOW FLIES** are large and noisy. Most species are metallic blue or green, like the Green Bottle and Blue Bottle flies shown here. The gray Cluster Fly, similar in appearance to House Fly, is a blow fly common in houses. Blow fly maggots develop in garbage or carrion.

**MOTH FLIES,** their wings and body covered with hair, often appear in sink or bathtub drains. The maggots develop in the gelatinous sludge in the bends of pipes. Sometimes large numbers invade from outdoors, where they develop in garbage or sewage. They are so tiny they can crawl through screens.

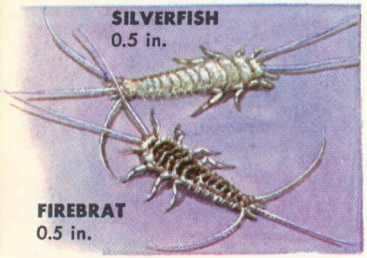
**FRUIT FLIES** can enter houses through ordinary screens. They are attracted to rotting or fermenting fruits or liquids. A complete life cycle requires less than two weeks. Other common names for them are Vinegar Flies or Pomace Flies.



**GNAT** is a name used for many kinds of small flies, most of which are only nuisances. The Eye Gnat, attracted to eye secretions, transmits pinkeye. These persistent tormentors are most active in early morning or evening hours.



**MANY OTHER KINDS** of insects, as well as spiders, and their kin enter houses, where they are either nuisances or potentially dangerous pests. Some of these are discussed in the section on insects that bite or sting (p. 38), others in the section on stored products (p. 146). Often an invasion of insects is only temporary, as when they are attracted to lights. When a lawn is mowed, a vacant lot is cleaned up, or a crop is harvested nearby, insects disturbed from their normal living places may be temporary pests. Others are regular visitors and companions in dwellings.



**SILVERFISH** are scaly, wingless insects that prefer foods with a high starch or sugar content. They eat the glue in book bindings or from wallpaper and often damage paintings or paper. Silverfish prefer cool, damp places; the closely related Firebrat lives in warm, drier spots. Residual sprays or dusts are effective in keeping down infestations.

**EARWIGS** are easily recognized by forceps at end of abdomen. Sometimes occur in large numbers in houses. They can bite and also pinch, but seldom break the skin. They hide during the day, feed at night. Use residual sprays or dusts.

**HOUSE CRICKETS** sing on the hearth or wherever they can find warmth. When cold, they are sluggish and quiet. Field Crickets also enter houses in autumn. As house pests, crickets eat a variety of foods and may be destructive to clothes. Household sprays, dusts, and poison baits are usually effective.

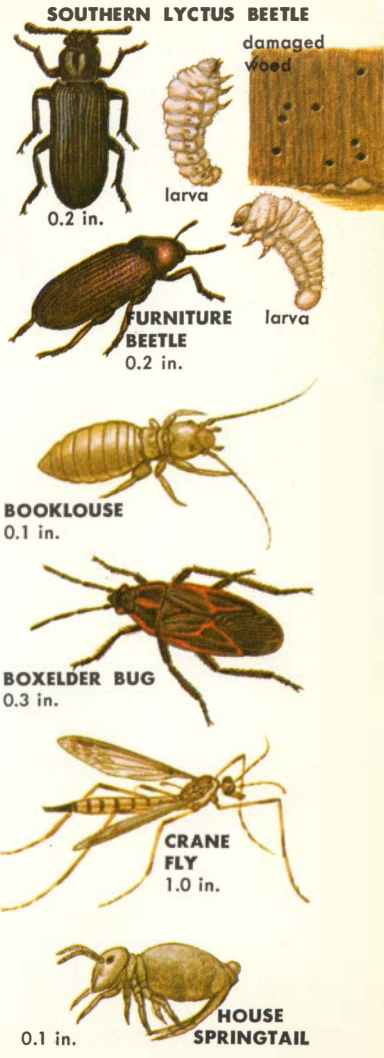
**WOOD-BORING BEETLES** of a number of species may infest wood used in houses or furniture. Larvae of the Southern Lyctus Beetle reduce wood to a fine powder, which is pushed outside through small holes. Droppings of the Furniture Beetle and others are round pellets. As some kinds feed, a ticking noise in the wood can be heard. Fumigation by a qualified pest-control operator is the best control.

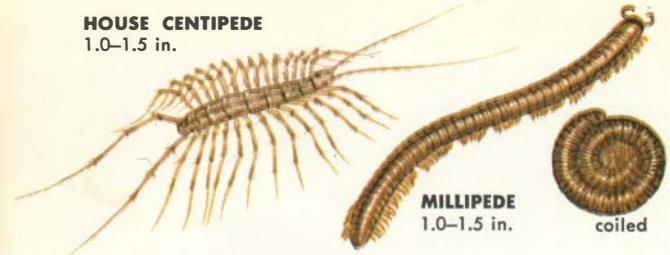
**BOOKLICE,** or Psocids, sometimes become abundant in stored furniture, books, or papers, particularly if damp. They feed mainly on molds but also eat cereals. Booklice are so small that it is difficult to keep them out of a house. Use contact sprays or dusts.

**BOXELDER BUGS** do not bite, sting, or carry diseases, but are annoyances when large numbers occur near or in houses. Can be killed with household sprays.

**CRANE FLIES** look like large mosquitoes but are harmless. Their larvae, or maggots, sometimes called leatherjackets, develop in damp vegetation or in the soil. Adults commonly are attracted to the lights in houses. They can be killed with household fly sprays.

**SPRINGTAILS** often congregate in cellars or in bathrooms or kitchens, wherever there is dampness. They are harmless and can be killed with household sprays or dusts.





**CENTIPEDES** are flat-bodied, with long antennae and one pair of legs on nearly every trunk segment. The House Centipede feeds on ants, flies, cockroaches, and other pests, hence is beneficial. Its bite, though rare, is painful. Use residual contact insecticides or treat joists, subfloors, and cracks with creosote or other repellents.

**MILLIPEDES** are almost cylindrical, with two pairs of short legs per apparent body segment, and short antennae. They move slowly. These features distinguish them from swift-crawling centipedes. Normally millipedes are found only outdoors, feeding on decaying vegetation, but they may invade houses after rains or to escape cold in fall.

**PILLBUGS AND SOWBUGS** are land-dwelling crustaceans. They can survive only in damp places, as in leaf mold or in basements. They feed mainly on decaying vegetation but also eat tender roots of plants. Controls: cleanup of debris in which they thrive; contact insecticides; poison baits in heavy infestations, as in greenhouses.

**SCORPIONS** are spider relatives found only in warm climates. Two species in southwestern U.S. are highly poisonous. Scorpions are nocturnal and feed mainly on insects, which they catch in their pincers, then paralyze or kill with their sting. Eliminate debris close to buildings and use contact insecticides that have residual action.

**DADDYLONGLEGS**
body 0.2 in.
2–3 in. across legs

**HOUSE SPIDER**
0.3 in.

**DADDYLONGLEGS,** or Harvestmen, resemble spiders but have a distinctly segmented abdomen and stink glands. They lack silk glands. Their long stiltlike legs are easily shed when the animal is touched. Daddylonglegs are harmless, feeding mainly on dead insects. They will kill and eat small insects, however, and may feed on fruits or vegetables.

**JUMPING SPIDERS** of several species often enter houses. They do not make webs. Instead they hunt actively for prey, searching over ceilings, walls, sills, and floors. They can jump quickly, and frequently use their silk as a payout line to let themselves down from high levels. These lines may be a nuisance, but the spiders are helpful.

**BLACK WIDOW SPIDERS** are widely distributed and rather abundant. Their bites are painful and may cause death. A doctor should be called immediately to give treatment. Fortunately, Black Widows are shy and do not bite without great provocation. They usually build their webs in or beneath objects close ta the ground.

**HOUSE SPIDERS** bother housewives because of their webs. Their bites may be very poisonous. House Spiders prey on the House Fly and other insects. Their webs are usually built in corners, where they collect dust as well as prey. These and other spiders can be killed with contact sprays or dusts; residual insecticides prevent reinfestation.

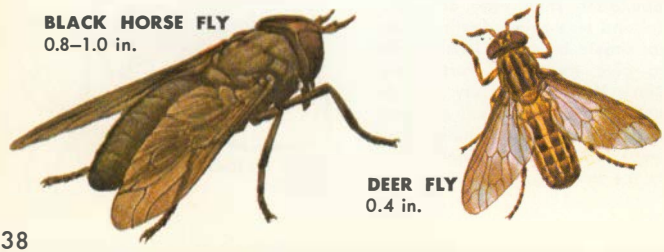
# INSECTS THAT BITE OR STING

Biting flies feed on the blood of their victims. They cut or stab through the skin with their knife-sharp piercing mouthparts, then lap up blood that flows from the wound. They may also be carriers of diseases.

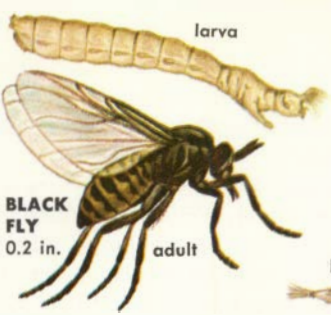
Insects that sting usually do so as a defense when disturbed or annoyed. Stings of bees or wasps may be extremely painful and also dangerous. In the United States more deaths result from insect stings than from the bites of poisonous snakes. Medical knowledge about the effect of insect venoms and how to treat stings is still limited. Usually there is swelling and in many cases a throbbing ache that may last for several days. Stings vary in severity with the species of insect and also with the amount of poison injected. A sting in an arm or a leg is less dangerous than a sting in the neck, where the poison may paralyze the vocal cords or hamper breathing. The effect of a sting also varies with individuals and with their physiological condition. Beekeepers commonly build up an immunity to stings.

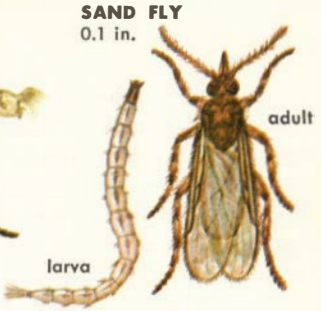
**HORSE FLIES,** active only in the daytime, are mainly pests of livestock (p. 56) but may also bite people. The bite, only from females, is very painful. Females lay egg masses on leaves, stems, or rocks.. On hatching, larvae drop to ground and complete development in damp soil or in water. Maggots may overwinter in mud, pupate in early spring, and emerge as adults a few weeks later. Equally pestering are closely related Deer Flies.



**BLACK HORSE FLY**
0.8–1.0 in.

**DEER FLY**
0.4 in.

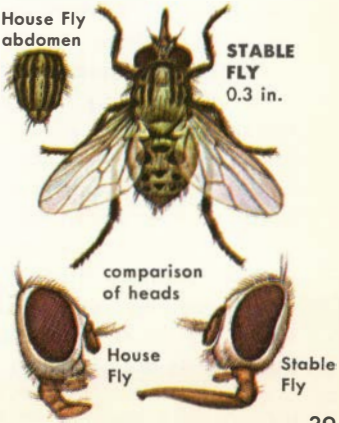




**BLACK FLIES,** also called Buffalo Gnats, are most abundant in late spring and summer in wooded regions of Canada and the U.S. These humpbacked bloodsuckers (only the females bite, causing a persistent irritation) crawl annoyingly into the eyes, ears, and nostrils. Females fasten their egg masses to rocks or vegetation in streams, in which the larvae develop and spin cocoons. A life cycle is completed in about six weeks. Repellents are effective.

**STABLE FLIES,** like Horse Flies, are principally pests of livestock but may at times bother people. They occur most abundantly in lowlands and seashore areas, becoming especially aggressive when the barometer is falling. Both sexes bite. Their mouthparts are sharp and stiletto-like rather than sponging, as in House Flies. In cool areas, they overwinter as larvae or pupae; in warmer climates, active the year around. In houses, can be killed with sprays. Eliminate breeding places (manure or decaying organic matter).

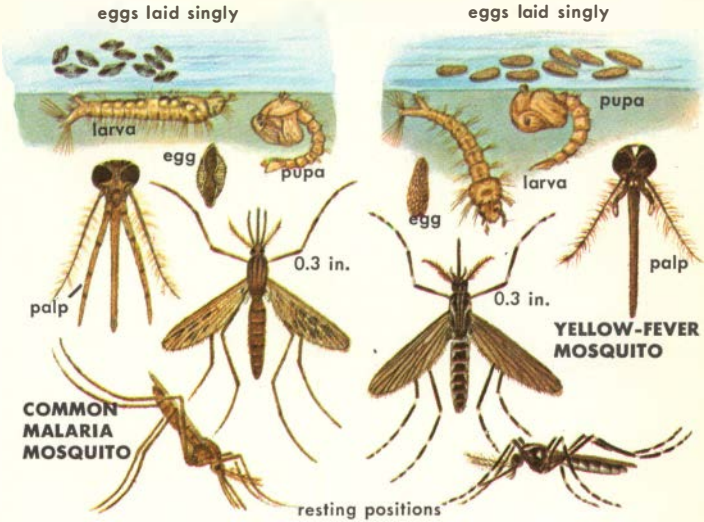
**SAND FLIES,** or No-See-Ums, are tiny bloodsucking flies, so small they can go through ordinary screens. They are most active in evening or early morning hours, and their bites are extremely painful. Screens and areas around lights can be sprayed or painted with an oil-emulsion contact insecticide. Repellents will keep the flies off in daytime. The maggots develop in moist vegetation or in pools (some species in salt water, others in fresh).



**MOSQUITOES** total more than 2,500 species. Many are carriers of diseases (malaria, yellow fever, dengue, and filariasis). Others, as annoyances, cause costly losses of man-hours to outdoor workers or reduce the pleasure of being outdoors.

Adult females lay their eggs on or near the surface of permanent pools or in moist or temporarily flooded locations. Some species lay their eggs singly; others deposit them in "rafts" of as many as several hundred. In most species the female must have a meal of blood before she can produce eggs. Males are nectar feeders and do not bite. The larvae, also called "wigglers," swim or rest just beneath the surface. They feed on microscopic organic matter. Development may be completed in as short a time as five days or may require several months; the average is a week to 10 days. Then the larvae transform into pupae, also known as "tumblers" because they continue to be active. The adults emerge in from two days to two weeks or longer, depending on the species and the water conditions. Adults live for a few days to several months, and most species do not travel more than a mile. Some hibernate in the adult stage.

Large-scale mosquito control consists of eliminating breeding areas by drainage, spreading oil films over the surface of the water, using insecticides to destroy the larvae or pupae, or spraying with contact insecticides to kill the adults. All of these controls may also destroy habitats or kill fish, birds, or other valuable wildlife and should be undertaken only after careful study by professionally trained people. Around houses, get rid of breeding places, such as ditches, low spots where water stands in lawns, or containers. Screening will keep adults out of houses.



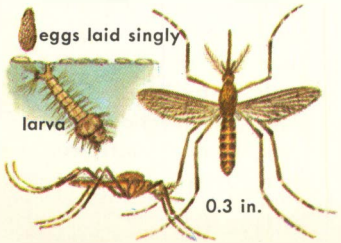
**COMMON MALARIA MOSQUITO** and the Western Malaria Mosquito, known to migrate 25 miles in spring flights, transmit malaria in N.A.

**YELLOW-FEVER MOSQUITO,** found mainly in port areas in South, is recognized by silvery stripes. Unlike most mosquitoes, it bites during day.

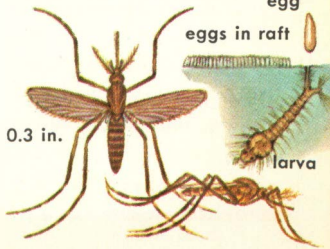
**SALT-MARSH MOSQUITOES** breed in large numbers along Atlantic and Gulf coasts. A related black species occurs in South, others in West.

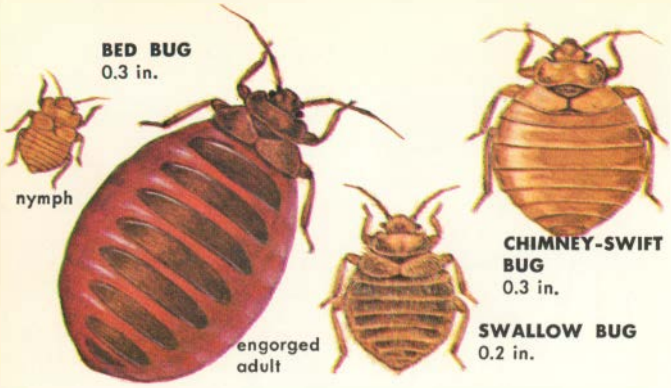
**HOUSE MOSQUITO,** worldwide in distribution, becomes active and bites at night. Members of this genus carry the virus causing encephalitis.

**SALT-MARSH MOSQUITO**



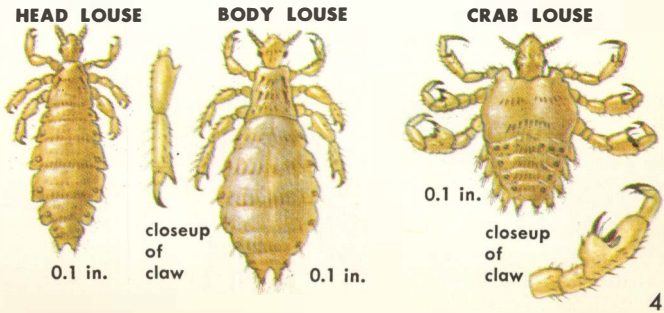
**HOUSE MOSQUITO**





**BED BUGS** feed on the blood of birds and mammals, including man. Both males and females bite, and as a rule, are active only at night. They pierce the skin and inject saliva that later causes the bite to itch or swell, the degree of irritation varying with the sensitivity of the individual. After becoming engorged, in five minutes or less, the bugs crawl away to hide. Bed Bugs breed the year around. Each female lays four to five eggs a day over a period of about two months, gluing them to rugs, furniture, or walls or laying them in cracks or crevices. The nymphs resemble the adults but are pale. After feeding and shedding (five molts), they become adults, living as long as a year. Bed Bugs are transported in bedding, furniture, or clothing. Heavy infestations can be detected by the odorous secretions given off by the bugs. Related species such as the Bat Bug, Chimney-swift Bug and Swallow Bug may also become pests in houses at times. To eliminate, spray floors, furniture, and walls with a residual contact insecticide in oil or water emulsion. Fumigation, necessary if infestations are spreading from chimneys or similar locations, should be done by a professional.

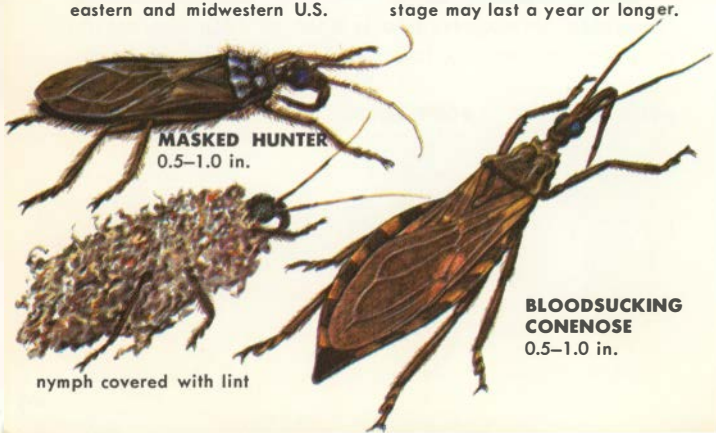
**LICE** are wingless insects parasitic on a variety of host animals. Those infesting pets, poultry, and livestock are described on pages 52–53. Three types may occur on humans. The Head Louse confines itself almost exclusively to the hair of the head, to which it glues its eggs or nits. The Body Louse, similar to the Head Louse in appearance, hides in clothing when not feeding. It lays its eggs in the clothes, especially in the seams. The Crab Louse, nearly as broad as it is long, lives among the coarse hairs of the body. The stout, curved claws on its first pair of legs do not form a locking device, as do those of the Head Louse and the Body Louse. All three types are bloodsuckers that may become abundant in unsanitary conditions. Their bite is not felt immediately but later becomes an itchy swelling. Lice are carriers of typhus fever and other diseases, transmitted through their bites. Young lice resemble the adults both in appearance and habits. Complete development, from egg to mature adult, takes about a month. Lice can be killed by dusting the clothing and body with a contact insecticide, such as DDT. Clothing can also be washed in an insecticide solution. Living quarters should be fumigated or subjected to a heat of 160 degrees F., steam or dry, for six hours or longer to destroy eggs.



**ASSASSIN BUGS** also go by the name of Conenoses because their head and mouthparts form a conelike beak. These insects bite quickly when disturbed. They should be brushed off swiftly but gently, and no attempt should be made to pick them up. They are bloodsuckers, thrusting their beaks forward to pierce the skin of their victim. The bite of some species is painless; the bite of others is extremely painful, the effects of the venom often lasting for months. Some are carriers of diseases, such as the very dangerous Chagas' disease of the American tropics. Some live in the nests of bats, rats, and other mammals. Where conenoses are abundant, spraying around doorways and lights with a residual contact insecticide will help to control them.

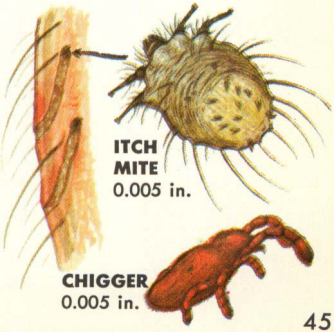
**MASKED HUNTERS** prey on Bed Bugs and other insects, from which they suck blood. The nymphs are covered with a sticky secretion to which lint and other camouflaging debris adheres to "mask" them. Also known as Kissing Bugs, the adults feed on warmblooded animals and may bite man. Occurs in eastern and midwestern U.S.

**BLOODSUCKING CONENOSES,** of southern and southwestern United States and Mexico, are known in some areas as Mexican Bed Bugs. At times they become locally abundant and may enter houses. They feed at night. Outdoors the eggs are laid on plants; indoors, in dark, dusty cracks or corners. The nymph stage may last a year or longer.

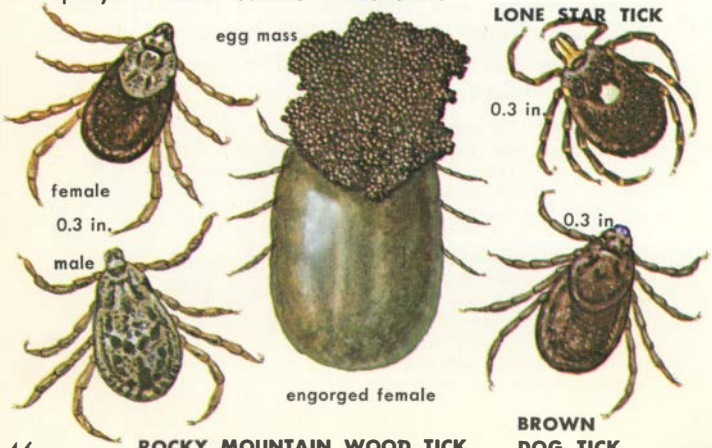


**CHIGGERS,** also called Jiggers or Red Bugs, are parasitic mites, more closely related to ticks and spiders than to insects. Some of the many species of mites are pests of poultry, pets, and livestock (p. 54). The tiny reddish adult chiggers, just visible to the naked eye, may be seen scurrying about in litter or in soil. The smaller larval stage that attacks man is the first of two stages before the mites become adults. The larvae wait on grass, leaves, or in litter for a victim. They usually crawl until they reach a belt line, an armpit, or similar obstruction, and there stop to feed by inserting their mouthparts into the skin to draw out fluids. When full, they drop off. As they feed, they release into the bite a digestive fluid containing a toxin that liquefies the cells and tissues and later causes swelling and intense itching. Dusting the clothing, particularly the cuffs, sleeves, and neckline areas, with sulfur helps to discourage chiggers, as do insect repellents. Or, before going into grassy or brushy areas, cover your arms and legs with a soapy lather and allow it to dry. Treat lawns infested with chiggers with a residual contact insecticide, and eliminate such breeding spots as weedy patches or plant debris. The chigger bites can only be soothed with ointments.

**ITCH MITES** spend their entire life on their host. Females burrow into the skin, sometimes making a tunnel an inch long, in which they lay as many as two dozen eggs. Both the tunneling and the feeding cause the itching, or scabies, and the bite spot commonly becomes infected. Ointments prescribed by a doctor will get rid of the mites and relieve the itching. Clothing and bedding should be sterilized.

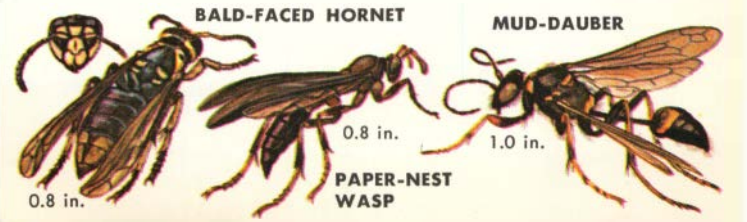


**TICKS** of several species are bloodsucking pests of man and his pets and livestock (p. 48). They are more closely related to spiders than to insects. Some ticks transmit diseases, the most dangerous of which is spotted fever. Bites of some ticks cause paralysis. When a tick is attached, do not try to pull it off, as the head and mouthparts usually break off and are left in the wound. Alcohol or ammonia applied to a tick's posterior will cause most ticks to release. Wait for 15–20 minutes before trying to remove tick. Engorged females drop from their host and lay their eggs on the ground or in debris. The larvae of most species feed on small animals, then become dormant until the following spring. They feed again and in about two months become adults, which in temperate climates do not feed until the next spring. It is at this stage that ticks feed also on man. Insect repellents will help to keep ticks off outdoors. After an outing in a tick-infested area, clothing should be removed and washed. Lawns or gardens can be sprayed with a contact insecticide.



**STINGING CATERPILLARS** have hollow hairs (setae) connected at their base to cells that secrete a poison. They may be in tufts or scattered over the body. When one of these spinelike hairs contacts the skin, the poison goes into the wound and causes either an itching or a painful swelling. Learn to recognize caterpillars that have stinging hairs and avoid touching them.

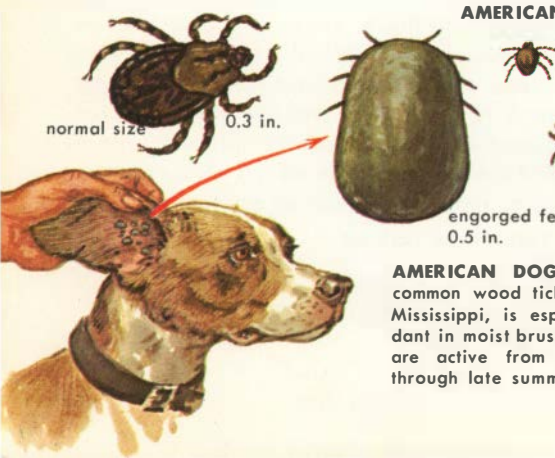
**WASPS AND BEES** have a stinger at the end of their abdomen. It is connected to a poison gland. These insects do not sting unless molested and are most troublesome when they nest in places where disturbing them is unavoidable. The occasional wasp or bee that gets indoors can be let out or killed. Spraying the nest with a residual contact insecticide, either as a dust or in an oil or water emulsion, will get rid of those few that become problems outdoors. It is best to spray at night, when the nest is fully occupied and the insects are not active. Stings can be soothed with ice packs or with a bicarbonate-of-soda paste. If the effects of a sting are severe, a doctor should be consulted promptly.



# PESTS OF PETS, POULTRY, AND LIVESTOCK

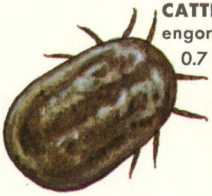
Insect pests of pets and domestic animals may be carriers of deadly diseases or of parasites that weaken the animals. Some of the diseases may be transmitted to man. Even pests that only bite or cause itching may reduce an animal's productiveness. Also, the animal's resistance to diseases may be lowered.

**TICKS** are more closely related to spiders than to insects. In addition to being annoyances or in extreme infestations causing anemia, these bloodsuckers carry such diseases as spotted fever and tularemia. The complex life cycle of ticks may require three years or longer. Females, after a blood meal, lay as many as 6,000 eggs, which hatch into tiny six-legged larvae, or seed ticks. Nymphs feed on mice or other small animals, and in most species only the adults attack such large animals as dogs, cats, horses, cattle, or man. Other species are discussed on p. 46.

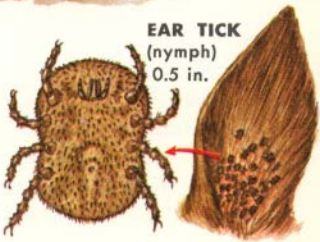


**AMERICAN DOG TICK,** most common wood tick east of the Mississippi, is especially abundant in moist brushlands. Adults are active from early spring through late summer.

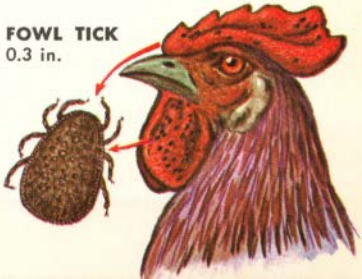
**CATTLE TICKS** of southern U.S., Central and South America, Africa, and parts of Europe transmit tick fever (Texas fever or cattle fever). The disease, spread only by ticks, may be fatal in a high percentage of cases. Tiny one-celled animals passed into the host's bloodstream by the tick destroy red blood corpuscles. Sheep, horses, mules, goats, deer, and other large animals are also susceptible. Cattle ticks winter in pastures in the egg stage or as seed ticks, or they may spend the winter as nymphs or adults on host animals. A rotation use of pasture may starve seed ticks, though they can live for months without feeding. Cattle in tick-infested areas are quarantined, and are dipped (usually forced to swim through vats of insecticide solution) to kill ticks.

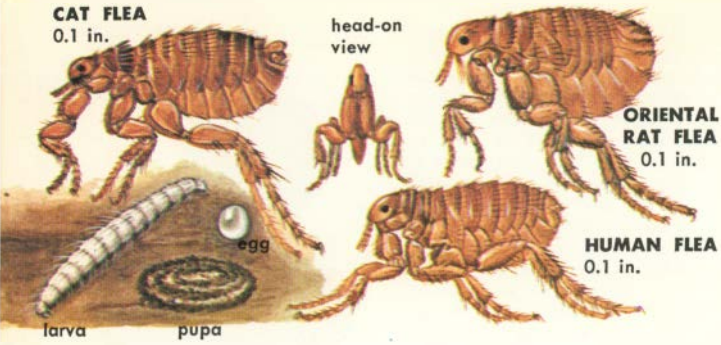


**EAR TICKS,** of southwestern U.S., are parasites only as nymphs, which crawl into the outer ear of sheep, horses, cattle, or other animals to gorge on blood. When full, they drop off and shed to become adults, which do not feed. Heavy infestations may cause deafness. Ear Ticks are killed with insecticides applied to the ear or head.



**FOWL TICKS** feed only at night, attaching to the bare skin under wings or around head. During the day they hide in cracks or crevices near roost. Worldwide in distribution in warm, dry climates, they transmit poultry diseases. Roosts are sprayed with a residual contact insecticide.



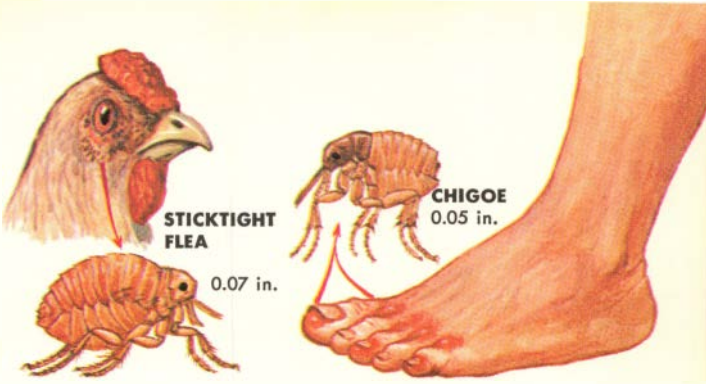


**CAT FLEAS** and Dog Fleas are similar in appearance and habits. Neither is restricted to the animal for which it is named, and both will bite humans.

**HUMAN FLEAS** are pests of man but also occur on rats, dogs, cats, and other animals. Like the Oriental Rat Flea, they may be carriers of bubonic plague.

**FLEAS** are wingless, bloodsucking parasites of pets, livestock, and man. A flea's body is compressed or flattened from side to side, enabling the insect to move with ease between the hairs on an animal's body. Its stiff hairs and spines (setae) project backward. When off its host, a flea travels rapidly by jumping.

An adult female flea lays small, whitish eggs on her host's body or in the host's den or nest. The eggs drop from the hair as the animal moves about or shakes itself and are commonly abundant where the animal sleeps. In about two weeks the eggs hatch into tiny, eyeless, wormlike larvae that feed on the droppings of adult fleas or other organic matter in an animal's bedding, in dust or lint, or in carpeting. Depending on the species, weather, and availability of food, the larvae complete their growth in a few days to six months or longer. When full grown, each spins a silken cocoon in which it pupates for a few days to several months before



**STICKTIGHT FLEAS,** of southern U.S., are flat-bodied and cling like ticks. They cluster on combs or bare skin of poultry, also on dogs, cats, and man.

**CHIGOES** are tropical fleas, not related to chiggers (p. 45), found rarely in southern U.S. Females burrow under the skin to lay their eggs.

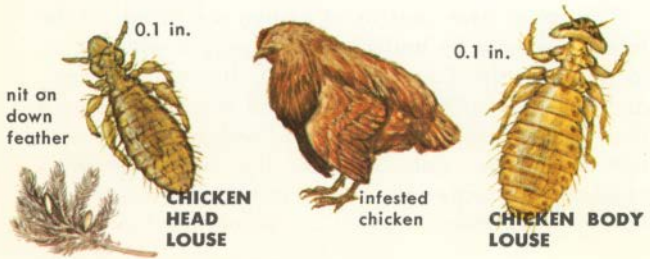
emerging as an adult. Adults can live for long periods without food, especially in cold weather. In warm weather fleas may breed outdoors in dry places.

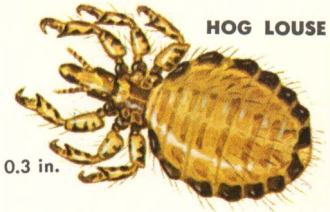
Fleas have piercing-sucking mouthparts. The painful bites may become swollen or inflamed. Some people or animals are more sensitive to the bites than others are. Before it begins to feed, a flea usually spits out a spot of partly digested blood near the bite. It may also leave wastes. These, with whatever disease organisms they contain, may spread into the bite.

Control of fleas consists of getting the adults off the infested animal by bathing it or dusting it with a contact insecticide. Equally important, the eggs, larvae, and pupae must be destroyed and the places where they develop cleaned and treated with a residual contact insecticide. Cats, because they lick themselves regularly, are especially susceptible to insecticide poisoning. Read labels. Consult a veterinarian if in doubt.

**LICE,** of which there are several thousand species, are divided into two groups—biting or chewing lice, principally pests of poultry and other birds; and sucking lice, parasites on mammals. Sucking lice feed only on blood, hence may be carriers of disease. Both kinds are wingless and have poorly developed or no eyes. A louse's body is flat, and its claws are developed for clinging. At hatching, young lice look like the adults, but are smaller. Before becoming adults, they molt several times, the number varying with the species. Most lice are confined to a single or to closely related host species. Some occur only on a particular body area. Lice move to a new animal if the host dies, if they become too numerous, or by contact. Those that infest humans are sucking lice (p. 43).

**POULTRY LICE** feed by chewing on feathers or dried skin, causing discomfort or irritation mostly as a result of their crawling. Louse-infested poultry are poor egg layers and are susceptible to diseases. Their wings droop, and they become drowsy. Young birds may die. The Chicken Head Louse occurs mainly on the head and neck areas, Chicken Body Lice on body feathers. The lice are spread from one bird to another either by direct contact or in heavy infestations by swarming over the roost. Female lice attach eggs (nits) to down feathers with a gluey secretion. The eggs hatch in about 10 days, and the young become adults about 10 days later. Poultry lice can be killed by dusting or spraying with a contact insecticide while birds are on roost. Birds can be treated individually by dipping in an insecticide solution or by dusting.





**SHEEP-BITING LICE** infest both sheep and goats. Infested animals scratch and rub themselves, often causing sores. The wool on sheep becomes tangled. Contact insecticides applied as wettable powders or dips are the best means of control.

**HOG LICE,** related to sucking lice that infest cattle, commonly collect about the ears or in folds of skin. They never leave their host except to crawl onto another hog. Control with residual contact insecticides applied as wettable powders or as dips.

**HORSE-BITING LICE** chew on skin, dried excretions, or hair, causing an animal great discomfort. Lice are most commonly spread by contact with other infested animals. They are usually most abundant in winter, when an animal's hair is thickest. Treatment in the fall therefore is both a cure and a preventive. Animals should be inspected regularly in winter months and treated again if necessary. Dusts, sprays, or dips are effective, the best method depending on the number of animals to be treated. A related species occurs on cattle. Check with veterinarian about best treatment.

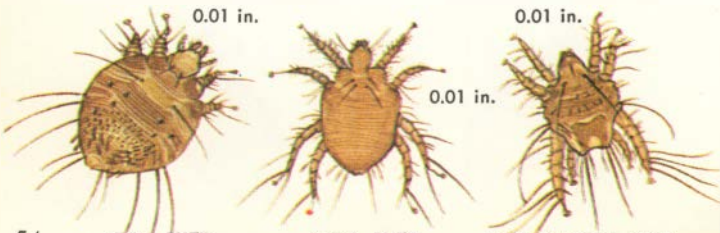
**SHORT-NOSED CATTLE LICE** are bloodsuckers, and heavily infested animals may be weakened from loss of blood. Dairy cattle do not produce as much milk; beef cattle do not put on as much weight. Controls are the same as for Horse-biting Lice, but insecticides that may contaminate milk cannot be used near dairy cattle. Burlap bags treated with an insecticide may be wrapped around a cable and stretched between two posts to give cattle a place to rub themselves and at the same time give themselves a treatment. Check with a veterinarian. A closely related species infests horses.

**MITES,** including ticks, are more closely related to spiders than to insects. Many species are barely visible to the naked eye. Some mites are free-living, others are pests of plants, and some are parasites of animals, including man (p. 45). Itch mites insert their piercing mouthparts into the skin to draw out blood or lymph. As the mites multiply, the feeding areas become larger. Scabs form, and hair or feathers drop out. As they feed, mites also secrete a poison that causes an intense itching. In most species the females burrow into the skin, making a tunnel up to an inch long, in which they lay their eggs and then die. The nymphs shed and become adults in about two weeks. Most mites never leave their host except to crawl onto another animal. Infested animals must be quarantined until cured, and their living quarters must be thoroughly disinfected, as mites are highly contagious and difficult to control. It is best to consult a veterinarian.

**ITCH MITES** cause an inflamed, scabby skin (mange) on dogs, horses, hogs, cattle, and other animals. The hair drops out as an animal scratches or rubs itself for relief from the itching. Infestations usually start where the skin is tender and hair is thin.

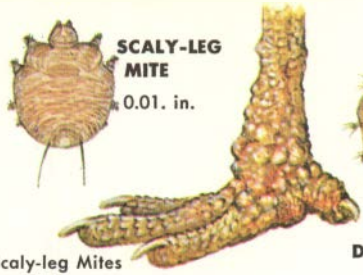
Scab Mites cause so-called "wet mange" (psoroptic scabies) of sheep, cattle, horses, and other animals. They feed on the surface, not burrowing under the skin as Itch Mites do.

Ear Mange Mites live inside the ears of dogs, cats, and wild animals, feeding on the soft skin near the eardrum. The irritation causes the animal to run about wildly, shaking its head. Controlled by swabbing the ears with sweet oil or glycerin.



ITCH MITE SCAB MITE EAR MANGE MITE

**CHICKEN MITE**
0.01 in.



Scaly-leg Mites on chicken

**CHICKEN MITES** feed on the blood of chickens or other poultry at night, hiding about the roost during the day. Infested birds become listless and are poor egg layers. Some fowl, particularly the young, are killed. Chicken Mites are most active in spring through summer. Female mites lay their eggs in debris near the roost; nymphs reach the adult stage in about 10 days. Chicken Mites are controlled by treating the poultry house rather than the birds. Clean it thoroughly, then dust, spray, or paint with a residual contact insecticide.

**FOLLICLE MITES** cause mange of cats, dogs, hogs, cattle, and other animals. The long, worm-like mites burrow deep into hair follicles or into oil glands, commonly around the eyes. Red, pus-filled pimples or nodules form, often becoming infected. To prevent spread of mites in livestock, infected animals are fattened for market and killed. Pens are disinfected thoroughly. Red mange, a serious disease of dogs, is caused by a follicle mite. Consult a veterinarian.

**SCALY-LEG MITES** stay on the body of their host, like ticks or itch mites, tunneling under the scales of the legs or into the skin of the comb. The scales stand up, and seeping scabs form. In time the infected bird becomes unable to walk. The tiny mites can be killed by soaking the host's legs in soapy water to loosen the scales, then greasing them with oil containing 15 percent sulfur. The Depluming Mite, a related and smaller species, burrows into the skin at the base of the tail feathers. The infected bird pulls out its tail feathers. Use a sulfur dip.

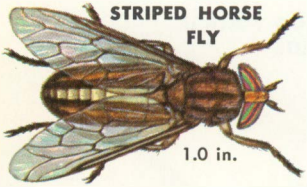
**HOG FOLLICLE MITE**

infected hog

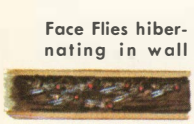
**FLIES** of some species bite painfully in getting their meal of blood. Those that do not bite worry or annoy animals by getting into their eyes or crawling over their body. Some flies transmit diseases. Many species, including mosquitoes, torment both man and his animals (pp. 32, 39, 40).

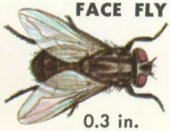
**HORSE FLIES** bite viciously and may also transmit such diseases as anthrax and tularemia. There are more than 100 species in the U.S. (p. 38).

**FACE FLIES** look like House Flies but are slightly larger. They feed on mucous secretions around the eyes and nostrils of livestock. In some areas they are pests in houses. They lay their eggs in fresh manure, in which the maggots develop and then pupate in the soil nearby. Adults commonly hibernate in the walls of buildings. There is no completely effective control for these pests, which have spread widely throughout the U.S. from Canada since the early 1950's.



Face Flies hibernating in wall

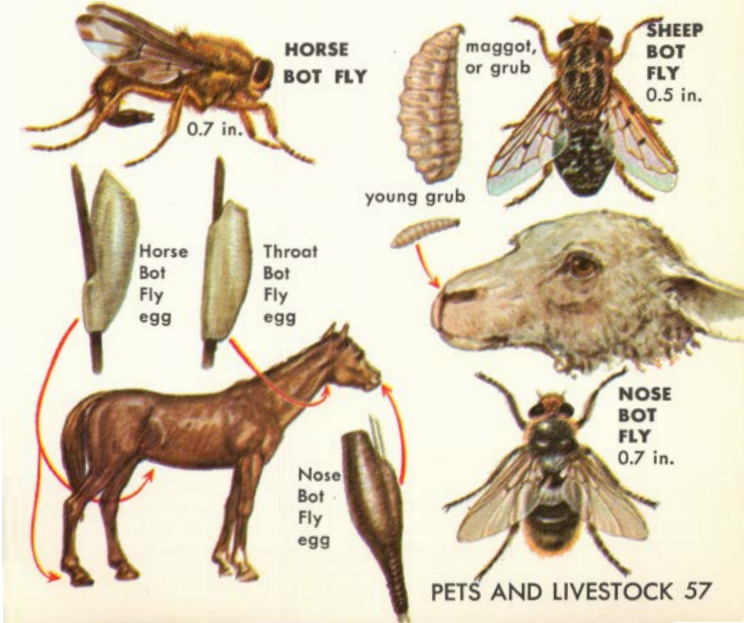


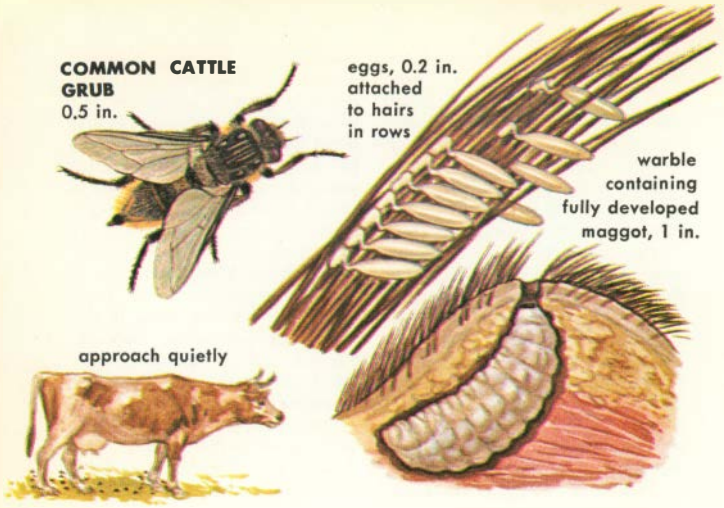


**HORSE BOT FLIES** glue their eggs to the hair of the hind legs or belly of horses or mules, rarely to smaller animals. Each female may lay 500 or more eggs, which hatch in about two weeks, but only if their temperature rises to 100 degrees F. or higher. This will happen if the animal touches them with its tongue. Newly hatched larvae tunnel immediately into membranes of the host's mouth. In about a month they molt and are swallowed. They feed on mucous secretions from the irritated stomach lining to which they fasten themselves. In about 10 months the maggots are full grown and are discharged in wastes. They pupate in the soil and emerge as adults in about three weeks. The Throat Bot Fly lays its eggs on hairs of the neck. The maggots emerge without special stimulation. They crawl to the mouth, often attaching to the pharynx and making it difficult for animal to swallow. Later they enter digestive tract. Eggs of Nose Bot Fly are laid near the lips and will hatch only if kept moist. Lip and throat guards help prevent bot fly infestations. Maggots in digestive tract can be killed with fumigants or with systemic insecticides given by a veterinarian.

**SHEEP BOT FLIES** occur wherever sheep are raised and may also infest goats or deer. Adult female flies dart rapidly about the sheep, sometimes hovering near the nostrils. Pestered sheep shake their heads, stamp their feet, or run to escape. The female deposits already hatched larvae, or maggots (not eggs), near the sheep's nostrils. She lays only a few at a time but several hundred in her lifetime. Maggots crawl into outer nasal passages, where they feed on mucus. After about two weeks they shed, becoming a size larger, and move deeper into nasal passages. Irritation of membranes by the crawling of spiny-bodied maggots causes a greater flow of mucus, which hinders breathing and may cause death in older or weakened animals. Full-grown maggots (1 in.) crawl out of nasal passage and burrow into soil to pupate, emerging as adults in about a month. In cold climates the small larvae become dormant in outer nasal passages in winter.

Control of Sheep Bot Flies is difficult, especially since it is harmful to kill the grubs in the nasal passages, where their decay will cause an abscess. Small grubs can be killed in the outer passages by irrigation with a 3 percent-Lysol solution. Pine tar applied to the sheep's snout discourages female flies from depositing maggots.





**CATTLE GRUBS,** or Ox Warbles, are maggots of bot flies. Infestations lower milk production of dairy cattle. The maggots cause a loss of meat in beef cattle, because the flesh must be trimmed around the grubs. Grub holes also reduce value of hides for leather. The Common Cattle Grub (also called Heel Fly) occurs throughout the U.S., the Northern Cattle Grub in Canada and all but southernmost U.S. Female Northern Cattle Grubs approach noisily and lay eggs, one at a time, on the hair of belly or legs. The cattle often stampede to escape bomber-like attacks, though the flies neither bite nor sting. The female Common Cattle Grub, in contrast, approaches victims stealthily, landing on ground nearby and backing up unnoticed to lay her eggs on the heel, or if the animal is lying down, on hair near the ground. She lays many eggs at one visit to her victim.

On hatching, the maggots (wolves) of both burrow into the skin and, over months, migrate through the tissues to the animal's back, where knotlike warbles form. The maggots develop in these cysts during the winter. The swellings are first noticeable in late fall or early winter, becoming large and pus-filled by spring. The spiny maggots feed on mucus that forms in the cysts, and they breathe through a small hole cut in the hide. In spring the maggots squeeze out through the hole and drop to the ground, where they pupate, emerging as adults in two weeks to two months.

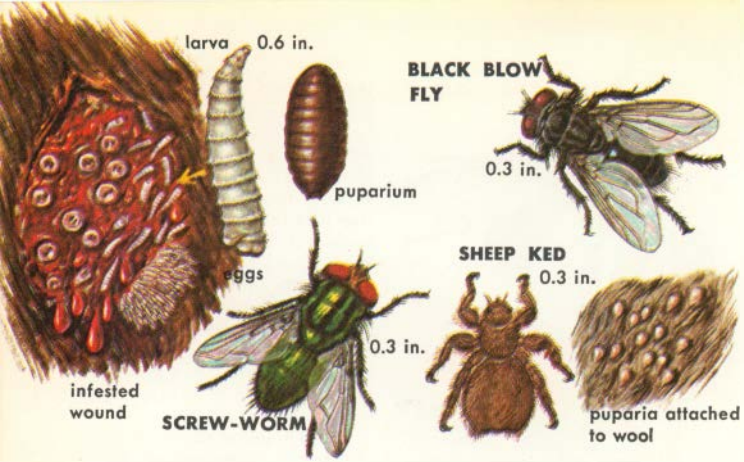
Control is most effective if all

cattle owners in an area participate in an eradication program, as adult grubs can travel several miles to find victims and start reinfestations. Formerly, cattle grubs could be controlled only in the warble stage, after they had done their damage. This was a safeguard against an increased infestation the next year, however. A 5 percent rotenone dust, sprayed or applied by hand, was used to kill the maggots. The best time for these applications varies with the locality and can be learned by consulting a local agricultural agent. Better controls are possible today with systemic insecticides given orally or applied to the skin. They kill the maggots as soon as they begin to feed on their victim and before they can do damage.

**HORN FLIES** are common, persistent summertime pests of cattle. Horn Fly bites are painful, as the fly sucks out its meal of blood. Each cow may harbor several thousand flies, which stay with the cow constantly and torment it. Tormented beef cattle lose valuable market weight; dairy cattle give less milk.

Horn Flies lay reddish-brown eggs in fresh manure, on which maggots feed. They pupate in or beneath the dung, a life cycle requiring about 10 days in warm months.

In hot weather the Horn Flies usually rest on an animal's belly or on its shaded side. In cooler weather the flies ride on its back or sometimes on its horns. Horn Flies can be killed by spraying, dusting, or dipping cattle with a residual contact insecticide. Consult a veterinarian or local agricultural agent before applying any insecticide. Avoid especially the use of chlorinated hydrocarbons around dairy cattle, as milk may be contaminated.



**SCREW-WORMS** occur in warm climates, from southern United States southward through the tropics. They infest cattle, swine, sheep, goats, and deer. Females lay clusters of eggs in fresh wounds—such as the bites of the Horn Fly or scratches from thorns or wire—or in the navel of newborn animals. The maggots eat into the flesh, creating a foul-smelling larger wound that attracts Screw-worms or blow flies to lay more eggs in the rotting flesh. If untreated, infested animals will die. Full-grown maggots, with ridges of spines circling the body segments, drop to ground to pupate, completing a life cycle in about 30 days in warm weather. Control of these flies has been successful in Florida and on Curaçao, W.I., by release of millions of sterilized males (p. 23). In other areas animals are treated with an ointment, such as EQ 355, to kill maggots and allow wound to heal.

**BLOODSUCKING FLIES** of a number of species pester livestock. Included are the Black Blow Fly and the Secondary Screw-worm, which deposit maggots in open wounds. Infestations may become infected. Sprays are effective but use only if prescribed by veterinarian.

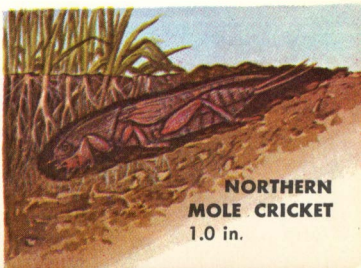
**SHEEP KEDS** are wingless flies commonly thought to be ticks. Adults pierce the skin of their host and suck blood, irritating the animal so that it rubs, bites, or scratches itself and ruins the wool. Sheep Keds spend their entire life on their host. Females give birth to fully developed maggots, gluing them to hair. Within a few hours the larva forms a reddish puparium. Adults emerge in about three weeks. Sheep Keds are found most abundantly on the neck or belly. Infested sheep are sprayed, dipped, or dusted with residual contact insecticides, usually after they have been sheared.

# INSECT PESTS OF VEGETABLE CROPS

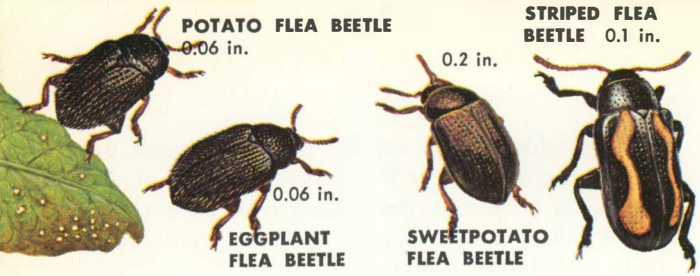
No vegetable crop is entirely safe from insect pests. Some pest species feed on only one kind of plant; others are general feeders. Some suck the juices from plants; others chew on the roots, leaves, stems, flowers, buds, or fruit. Often a crop is attacked by several pest species at the same time, and in some cases more than one stage in the life cycle of an insect pest is damaging to the same crop.

Some insect pests of vegetable crops can be controlled without the use of chemicals. Crops can be rotated so that pests depending on only one plant species do not build up a large population. Weeds, crop stalks, and other debris in which pests may breed or hibernate can be plowed under. Disking or shallow plowing in winter exposes hibernating stages to freezing temperatures. Some pests can be picked off by hand, or young plants can be covered until large enough to withstand attacks. In many cases crop planting can be timed to miss heavy infestations. Despite these precautions, chemical controls are often the only way now available to protect a crop. Chemicals must be used with great care, for they are dangerous to the person who applies them and also may be absorbed by the vegetable or remain as a poisonous residue.

**MOLE CRICKETS,** abundant in warm climates, use their stout paddlelike front legs for burrowing. They disturb the roots of young plants and also feed on them. Mole Crickets can be killed with contact insecticides or poison baits applied to the soil before planting.

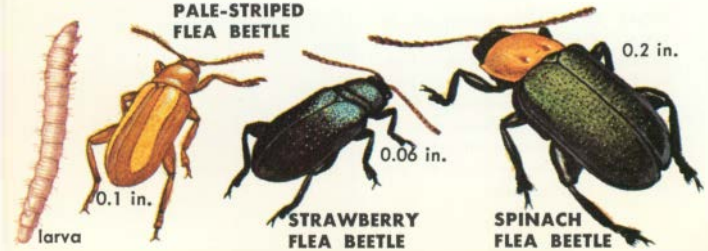


**NORTHERN MOLE CRICKET** 1.0 in.

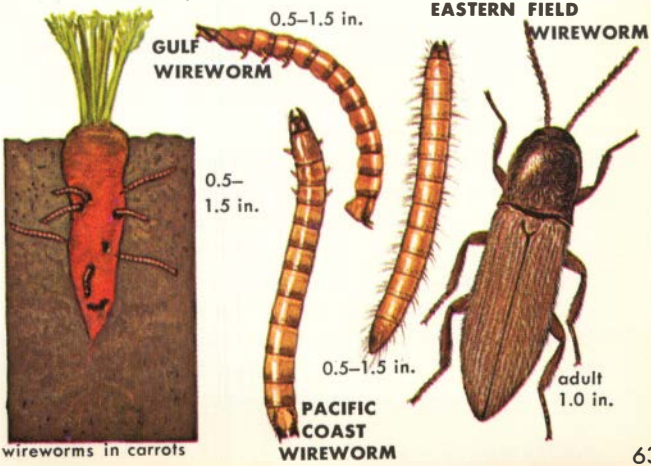


**FLEA BEETLES** chew small, round holes in leaves, giving a plant the appearance of being peppered with shot. Grubs (larvae) of some species feed on leaves or stems, others on the roots. The many species of flea beetles (so called because of their enlarged hind legs for jumping) feed on a variety of plants, but many, as indicated by the specific names, occur on only one kind or on closely related plants. Most species overwinter as adults beneath debris and thus get an early start in spring. Flea beetles are especially damaging to seedlings, and the holes they eat in the foliage are entry avenues for diseases. Usually there are two generations a year.

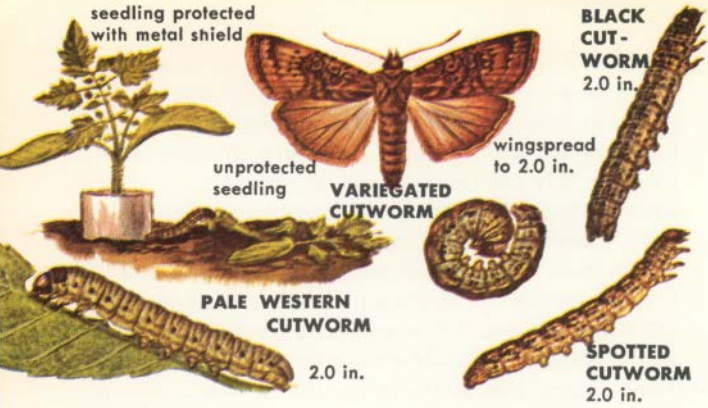
Eliminate places where the beetles can hibernate by plowing under weeds or plant stalks. Infested plants can be dusted or sprayed with contact or stomach-poison insecticides to kill adult or immature stages. Do not use insecticides immediately before an edible crop is ready for harvest because of poisonous residues. Follow directions carefully.



**WIREWORMS** are the grubs, or larvae, of click beetles. Those of pest species feed on the underground stems, roots, or tubers of such plants as carrots, beets, potatoes, onions, turnips, beans, and corn. Wireworms may be especially abundant in land recently in grass, though some species live exclusively in cultivated land. Adult female beetles lay their eggs in the soil, and the larvae (wireworms) migrate vertically in the soil, staying at the level where the temperature and moisture are most comfortable for them. Some species become full grown in two years; others do not mature for as long as six years. They change into pupae in the soil. A few weeks later they become adults but do not emerge until following spring. Cultivation from midsummer until freezing weather destroys many larvae and pupae. Infested soil can be fumigated, which kills the worms but gives no lasting protection, or treated with a contact insecticide. Insecticides absorbed by root crops may cause objectionable odors or leave poisonous residues. Check for best method in your area.



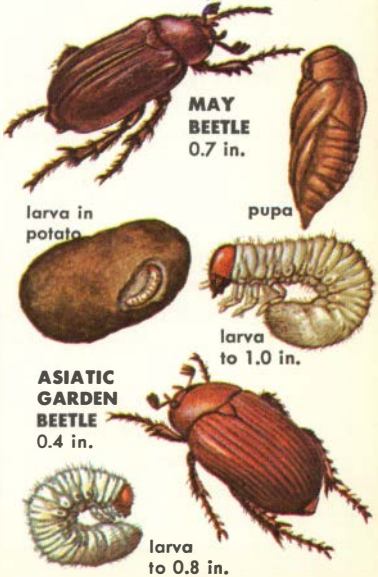
wireworms in carrots



**CUTWORMS** are the fat larvae of a large family of dull-colored, medium-sized moths. More than two dozen species are pests of field and garden crops. Cutworms are classified by their method of feeding—whether underground, at the surface, or above the ground. The most damaging to vegetable crops are species that cut off plants at the surface. Cutworms feed mainly at night. During the day they rest in the soil, coiled in a ball. When full grown, they burrow deeper to pupate. They may emerge as adults in a few weeks or may overwinter as pupae. In warm climates cutworms have several generations a year. Collars of tin cans with the ends removed or of stiff cardboard inserted at least an inch into the soil and sticking above the surface about two inches will protect young plants. Deep plowing or spading in late summer or fall destroys eggs and also exposes the pupae. Poison baits used for grasshoppers (p. 99) are also useful. The soil can be treated with contact insecticides such as chlordane or DDT, but use precautions as noted for Flea Beetles and Wireworms (pp. 62–63) when applying to edible crops.

**WHITE GRUBS,** the larvae of several species of beetles known as May Beetles or June Bugs, are widely distributed in the U.S. but are most abundant in the Midwest and South. Adult beetles feed on the foliage of trees and are commonly attracted to lights. Females lay their eggs on the ground, commonly in grassy areas. The grubs feed on roots, burrowing deeper into the soil in winter and remaining dormant until spring. Depending on the species, a second, third, or even a fourth summer may be spent as grubs before they pupate. They transform into adults in the fall but do not emerge until spring. Soil infested with white grubs can be treated with a contact insecticide before a crop is planted. In late summer or fall, soil can be turned to expose grubs and pupae to weather and predators.

**ASIATIC GARDEN BEETLES** are introduced pests that feed on a great variety of plants, including many garden vegetables. First found in 1922 in New Jersey, they have since spread north in coastal states as far as Massachusetts and south to the Carolinas. Apparently they survive only where there is heavy summer rainfall. Asiatic Garden Beetles winter as grubs in the soil, burrowing 8 to 10 inches deep. In spring they move back to the surface to feed on roots, then pupate in late spring or summer. Adults, which look like small, hairy May Beetles, appear in midsummer and feed on foliage until frost. Females usually lay their eggs in grassy or weedy soil. Soil or plants infested with adults or grubs can be treated with a contact insecticide. Adults are attracted to light traps.

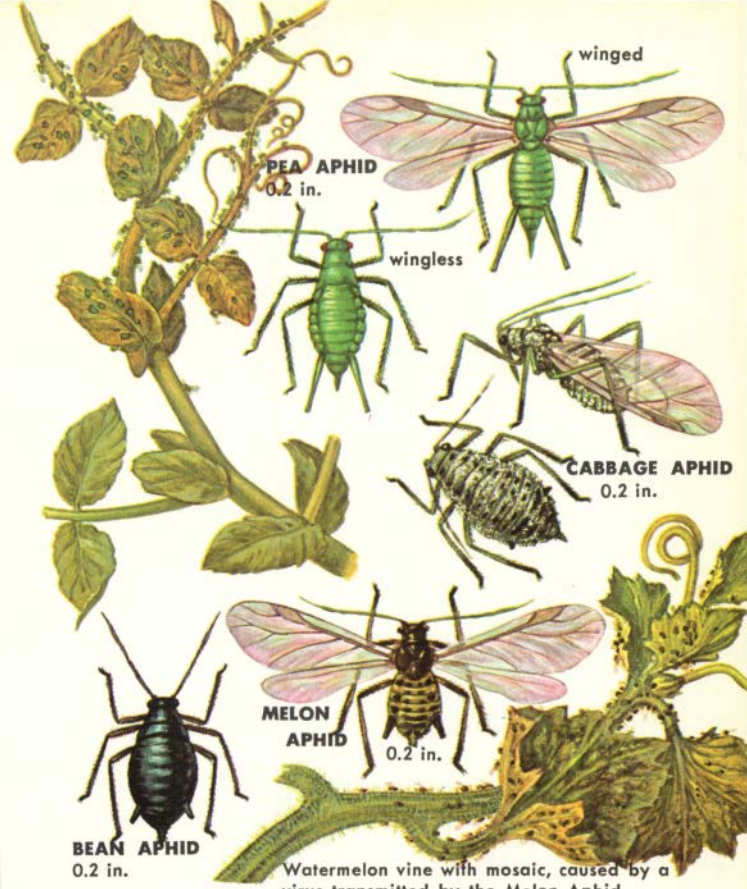


**APHIDS, OR PLANT LICE,** are small (average 0.2 in.), soft-bodied insects that feed on plants by sucking their fluids or sap. They pierce stems, leaves, buds, roots, and fruit with the slim, needle-sharp stylets in their beak. In abundance, aphids may cause leaves to curl or may stunt a plant's growth and stall its production of flowers or fruit. Eventually the plant may die. Aphids also introduce fungus, bacterial, and virus diseases that can be as damaging as the aphids.

Aphids expel from the end of their abdomen a sticky, sweet substance called honeydew, a favorite food of some species of ants. These ants move the aphids to productive plants and take them into their nests below ground to protect them at night or when the weather is bad (p. 100). Black molds grow on honeydew that drops to the ground beneath plants where aphids are feeding.

In the typical life cycle of aphids that live in temperate climates, winter is passed in the egg stage, glued to the stem or to other parts of plants. Nymphs that hatch from the eggs the following spring grow rapidly to become wingless adults, called stem mothers. Stem mothers give birth to their young, holding the eggs inside their body until they hatch. Within about a week these aphids produce young in a similar manner. More than a dozen generations appear in a short time, forming a feeding cluster on the plant. At intervals some or all of the young develop wings and migrate to other plants, starting new colonies. In some species the winged stages settle on plants of the same kind; in others they always settle on different kinds of plants. In autumn males and females are produced, and the females lay fertilized eggs that overwinter. In warm climates reproduction is continuous.

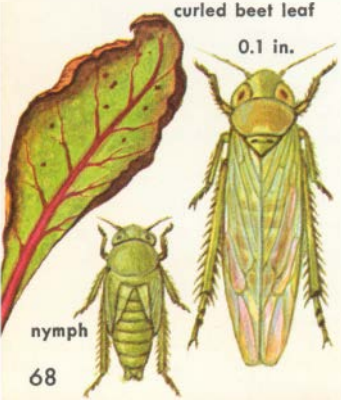
Aphids are eaten by birds, preyed on by various lady



Watermelon vine with mosaic, caused by a virus transmitted by the Melon Aphid.

beetles, and parasitized by wasps. Chemical controls may be necessary, however, to protect crops when aphids are abundant. Contact insecticides applied as dusts or sprays are effective. Precautions regarding the use of these poisons should be followed, as noted on labels or advised by agricultural agents.

**LEAFHOPPERS** are small, active insects that damage plants by sucking sap from their leaves. The leaves curl, due either to the loss of sap or possibly to a toxin introduced by the leafhoppers as they feed. Some leafhoppers also spread virus diseases. When disturbed, adult leafhoppers hop into the air and fly away, their wings appearing white in flight. The wingless nymphs run sideways to dodge out of sight on the opposite side of a leaf. Like aphids, leafhoppers excrete from the end of their abdomen a sticky, sweet substance called honeydew. A population of several million leafhoppers may build up on plants on an acre of land in favorable conditions. Contact insecticides sprayed or dusted on the plants will kill the leafhoppers, but the insecticide must reach insects feeding on the underside of the leaves. Do not use insecticides after edible parts of plant have formed, because poisonous residues may remain. Local county agent can give information on best times and the proper dosages of insecticides. To guard against the spread of a virus disease by these pests, it may be necessary to control the leafhoppers on their wintering plants.

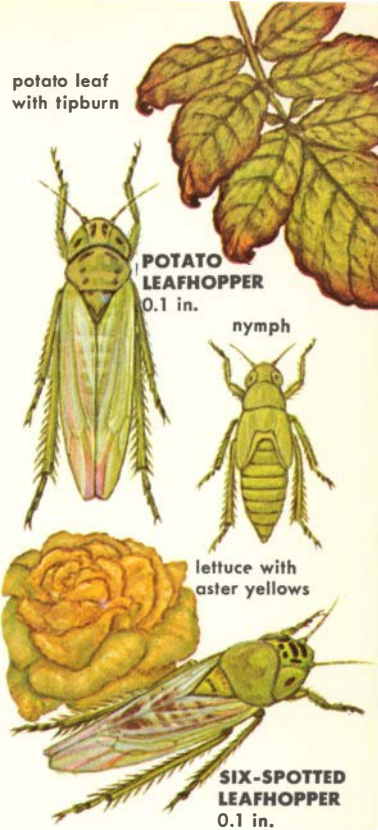


**BEET LEAFHOPPERS** are pests in western U.S., ranging east to Illinois. They transmit the virus causing curly top, a disease of sugar beets, beans, spinach, peppers, squash, and other vegetables. Adults winter on wild plants, and in early spring females lay eggs in stems or on the leaves. This generation feeds and matures on wild plants. The second generation invades cultivated crops. As many as five generations may be produced in a season.

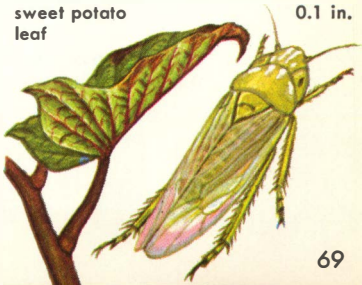
**POTATO LEAFHOPPERS** are damaging pests of potatoes east of the Rocky Mountains. They winter in southern states, migrating as far northward as Canada in spring and summer. Potato Leafhoppers commonly attack young bean plants before appearing on potatoes, because young bean plants apparently contain a greater amount of sugar than do the young potato plants. Females lay their eggs in the stems of leaves, depositing two to three eggs a day over three to four weeks. The nymphs hatch in 10 days and are full grown in about two weeks. Tipburn, or hopperburn, is caused by the feeding of Potato Leafhoppers. First a triangular brown spot appears on a leaf tip; then similar spots show elsewhere, always at end of veins. Eventually entire leaf turns brown and curls.

**SIX-SPOTTED LEAFHOPPERS** transmit the virus disease called aster yellows. In diseased plants, the young leaves turn yellow, and older leaves become curled and reddish. Lettuce, celery, tomatoes, onions, and carrots are common vegetable crops injured by aster yellows. The Six-spotted Leafhopper winters on weeds or flowers, spreading in spring.

**SOUTHERN GARDEN LEAFHOPPERS,** similar and closely related to the Potato Leafhopper, range as far north as New York, though they are most abundant in southern states. They infest ornamentals as well as vegetable crops.



**SOUTHERN GARDEN LEAFHOPPER** 0.1 in.

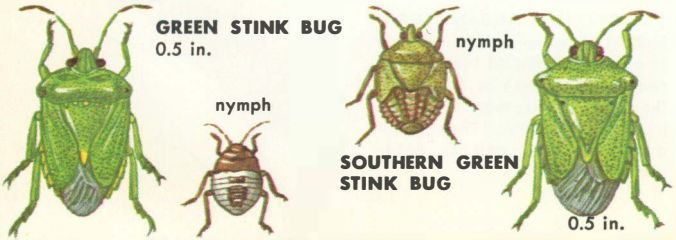


**HARLEQUIN BUGS** are pests of cabbage, turnips, radishes, and related plants. They have spread from Mexico through most of the U.S. Females lay barrel-shaped eggs on the underside of early planted crops. Nymphs, which hatch in about a week, may kill young plants by sucking out sap. In the South they breed year around; in the North adults hibernate under vegetation.

**STINK BUGS** do damage, both as adults and as nymphs, by sucking sap from plants and causing them to wilt. Peas, beans, or fruit on which stink bugs have fed become pimpled or malformed. The bugs also give off a strong odor that may be detected on edible parts of plants over which they have crawled. The wingless nymphs generally resemble the adults, though in some species they differ in color. In both, the triangular area, or scutellum, is large and conspicuous. Infested plants can be sprayed with contact insecticides, but this should not be done after edible parts are formed. The bugs are large enough to be picked off by hand.

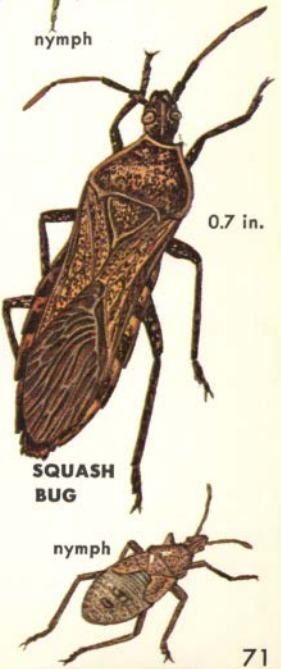
**GREEN STINK BUGS** commonly feed on beans, causing pods to fall before they are fully formed. In the South they are also pests of cotton.

**SOUTHERN GREEN STINK BUGS** are most abundant in southeastern U.S. They feed on most legume crops and on many garden vegetables.



**TARNISHED PLANT BUGS** feed on more than 50 species of cultivated plants, including beets, celery, and other garden vegetables. A toxin injected into the plant as the bug sucks out its sap deforms the leaves, stems, or fruit. Both adults and nymphs can be killed with contact-insecticide sprays or dusts, but do not use poisonous insecticides after the plant begins to form edible parts. In temperate climates, where the adults hibernate in winter, weeds or similar hiding places should be destroyed.

**SQUASH BUGS** injure pumpkins, cucumbers, squash, and related plants, first causing the leaves to wilt and then the vine to turn black. Crushed Squash Bugs give off an odor similar to a stink bug's. Squash Bugs are difficult to control, as squash plants are burned by many contact insecticides. Adults can be picked off plants by hand. Leaves that show egg-laying scars should also be removed. Adults may congregate under boards placed between crop rows. In the fall, get rid of all debris under which adults may hibernate.



EGGPLANT LACE BUG
0.1 in.

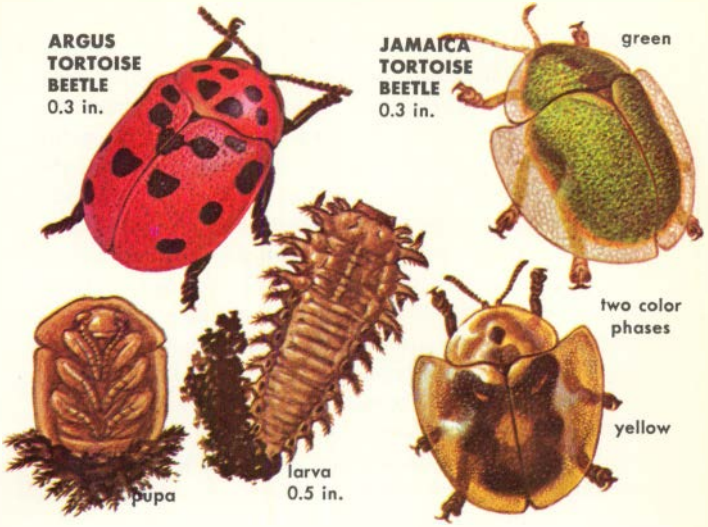
**LACE BUGS** have a broad thorax and transparent wings with an attractive lacelike pattern. Lace Bugs are known to carry a virus disease of sugar beets, and their feeding in large numbers stunts a plant's growth. Contact insecticides are an effective control.

**THRIPS** are slender insects with stout, cone-shaped mouthparts. They rasp or scrape the stem or leaf of a plant, then suck out the sap that flows into the wound. If an infestation is heavy a plant's growth is slowed; edible parts of vegetables are poorly formed. Thrips are known also to transmit a virus causing wilt. Most thrips' legs end in a bladder-like swelling that helps them in crawling over smooth surfaces. Most species of thrips have narrow, bristle-like fringed wings. Nymphs are wingless. Of the several thousand species, only a few are pests of specific plants.

ONION THRIPS
0.04 in.

detail of head

**ONION THRIPS** are especially injurious to onions but feed also on carrots, beans, peas, and other vegetable crops. In winter they hibernate but begin feeding on young plants in early spring, producing a new generation approximately every two weeks in warm weather. Onion leaves turn pale to white, a condition known as silver top. Well-cultivated crops may grow faster than the thrips can do damage. In the fall, bury debris under which thrips might hibernate. Contact insecticides will kill thrips, but they crawl deep into leaves and are hard to reach.



**TORTOISE BEETLES** often go by the name of Gold Bugs because of their metallic colors. Adult beetles hibernate under leaves or other debris on the ground. They emerge in late spring, and the females lay eggs on the stems or underside of leaves of sweet potatoes and other plants of the morning-glory family. The larvae are spiny and covered with a dirty-looking mass consisting of their shed skins mixed with silk and excrement. They feed on the underside of leaves and do the greatest injury to young plants. When full grown the larvae (sometimes called peddlers) form spiny pupae attached to the underside of a leaf. The adult beetle emerges in about a week. Both adults and larvae can be killed with either stomach-poison or contact insecticides applied as dusts or sprays. Cleaning up vines in the fall destroys the hibernating place of the adults.

**COLORADO POTATO BEETLES** are pests principally of potatoes but also attack tomatoes, peppers, and other garden vegetables. They occur throughout the United States and in Europe, having spread in the 1800's from a limited range on the lower slopes of the Rockies. There they fed on the buffalo or sand bur, a plant related to the potato. Adults emerge from hibernation in early spring and begin feeding on young plants. The females lay their eggs on the lower surface of the leaves. The larvae feed on foliage for two to three weeks, then pupate in soil. Adults emerge in about two weeks and start cycle again. Two generations in a season are usual; sometimes there are three. Both adults and larvae (grubs or slugs) can be picked off by hand, or plants can be sprayed or dusted with a contact or stomach-poison insecticide. Start treatment as soon as beetles appear.

**BLISTER BEETLES,** or Old-fashioned Potato Bugs, eat the foliage of potatoes, beans, peas, and other vegetables. Only the adults are damaging. Females lay their eggs in the soil, and the burrowing larvae feed on grasshopper eggs. With each of its four molts the larva's legs and mouthparts become smaller compared to the remainder of its body. Winter is passed in an inactive pseudopupa stage. Most species molt the following spring, and the larva becomes active for a short time before entering the true pupa stage. Adults emerge in midsummer. Blister beetles can be brushed into pans of kerosene. Do not touch the beetles with bare hands, as they give off a blistering secretion. The beetles can also be herded along crop rows and trapped in steep-sided ditches. Can be killed with stomach-poison or contact insecticides (except arsenic compounds).

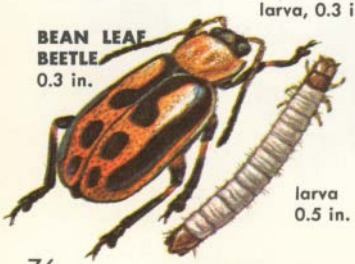
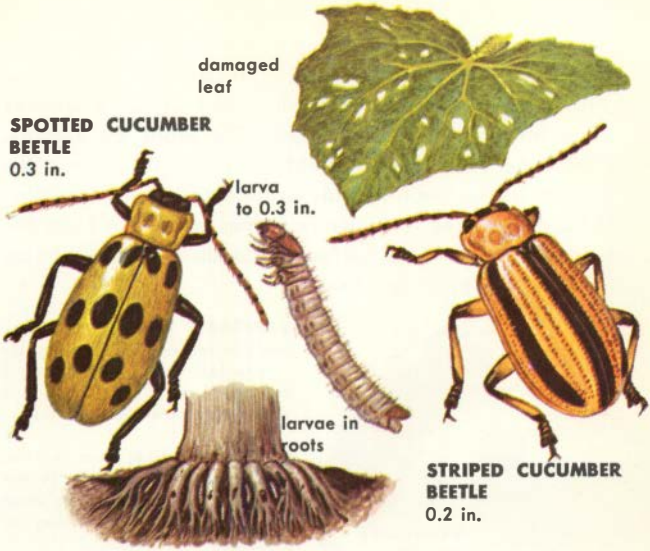
**MEXICAN BEAN BEETLES** and their larvae feed on the foliage of bean plants, eating away the lower surface and leaving only a skeleton of a leaf. When the beetles are abundant, they feed also on bean pods and stems. Native to southwestern U.S. and Mexico, the beetle has spread throughout the U.S., except along Pacific coast. Adult beetles hibernate beneath vegetation and begin feeding in early spring. The eggs, laid on the underside of bean leaves, hatch in about two weeks. When full grown, about a month later, the larvae fasten themselves to the underside of a leaf, shed, and become pupae. Adults emerge in about two weeks and start a second cycle. Three or four generations are common in warm climates. Insecticide sprays or dusts such as rotenone are applied to underside of leaves where insects feed. After beans are harvested, plants should be buried or burned.

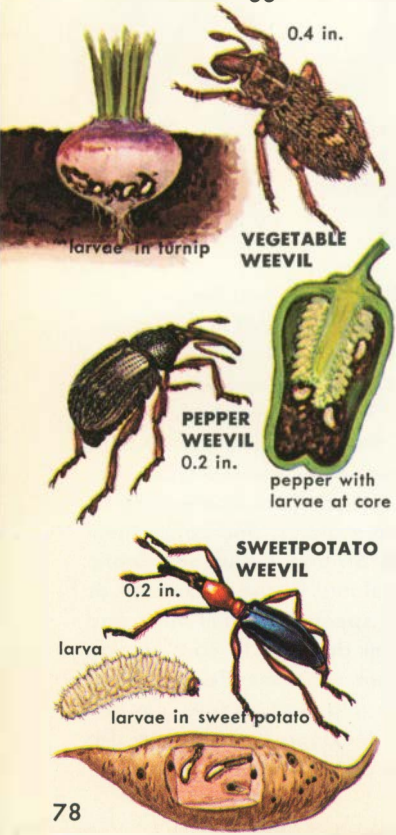


**BEAN LEAF BEETLES** are most abundant in southeastern U.S. but occur also in midwestern and eastern states. Adults chew holes in bean-plant leaves; the larvae feed underground on the roots or on the stems at the soil line. Bean Leaf Beetles can be controlled by the methods used for the Mexican Bean Beetle.



**CUCUMBER BEETLES,** both Spotted and Striped, are general feeders as adults. They chew holes in the foliage and eat on the stems. Adult beetles come out of hibernation in early spring, and females lay their eggs in the soil at the base of plants. These hatch into the worm-like larvae which bore into the roots, where they feed and become mature by midsummer. Spotted Cucumber Beetles are also known as Southern Corn Rootworms, as the larvae bore out young corn plants, and cause them to break off. Larvae of the Striped Cucumber Beetle feed only on the roots of plants in the cucumber or melon family. Adults of both species transmit virus and bacterial diseases. To prevent damage to corn, spring plowing and late planting are recommended, or treat soil with insecticides before planting. Adults can be killed by methods used for Mexican Bean Beetle. Do not use sulfur compounds on cucumber or melon vines.

**WEEVILS** are a large family of beetles with long, usually down-curved snouts that may in some species be as long as the beetle's body. The snout, an elongation of the head, has the beetle's small chewing mouthparts at its tip; the antennae are located along its sides. The snout is used to puncture leaves, stems, or fruit, for feeding beneath the surface, and also to make holes in which the eggs are laid.

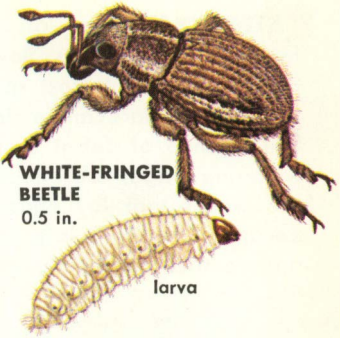


**VEGETABLE WEEVILS** are dormant in summer but become active in fall. Grubs feed at night on many vegetables. Do not spray vegetables to be eaten.

**PEPPER WEEVILS,** from Mexico, feed inside the buds or in the peppers, causing them to drop off. Several generations may be produced every year.

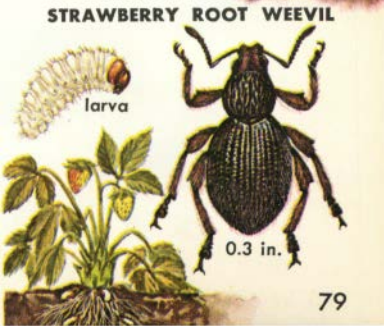
**SWEETPOTATO WEEVILS** are pests only in the Gulf states. Adults lay their eggs singly in holes on the stems or in the sweet potatoes, and for 2 or 3 weeks the grubs feed and grow either in the vines or in the potatoes. They become pupae in the cavity hollowed by their feeding and emerge as adults in about a week. The adults also feed on the leaves and stems of the sweet potato vine. Pulling dirt high around vines helps to prevent weevils from reaching the potatoes. Plants can be treated with a contact insecticide before planting. After an infestation, burn vines and destroy all infested sweet potatoes. Do not replant sweet potatoes in same field or within one mile of infestation for a year.

**WHITE-FRINGED BEETLES,** from South America, are general garden pests of southeastern U.S. Adults appear from May through August and feed sparingly. The females reproduce without mating and lay their eggs in sticky masses of 50 or more on rocks, sticks, or stems. The larvae burrow into the soil, where they feed on roots or underground stems. They winter as grubs, forming pupae in the spring. Adults cannot fly (hard outer wings are fused) and can be trapped in steep-sided ditches. Treat soil with a contact insecticide to kill grubs or adults as they emerge.

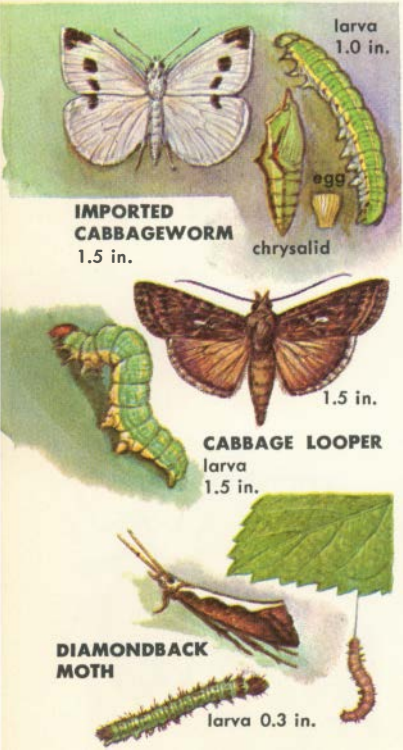


**CARROT WEEVILS** damage carrots, celery, parsnips, and related plants. The grubs cut irregular furrows in the roots or may tunnel inside the roots or stems. In winter adults hibernate beneath debris and lay their eggs in early spring. Two and sometimes three generations are produced every season. Early spraying of plants with insecticide will kill adults. Because they feed inside roots or stems, grubs are difficult to kill.

**STRAWBERRY ROOT WEEVILS** are widely distributed in the U.S. and Europe. In the grub stage they feed on the roots and crown of strawberry plants, which become stunted or die. Adult weevils often hibernate in the crown of the plant; the larvae burrow deep into the soil. Rotate plants to new beds regularly to prevent pest buildup.



**CATERPILLARS,** the larvae of butterflies and moths, feed on leaves, stems, flowers, or fruit. Some species tunnel inside, but most species eat from the outside. Large caterpillars can be picked by hand and destroyed. Fall cleanup of debris and turning the soil to expose wintering stages are effective. Among natural controls are wasps that lay eggs on the caterpillars, which become food for wasp larvae. Both stomach-poison and contact insecticides are effective controls.



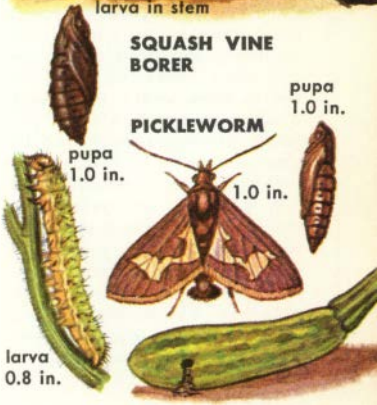
**IMPORTED CABBAGEWORMS** are primarily pests of cabbage-family plants but may at times feed on other garden vegetables, chewing holes in leaves. They hibernate as pupae and emerge as the familiar White Cabbage Butterflies. Several broods a year in warm climates.

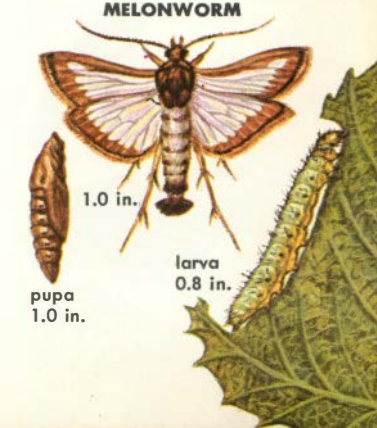
**CABBAGE LOOPERS,** common throughout the U.S., feed on the underside of the leaves of cabbage and related plants. They crawl with a distinctive looping, or measuring-worm, movement. Cabbage Loopers winter as pupae attached to the underside of a leaf and emerge in spring as brown moths. Usually there are two or more generations a year.

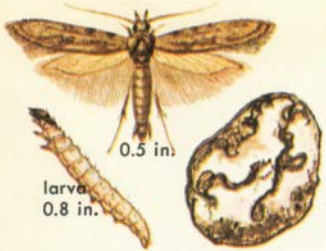
**DIAMONDBACK MOTH** caterpillars eat small holes in the leaves of cabbage and related plants. Though seldom abundant, there may be local outbreaks. When disturbed, the worms wriggle rapidly and drop from the plant, hanging by a silken thread. Adult moths winter on the leaves of plants or in debris.

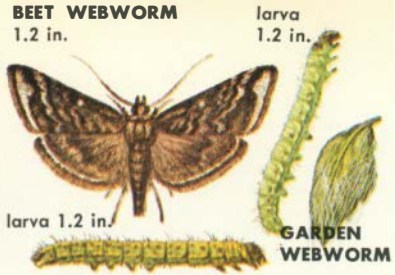
**SQUASH VINE BORERS** eat out the center of the stems of squash vines, causing them to wilt. They also attack pumpkins and, less commonly, cucumbers and muskmelons. Squash Vine Borers winter in the soil in silken cocoons. The moths, active during the day, lay their eggs at the base of plants, and the larvae burrow into the stems. Like other borers, these worms are hard to control because they work inside stems. Presence can be detected by the excrement (frass) pushed from hole in vine. Worms should be cut out by a lengthwise slit. After crop harvest, turn soil to expose the cocoons.

**PICKLEWORMS** bore into squash, muskmelons, and cucumbers, causing them to rot. Full grown after about two weeks of feeding, the worms roll the edge of a leaf over themselves and spin a thin layer of silk to form a pupa. Some cocoons remain attached to the plant; others drop to the ground. Adults emerge in about 10 days. Pickleworms reach a population peak late in the season; therefore, crops planted early are damaged least. Three or four generations are produced in a season. The related Melonworm feeds mostly on foliage. Both species are abundant pests in southern states, and the Pickleworm ranges as far north as Canada. To protect melons, squash are planted between the rows to collect the worms, which prefer the squash to the melons.





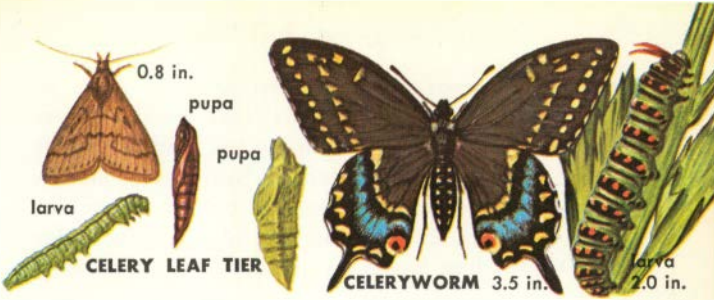




**POTATO TUBERWORMS** that hatch early in the season feed on leaves and stems of the potato plant. When full grown, in two to three weeks, each spins a silken cocoon in which it pupates on the ground. Adults emerge in about 10 days. Worms that hatch later in season tunnel into potatoes. Six generations may be produced in a year. Pull soil high around plants, as worms will not burrow deep. Cut, burn infested vines. Store potatoes where night-flying moths cannot lay eggs on them. Fumigate infested potatoes.

**WEBWORMS** of several species are general feeders on garden vegetables. In large infestations the worms migrate from one food plant to another. Webworms winter as larvae in silk-lined tubes and enter the pupa stage in the spring. Adults of the first generation emerge from March through June. The feeding worm spins a silken web that pulls together the edges of a leaf and anchors it to the ground. The worm hides in dirt at bottom of funnel. Can be killed with stomach-poison or contact insecticides.

**TOMATO HORNWORMS,** also pests of tobacco, potatoes, and other related plants, pass the winter as hard-shelled pupae. The adults are large hawk moths that feed harmlessly on the nectar of deep-throated flowers such as petunias. Female moths lay their eggs on leaves of tomato plants, and the larvae feed ravenously, becoming full grown in about a month. They burrow into the soil to pupate. Two generations may be produced in a year in warm climates. The Corn Earworm (p. 109) and a number of cutworms (p. 64) burrow into tomatoes and feed inside.



**CELERY LEAF TIERS** infest celery, spinach, beets, and related plants, feeding on the leaves and tender growing parts and covering them with webs. When full grown, the worm pulls together the edges of a leaf and fastens them with silk. It pupates in a silken cocoon inside this roll. A complete life cycle takes about a month and a half, and in warm climates there may be several broods a year. Celery Leaf Tiers can be controlled with stomach-poison or contact insecticides, which should not be used on edible parts of plants.

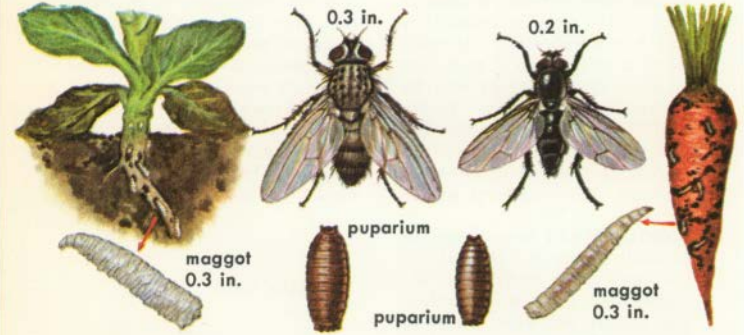
**CELERYWORMS** feed on the leaves of celery, parsnips, carrots, parsley, and related plants. When disturbed, the caterpillars protrude two orange horns near their head. The horns are soft and harmless, but at the same time the worm gives off a sweetish odor that apparently discourages predators. The butterflies (Black Swallowtails) overwinter in southern states. In the North the worms enter the pupa stage in winter. Celeryworms are seldom serious pests, and as they are large, they can be picked off the plants by hand.

**WOOLLYBEARS** are orange- or yellow-and-black caterpillars that feed on all kinds of garden vegetables. They may produce two broods per year. None of the several species are serious pests of particular plants. Some species hibernate as larvae, others in a cocoon made partly from their body hairs. They can be hand picked or killed with either contact or stomach-poison insecticides. The caterpillars roll into a ball when disturbed. In folklore the width of the bands on the caterpillar's body is said to forecast the winter—the more black, the colder the winter.

**MAGGOTS** (larvae) of some flies bore into stems or roots. Others, called leaf miners, feed on the tissues of leaves. The larvae pupate in the soil, and the adults lay their eggs on stems or leaves. Use contact insecticides to kill the adults, and stomach-poison insecticides for the maggots. Do not apply poisonous insecticides to plant parts that are to be eaten.

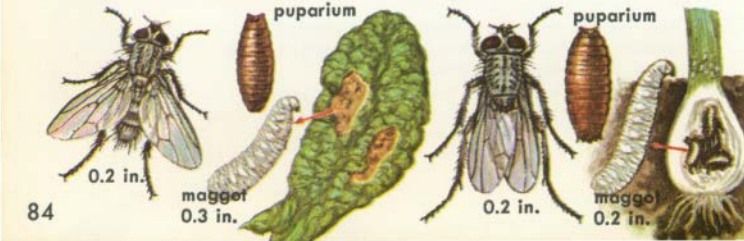
**CABBAGE MAGGOTS** are pests in northern U.S., where they feed on the roots of cabbage, turnips, radishes, broccoli, and similar vegetables. Infested plants wilt and may die. Several generations are produced in a year.

**CARROT RUST FLIES** lay their eggs at the base of plants, and the maggots work into the soil to feed on roots. Entire root systems of carrots, celery, parsnips, and related plants may be destroyed by these maggots.



**SPINACH LEAF MINERS** infest beets, spinach, and other leafy vegetables, causing yellowish channels in leaves.

**ONION MAGGOTS,** especially bad pests in wet years, tunnel into onion bulbs. They are most abundant in northern states.



**MITES,** more closely related to spiders and ticks than to insects, are major pests of plants and also of man (p. 45) and his pets and domestic animals (pp. 54–55). Plant feeders suck the sap from leaves or tender parts of stems, causing them to become discolored. The injury weakens and may kill young plants. Many species spin, on the undersurface of leaves, a fine web containing their eggs and shed skins. Mites are most damaging in hot, dry weather, when a life cycle may be completed in as short a time as one week. Mites can be reduced in numbers by getting rid of weeds or other debris in which they pass the winter as adults or in the egg stage. Infested plants can be sprayed with a contact insecticide. Special miticides are also available. Consult a local agricultural agent.

**SLUGS AND SNAILS** are mollusks that sometimes feed on the foliage of vegetables. The damage may be mistaken for the feeding of insect pests. Slugs lack shells. Both slugs and snails leave a slimy trail. They usually feed at night and hide under debris during the day. Spread poison baits of calcium arsenate or metaldehyde mixed with bran, molasses, and water.

## PESTS OF FLOWERS AND SHRUBS

Some insect pests of flowers and shrubs feed on a wide variety of plants, including vegetable and field crops. Others attack only one kind of plant. A greater range of chemicals can be used to kill insect pests on flowers and shrubs than can be risked on food plants, but follow carefully the directions for applying insecticides. Nearly all of these poisons are dangerous to people, pets, and domestic animals as well as to insects.

**SCALES AND MEALYBUGS** are among the most damaging of all insect pests of flowers and shrubs. Males of both mealybugs and scales can fly; females are wingless. Female mealybugs have legs and crawl slowly over stems and leaves as they feed. Soft scales, though legless, can move sluggishly but seldom do. Female armored scales, covered with a tough scale of wax mixed with shed skins of the nymph stages, fasten themselves permanently to a plant. A mealybug's body is covered with a cottony mass of wax that forms thread-like extensions. Scales and mealybugs suck the sap from leaves or stems, sometimes causing plants to wilt. If infestations go unchecked, a plant may die. Both mealybugs and scales produce large amounts of honeydew. The sweet excretion attracts ants, and patches of sooty mold grow where the honeydew drops beneath the infested plants. Mealybugs and scales can be killed with thiocyanate or nicotine-sulfate sprays, usually applied in white-oil emulsion. Parathion and malathion are also excellent controls but must be used with extraordinary caution. Rinse plants with a strong spray of water about an hour after application to prevent damage to the plant by chemical

**LONG-TAILED MEALYBUGS** have long filaments at the tip of the body. Females give birth to nymphs. The Mexican Mealybug lays eggs.

**MEXICAN MEALYBUGS** are common pests in greenhouses and in warm climates attack plants outdoors. Hollyhocks, geraniums, and chrysanthemums are frequent victims.

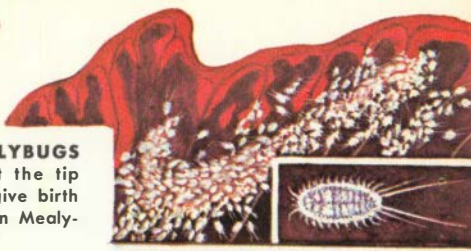
**FERN SCALES** are pests of bananas, orchids, citrus, and other plants outdoors in warm climates. In cool climates they occur indoors on ferns and other plants.

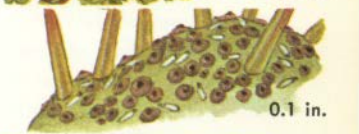
**CACTUS SCALES** are abundant, armored scales, found outdoors in southwestern U.S. or indoors on plants in greenhouses and homes.

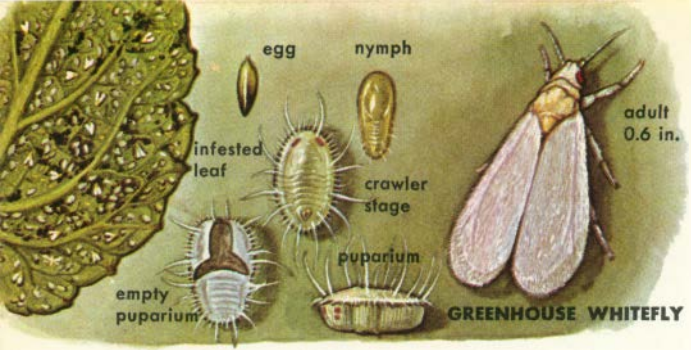
**HEMISPHERICAL SCALES** are pests in warm climates or on indoor plants. Oval scales become strongly convex. Flat young scales are notched at rear.

**BROWN SOFT SCALES,** flat and close to the color of their host, are pests in greenhouses; outdoors on gardenias and oleanders in warm climates.

**GREENHOUSE ORTHEZIAS,** related to scales and mealybugs, are pests in greenhouses and outdoors, attacking more than 100 species of plants.

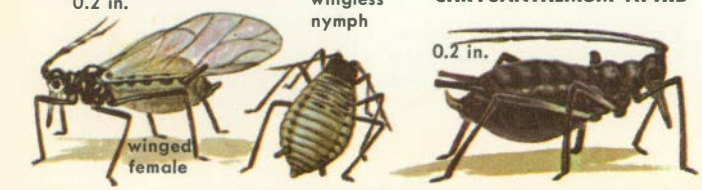


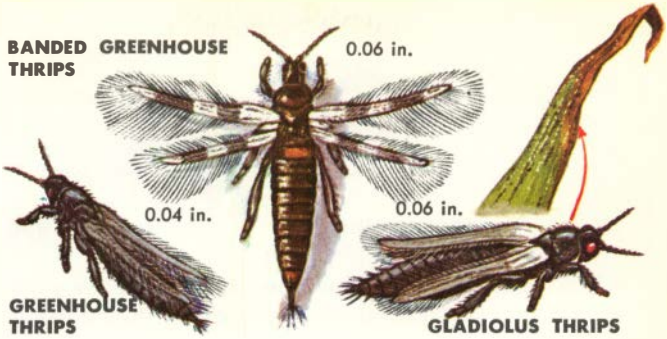




**WHITEFLIES** in large numbers may feed unnoticed on the underside of leaves until the white-winged adults are disturbed and take flight. Both the adults and nymphs suck sap from stems and leaves, causing an infested plant to wilt. In warm climates whiteflies are pests outdoors the year around; in cool climates they are principally pests in greenhouses or on plants kept in the home. Some species, such as the common Greenhouse Whitefly, spread outdoors during the warm months. Like aphids, whiteflies excrete honeydew. These pests can be killed with oil sprays and also with the organo-phosphate insecticides.

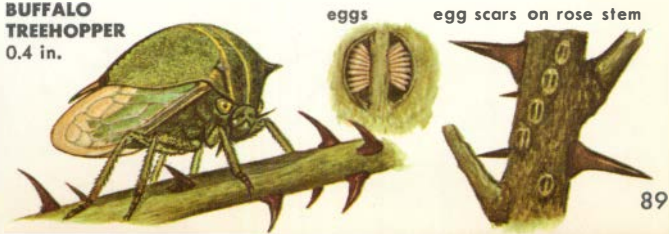
**APHIDS** are pests of flowers and shrubs. All aphids have similar life histories and habits. A few species feed on the roots of plants, but most kinds suck sap from leaves or stems. Control of aphids on ornamentals is the same as for vegetables (p. 66).

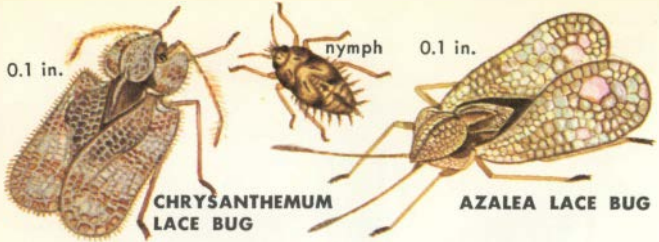




**THRIPS,** pests of a variety of plants, are much alike in appearance and life history (p. 72). Most thrips attack shrubs and flowers, particularly in warm climates, and they are especially damaging in greenhouses. The Greenhouse Thrips is found throughout the world. The Banded Greenhouse Thrips is a prevalent pest in western U.S., while the Gladiolus Thrips is distributed throughout the U.S. on gladioli, irises, and lilies. The leaves of infested plants turn white or silvery and then brown due to the loss of sap drawn out by the feeding thrips. Thrips can be killed with contact insecticides, and bulbs can be dusted with insecticide when stored.

**TREEHOPPERS,** related to leafhoppers (p. 68), lay eggs in crescent-shaped slits cut in twigs. Fungi develop in the slits, and the scarred twigs do not grow well. Nymphs of treehoppers suck the juices from grasses, lilies, and other plants. Spray with contact insecticide.



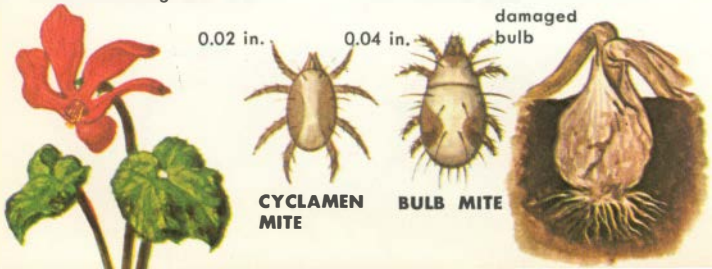


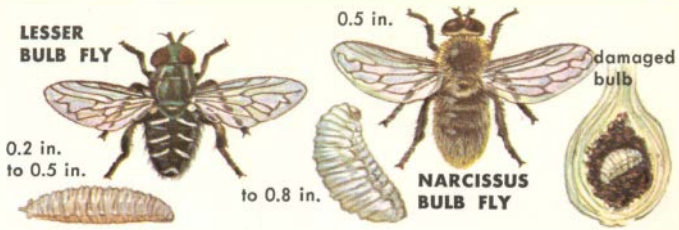
**LACE BUGS,** both the handsome adults and the spiny nymphs, suck juices from leaves or stems. They damage ornamentals and also vegetable plants (p. 73). Leaves of infested plants are spotted with dark, shiny excrement. Lace bugs overwinter as eggs attached to leaves and in warm weather produce two or more broods in a season. Contact insecticides should be used to kill adults or nymphs as soon as they appear.

**MITES** damage plants in greenhouses and attack a great many kinds of plants outdoors in warm weather. They are pests also of vegetables (p. 85), man (p. 45), and domestic animals (p. 54–55).

**CYCLAMEN MITES** attack cyclamens, delphiniums, marigolds, other garden flowers, and also strawberries. They feed on tender leaves in the plant's crown and also overwinter there. Foliage turns black. Immerse suspected seedlings in water at 110 degrees F. for about 20 minutes before setting them out.

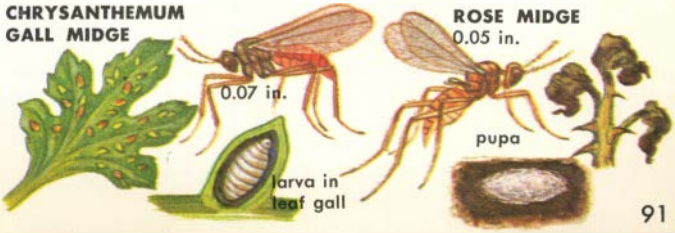
**BULB MITES** attack roots, corms, and bulbs of such plants as lilies, crocuses, hyacinths, gladioli, and tulips. Infested bulbs turn soft, and the stem of the plant breaks over. Destroy infested bulbs by burning or burying them deeply. Or immerse bulbs in water at 110 to 115 degrees F. for an hour and a half.





**BULB FLIES** attack bulbs of lilies, narcissuses, irises, hyacinths, and such root crops as onions, carrots, and potatoes. The maggots feed inside the bulbs, opening them to fungi. They pupate in the bulb or in the soil. The Lesser Bulb Fly produces two broods a year, the Narcissus Bulb Fly one. Maggots of the Lesser Bulb Fly usually infest already weakened or injured bulbs, and many maggots may occur in one bulb. Only one maggot of the Narcissus Bulb Fly is ordinarily found in a bulb. In early spring, when the adult flies lay their eggs, cover plants with cheesecloth. At harvest, destroy bulbs that feel soft and are probably infested. Treat the others in hot water, as for Bulb Mites (p. 90).

**MIDGES** are small flies. Some species, such as larvae of the Chrysanthemum Gall Midge, form galls on stems or leaves. Maggots of the Rose Midge feed on buds and new shoots, deforming and causing them to die. Full-grown maggots burrow into the soil to pupate. Remove and destroy infested parts of plants. Treat soil with a contact insecticide; spray plant to kill larvae.



**LEAF MINERS,** the larvae of certain moths, flies, beetles, or sawflies, feed between the epidermal layers of a leaf, causing blisters, blotches, or tunnels. In time the leaves turn brown and drop off.

**AZALEA LEAF MINERS,** the caterpillars of a small moth, feed in the leaf tissues until about half grown, then emerge and feed at the tip or margin. The caterpillar rolls or folds the leaf over itself and feeds inside this cover, in which it also pupates. Leaf rolls can be pulled off and destroyed. Dust plants with a stomach-poison insecticide to kill larvae feeding on surface.

**ARBORVITAE LEAF MINERS** eat out the inside of needles at the branch tips. The caterpillars overwinter in the branches and emerge in late spring or early summer. Females lay eggs on the foliage. Cut and destroy infested tips. Adults and newly hatched larvae should be killed with a contact insecticide.

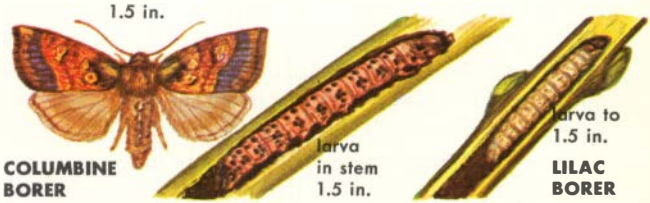
**COLUMBINE LEAF MINERS,** also pests on asters, are fly larvae. As many as a dozen larvae attack one leaf. Infested leaves should be burned or buried. Spray plants with a contact insecticide.

**LARKSPUR LEAF MINERS** mine in leaf tissues of delphiniums. Adult flies puncture the undersurface of leaves, turning them brown. Destroy infested leaves. Spray or dust plants with a contact insecticide. Cultivate soil to kill pupae.

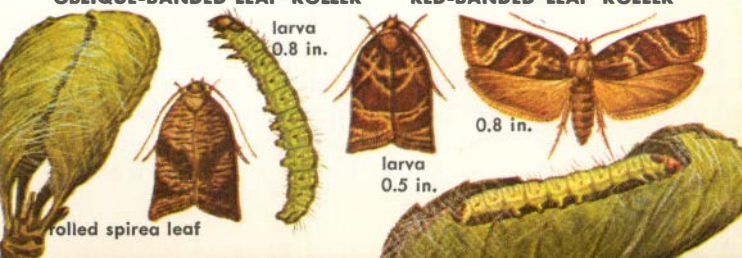
**BORERS** feed inside stems, leaves, fruit, or roots. They are difficult to reach with sprays or dusts. An infected plant wilts and in time dies or breaks off. Bacteria and fungi enter the plants through the holes made by borers.

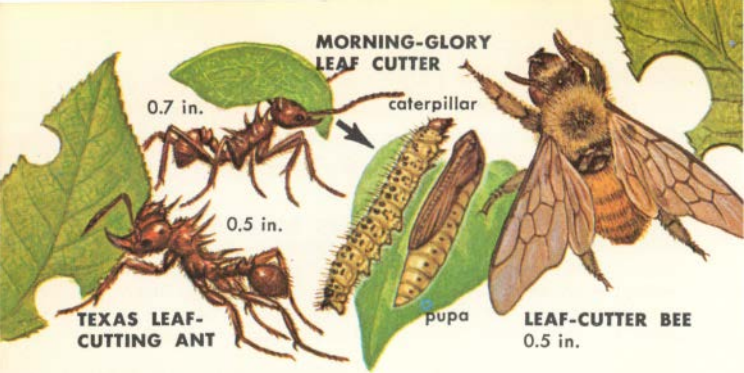
**COLUMBINE BORERS** lay eggs on the ground or in debris near plants. A fall cleanup of debris destroys many eggs. Contact insecticides in soil at base of plants kill caterpillars.

**LILAC BORER** caterpillars winter inside the stem. Cut off and burn infested stems. Or kill borers inside holes in stems with a wire probe or squirt in a few drops of carbon bisulfide.



**LEAF ROLLERS** twist or roll a portion of a leaf over themselves and fasten it together with silk. They feed on the surface or at the edge of the leaf, and when full grown, pupate inside the roll. The two most common species of leaf rollers, attacking a wide variety of flowers and shrubs, are the Oblique-banded and the Red-banded. Both stomach-poison and contact insecticides are effective controls and should be applied as soon as damage is discovered.





**LEAF CUTTERS** are bees, caterpillars, ants, or other insects that cut large pieces from leaves. Leaf-cutter ants, found in Louisiana, Texas, and southward, take the pieces of leaves to their nest and chew them up to make a mulch on which fungus grows. Leaf-cutting bees roll the piece of leaf into a thimble shape to line the stem cavity in which the larva is feeding. The Morning Glory Leaf Cutter cuts off the leaves of morning glories, zinnias, dahlias, and other flowers. The caterpillars feed at night and hide during the day in the wilted leaves. Use stomach poisons as dusts or sprays.

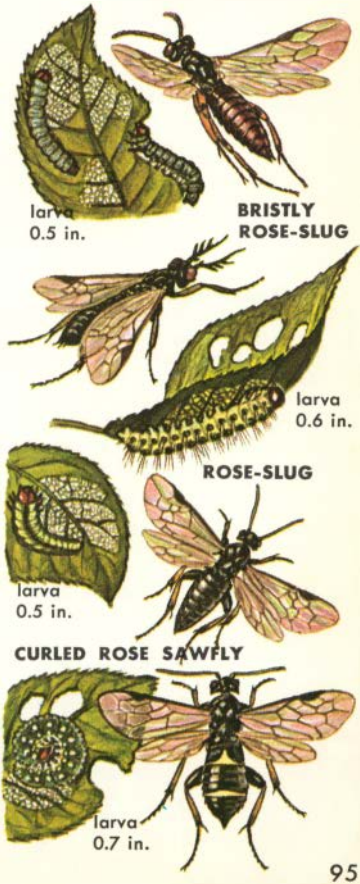
**BAGWORMS** move about in a bag of tough silk, covered with needles or twigs. Especially damaging to conifers. In late summer the caterpillars form pupae inside the bags. Winged males emerge in the fall and mate with the wingless females, which lay their eggs inside the bag and never emerge. Bags can be picked by hand, or plants sprayed with a stomach-poison insecticide while larvae are feeding.

**SAWFLIES** belong to the same order of insects as bees and wasps. Instead of stingers, the females have a saw-tooth-edged ovipositor with which they cut slits in leaves or bore holes into stems to lay eggs. The larvae of sawflies resemble caterpillars of moths and butterflies and, like them, feed on foliage.

**VIOLET SAWFLIES,** pests of both violets and pansies, feed at night. They first eat out the underside of the leaf and skeletonize it. Then they eat holes through the leaf and may completely defoliate a plant. Blisters are formed on the leaves where the females lay eggs. Spray plants with a stomach-poison insecticide.

**ROSE-SLUGS** are the larvae of several species of sawflies. Bristly Rose-slug larvae feed first on the undersurface of the leaves, skeletonizing them, then eat holes through the leaves. As many as six broods are produced in a season. The Rose-Slug feeds on the upper surface of the leaf and produces one generation in a season. Larvae of the Curled Rose Sawfly eat the whole leaf, usually feeding in a curled position like a grub. Slugs can be killed with stomach-poison insecticides applied to leaves in early stages of the feeding.

The Bristly Rose-slug and the Rose-Slug pupate in debris or loose soil; hence a fall cleanup destroys the pupae. The Curled Rose Sawfly larvae pupate in woody or pithy stems. Paint pruned ends of stems and get rid of debris.

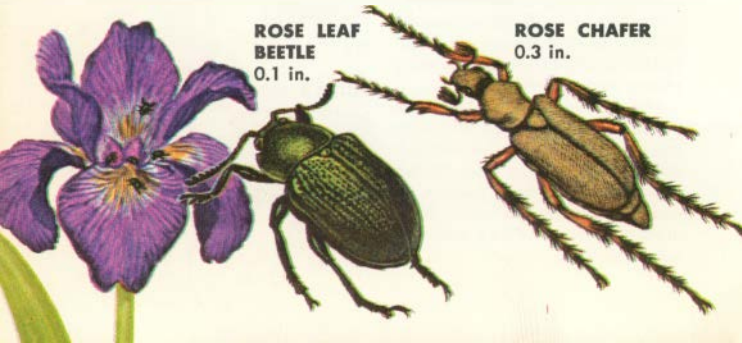


**BLACK BLISTER BEETLES** are pests of asters, zinnias, chrysanthemums, anemones, and other flowers. They commonly eat the petals in preference to the leaves. The Black Blister Beetle resembles the Striped Blister Beetle (p. 74) in life history and habits and is controlled by the same methods.

**BEETLES** Some of the many species of beetles feed on the foliage, flowers, stems, roots, or fruit of shrubs and flowers. Some are damaging only in the larva, or grub, stage; others do their greatest damage as adults. Both larvae and adults have chewing mouthparts. Some are pests in both stages. Many beetles are general feeders; others attack only one kind or related plants.

**ROSE LEAF BEETLES** feed on the blossoms of irises and peonies as well as roses. They also eat leaves, blossoms, buds, and young fruit of pears, plums, apples, peaches, strawberries, and others. They can be hand-picked or jarred into a pail of kerosene and water. They feed deep in flowers or buds and are hard to reach with insecticides. Pyrethrum or other contact insecticides are effective.

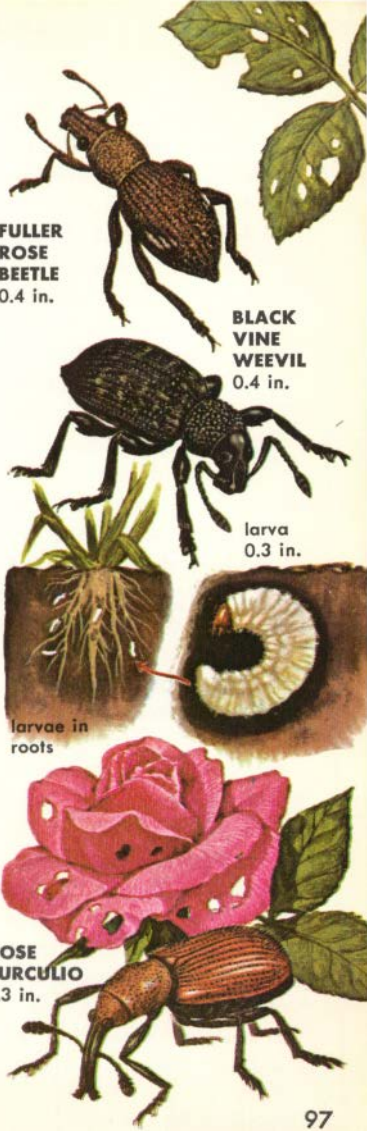
**ROSE CHAFERS** are general pests of flowers and shrubs and also of many fruit and vegetable crops. Adult beetles appear in late spring or early summer, feeding first on the flowers and then on foliage. The larvae feed on the roots of grass and burrow deep into the soil to hibernate. Adults can be hand-picked, or infested plants can be sprayed. Rose Chafers are deadly poisonous to chickens.



**FULLER ROSE BEETLES** are weevil pests (p. 78) of roses, carnations, geraniums, gardenias, chrysanthemums, azaleas, and many other shrubs and flowers. Adults feed at night, eating the margins of the leaves. The grubs feed on the roots, causing the foliage to turn yellow. They can be controlled by the same methods used for the Rose Curculio.

**BLACK VINE WEEVILS** are pests of gardenias, azaleas, begonias, spirea, arborvitae, rhododendron, and many other flowers and shrubs. The larvae feed first on the root hairs of plants and then on larger roots, stripping them of bark. The grubs hibernate in winter, feed again on the roots in spring, then form pupae and emerge as adults in early summer. The adult weevils (p. 78) are active at night, eating foliage for about a month before laying eggs in soil. Spray or dust with a stomach-poison or a contact insecticide.

**ROSE CURCULIOS** are weevils (p. 78) with especially long snouts, or beaks. They eat holes in the stems or unopened buds of roses. Injured buds may not open, or if they do, the petals are filled with holes. The larvae develop in the young fruit or hips, and when full grown, drop to the ground to pupate. Beetles can be hand-picked or jarred from the plant into a container of water and kerosene. Dust plants with a stomach-poison or contact insecticide. Destroy infested rose hips.

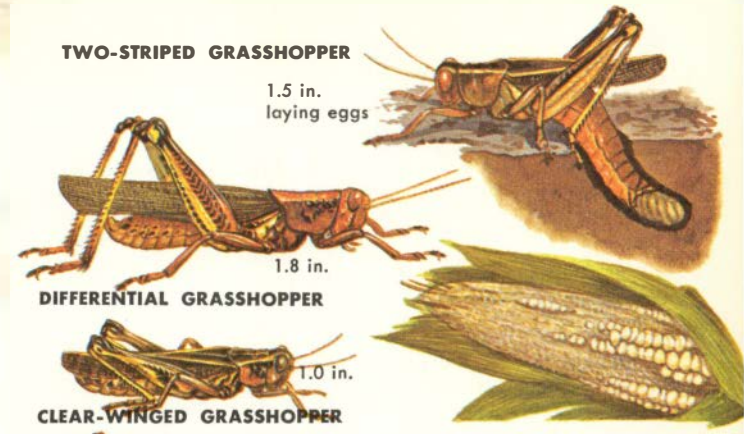


## FIELD AND FORAGE CROP PESTS

All field crops are food for insects. Losses average 10 percent, but in epidemic outbreaks entire crops are lost.

**GRASSHOPPERS** About 600 species of grasshoppers inhabit North America. Ninety percent of the damage is due to five species that attack field crops; more than 20 species are damaging to grasslands. The dry grasslands east of the Rocky Mountains, where the annual rainfall is less than 30 inches, periodically have grasshopper outbreaks in which the crop losses amount to millions of dollars. Most species of grasshoppers are general feeders, though they prefer young, green plants. In epidemic outbreaks the hungry hordes will eat any food available. They will strip a tree or bush of its foliage and then feed on the bark. In heavy outbreaks, with 50 or more grasshoppers to the square yard, grass is cropped close and permanently injured, exposing the land to wind and water erosion.

Most grasshoppers lay eggs in late summer or early fall. The female pushes her ovipositor as deep as two inches into the soil, depositing her eggs in packets consisting of as many as 100 eggs. These masses of eggs, glued together with particles of soil, are called pods. Each female may lay as many as a dozen pods. The eggs hatch in the spring, and the nymphs begin eating immediately. The number of times they shed before becoming adults varies with the species but is usually five or six. Most species produce only one generation a year, but the Migratory Grasshopper and several others may produce two generations in warm climates. Plowing or disking the land in the fall buries some of the eggs so that the nymphs cannot make their way to the surface.



These five species of grasshoppers are the most damaging to field and forage crops in the United States. The ear of corn above has only a few scattered kernels because grasshoppers ate off silks before pollination.

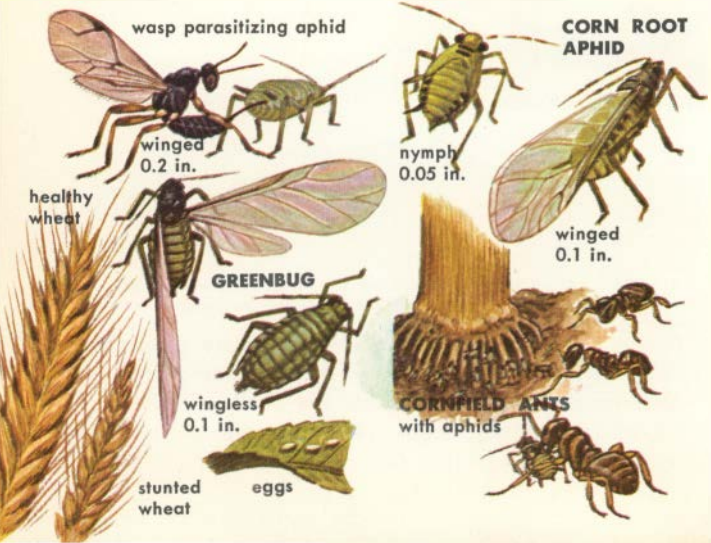
Bare range land was scoured by foraging grasshopper horde. Grass still grows heavy under screened plot.

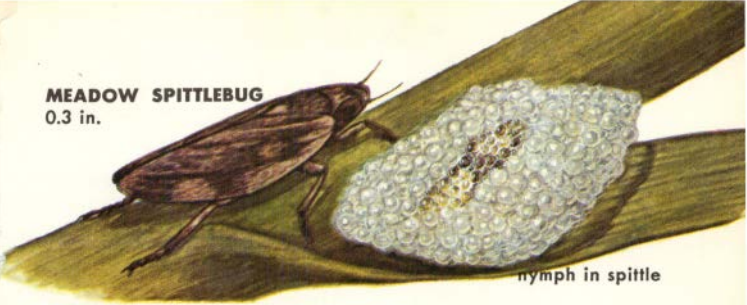
Others are exposed to the weather or to predators. Poisoned baits (sweetened bran containing arsenic, chlordane, or similar poisons) are used effectively to kill adults, and large areas in western states are sprayed with contact insecticides from airplanes.

**APHIDS** damage plants by sucking the sap from the stems, leaves, or roots. They stunt the plant's growth, or in heavy infestations cause it to die. Aphids have complex life cycles (p. 66).

**GREENBUGS** are aphid pests of grains. In warm climates they are active throughout the year. In cool climates males and females are produced in late summer. They mate, and the females deposit eggs in the folds of leaves. Greenbugs are parasitized by a small wasp that lays its eggs in the aphid's body. The wasp's larvae feed on the aphid's internal organs. In a cool spring, the aphids build up a large population before the wasps become active. Plow under volunteer crops. Plant resistant varieties. Use contact insecticides to check infestations of Greenbugs.

**CORN ROOT APHIDS** infest the roots of corn. The corn grows well until about a foot tall and then becomes stunted and yellowed. The aphids winter in the egg stage, stored in the nests of the Cornfield Ant. As soon as they hatch in spring, the young are pastured first on the roots of weeds or grasses, then on corn plants. The aphids produce winged generations that fly to other plants, where they are captured by ants and put to work. The ants eat the honeydew expelled by the aphids. Ant nests should be destroyed by plowing or by treating the soil with a contact insecticide.

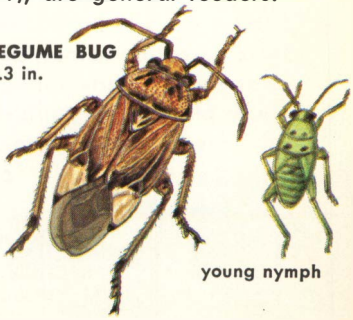


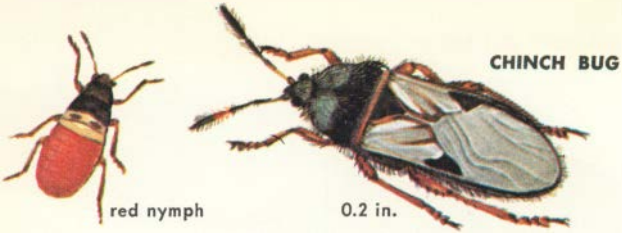


**SPITTLEBUGS** damage plants as nymphs, sucking the juices from stems or leaves. The nymphs surround themselves with a mass of froth, or spittle, as they feed. The squat, broad adults are sometimes called froghoppers. The Meadow Spittlebug, a pest of alfalfa and other legumes and also of many ornamentals, produces only one generation in a season. The nymphs hatch from eggs laid in stubble. Spray plants with contact insecticides before fall harvest to kill egg-laying adults or in early spring to kill young nymphs.

**PLANT BUGS,** also called leaf bugs, are a family of true bugs containing many species that damage and deform plants by sucking out juices. Some feed on only one group of plants, such as grasses; others, such as the Tarnished Plant Bug (p. 71), are general feeders.

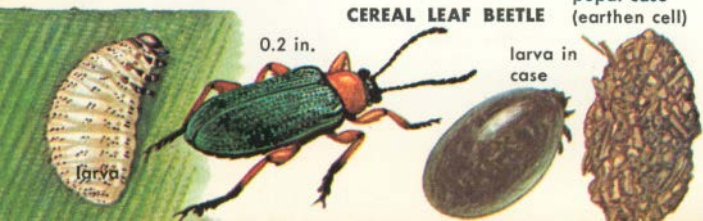
**LEGUME BUGS** are pests of legumes and other plants. Nymphs are most damaging, but adults also feed on plants. Both introduce a toxin causing deformities. Adults overwinter, and females lay their eggs in plant tissues in spring, with four or five generations produced in a season. Use a contact insecticide in spring when nymphs begin to feed. Do not spray plants in flower, thus killing bees that pollinate crop.





**CHINCH BUGS** are major pests of corn but also damage other grains and grasses. Adults overwinter in debris, and in the spring the females lay eggs at the base of plants, on which the nymphs feed by sucking out juices. Young plants are commonly killed; older plants survive but may not produce. As food plants are exhausted in one place, the nymphs migrate in droves to find new food plants. Chinch Bugs can be killed with contact insecticides sprayed or dusted on infested plants, or the insecticides may be used as a chemical barrier to prevent entry of crawling nymphs. Some crop varieties are resistant to Chinch Bugs. Crop rotation prevents population buildup.

**CEREAL LEAF BEETLES,** from Europe, were first found in the U.S. in 1962 and are now a potential major pest of grain crops in the Midwest. Adults survive cold winters by hibernating under debris. The larvae hatch from eggs laid in early spring and feed on the leaves of young plants. They pupate in June, and adults appear in July, feeding until winter.

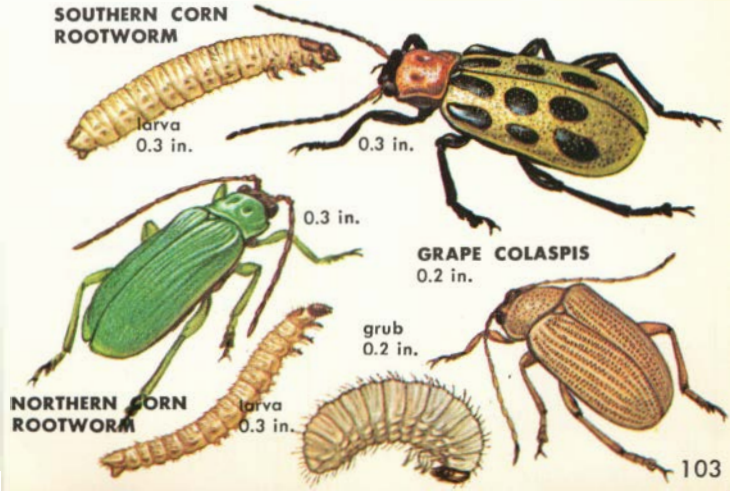


**ROOTWORMS** are grubs, or beetle larvae, that injure plants by feeding on or in their roots. Often the adults damage entirely different plants.

**NORTHERN CORN ROOTWORMS,** which feed only on corn, are pests from New York westward to the Rocky Mountains, especially in the northern Mississippi Valley. Infested plants grow slowly and are weakened so that they topple in wind or heavy rain. The larvae also transmit wilt, a bacterial disease. In midsummer the larvae leave the roots and pupate in the soil. The adults, which feed on a variety of plants, die after laying eggs around roots of cornstalks in the fall. Eggs hatch the following spring. Rotating crops is effective. Chemical controls include soil treatment with contact insecticide before plowing, or sprays or dusts on adults.

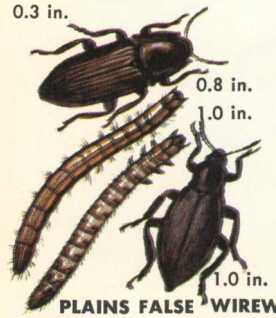
**SOUTHERN CORN ROOTWORM** damage is similar to injury by the Northern Corn Rootworm, but worms also bore into stalks at soil line. Adults are equally damaging.

**GRAPE COLASPIS** grubs (Clover Rootworms) feed on the stems and foliage of grapes and other plants. Adult beetles emerge in midsummer and lay their eggs around roots of cover crops such as clover. The grubs feed on the roots until cold weather, then hibernate until spring, when they continue feeding. If a field is plowed in spring and then planted in corn, the half-grown grubs feed on roots. Fall plowing exposes grubs to freezing.



**FLEA BEETLES,** especially abundant in cool, wet seasons, attack many field and garden crops. In addition to eating leaves and generally weakening a plant, they transmit the bacteria for Stewart's disease, a wilt. Heavy infestations sometimes cause a complete loss of crops. Keep fields free of weeds under which the beetles hibernate in winter. For other controls see p. 62.

**WHITE GRUBS** of a number of species eat the roots of lawn grasses, corn, wheat, and forage crops. Infested corn plants may die after growing to a height of about two feet. In addition to the grubs of May and June beetles, larvae of the Oriental Beetle are serious pests. Control by soil fumigation and by other methods described on p. 65.

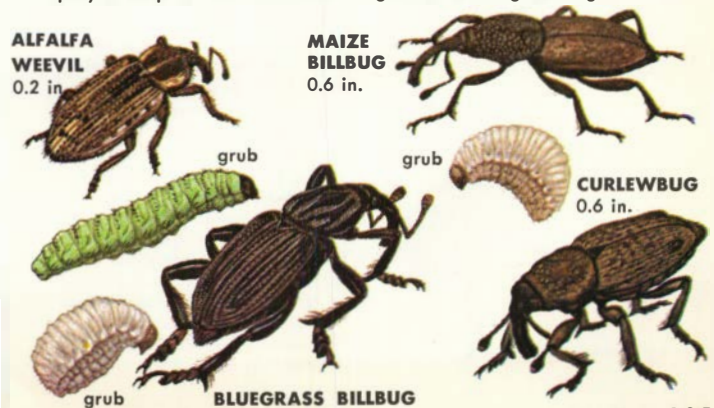


**WIREWORMS** of several species injure corn, wheat, lawn grasses, and root crops. The Plains False Wireworm, particularly damaging to wheat, is a darkling beetle larva rather than a click beetle as are true wireworms. Controls are given on p. 63.

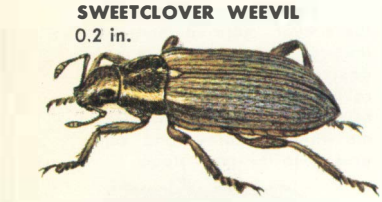
**WEEVILS,** the largest family of beetles, are easily recognized by their long snout, at the end of which are their chewing mouthparts. When disturbed, many weevils "play dead." Some weevils are pests of vegetable crops (p. 78), fruits (p. 125), and stored products (p. 146). Many are as damaging in the grub, or larva, stage as they are as adults.

**ALFALFA WEEVILS,** important pests in western U.S., winter as adults in debris on the ground. In spring they emerge and feed on alfalfa or other legumes. The females lay their eggs in cavities chewed into the stems. At first the grubs feed where they hatch; later they move up to the tips. Often the plant is stunted, and the entire first-growth crop may be lost. When full grown, the larvae spin cocoons, and the adults appear in about ten days. Adults can be killed with contact insecticide. Consult agricultural agent for best time to apply and for advice on use of sprayed crop as livestock feed.

**BILLBUG** is a name used for several species of snout beetles that attack corn, wheat, and other grains. Adult Maize Billbugs eat holes in the stems and leaves of corn. The grubs, even more damaging, feed on the taproots and in the pith of the stalks, forming pupae in late summer or early fall. Adults hibernate in winter. Crop rotation is an effective control for the Maize Billbug and the similar, more southern Curlewbug. Maize Billbugs can be destroyed in hibernation by raking a field and burying debris. The Bluegrass Billbug feeds on wheat, timothy, and other grasses in the grub stage.



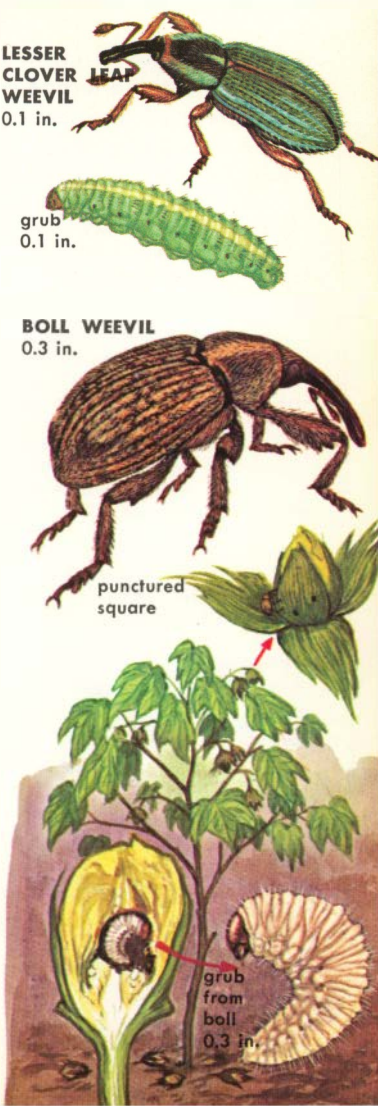
**CLOVER LEAF WEEVILS,** also pests of alfalfa, are most damaging in early spring and may destroy an entire crop. The grubs feed on leaves at night and hide beneath plant during the day. They complete growth by late spring and spin a cocoon in the soil or on the plant. Adults emerge in early summer. After a brief period of feeding they become relatively inactive until fall, then mate and the females lay eggs. Larvae that hatch in the fall hibernate until spring. Some eggs do not hatch until spring. In wet seasons many larvae are killed by fungus disease. A field can be plowed and planted in grass, or crop sprayed with a contact insecticide.



**SWEETCLOVER WEEVILS** and closely related Clover Root Curculios are pests of nearly all legumes. The grubs burrow into the roots, causing plants to wilt and die. These weevils usually overwinter as young larvae, though in some regions they pass the winter in the egg or adult stage. Larvae complete their development by late spring, then form pupae and emerge as adults by summer. Adults feed on foliage for about a month, after which they become less active until fall, when they begin to feed again. At this time they mate and females lay eggs on food plant. Control is difficult. Fields can be plowed in early spring or late fall and planted in grass or other non-legume plant. Contact insecticides will kill weevils but may make crop unusable as a livestock food.

**LESSER CLOVER LEAF WEEVILS** are most damaging to red clover but may also attack alfalfa and sweetclovers. The damage, greatest in dry seasons, is done largely by the grubs, which feed on the stems, leaves, and buds. An infested plant wilts and dies. No good control methods have been discovered.

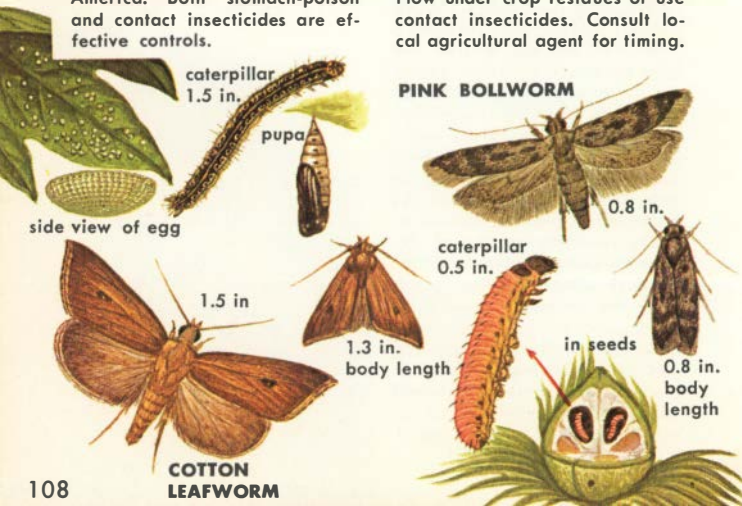
**BOLL WEEVILS** are one of the more than 100 insect pests of cotton. As many as seven generations of Boll Weevils are produced in a season, damaging the plant at all stages of its growth. Each generation completes its development in about three weeks in good weather. Adults that emerge from hibernation in debris near cotton fields begin feeding on the buds of young cotton plants. The females lay one egg in a deep puncture in each developing flower bud, or square. If not enough squares are available, more than one egg may be laid in a square. The larvae feed in the square, causing it to turn yellow and drop. In heavy infestations the bloom of an entire crop is destroyed. When bolls do form, the weevils feed inside. Young bolls drop from the plant; older ones are stained or decay. Controls consist of destroying cotton stalks or debris in which adults hibernate, planting early maturing varieties of cotton, and using contact insecticides to kill the feeding larvae and adults. Timing is critical in the success of these controls and varies with local conditions. Consult regional agricultural agent.

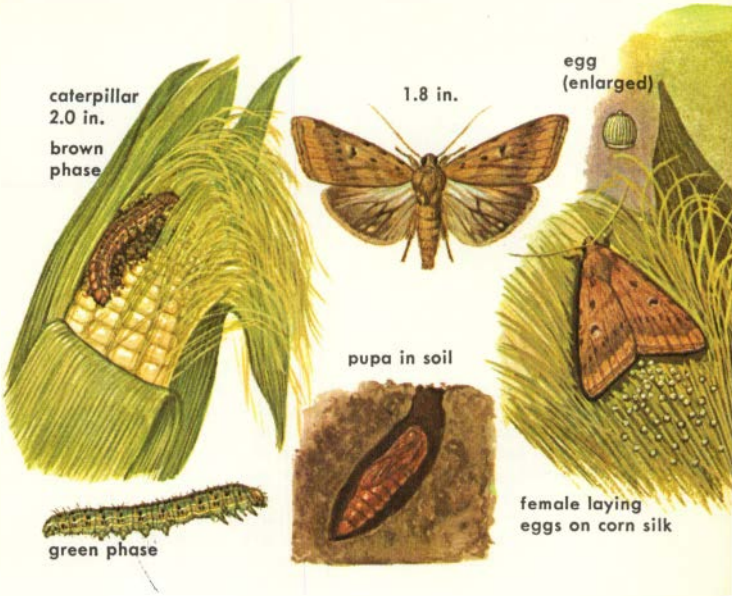


**CATERPILLARS** of moths and butterflies are common pests of field and forage crops. Methods of combating them are much the same as those used in controlling caterpillars that damage vegetable crops (p. 80). All have strong chewing mouthparts.

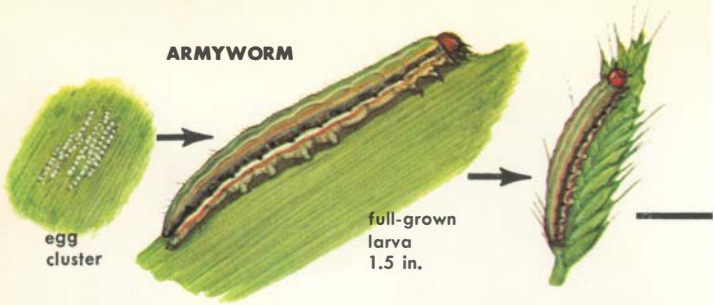
**COTTON LEAFWORMS** crawl by looping their body, like measuring worms. Unlike almost all other moths, the adults may be pests, using their spiny mouthparts to make slits in grapes, peaches, or other fruit to get the sweet juices. The larvae hatch from eggs laid on the underside of cotton leaves. Later they pupate in folded leaves. A life cycle is completed in about a month, with as many as three or four generations a season. No stage survives winter in the U.S., the pest invading each year from Central America. Both stomach-poison and contact insecticides are effective controls.

**PINK BOLLWORMS** feed on cotton blossoms, or squares, causing them to wilt and drop. Later they feed in the bolls. Pink Bollworms winter in cocoons in the soil, inside bolls, or in the seed. Larvae may remain in this resting stage for more than two years, which accounts for the world-wide spread of this pest. Each generation requires about a month, with as many as six generations a season. Worms in the seed are killed by heat (145 degrees F.) or by fumigation. Early crops give harvests before the pests are numerous. Plow under crop residues or use contact insecticides. Consult local agricultural agent for timing.





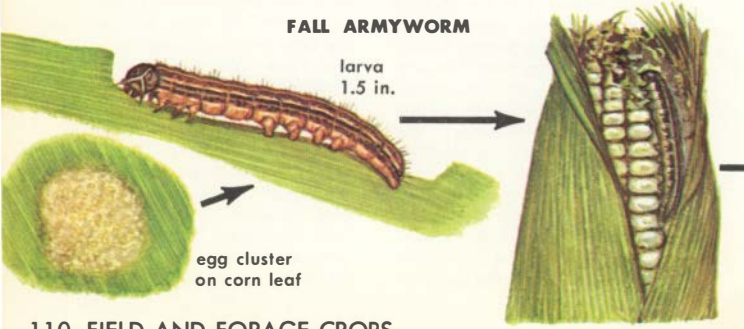
**CORN EARWORMS,** known as Bollworms and Tomato Fruitworms, are the major pests of sweet corn in the U.S. From 500 to more than 2,000 eggs are laid by each female. The larvae feed on the unfolding leaves, sometimes stunting the plants. Greatest damage occurs when the corn is in the tassel, or silk, stage, as the larvae that hatch on the silks feed there and also on the developing kernels. In addition to destroying the kernels, the larvae open avenues for molds and for other insect pests. The worms feed also on the flowers of tomatoes and eat the green fruit. They feed on the buds of tobacco plants and in the seed pods. In cotton-growing areas they feed on the tips of the plants, on the blossom, and in the bolls. Up to seven generations are produced each year in warm climates; three or four in the Corn Belt, only one in northern states. Corn Earworms overwinter in the soil in a pupa case, hence plowing in late fall destroys many or exposes them to freezing temperatures. Feeding worms can be killed with contact-insecticide dusts. Some hybrid corn varieties are resistant to Corn Earworms. Early maturing varieties can be harvested before the pest population builds up.

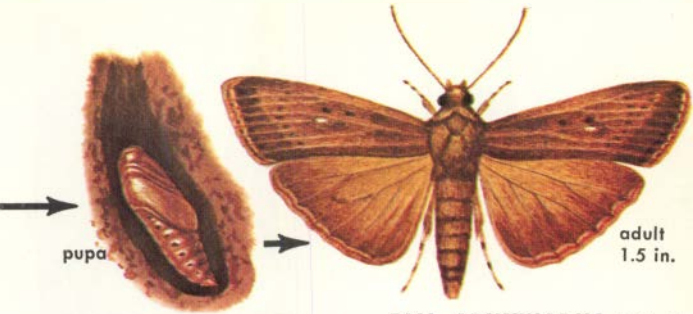


**ARMYWORMS** hibernate as half-grown caterpillars that begin feeding in spring and are full grown by early summer. They burrow into the soil, pupate, and emerge as night-flying moths that are identified by the white dot on each front wing.

Female moths, after a period of feeding on nectar or decaying fruit, lay their eggs on grass or other plants. Larvae hatch in about a week and begin feeding ravenously on the plants around them. If conditions have been favorable, many thousands of caterpillars are produced. When the plants are consumed in one area, the hungry hordes move in "armies" to find a new supply. Caterpillars of this second, or summer, generation become full grown in late summer. They pupate, and the adults emerge in the fall, each female laying as many as 2,000 eggs, in clusters of 25 to 100. These hatch into the larvae that overwinter.

The summer generation does the greatest damage, and in the years of severe outbreaks many crops are attacked and completely destroyed. The caterpillars hide during the day and feed at night; hence a crop may be destroyed completely before the caterpillars are noticed. Armyworms are parasitized by a fly that lays its eggs on the caterpillar's back; the fly's larvae

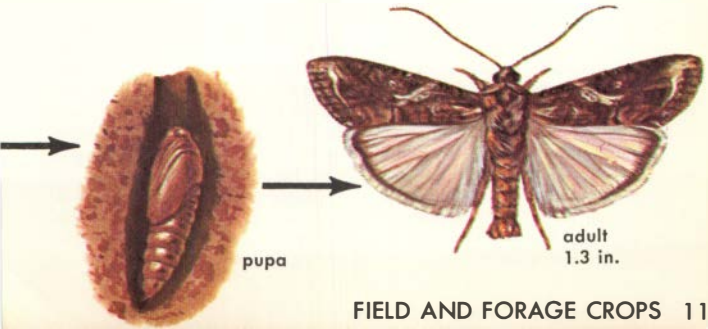


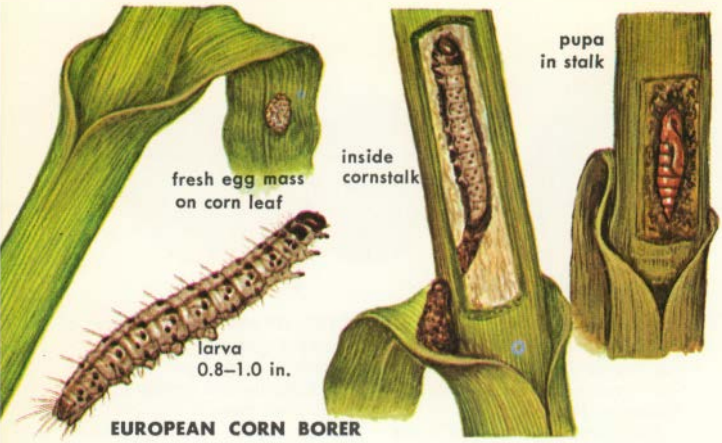


then feed on the caterpillar and kill it. A tiny wasp that lays its eggs inside the Armyworm's eggs is an even more effective natural control of this pest.

Advancing "armies" of these caterpillars can be trapped in deep furrows containing kerosene or a contact insecticide. Poison-bran baits such as those used for grasshoppers (p. 98) can be spread in the path of the migrating caterpillars, or fields can be sprayed with contact insecticides. When the worms disappear, indicating that they have burrowed into the ground to pupate, shallow plowing will expose the pupae to predators and to weather.

**FALL ARMYWORMS** are a southern species closely related to the Armyworms. Sometimes the moths fly into northern states, appearing there in the fall. They do not survive northern winters, however. In the South as many as six generations are produced in one season. The caterpillars feed first on grass, then move to corn or other field and vegetable crops. In the South the caterpillars go by the name of Grass Worms. Fall Armyworms do not hide during the day as do Armyworms. In addition to the controls effective against the Armyworm, it is important to keep fields free of grass on which the larvae feed first.





EUROPEAN CORN BORER

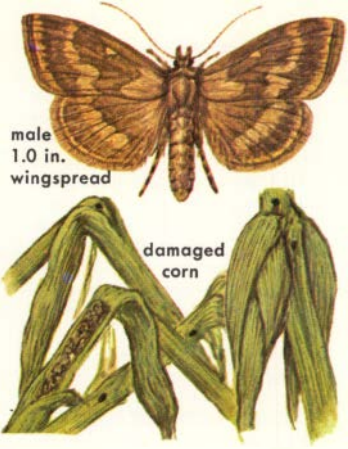
**EUROPEAN CORN BORERS** are the most injurious pests of corn in the U.S. From their point of introduction in the Boston area, just before 1917, they have spread across the continent to the Rocky Mountains.

Originally the European Corn Borer produced only one generation each season, but in the East it now usually produces two. Though corn is preferred, the caterpillars, particularly those of the second generation, will feed on many other kinds of plants. European Corn Borers overwinter as caterpillars in the stems of food plants. In the spring they pupate in the stem, emerging as night-flying adult moths in about 10 days. During the day the moths stay in hiding under the corn leaves or in weeds nearby. The female moth lays her eggs in flat clusters of a dozen or more on the underside of the leaves of food plants. Each female may lay a total of nearly 2,000 eggs, which are at first white but later turn yellowish.

Newly hatched larvae are yellowish. They feed first on the leaves, then bore into the stem or the ear, where they feed until full grown, in about a month. Where there are two generations per year, the first is completed by midsummer, and the larvae of the second generation are full grown by winter.

Often many borers attack a single plant, weakening it and causing it to fall over. Food canals in the cornstalk are cut off so that ears of corn do not form properly. Borings are also openings for other insect pests and for rot fungi.

Stems and stalks in which borers might hibernate should be plowed under in the fall or early spring. Resistant varieties of

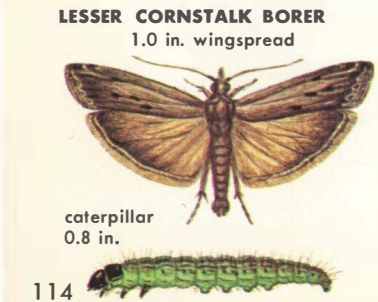


corn should be planted. Some hybrid varieties give a good yield of corn even though infested with borers. Late planting of any variety will reduce the infestations but may also lower the yield of corn. Where economical to do so, corn may be rotated with legumes. Of the many natural enemies that biologists have introduced from Europe, the most effective are three species of wasps and a species of fly, all of which parasitize the caterpillars. Contact insecticides can be applied to infested plants either as dusts or sprays, but their effectiveness depends to a great degree on proper timing. Generally the insecticide is applied when 70–80 percent of the plants in a field show signs of infestation. Local agricultural agents can advise the time and recommended rates of spray per acre for use in a particular area.

**TOBACCO HORNWORMS** are the large caterpillars of attractive moths. They overwinter as a distinctive chrysalis, with its tongue in a separate handlelike projection. The handle is longer than the closely related Tomato Hornworm's (p. 82). The giant caterpillars are ravenous feeders on the leaves of many plants. They can be destroyed by hand-picking them, or if especially abundant, with insecticides. Fall plowing to expose the pupae is also effective. At rest, caterpillars hold front of body erect in a stiff sphinxlike pose. The naked pupa has a distinctive handle in which the proboscis fits. Swift-flying adults are called sphinx or hawkmoths.

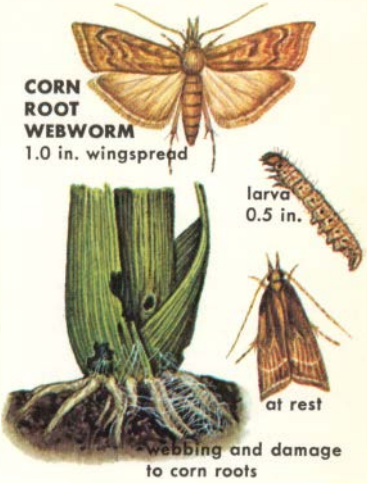
**STALK BORERS** are moths that overwinter as eggs attached to grass or weeds. The eggs hatch in early spring, and the larvae bore immediately into the stem of a plant, usually the one on which the eggs were laid. Later the caterpillars move to giant ragweeds, corn, and other large plants. In August they pupate, either in the stem or in the soil nearby, and emerge as adult moths in late summer or early autumn. The females lay eggs before winter. Stalks and debris should be plowed under in fall.

**SOUTHERN CORNSTALK BORERS** are pests from southern U.S. to South America. The similar Southwestern Cornstalk Borer occurs only in southwestern United States and Mexico. Infested corn is stunted, the stalks enlarged or swollen. Ears are poorly formed and may drop. The caterpillars overwinter in the cornstalks, change to pupae in early spring, and emerge as adults before summer. As many as three generations are produced in a season. Destroy stalks harboring hibernating larvae; rotate corn with legumes.

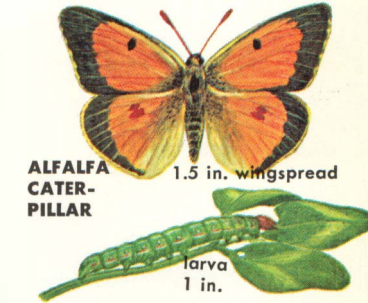


**LESSER CORNSTALK BORERS,** pests in southern U.S., bore into the base of cornstalks and also legumes, stunting and deforming the plants. They usually overwinter as larvae, forming pupae in late winter and emerging as adults in early spring. Two generations are produced in a season. Destroy stalks in which larvae overwinter.

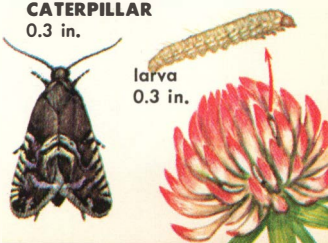
**WEBWORMS** are general feeders, though some species are especially damaging to lawns or to particular field crops. Bluegrass Webworms and related species are lawn pests. They feed only at night, cutting off blades of grass and dragging them into their silk-lined tunnels formed along the surface of the ground. The adult moths, which have a prominent snout, are commonly seen flying over grassy areas at dusk. The Corn Root Webworm (illustrated) attacks corn, tobacco, and other crops as well as grasses in which they hibernate. Plowing is an effective control for pests of field crops. Lawns can be treated with a contact insecticide.



**ALFALFA CATERPILLARS** feed on alfalfa and other legumes. Winter is passed in the pupa stage, from which butterflies emerge in early spring. Females lay eggs on the leaves of plants, on which the larvae feed. There may be seven generations a year. Plants can be sprayed with a contact insecticide if the crop is not used for hay.



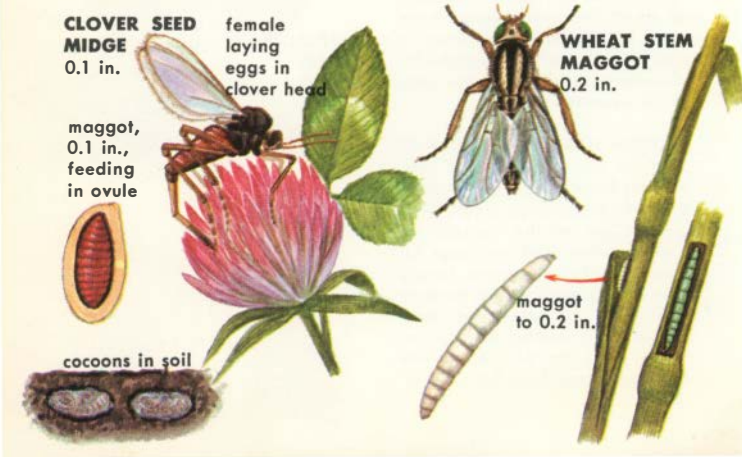
**CLOVER HEAD CATERPILLARS** feed in the clover head, preventing flowers from opening, or on green developing seeds. First-generation moths appear in early summer and lay eggs on clover plants, where the larvae feed and pupate. Three generations may be produced each season. Early cutting of crop destroys many larvae. The larvae are also parasitized by a wasp.

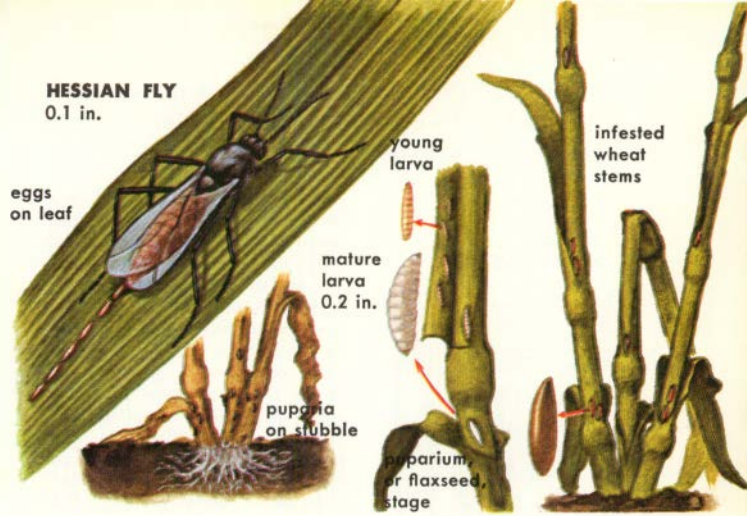


**FLY MAGGOTS** of only a few species are serious pests of field and forage crops. They damage plants in the same ways as do larval pests of vegetable crops (p. 84). feeding inside the stem, flowers, or seeds.

**CLOVER SEED MIDGES** winter as larvae in a thin cocoon in the soil or under debris. They enter the pupa stage in the spring and emerge as adult flies in late spring. Within a few days the females deposit eggs in young clover heads, using their long ovipositor to reach deep inside. The developing larvae feed by sucking the sap from the flower parts, thus preventing the formation of seed. When full grown, in about a month, the larvae drop to the ground to pupate. Adults of this generation appear in midsummer and lay eggs that hatch into the overwintering larval forms. The best means of control is cutting the clover before it is in full bloom.

**WHEAT STEM MAGGOTS** are minor pests of wheat. In the fall they feed in the lower stem of the plant. Their damage is similar to that done by the Hessian Fly (p. 117). In summer the maggots feed near the wheat heads. Infected stems eventually turn white and die. Oats, barley, rye, and other grasses are also attacked. Wheat Stem Maggots overwinter as larvae inside the stem of their food plant. They form pupae in the spring and emerge as adult flies in early summer. A second generation starts in summer, and these larvae overwinter. Crop rotation and destruction of straw in which the larvae are feeding are effective controls.



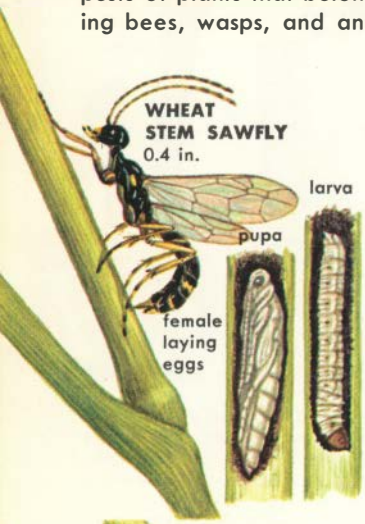


**HESSIAN FLIES** are the most damaging pests of wheat. They also attack barley, rye, and some species of wild grasses. The feeding of the larvae stunts the plant's growth or kills it if the infestation is heavy. Plants that survive give poor yields. Secondary fungus infections also occur. The life history of the Hessian Fly varies with the region and the wheat-growing method.

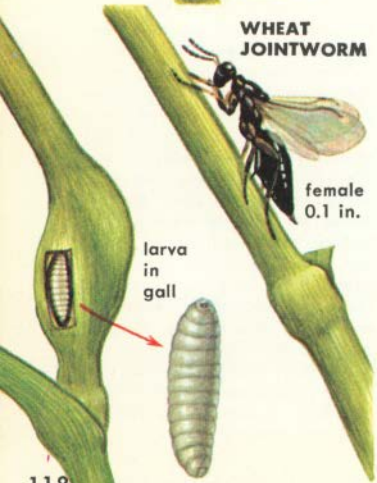
In winter-wheat plantings, eggs are laid on leaves of wheat that come up in late summer or fall, and the maggots move down the leaf to where it joins the stem and begin sucking out the plant's juices. Growth is completed in two to six weeks. The larvae then form pupae in their last larval skin. The flat puparia look like flaxseeds. Adult flies emerge in the spring, and within a few days the females begin laying eggs on the leaves of the wheat plants. Again the larvae feed at the point of juncture of the leaf with the stem and form pupae before the wheat is ready for harvest. Adult flies emerge in late summer and lay eggs that start a second generation on the winter wheat.

Where spring wheat is grown, the second generation is completed earlier, and the flies overwinter also as pupae. If fall planting can be delayed, the flies are unable to lay their eggs on the leaves in time for the larvae to complete development before cold weather. A local agricultural agent can specify the proper time for planting. Volunteer wheat should be destroyed, as should the stubble after a harvest. Resistant varieties of wheat have been developed, and crops should be rotated where possible. Systemic insecticides are now available.

**SAWFLIES AND CHALCIDS** are among the few insect pests of plants that belong to the large order containing bees, wasps, and ants.



**WHEAT STEM SAWFLIES** are destructive to wheat and other small grains. The larvae feed inside the stems, working from the top of the plant, where the eggs are laid, toward the bottom. Near the ground level the larvae eat out the inside of the stem completely, causing it to break off. The larvae plug the open base with droppings and then pass the winter in this chamber. Pupae are formed in the spring, and adult sawflies emerge in early summer. The best control is plowing under stubble. Planting corn, legumes, or other crops not attacked by the Wheat Stem Sawfly prevents buildup of pests. Resistant varieties of wheat are available.

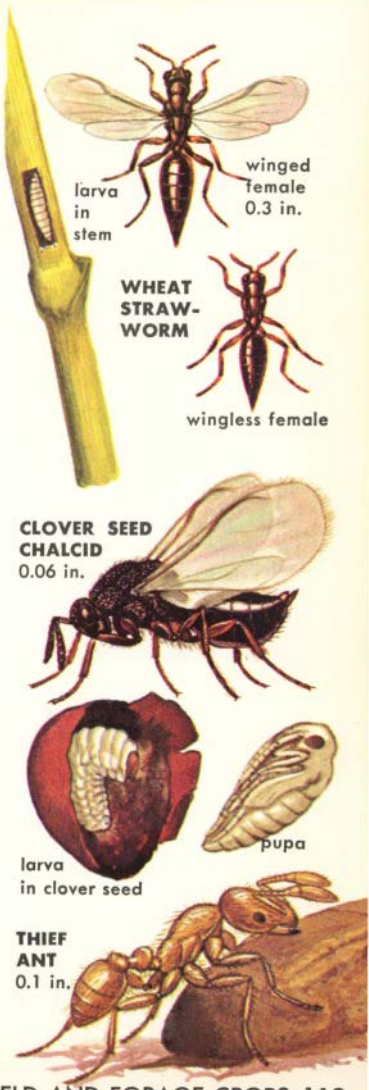


**WHEAT JOINTWORM** damage is similar to the injury done by the Hessian Fly, causing the wheat plants to break over. The break occurs at a gall-like swelling on the inside of which are the feeding maggots. Adult females have a stiff ovipositor, with which they drill a hole into the stem of a wheat plant just above a joint. Inside the stem they lay from one to two dozen eggs. The feeding of the larvae on the tissues causes the stem to swell and twist. The full-grown larvae remain in the stem, wintering either as larvae or as pupae. Adults emerge in spring. Wheat stubble should be plowed under or burned.

**WHEAT STRAW-WORMS** have two generations a year. Young plants are attacked in the spring and stunted by larvae that eat into the stem and developing heads. Larvae of the first generation, full grown by May, form pupae in the plant stem and emerge as winged adults by early June. The females deposit their eggs in wheat stems, usually only one egg per stem, and the larvae feed inside through the summer. They pupate in the fall and emerge from the straw or stubble as wingless adults in early spring. They look much like ants. The females lay eggs on young wheat, thus renewing the cycle. Crop rotation is effective. Stubble and volunteer wheat should be plowed under.

**CLOVER SEED CHALCIDS** destroy the seeds of alfalfa and clovers. The larvae winter inside the seeds on the ground, forming pupae in early spring and emerging as adults in late spring. The tiny adults lay their eggs in the formed but still soft seeds, which then become food for the larvae. Adults are produced from this generation by midsummer, and another generation is started. In warm climates there are as many as three generations. There is no good control for this pest.

**THIEF ANTS** are not only household pests (p. 24) but may also be field pests. They prefer protein foods, but will eat corn and other seeds. Best control is cultivation of field to break up ant nests.



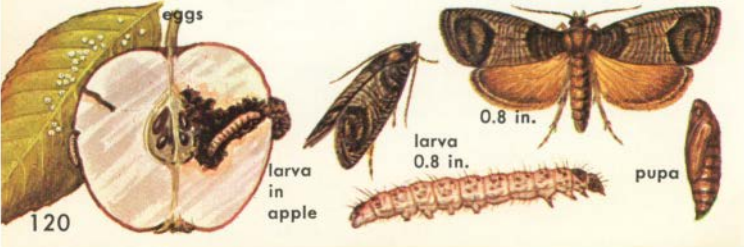
# PESTS OF FRUITS AND FRUIT TREES

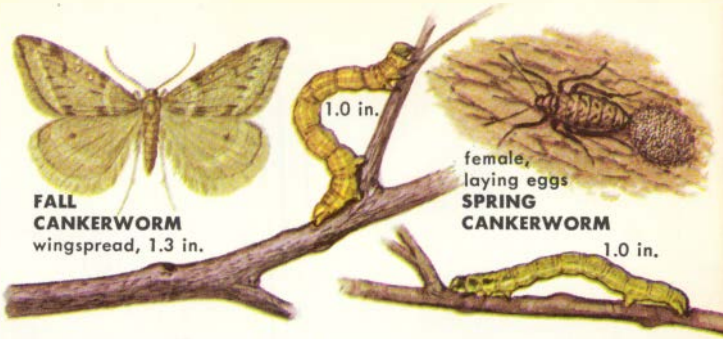
Entire fruit crops are sometimes lost because of insect pests. Some species attack through the roots, trunk, branches, or leaves. Other insects attack only the fruit. Some do damage in only one stage of their life history, while others are pests both as larvae and as adults.

**CATERPILLARS** of moths and butterflies form the largest group of insect pests attacking fruit and fruit trees. A few caterpillars feed only on the fruit. Many others are leaf feeders.

**CODLING MOTHS** are the most damaging pests of apples. They also attack pears, quinces, and other fruits. Adults appear in the spring and are active at dusk, the females laying their eggs on leaves, twigs, or fruit spurs. The worms at first feed on the leaves but soon crawl to the developing fruit and burrow inside, feeding near the core and on the seeds. When their growth is completed, usually in about a month, the larvae crawl to the outside and either drop to the ground or crawl down the trunk. They spin a cocoon under debris or loose bark and pass the winter in full-grown larval stage, transforming in spring into pupae and emerging as adults in about two weeks. In most areas there are two generations a year. The first is completed in midsummer; larvae of second generation overwinter.

Control consists of cleaning up debris, including the loose bark on trees, to eliminate places where larvae spin cocoons. Trees can be sprayed with contact insecticides to kill larvae before they enter fruit. Do not spray until petals have fallen from flowers, as early spraying will kill honeybees visiting the blossoms. Do not spray within two weeks of harvest.





**CANKERWORMS** eat leaves of trees and shrubs, often defoliating them. The caterpillars move with a looping motion. Inchworms and Measuring Worms are other names for these caterpillars. Spring Cankerworms have three pairs of true legs on the thorax and two pairs of prolegs on the abdomen. In crawling, the rear of the body is brought forward so that the hind legs are against the front legs, the center of the abdomen forming a loop. Then the front part of the body is stretched forward full length. If disturbed, worm drops on a silk thread.

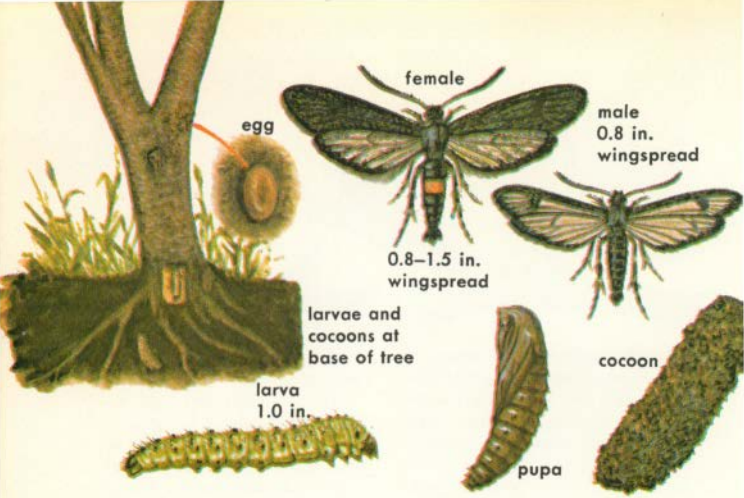
Adult moths of the Spring Cankerworm emerge from the pupae in early spring. Males are winged, females wingless. The females lay their eggs in clusters on the bark of trees. As soon as they hatch, the larvae move to the leaves, which are usually just coming out, and begin feeding. After about a month the full-grown caterpillars drop to the ground and pupate, emerging the following spring.

Fall Cankerworms have a similar life history, but the adult moths emerge from the pupae in the fall and lay eggs that do not hatch until spring. The caterpillars have three pairs of prolegs at the end of the abdomen rather than two as in the Spring Cankerworm.

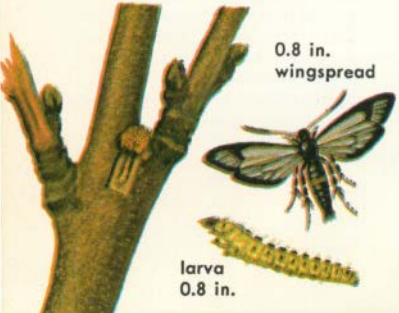
Both pests can be controlled by painting a band of contact insecticide around trunk of tree to kill wingless females that crawl up the trunks to lay eggs. Spray foliage to kill larvae.

**BUD MOTHS** of several species feed on the young buds of pear, apple, and other fruit trees. The caterpillars overwinter in silken cases attached to twigs and begin feeding in early spring. They form pupae and emerge as adults by midsummer, starting a second generation. They can be controlled by spraying with contact insecticides.

**EYE-SPOTTED BUD MOTH**

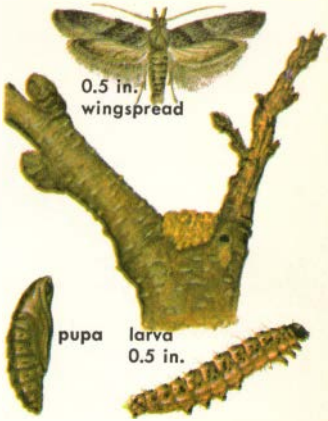


**PEACH TREE BORERS** are the most damaging pests of peaches. The larvae winter in burrows in the tree trunk, from a foot above the surface to just beneath the soil level. When full grown, the caterpillars change into pupae, spinning a silken cocoon mixed with their excrement and gum from the tree. Adult moths emerge during summer and early fall. Unlike most moths, they fly by day. The females lay their eggs on the trunk of trees, commonly on injured or previously infested trees. The larvae bore immediately into the bark and begin feeding. If an infestation is not stopped, the tree dies. Simple controls are effective, however. The trunk of the tree can be sprayed with a contact insecticide. Or crystals of paradichlorobenzene spread in a circle around the base of the tree trunk and covered lightly with soil will give off a gas and kill young borers in their burrows. Consult an agricultural agent for the best time to apply controls.

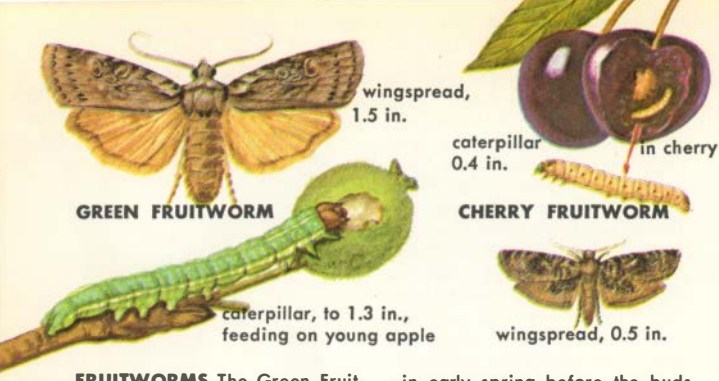


**LESSER PEACH TREE BORERS** are similar to the Peach Tree Borer in appearance and in type of damage, though they generally attack higher on the trunk or in large branches. To control these pests, injured parts of tree must be sprayed in the fall, after the eggs have hatched. Larvae can also be dug out with a knife, as can Peach Tree Borers.

**PEACH TWIG BORERS** feed on the new growth of peach twigs, causing them to wilt and die. If a twig dies before a larva completes its growth, the larva moves to another twig. When about half an inch long, the larva spins a cocoon on the branch of a tree and transforms into a moth. Females lay eggs on twigs. As many as four generations are produced in a season, the later generations also attacking fruit. Apply a lime-sulfur or oil-emulsion spray to infested trees to kill larvae in cocoons. Check with your local agricultural agent.



**ORIENTAL FRUIT MOTHS,** closely related to the Codling Moth, are pests principally of peaches but also attack apples, plums, pears, and other fruits. The full-grown larvae overwinter in silken cocoons attached to the bark of the tree or in debris on the ground. They transform into pupae and emerge as adult moths in the spring. In a few days the females lay their eggs on leaves or twigs. The larvae of the first generation feed on the young twigs, causing them to die. In about a month the larvae are full grown. They spin cocoons, pupate, and emerge as adults about a week later. In the South there are as many as seven generations a year; in the North, four. Later generations feed inside the fruit. Oriental Fruit Moths are controlled to some degree by an introduced wasp that parasitizes the caterpillars. Many overwintering larvae can be killed by cultivating the orchard in the spring. Apply contact insecticides to the trees approximately every three weeks.

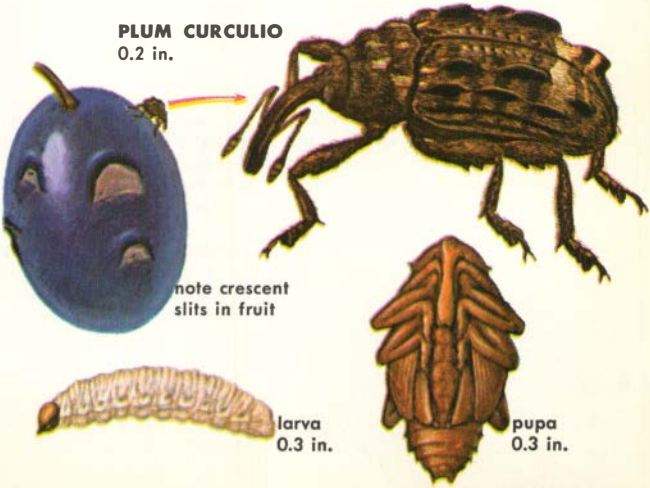


**FRUITWORMS** The Green Fruitworm, though seldom abundant, feeds on apples and other fruits or on tender foliage and buds. The larvae, usually full grown by June, crawl down the tree and transform into the pupal stage in a silken cocoon in the soil. The adult moths emerge in late summer or fall and hibernate in winter. They die the following spring after mating and laying eggs. The worms can be killed with contact insecticides applied in early spring before the buds have opened. The Green Fruitworm occurs in eastern U.S.; the Cherry Fruitworm, similar in habits, mainly in the Northwest. Cherry Fruitworm larvae feed inside cherries until full grown. They hibernate under the bark and transform into pupae in the spring. Adult moths emerge in early summer, and females lay their eggs on developing fruit. Trees should be sprayed with a contact insecticide at this time.

**LEAF ROLLERS** eat leaves, green twigs, and buds, injuring many kinds of trees and shrubs (p. 93). Species that attack fruit trees feed on the developing fruit. Fruit-tree Leaf Roller caterpillars hatch in the spring from eggs laid on the bark or twigs the previous fall. They pupate in a roll of leaves held together with silk. The adult moths emerge in midsummer, and within a few days the females lay eggs. The most successful control is obtained with the use of an oil-spray insecticide applied to each of the brownish egg masses on the bark or twigs.

**WEEVILS** that damage fruit or fruit trees do so both as adult beetles and as larvae, or grubs. Many kinds of weevils are pests also of vegetables (p. 78), field and forage crops (p. 105), and stored products (p. 146).

**PLUM CURCULIOS** are pests of apples, cherries, peaches, plums, and other stone fruits. Adults hibernate beneath trash under trees and in early spring feed on buds and young leaves. The female chews a hole in a developing fruit, then lays an egg inside. The beetle uses her snout to push the egg deep into the hole. Finally she cuts a crescent-shaped slit in the skin of the fruit below where the egg is laid. Hundreds of eggs may be laid in one fruit; the spots and crescents are a telltale sign of an infestation. The eggs hatch in about a week, and the grubs burrow into flesh toward the stone or seeds, around which they feed. The fruit usually drops before the larvae are full grown. When the larvae reach full growth, they emerge and burrow into the soil to pupate. Adults appear in midsummer and feed on fruit on the ground until cold weather, when they hibernate. Orchards should be cleaned of trash under which the adults might hibernate. Plow or disk the orchard in early summer to kill the pupae. Destroy any dropped fruit. Spray the trees with a contact insecticide after they have bloomed.



larva
in
apple

**APPLE FLEA WEEVIL**
0.1 in.

**APPLE CURCULIO**
0.2 in.

**APPLE CURCULIOS** are similar to Plum Curculios in the damage they do to fruit. The Apple Curculio has a much longer snout and a broader body. Females do not make crescent-shaped scars on the fruit when they lay eggs, and the larvae pupate inside the fruit. The fruit becomes stunted, knotty, and mummified. In heavy infestations fruit drops before ripening. Adults emerge in midsummer and feed until cold weather, then hibernate under debris until spring. Best control is a thorough cleanup of the orchard when an infestation is discovered. Chemical controls are difficult, as beetles feed deep in fruit. A variety of the Apple Curculio attacks cherries.

**APPLE FLEA WEEVILS** are pests mainly in the Midwest. Adults feed on buds and young leaves in the spring. The grub, or larva, mines through the leaf tissues. At the edge of the leaf the larva forms a blister-like cell in which it transforms into the pupa. Adult beetles appear in late May or June, feed on the foliage for a few weeks, and then become inactive through the summer. They hibernate in winter and begin feeding again in early spring. Contact insecticides applied beneath the trees will kill many of the hibernating adults in the fall, or trees can be sprayed in early spring. Check with your agricultural agent for the best time for spraying locally.

**IMBRICATED SNOUT BEETLE**

**IMBRICATED SNOUT BEETLES** eat buds, young fruit, and leaves of apples and other fruit trees. Adults appear in June, feed for several weeks, then become inactive until spring. The larvae feed in roots of legumes and other plants. Control is by the same methods used for Apple Flea Weevil.

**BORERS** that feed on the inner bark and sapwood of fruit and shade trees are the grubs, or larvae, of beetles. Usually they attack only the young or injured and already weakened trees.

**ROUNDHEADED APPLE TREE BORERS** burrow into apple, pear, and other trees. The soft-bodied grubs have an enlarged, round area just behind their head and make round tunnels. Small trees are girdled and killed. Two (sometimes three) winters are spent as grubs. Full-grown grubs pupate in spring, and adults emerge in early summer. They feed on leaves and twigs but do little damage. Females lay eggs in slits cut in bark at base of trunk. Young grubs usually work near soil line; older grubs feed higher, bore deeper. Dig grubs from burrows with knife or wire probe or fumigate burrows. Contact insecticides kill adults.

**FLATHEADED APPLE TREE BORERS** attack nearly all kinds of trees and shrubs. The grubs burrow through the inner bark and sapwood and are especially damaging to young trees. The grubs, which work mainly on the sunny side of the tree, have a flattened enlargement just behind the head. The grubs hibernate in their burrows, which are filled with excrement and sawdust. They form pupae in the spring and emerge in early summer. Like the larvae, the adult beetles congregate on the sunny side of the tree, the females laying their eggs in cracks in the bark. The trunks of young trees should be wrapped in paper or cloth. Borers can be dug out.

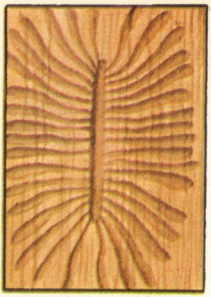
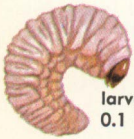
"shot holes" in wood



tunnels branching from parent gallery

**SHOT-HOLE BORER**

**SHOT-HOLE BORERS** tunnel in the inner bark of fruit and shade trees. The grub tunnels are branches from a parent gallery, about two inches long, in which the female beetle laid her eggs. When full grown the grubs form pupae at the end of the tunnel, and the adults bore straight out through the bark, making the identifying "shot holes." The adult beetles fly from tree to tree. Females usually lay eggs in an already injured tree. The leaves of an infested branch turn yellow and drop; small trees are killed. Infested trees should be sprayed with a contact insecticide in late spring, when the adults are emerging, or in the fall, when the adults are laying eggs. Healthy trees are seldom attacked, as the females cannot find places to enter to lay eggs. The beetles overwinter in the grub stage.



larva

0.1 in.

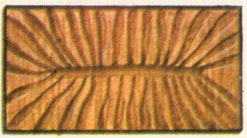
**PEACH BARK BEETLE**

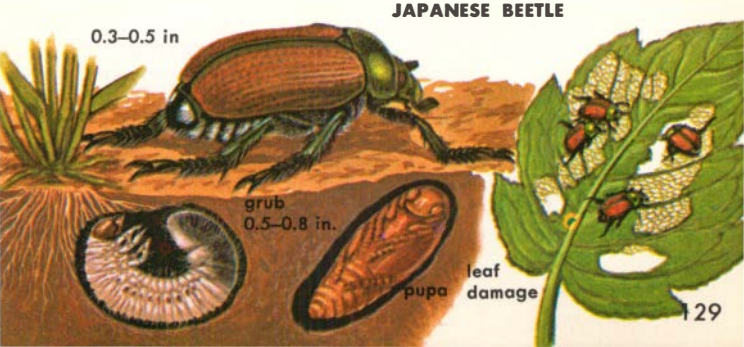


parent gallery and tunnels

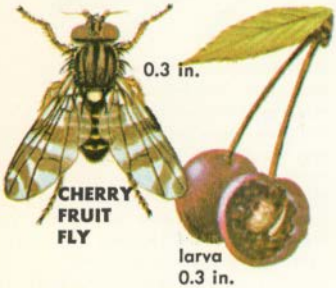
**PEACH BARK BEETLES** are closely related to the Shot-hole Borer and their damage is similar. The parent gallery runs across the grain of the trunk; the Shot-hole Borer's gallery runs with the grain. Peach Bark Beetle grubs tunnel with the grain; Shot-hole Borer grubs work across the grain. Peach Bark Beetles are controlled by the same methods used for the Shot-hole Borer.

**SINUATE PEAR TREE BORERS** tunnel through the inner bark of pear, hawthorn, and other trees. The larvae, or grubs, hibernate in the burrows, which cause the bark of the tree to split and darken. Full-grown grubs pupate in the spring and emerge in early summer as adults. The beetles feed on the foliage but do little damage at this stage. The females lay their eggs in cracks in the bark, and the grubs bore inside. Two years are required to complete a life cycle. Young trees are commonly killed. Dead or infested limbs should be cut off and destroyed. Trees should be sprayed twice —late May and early June.

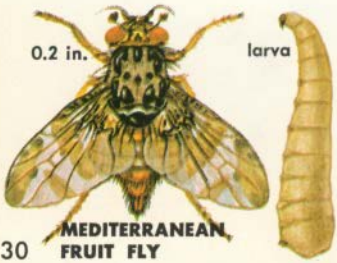
**JAPANESE BEETLES** feed on the foliage of many kinds of shade and fruit trees and also destroy fruit. Many beetles congregate on one plant. The grubs are major pests in lawns and greens, feeding on grass roots. In most areas two years are spent as grubs. The larvae then pupate in the soil, emerging as adults in midsummer. Adults are killed with contact-insecticide sprays or lured to traps. Grubs are killed by treating the soil with insecticides and also with "milky spore" (p. 13).



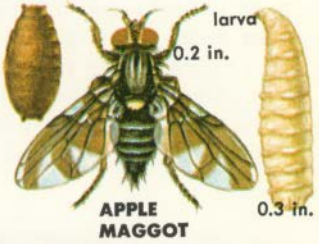
**MAGGOTS,** the larvae of flies, are sometimes serious pests of fruits. Maggots feed deep inside fruit; hence to be effective controls must be applied when the adults are laying eggs.



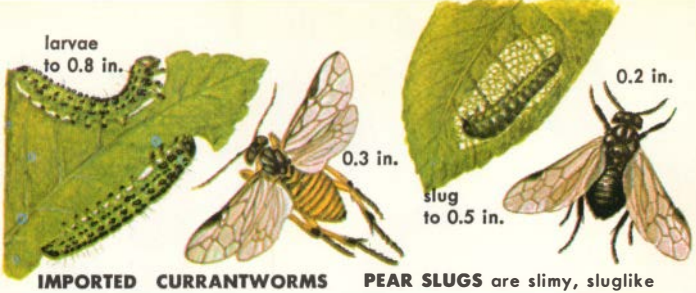
**APPLE MAGGOTS** tunnel through apples, blueberries, and other fruits, reducing the flesh to a brown, decaying pulp. When full grown—and usually after the fruit has dropped—the maggots emerge and pupate in debris or in loose soil. Adults appear in late June or July the following summer. In about ten days the females lay their eggs in fruit, puncturing the skin with their sharp ovipositor. Lead arsenate or contact insecticides are effective. An agricultural agent can advise best time to spray.



**CHERRY FRUIT FLIES** infest pears, plums, and other fruits as well as cherries. The maggots hatch from eggs laid in slits cut in the fruit by the female flies. They feed on the flesh of the fruit and cause it to be dwarfed, misshapen, or decayed. When full grown, the worms drop to the ground and pupate in loose soil or under debris. Adults emerge late the following spring and feed on leaves or developing fruit by scraping surface and sucking juices. Stomach-poison or contact insecticides, applied in spring are effective.



**MEDITERRANEAN FRUIT FLY** larvae feed on citrus fruits, peaches, plums, and other fleshy fruits. This dangerous pest has gained entry to continental U.S. several times through introductions in Florida, but each time has been exterminated. Mexican Fruit Fly has been kept in check by inspection and control along Texas-Mexico border.



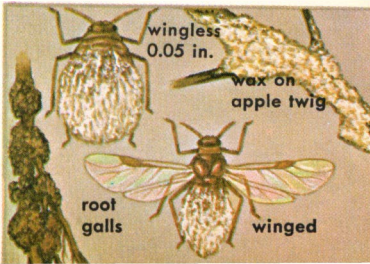
**IMPORTED CURRANTWORMS** hatch from eggs laid on the leaves of currant or gooseberry bushes. The larvae eat from margin of leaf toward center. When full grown, they drop to the ground to pupate. In warm regions there are two and a partial third generation every year.

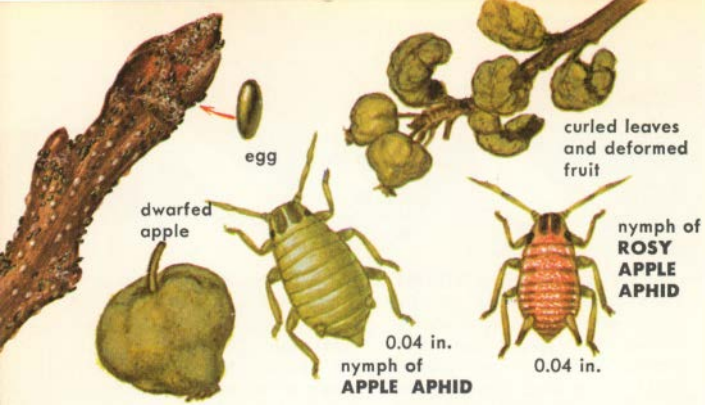
**PEAR SLUGS** are slimy, sluglike larvae that eat the foliage of pears, plums, cherries, and other fruit trees. Only the veins of the leaves remain. The full-grown worms pupate in the soil. A second generation appears in midsummer, in heavy infestations completely defoliating trees.

**SAWFLY LARVAE** are leaf feeders (p. 95) attacking many plants. They are easily killed with stomach-poison or contact insecticides.

**APHIDS,** or plant lice, are all similar in habits and life history, which is often complex (p. 66). All are injurious pests of plants, and some species are especially injurious to fruits.

**WOOLLY APPLE APHIDS** secrete a woolly, white wax over their body as they feed. They overwinter either in the egg stage in crevices on the bark of elms or as nymphs hibernating on roots of apple trees. Nymphs that hatch from the eggs on elms feed on the leaves and buds. In the third generation winged forms appear and migrate to apple trees, where they feed on roots, causing galls to form. Sometimes they stay on the roots for two seasons, through several generations. They stunt the tree's growth and may kill it. These pests are difficult to control. Stomach-poison or contact insecticides are effective if applied heavily. An introduced wasp parasite is also effective.





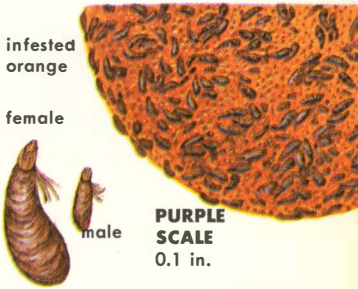
**APPLE APHIDS** overwinter as eggs on the bark of trees. Nymphs hatch in early spring and feed first on buds. A contact insecticide applied at this time gives good control, especially since all of the eggs hatch at about the same time. Trees can be sprayed a second time in late summer to kill winged adults that may have migrated from nearby orchards or from wild host trees.

**ROSY APPLE APHIDS** are pests principally of apples but may also infest pears, hawthorns, and such nonwoody plants as plantains. Leaves and twigs of an infested tree curl and the fruit becomes hard and knotty. The eggs hatch over a period of several weeks in early spring about the time the trees begin to bud. Dormant oil sprays (p. 22) will destroy both the eggs and newly hatched nymphs.

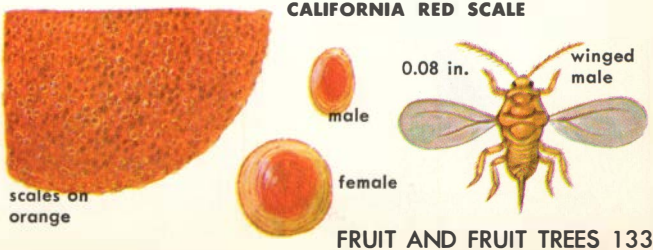
**SPIREA APHIDS** collect in large numbers on the new growth of spirea and other plants. Also known as the Green Citrus Aphid, this species commonly attacks citrus in Florida and California. It causes leaves to curl, deforms fruit, and covers the ground with honeydew, on which black sooty mold grows. It also transmits a virus disease. Winged forms, produced whenever a colony becomes crowded, migrate to other trees. Use contact insecticide sprays in early spring, before the population of aphids has built up.

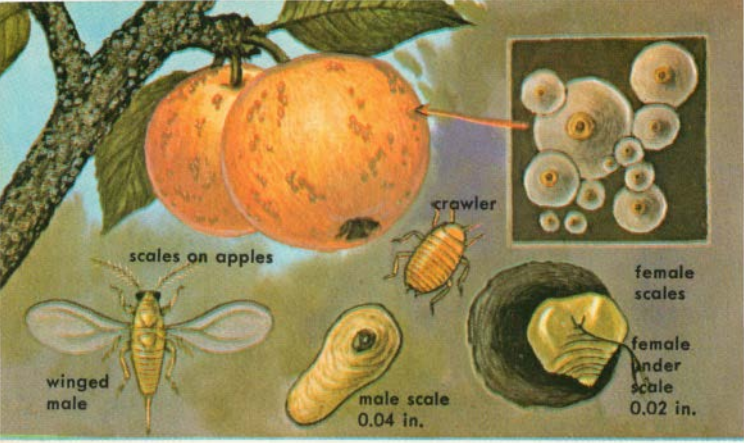
**SCALES AND MEALYBUGS** are so modified in body form that they are often not recognized as insects (p. 86). All of the thousands of species damage plants by feeding on their juices, thus stunting their growth and deforming the fruit. Scales and mealybugs are the most destructive insect pests of citrus.

**CALIFORNIA RED SCALE** is the most damaging scale pest of citrus in California, occurring less abundantly in Texas, Arizona, and the Gulf states. California Red Scale is also a pest of many other fruit trees and ornamentals. It feeds on the stems and leaves as well as on the fruit. Nymphs crawl over the plant for several hours before settling to feed and secreting a waxy covering over their body. Males mature in about two months and emerge from scale as yellow-winged adults. Each inseminates an immobile female, then dies. Fertile females give birth to two or three young every day for several months. Four generations are produced every season. Trees are fumigated with hydrogen-cyanide gas or are sprayed with a contact insecticide to kill the "crawler" nymphs.

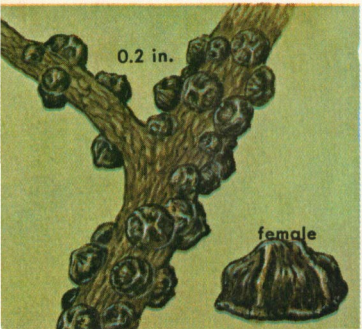


**PURPLE SCALE,** a widely distributed species, is the most damaging citrus scale pest in Florida. It also occurs in California. In addition to citrus, this scale infests avocados, pecans, and many ornamentals. In Florida, controlled by spraying with oil to kill the young still crawling and before they secrete a protective armor. Parathion and other contact insecticides are used in California.





**SAN JOSE SCALE** is damaging to apple, pear, peach, cherry, and many other fruit and shade trees and ornamental plants. Heavy infestations may kill the trees, which are first weakened and their foliage yellowed. Infested fruit is spotted. San José Scales overwinter as partly grown nymphs, or crawlers, that cling to the bark of the tree. They begin to feed in early spring, as soon as the sap starts to flow, and are full grown by the time the trees bloom. The winged males inseminate the females, which never emerge from under their scale. Females give birth to as many as 500 nymphs in 1½ months. The tiny mitelike crawlers move over the plant for several hours before settling to feed, secreting a waxy scale over themselves. In the crawling stage they may be blown by the wind or carried by man or other animals to infest other plants. As many as six generations are produced each year. A dormant spray in late winter or early spring kills overwintering nymphs. Wasp parasites also effective.

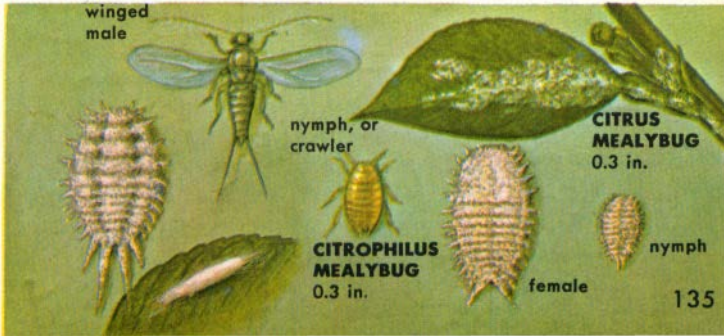


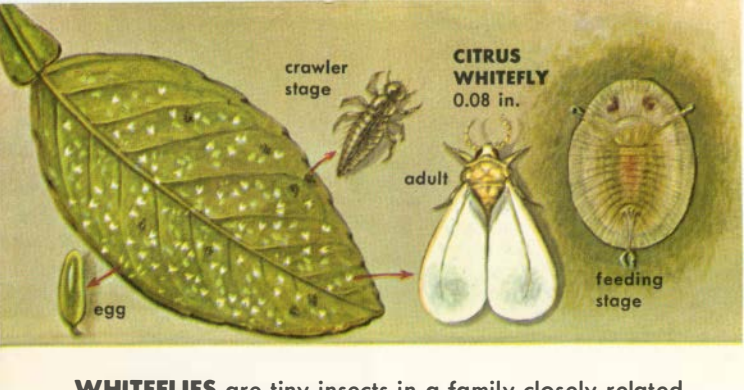
**BLACK SCALE** infests citrus, apples, figs, grapes, pears, and many ornamentals in warm regions and is also a greenhouse pest in cold climates. In addition to the damage done by sucking the plant's juices, large amounts of honeydew are excreted on which sooty mold grows. Controlled principally with oil sprays. An introduced wasp parasite is also effective.

**COTTONY-CUSHION SCALES** are pests of citrus and many other fruit trees and ornamentals. The female, which has a brown or reddish body, secretes a large cottony mass containing as many as 1,000 red eggs. Both the young and the adults can move, although the female stops moving after her egg sac forms. The tiny males are winged.

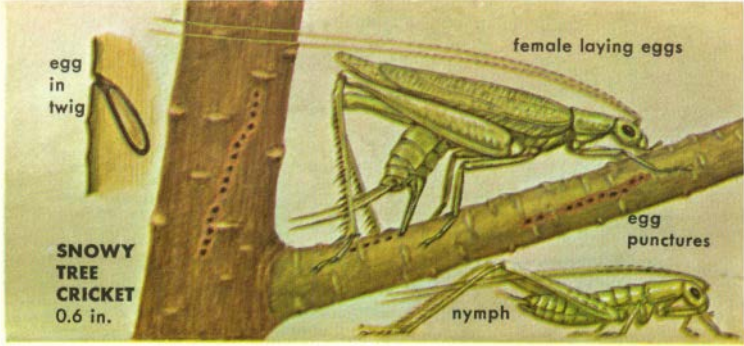
Cottony-cushion Scale, once the most damaging pest of citrus in California, was brought under control by Vedalia, a predatory lady beetle introduced from Australia. The use of insecticides to kill other pests has destroyed the Vedalia in some areas, where insecticides must be used now to control the Cottony-cushion Scale until the beetles are again established.

**CITRUS MEALYBUGS** suck the juices from the leaves, stems, and fruit of citrus and many other plants. In warm climates they are outdoor pests, sometimes infesting potatoes and vegetable crops. In cool climates they are pests of house plants and in greenhouses. Citrus Mealybugs expel large amounts of honeydew. Females are covered with wax; males are winged. On small plants they can be picked off by hand, washed off with water, or killed with contact insecticides. In groves lady beetles and parasitic wasps have been effective controls for Citrus and related Citrophilus, Grape, and Long-tailed mealybugs.





**WHITEFLIES** are tiny insects in a family closely related to aphids and scale insects. Two dozen or so species, including the Greenhouse Whitefly (p. 88), are damaging to ornamentals and fruit trees, particularly citrus and other plants that grow in warm climates. Fruit on an infested tree is discolored by sooty mold. If an infestation is allowed to persist, the plant's growth is stunted and its yield is greatly reduced. All whiteflies have a similar life history. The female lays her eggs on short stalks attached to the underside of leaves. The nymphs hatch in 4–12 days and are called "crawlers" because they move about over the plant. Soon, however, they insert their beaks into a stem or leaf and begin to feed on the plant's juices. When the nymphs shed, they lose their legs and their antennae are greatly reduced in size. At this stage the nymphs are immobile and resemble scales. On the fourth molt the adults emerge. Both males and females are winged and are covered with white, powdery scales. As many as three or four generations are produced in a season in warm climates. Infested plants should be sprayed in spring and fall with an oil emulsion or with a contact insecticide, such as malathion or parathion. Consult local agricultural agent for best time to spray.



**TREE CRICKETS** lay eggs in the branches or stems of trees and shrubs. The female drills a hole, lays an egg, then moves forward and repeats the process, sometimes laying several dozen eggs in a row. The stem beyond the punctures usually dies. Spray with lead arsenate or other stomach poison in summer before egg laying begins. Remove and burn punctured stems in the fall.

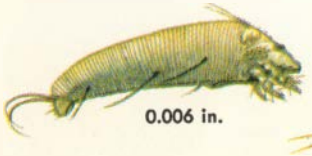
**CITRUS THRIPS** is a serious pest in California but does not occur in Florida. It feeds on buds, new growth and young fruit, scraping away outer tissues and sucking up juices. Infested trees grow slowly and fruit shows distinct ring scar. Thrips winter in the egg stage on leaves and stems. A life cycle is completed in about three weeks or less. Both stomach-poison and contact insecticides are effective.

**CITRUS RED MITES,** called Purple Mites in Florida, cause the leaves of infested trees to be speckled, finally turning brown and dropping. The fruit is discolored. The Citrus Red Mite is an especially serious pest in California. Six-spotted Mites are more abundant in Florida. They collect on underside of leaves.

**MITES,** relatives of spiders and ticks, have become more serious pests in recent years. Some of the newer insecticides kill the predators and parasites of mites. Only those mites especially damaging to citrus are described here. Other pests include the European Red Mite, Pacific Spider Mite, and Pear Leaf Blister Mite, which infest pear, cherry, apple, and other fruit trees of temperate regions. Mites are also pests of man (p. 45), domestic animals and pets (pp. 54–55), vegetable crops (p. 85), and flowers and shrubs (p. 90). Oil sprays, sulfur dusts, and lime-sulfur sprays are effective controls, as are special miticides. Your agricultural agent can tell you the best chemical and time of application in your area.

**CITRUS BUD MITES,** pests mainly in California, feed on buds and blossoms of lemons, less commonly on other citrus. Fruit leaves and twigs are deformed.

**CITRUS RUST MITES,** serious pests in Florida, damage mainly oranges but also injure grapefruit, limes, and lemons. Females lay eggs on fruit and leaves.



# PESTS OF FOREST AND SHADE TREES

Insect pests destroy more timber than do forest fires. Ordinarily the damage is not conspicuous, but in severe outbreaks whole stands of timber may be killed in one season. Some species spread plant diseases. State and national government agencies battle forest insects in large-scale control programs.

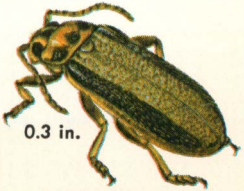
**BEETLES** are damaging to trees both as adults and as larvae (grubs). Most injurious are the borers that work in the wood of the trunk or in the branches.

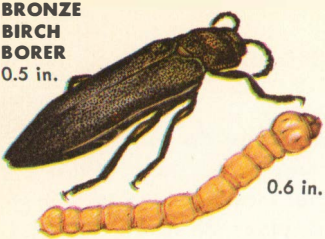
**SMALLER EUROPEAN ELM BARK BEETLE**

**ELM BARK BEETLES** are carriers of the deadly Dutch elm disease, caused by a fungus. The Smaller European Elm Bark Beetle was introduced to North America in 1909, the disease in 1930. The Native Elm Bark Beetle is now also a carrier. Adults of both species appear in late spring or early summer and feed on branches or twigs. Eggs are laid only in dead or dying wood. Keeping trees healthy and eliminating damaged or diseased portions gives partial control.

**ELM LEAF BEETLES** overwinter as adults and in early spring lay clusters of eggs on underside of elm leaves. Grubs and adults feed on leaves. Grubs are full grown in about three weeks. They pupate in debris under tree and emerge as adults in about two weeks. Three or more generations are completed in a year. Spray leaves with stomach-poison or contact insecticides to destroy grubs and adults, and at base of infested tree to kill grubs descending to pupate.

**ELM LEAF BEETLE**

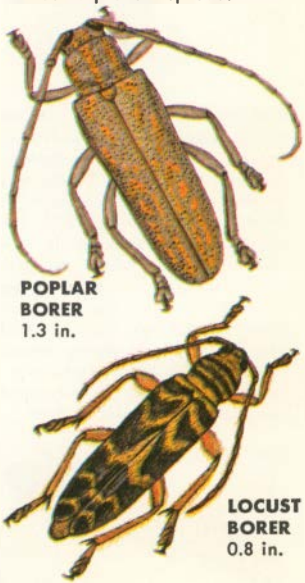


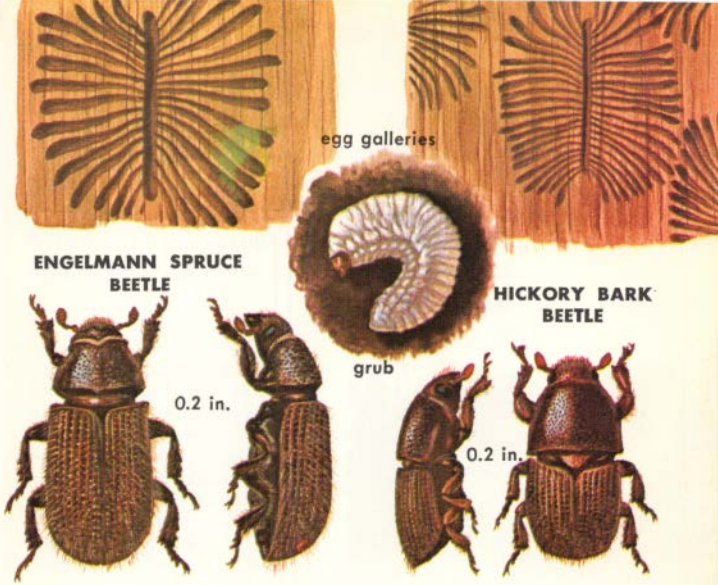


**BRONZE BIRCH BORERS** are mainly injurious to birches but may also attack willows, poplars, and cottonwoods. The larvae overwinter in the sapwood, forming pupae in early spring and emerging as adults in late spring or early summer. Females lay their eggs in crevices in the bark. On hatching, the grubs immediately burrow into the wood. Their tunnels, sometimes 4 feet long, may cut off the flow of sap. First the tips of the branches turn brown, then the tree dies. The Bronze Birch Borer, related to the Flatheaded Apple Tree Borer (p. 127), is most likely to attack sick or injured trees. Use contact insecticides for adults.

**LOCUST BORERS** winter as small larvae in the bark and start their tunneling into the wood in spring, causing swollen areas to appear on the trunk. The borers commonly kill the tree. Full-grown grubs pupate in cells in the wood in midsummer. Adult beetles appear in late summer or early fall. They fly actively, feeding on flowers. The females lay their eggs in cracks in bark, most often attacking small or weakened trees. Spray trunks with a contact insecticide before tree starts spring growth.

**POPLAR BORERS** are long-horned beetles. The grubs tunnel in the trunk and large limbs of trees, weakening the wood so that limbs break off. Eventually an infested tree dies. Larvae are usually full grown in two years but may take three years to complete development. They pupate in the burrows and emerge as adults in late summer or early fall. The female beetle deposits eggs in cracks in the bark. The newly hatched grubs immediately burrow inside. Larvae can be killed with probes or by fumigating tunnels with carbon bisulfide (see Roundheaded Apple Tree Borer, p. 127). Badly infested trees should be cut and burned to prevent spread.

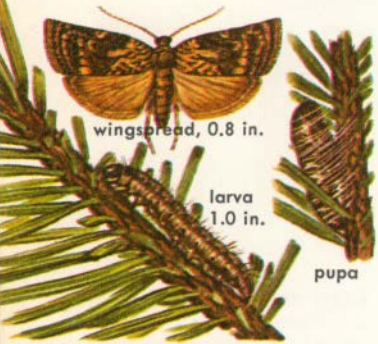




**ENGELMANN SPRUCE BEETLES** bore through the outer bark of living trees, cutting egg galleries parallel to the surface. Each gallery contains about 125 eggs. The grubs feed on the wood near the chamber until cold weather, rest until spring, then feed again. They pupate in midsummer and become adults in late summer or fall, spending the winter under the bark of the girdled and dying or dead trees. The following spring the beetles infest new trees. Normally the beetles are controlled by natural predators. Foresters check constantly for infestations. Bark of infested trees is peeled off and burned, or trees treated with a penetrating insecticide.

**BARK BEETLES** of several species damage conifers, and less commonly, deciduous trees. Among these are the Hickory Bark Beetle, Douglas Fir Engraver, Western Pine Beetle, and Southern Pine Beetle. Typically the beetles mine, or tunnel, just beneath bark to make galleries for eggs. More extensive tunnels ramify from galleries as the grubs feed. Sap occasionally flows from tunnels, and dust of borings collects around base of tree. Tunnels open way for fungus diseases, and destruction of cambium eventually kills tree. In street and yard plantings, prune dead wood of trees to destroy breeding places. Kill adults with contact insecticide.

**CATERPILLARS,** the larvae of moths and butterflies, feed on the leaves, buds, and flowers of many kinds of trees and shrubs. Certain species of moths are among the most damaging pests of forests. Control of the most serious pests may involve several states or an entire region. Such large-scale control programs are conducted by state and federal agencies. Infestations of shade trees may be controlled locally.



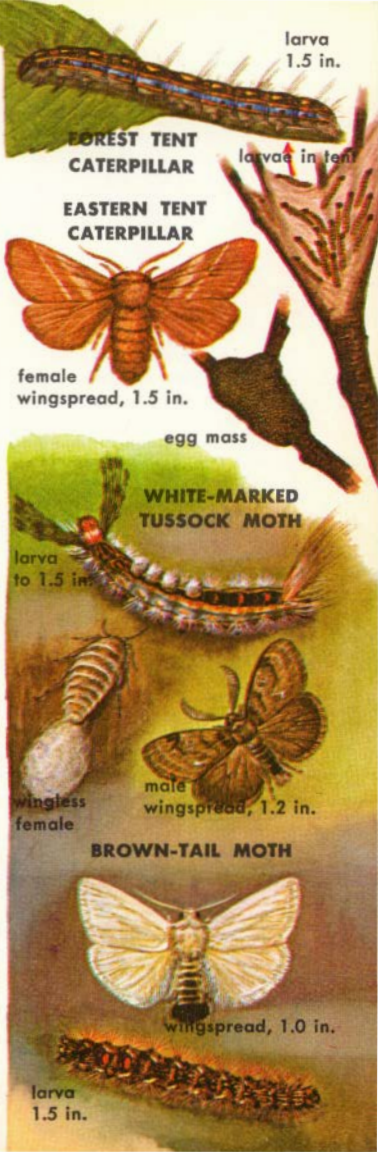
**SPRUCE BUDWORM**

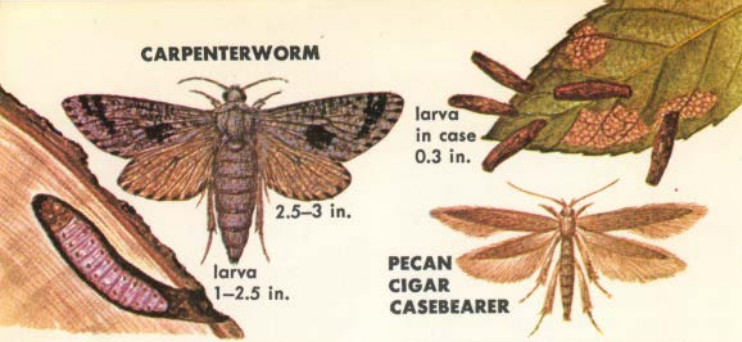
**SPRUCE BUDWORMS,** of the conifer forests of eastern United States and Canada, are among the most injurious of all insect pests. Young caterpillars overwinter beneath bark and become active in early spring, feeding on buds and new growth. They are full grown by early summer, forming pupae and transforming into adults. Moths lay eggs in late summer. Heavy infestations kill trees; light infestations turn needles brown. Control with stomach-poison or contact insecticides.

**GYPSY MOTH** caterpillars feed on leaves of deciduous trees, conifers, and many other plants. They form pupae in midsummer and emerge as adults in July and August. The Gypsy Moth overwinters in the egg stage. As the females cannot fly well, the Gypsy Moth is spread long distances principally by man—on cars, trucks, trains, or other vehicles. The caterpillars spin silken threads and may be blown by the wind. Egg masses can be destroyed or the trunks of trees treated with a contact insecticide to kill caterpillars.

**FOREST TENT CATERPILLARS** at times migrate in armies of millions, defoliating trees and shrubs in their path. They usually feed on the leaves of oaks, maples, elms, ash, and conifers. Winter is passed in the egg stage, and the larvae hatch in early spring. Adult moths appear in midsummer. Forest Tent Caterpillars, despite their name, do not make tents, as do the closely related Eastern Tent Caterpillars. Foliage of infested trees can be sprayed with a stomach-poison or contact insecticide to kill caterpillars.

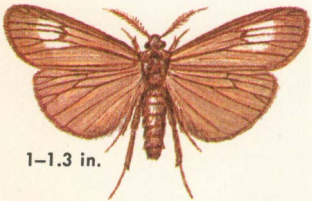
**TUSSOCK MOTH** caterpillars are hairy and usually have several long tufts of black hairs on the head and tail. The caterpillars hatch in late spring from egg masses laid on bark and leaves or on the cocoon case from which the nearly wingless females emerged. They feed on the foliage of a great variety of trees and shrubs and are full grown by midsummer. In many regions there are two generations a year. Egg masses can be painted with creosote or gathered and burned. The larvae can be killed with stomach-poison or contact insecticides. The White-marked Tussock Moth is a common and widespread species; others are the Hickory Tussock Moth, Douglas Fir Tussock Moth, and Western Tussock Moth. The Gypsy Moth (p. 142) and the Brown-tail Moth belong to the same family. The Brown-tail Moth, once a damaging pest in eastern United States, is now largely under control.





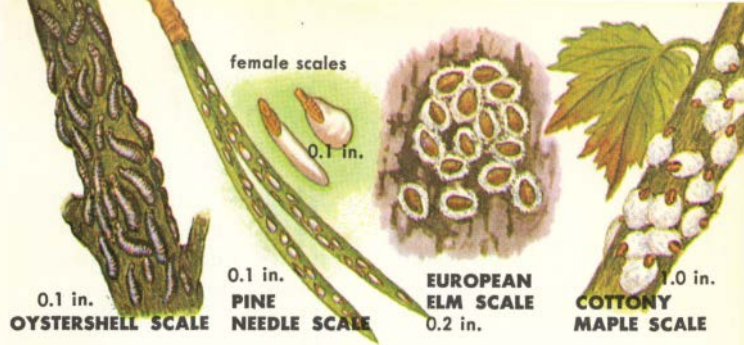
**CARPENTERWORMS** burrow into the wood of oaks, elms, maples, and other deciduous trees. The holes weaken the trees so that limbs break off in heavy winds. The damaged wood is greatly reduced in value. The full-grown larvae pupate in the wood. When it is time for the adults to emerge, the pupae wriggle their way partly out of the tree. The adult moth leaves the shed pupal skin in the hole. Each generation requires three years or longer. Best control is fumigation of burrows.

**CASEBEARERS** are a family of moths in which the caterpillars build portable cases carried with them as they feed. The caterpillars can be killed by spraying the foliage with either stomach-poison or contact insecticides. Some species are especially damaging to fruit trees, others to shade or forest trees. Many attack only one kind of tree. The Pecan Cigar Casebearer is a pest of pecan, hickory, and walnut trees in eastern U.S., the California Casebearer damages willows in California.



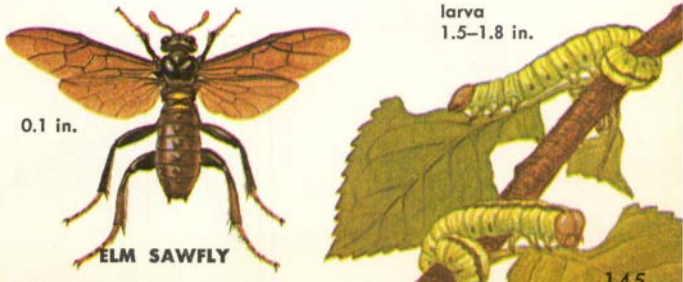
**CALIFORNIA OAKWORM**

**OAKWORMS** are foliage feeders. The California Oakworm is a pest of live oaks in California. The Orange-striped Oakworm, of a different family, infests oaks of eastern U.S. Both will feed on other deciduous trees. In warm regions there may be two generations a year. Spray with stomach-poison or else with a contact insecticide.



**SCALES** that injure forest and shade trees are similar in life history to species damaging flowers and shrubs (p. 86) and citrus (p. 133). In heavy infestations the foliage turns brown and drops. Young plants may be killed. Oystershell, Pine Needle, Cottony Maple, and European Elm scales are common, widespread species. Scales are killed by applying a dormant oil spray before the plant buds in spring or by spraying with a contact insecticide when scales are in the crawling stage.

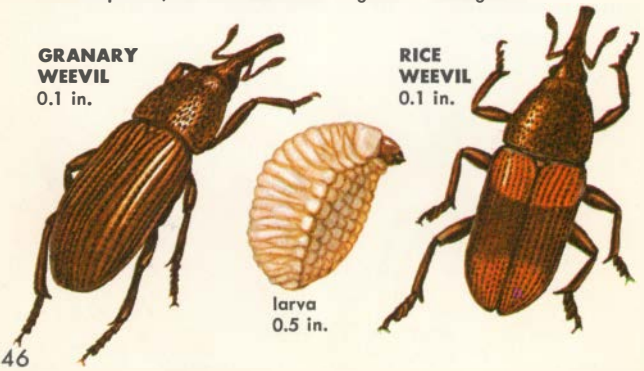
**SAWFLY** larvae look like caterpillars, though the adults belong to the same order of insects as bees, wasps, and ants. The larvae feed on foliage. Some species damage shade and forest trees. Kill larvae by spraying with either stomach-poison or contact insecticides when they are actively feeding.

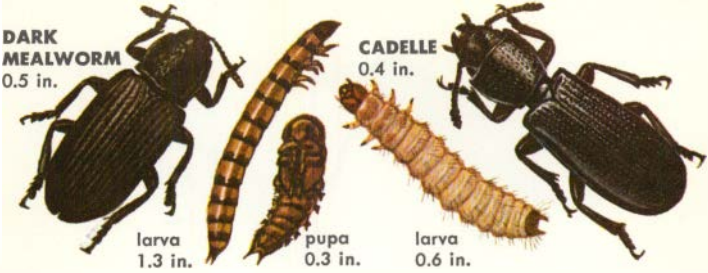


# INSECT PESTS OF STORED PRODUCTS

Pest infestations in stored products are difficult to detect and control. The pests not only eat the grain or other stored products but may also create damp, warm conditions in which equally destructive molds can grow. Cheese, cured meats, furs, and wool fabrics are among the animal products attacked by insect pests. Other pests of stored products are described in the section on Household Pests (p. 24).

**WEEVILS** may destroy an entire storage of grain. Most damaging and widely distributed are Granary and the Rice weevils. The Granary Weevil does not fly, hence does not infest grain in the field. It thrives in northern climates; the Rice Weevil is most abundant in warm climates. The Rice Weevil can fly and often infests grain before storage. Adults of both species will eat whole grain or grain products. The larvae can develop only in whole kernels, in sizable pieces, or in flour that has become moist and caked. A life cycle is completed in one to two months, and the weevils overwinter either as larvae or as adults. Each female lays about 400 eggs in her lifetime. She chews a hole in a kernel and then deposits one egg inside. Adults live two years or longer and can survive long periods without food. In households, infested products should be burned, and the storage area cleaned thoroughly. Similar sanitary measures are taken in granaries, or the grain is fumigated.

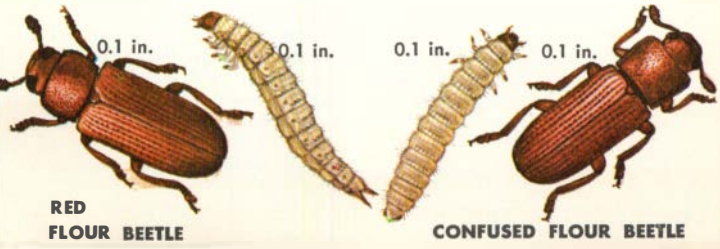




**MEALWORMS** feed on all types of grain and grain products, particularly if stored in dark, damp places. After six to nine months, larvae form pupae in grain and transform into adults. Yellow Mealworms are more abundant in cool climates, Dark Mealworms in warmer climates. In storage bins or elevators, larvae are killed by superheating, freezing, or fumigation.

**CADELLES** are beetles that infest grains and seeds in storage. The larvae feed on the grain, but the adult beetles attack and eat other inescts or their larvae. Both the eggs and pupae are killed by low temperatures, but the adults and larvae survive long periods of cold. The adults and larvae tunnel into soft wood in storage areas and are most easily killed by fumigation.

**FLOUR BEETLES** feed on grain or grain products, spices, nuts, dried fruits, chocolate, and other stored foods. They give flour a disagreeable, moldy flavor. The Red Flour Beetle is most abundant in warm regions, the Confused Flour Beetle in cool climates. Both are worldwide in distribution and are among the most familiar of the stored-product pests to reach the home from the grocery store. Note that the Red Flour Beetle's antennae are enlarged abruptly, while the Confused Flour Beetle's antennae enlarge gradually. In the house, infested products should be destroyed and cupboards cleaned thoroughly. If a product must be saved, larvae can be killed if kept for several hours at 40 degrees F. or if heated to about 130 degrees F. for two hours. Destroying flour is usually most practical.

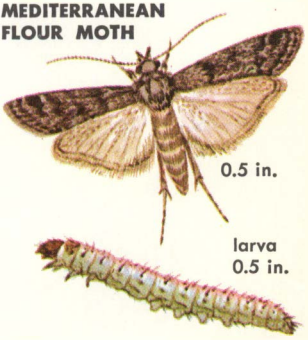


**SAW-TOOTHED GRAIN BEETLES,** worldwide in distribution, feed on a wide variety of foods but especially on flour, cereals, and other grain products. The beetles are so flat they can crawl into sacks or boxes that appear to be tightly sealed. The females deposit their eggs in the food, and when full grown, the larvae form pupae and transform into adults. A life cycle usually takes about two months, with six or seven generations a year. All life stages are killed by cooling to 0 degrees F. for one day or heating to 125 degrees F. for an hour. Clean storage areas. Avoid contaminating foods with insecticides.

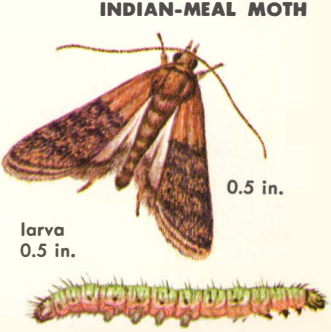
**ANGOUMOIS GRAIN MOTH** caterpillars attack grain in storage and also in the field. They prefer tender, damp grain rather than grain that is hard and dried. The larvae tunnel into the kernels and seal the entrance holes with silk. When full grown the larvae spin a cocoon in the cavity. If the seed is small, as in sorghums, several are tied together with silk, and the larva lives and feeds outside the seed in the silken ball. Life cycles are completed in about a month in warm weather. The larvae remain dormant in winter, prolonging life cycle to six months or more. Mills, bins, or warehouses are cleaned thoroughly, then pests killed by superheating, freezing, or fumigation. A tiny parasitic chalcid wasp is also an effective control.

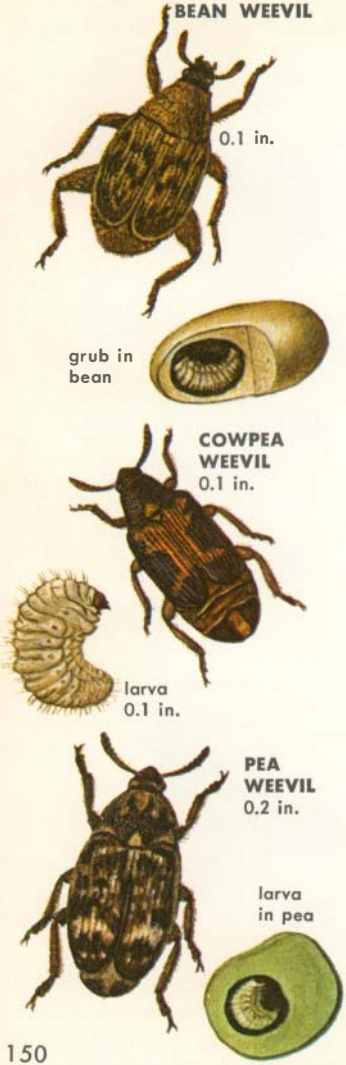
**LESSER GRAIN BORERS,** pests of stored grains, particularly wheat, are damaging both as larvae and as adults. They also feed on wood and paper. The closely related Larger Grain Borer feeds mainly on corn and is a pest principally in southern United States. Both cold and heat, as used for the Saw-toothed Grain Beetle, are effective, as are fumigants for non-food substances.

**MEDITERRANEAN FLOUR MOTH** caterpillars are especially serious pests in flour mills. The caterpillars spin a silken tube in which they live as they feed, and the web masses clog the machinery in the mills. In the home, the caterpillars are found in beans, dried fruits, and many other foods as well as in flour and grain products. As many as six generations may be completed in a year. Destroying the infested food material and cleaning storage areas are best home controls. In mills, pests are killed by fumigation.



**INDIAN-MEAL MOTH** caterpillars feed on a variety of stored foods, particularly dried fruits and cereals, spinning webs as they feed. In an abundance of food and with proper warmth and moisture a life cycle is completed in a month, with as many as six generations a year. Sanitation and continuous checking to catch infestations early are the best controls in the home. Bins, elevators, or other large storage areas are fumigated.





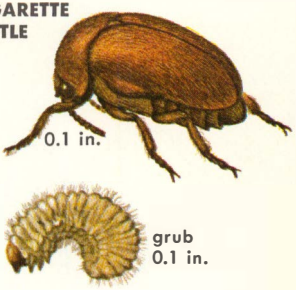
**BEAN AND COWPEA WEEVILS** eat out the center of stored beans, leaving only the shells. Bean Weevils are found throughout the U.S., the Cowpea Weevil most abundantly in southern states. The grubs, or larvae, hatch from eggs laid in holes chewed into stored beans or into pods in the field. In heavy infestations there may be two dozen or more tiny, newly hatched larvae in one bean. When full grown the larvae form pupae in the eaten-out cavity. As many as six generations are produced in a season. Infested beans should be destroyed. If the beans are to be planted rather than eaten, they should be fumigated first to kill the grubs. The larvae can also be killed by heating the seeds to 145 degrees F. for two hours. Bury vines and pods in the field.

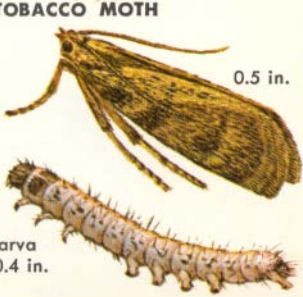
**PEA WEEVILS** infest only peas. Adult beetles that overwinter in the field feed on the leaves and flowers of the pea plants in the spring. The female beetles lay their eggs on the pea pods, and the spiny larvae burrow inside and begin feeding on a developing seed. The entry hole made by the grub is sealed with silk. The full-grown grub forms a pupa in the seed and in about two weeks emerges as an adult. In cold climates adults may hibernate in stored peas and emerge in the spring. Vines, pods, and other debris should be buried. Plants can be sprayed with a contact insecticide when in bloom to kill adults, or peas can be fumigated at harvesting.

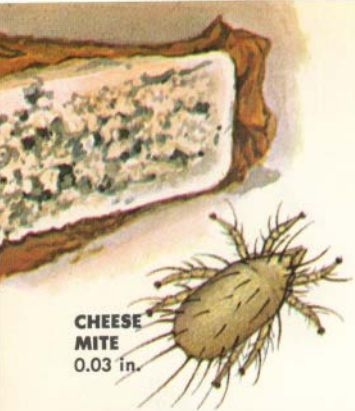
**CIGARETTE BEETLE** grubs feed on stored tobacco leaves and tobacco products. A life cycle is completed in about 1½ months, with as many as six generations a year. Tobacco warehouses are cleaned and fumigated, or tobacco is exposed to a freezing temperature for a week or longer or heated to 135 degrees F. Beetles also feed on books, spices, upholstered furniture, and seeds. Use fumigants or contact insecticides but do not contaminate foods.

**RED-LEGGED HAM BEETLES** feed on cured meats, fish, cheese, and other dried foods. Most damage is done by the larvae, which bore into meat, particularly the fat, and collect around the bones. The adults feed at the surface. A life cycle may be completed in as short a time as 30 days. In the home infested foods should be destroyed. Careful cleaning to eliminate bits of food that might support developing larvae is important. The Larder Beetle (p. 31) is also a pest of cured meats.

**TOBACCO MOTHS** are closely related to Mediterranean Flour Moth and to the Indian-meal Moth but do not infest grains or flour commonly. They are most damaging to stored tobacco, the caterpillars eating holes through the leaves. They are also common pests of stored chocolate and are sometimes referred to as Chocolate Moths. Nuts and other dried foods may be infested too. Control by methods used for Cigarette Beetle.

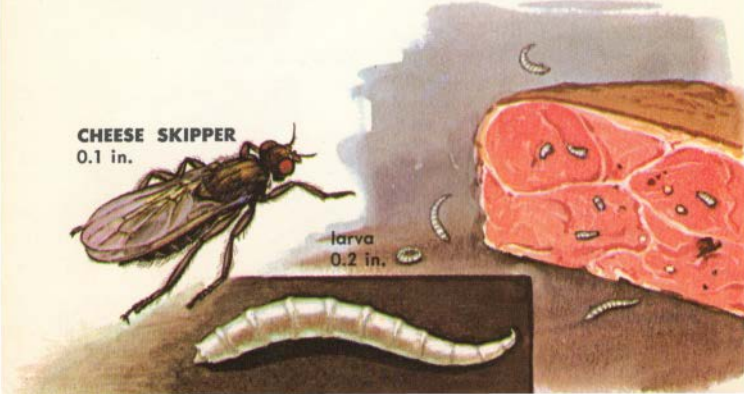


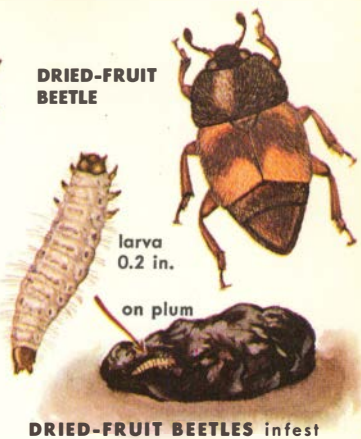




**CHEESE MITES** and closely related species feed on cheese, cereals, flour, cured meats, and other foods, giving them a sweetish odor. Infested flour appears to seethe, though the mites themselves are nearly microscopic. The shed skins, dead bodies, and excrement form a brownish powder. "Grocer's itch" is a skin irritation produced from handling mite-infested flour. Mites do not thrive in dry conditions; hence do not permit stored food to get damp.

**CHEESE SKIPPERS** are so named because they sometimes flip into the air to move from one spot to another. To do this the maggot curves its body and holds its tail with the hooks around its mouth, then suddenly releases its hold. Normally the maggots crawl in a wormlike manner. Cheese Skippers infest cured meats as commonly as they do cheeses. When full grown the larvae leave the food and pupate in dark crevices nearby. Adult flies are attracted to the odor of cheese or meat, on which they feed and lay their clusters of eggs. A life cycle requires about 2½ weeks. Infested portions of meat or cheese should be cut off and burned. A fine-mesh screen or cloth over storeroom windows and vents will keep out the adult flies. Where infestations have occurred, fumigation may be necessary. In commercial storage of meats, all stages of the Cheese Skipper can be killed by heating meats to 125 degrees F. for an hour or by storage of meats and cheeses at 43 F. or lower.

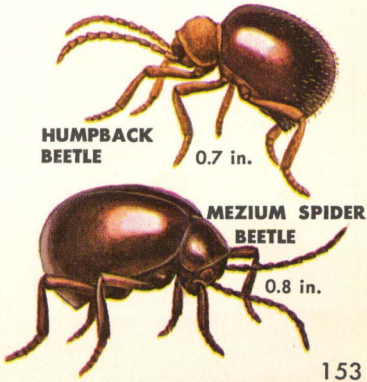




**DRUGSTORE BEETLES** are common house and storage-area pests. They eat an amazing variety of substances—bread, spices, drugs (including strychnine), and books. They even bore into lead or tinfoil. In cool climates there is one generation per year; in warm climates, four. Burn infested material or expose to about 150 degrees F. for several hours. Fumigation may be necessary in warerooms.

**DRIED-FRUIT BEETLES** infest both fresh and dried fruits. They are especially serious pests of dates and figs in California, transmitting the spores of fungi and bacteria that cause the fruit to sour. Female beetles lay their eggs on ripe fruit, in which the larvae feed and develop. A life cycle is completed in three weeks in warm weather. Destroy fruit dropped from trees as it will serve as a breeding area.

**SPIDER BEETLES** feed on dried foods and on feathers, hides, books, drugs, and spices. Unusually resistant to cold, they are active at temperatures as low as 40 degrees F. and are common pests in Canada and northern United States. Many species cannot survive above 80 degrees F. Some, such as the Golden Spider Beetle, are wingless and are spread only by crawling or by man. Clean the infested area and spray with a residual contact insecticide if there is no danger of food contamination.



## SCIENTIFIC NAMES

**4** *Melanoplus differentialis*
**8** *Lepisma saccharina*
**9** Chinch: *Blissus leucopterus*
Japanese: *Popillia japonica*
**11** Fly: *Winthemia quadripustulata*
Armyworm: *Pseudaletia unipuncta*
Braconid: *Aphidius testaceipes*
Cotton Aphid: *Aphis gossypii*
Cabbage: *Hylemya brassicae*
Rove: *Aleochara bimaculata*
**12** Vedalia: *Rodolia cardinalis*
Cottony: *Icerya purchasi*
**13** Braconid: *Apanteles glomeratus*
Tobacco: *Protoparce sexta*
Jap. Beetle: *Popillia japonica*
Imported: *Pieris rapae*
**15** Tobacco: *Protoparce sexta*
Tarnished: *Lygus lineolaris*
**21** Rose Scale: *Aulacaspis rosae*
**24** Odorous: *Tapinoma sessile*
Argentine: *Iridomyrmex humilis*
Thief: *Solenopsis molesta*
Pharaoh: *Monomorium pharaonis*
**25** Crazy: *Paratrechina longicornis*

## INDEX

Alfalfa Caterpillar, 115
Alfalfa Weevil, 105
American Cockroach, 29
American Dog Tick, 48
Angoumois Grain Moth, 148
Ants, 24–25
Aphids, 11, 66–67, 88, 100, 131
Apple Aphid, 132
Apple Curculio, 126
Apple Flea Weevil, 126
Apple Maggot, 130
Arbor. Leaf Miner, 92
Argentine Ant, 24
Argus Tortoise, 73
Armyworm, 11, 110–111
Asiat. Garden Beetle, 65
Assassin Bugs, 44
Azalea Lace Bug, 90
Azalea Leaf Miner, 92

Bagworm, 94
Banded Greenhouse Thrips, 89
Banded Woollybear, 83
Bark Beetles, 141
Bean Aphid, 67
Bean Leaf Beetle, 76
Bean Weevil, 150
Bed Bugs, 42
Bees, 47
Beet Leafhopper, 68
Beet Webworm, 82
Billbug, 105
Biol. Control, 12–13
Biting Insects, 38–47
Black Beetles, 29
Black Blister Beetle, 96
Black Cutworm, 64
Black Flies, 39
Black Horse Fly, 38
Black Scale, 134
Black Swallowtail, 83
Black Vine Weevil, 97
Black Widow Spider, 37
Blister Beetles, 74, 75, 96
Bloodsucking Conenose, 44
Bloodsucking Flies, 60
Blow Flies, 33, 60
Blue Bottle Fly, 33
Bluegrass Billbug, 105
Body Louse, 43
Boll Weevil, 107
Booklice, 35
Borers, 93, 127–129
Bot Flies, 56–57
Boxelder Bug, 35
Braconids, 11, 13
Bristly Rose-slug, 95
Bronze Birch Borer, 140
Brown-banded Cockroach, 29
Brown Dog Tick, 46
Brown Soft Scale, 87
Brown-tail Moth, 143
Bud Moths, 121
Buffalo Treehopper, 89
Bulb Flies, 91
Bulb Mite, 90

Cabbage Aphid, 67
Cabbage Looper, 80
Cabbage Maggot, 11, 84
Cactus Scale, 87
Cadelle, 147
Calif. Casebearer, 144
Calif. Oakworm, 144
Calif. Red Scale, 133
Cankerworms, 121
Carolina Sphinx, 113
Carpenter Ant, 25
Carpenterworm, 144
Carpet Beetles, 31
Carrot Rust Fly, 84
Carrot Weevil, 79
Casebearers, 144
Casemaking Moth, 31
Cat Flea, 50
Cattle Grubs, 58–59
Cattle Ticks, 49
Celery Leaf Tier, 83
Celeryworm, 83
Centipedes, 36
Cereal Leaf Beetle, 102
Chalcid, 118, 148
Cheese Mite, 152

Cheese Skipper, 152
Cherry Fruit Fly, 130
Cherry Fruitworm, 124
Chicken Body Louse, 52
Chicken Head Louse, 52
Chicken Mite, 55
Chigger, 45
Chigoe, 51
Chimney-swift Bug, 42
Chinch Bug, 9, 102
Chocolate Moth, 151
Chrys. Aphid, 88
Chrys. Gall Midge, 91
Chrys. Lace Bug, 90
Chrysolina Beetle, 13
Cigarette Beetle, 151
Citrophilus Mealybug, 135
Citrus Bud Mite, 138
Citrus Mealybug, 135
Citrus Red Mite, 138
Citrus Rust Mite, 138
Citrus Thrips, 137
Citrus Whitefly, 22, 136
Clear-winged Grasshopper, 99
Clothes Moths, 30–31
Clover Head Caterpillar, 115
Clover Leaf Weevil, 106
Clover Root Curculio 106
Clover Seed Chalcid, 119
Clover Seed Midge, 116
Cluster Fly, 33
Cockroaches, 28–29
Codling Moth, 120
Colo. Potato Beetle, 74, 75
Columbine Borer, 93
Colum. Leaf Miner, 92
Conenoses, 44
Confused Flour Beetle, 147
Corn Earworm, 109
Cornfield Ant, 25, 100
Corn Flea Beetle, 104
Corn Root Aphid, 88, 100
Corn Root Webworm, 115
Cotton Aphid, 11
Cotton Leafworm, 108
Cottony-cushion Scale, 12, 135
Cottony Maple Scale, 145
Cowpea Weevil, 150
Crab Louse, 43
Crane Fly, 35
Crazy Ant, 25
Crickets, 34, 137
Croton Bugs, 29
Cucumber Beetles, 77
Cultural Controls, 14
Curled Rose Sawfly, 95
Curlewbug, 105
Cutworms, 64
Cyclamen Mite, 90

Daddylonglegs, 37
Dark Mealworm, 147
Deer Fly, 38
Depluming Mite, 55
Dermestid Beetles, 30
Diamondback Moth, 80
Differential Grasshopper, 4–5, 99
Dried-fruit Beetle, 153
Drosophila Fruit Fly, 33
Drugstore Beetle, 153
Drywood Termites, 27

Ear Mange Mite, 54
Ear Tick, 49
Earwig, 34
E. Field Wireworm, 63
E. Subterranean Termite, 27
E. Tent Caterpillar, 143
Eggplant Flea Beetle, 62
Eggplant Lace Bug, 72
Elm Bark Beetle, 139
Elm Leaf Beetle, 139
Elm Sawfly, 145
Engel. Spruce Beetle, 141
Eur. Corn Borer, 112, 113
Eur. Elm Scale, 145
Eye Gnat, 33
Eye-spotted Bud Moth, 121

Face Fly, 56
Fall Armyworm, 110, 111
Fall Cankerworm, 121
Fern Scale, 87
Field Wireworm, 63
Fire Ant, 25
Firebrat, 34
Flatheaded Borer, 127
Flea Beetles, 62, 104
Fleas, 50–51
Flour Beetles, 147
Follicle Mites, 55
Forest Tent Caterpill., 143
Fowl Tick, 49
Fruit Flies, 33, 130
Fruit-tree Leaf Roller, 124
Fruitworms, 124
Fuller Rose Beetle, 97
Furniture Beetle, 35

Gambusias, 13
Garden Webworm, 82
German Cockroach, 28, 29
Gladiolus Thrips, 89
Gnats, 33
Granary Weevil, 146
Grape Colaspis, 103
Grape Mealybug, 135
Grasshoppers, 4, 5, 6, 98–99
Grass Worms, 111
Gray Blister Beetle, 74
Green Bottle Fly, 33
Greenbug, 100
Green Citrus Aphid, 132
Green Fruitworm, 124
Greenhouse Orthezia, 87
Greenhouse Thrips, 89
Greenhouse Whitefly, 88
Green Stink Bug, 70
Gulf Wireworm, 63
Gypsy Moth, 142

Hag Moth, 47
Harlequin Bug, 70
Head Louse, 43
Hemispherical Scale, 87
Hessian Fly, 117
Hick. Bark Beetle, 141
Hick. Tussock Moth, 143
Hide Beetle, 31
Hog Follicle Mite, 55
Hog Louse, 53
Hornets, 47
Horn Fly, 59
Horse Biting Louse, 53
Horse Bot Fly, 56, 57
Horse Flies, 38, 56
House Centipede, 36
House Cricket, 34
House Fly, 32, 39
Household Pests, 24–37
House Mosquito, 41
House Spiders, 37
House Springtail, 35
Human Flea, 50
Humpback Beetle, 153

Imbricated Snout Beetle, 126
Imp. Cabbageworm, 13, 80
Imp. Currantworm, 131
Indian-meal Moth, 149
Insecticides, 15–23
  aerosols, 16
  aldrin, 20
  allethrin, 19
  applications, 16
  benzene hexachloride, 20
  Bordeaux mixture, 18
  carbon bisulfide, 22
  chlordane, 20
  chlorinated hydrocarbons, 20

# INSECT PESTS

## A GOLDEN NATURE GUIDE

GEORGE S. FICHTER received his training in entomology at North Carolina State College, Raleigh and taught zoology at Miami University in Oxford, Ohio. He was editor of a national sports magazine, has written articles for many magazines, and is author of more than a dozen books on natural history subjects.

HERBERT S. ZIM, Ph.D., Sc.D., an originator and former editor of the Golden Guide Series, was also an author for many years. Author of some ninety books and editor of about as many, he is now Adjunct Professor at the University of Miami and Educational Consultant to the American Friends Service Committee and other organizations. He works on educational, population and environmental problems.

NICHOLAS STREKALOVSKY studied art in England. After working for the British Museum, he went to Egypt where he did illustrations of natural history and medical subjects for the government. His first work in the United States was for the Agassiz Museum at Harvard University. INSECT PESTS is the first book he has done for Golden Press.

## THE GOLDEN NATURE GUIDES

are an introduction to the world of nature, a guide to the most common, most easily seen, and most interesting aspects of the world around us. Each guide combines the authority of eminent scientists and experts in science education. These 160 page books overflow with accurate full color illustrations and concise, double-checked information which makes identification and understanding the subject easy and enjoyable.

# PESTICIDES

## Children's Health and the Environment

**WHO Training Package for the Health Sector**

**World Health Organization**

***www.who.int/ceh***

***July 2008 version***

1

**<<NOTE TO USER: Please add details of the date, time, place and sponsorship of the meeting for which you are using this presentation in the space indicated.>>**

**<<NOTE TO USER: This is a large set of slides from which the presenter should select the most relevant ones to use in a specific presentation. These slides cover many facets of the problem. Present only those slides that apply most directly to the local situation in the region.>>**

## LEARNING OBJECTIVES

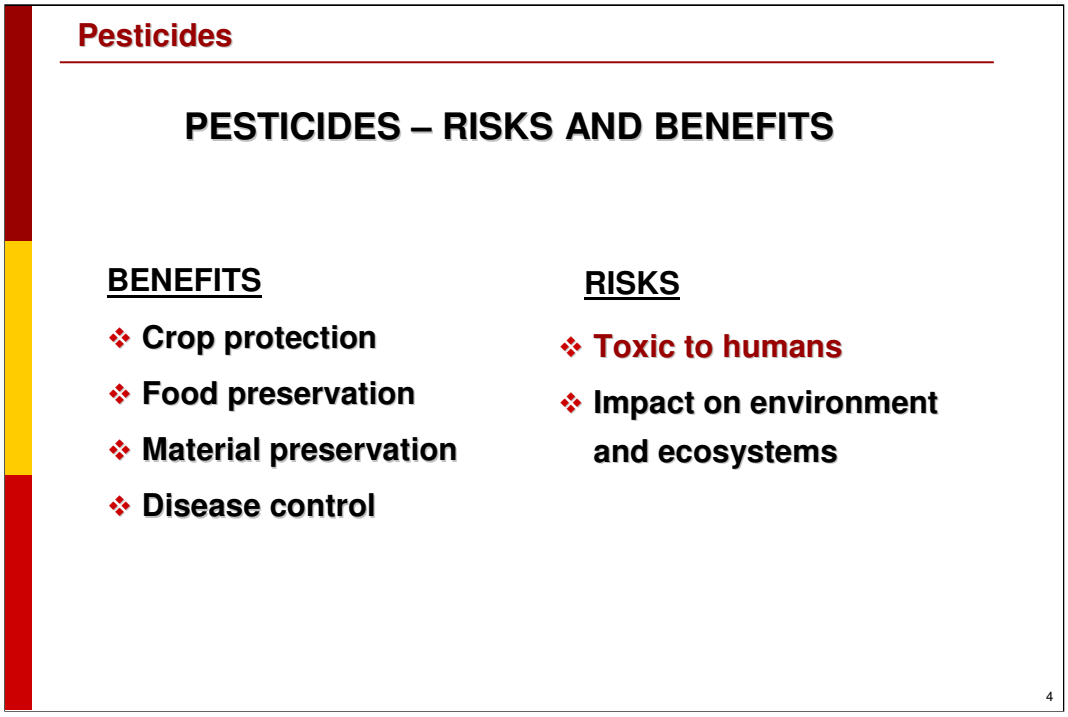
- Learn about pesticides – what they are and what are the risks they may pose?
- Identify the scenarios – where and when are children exposed?
- Recognize signs, symptoms and diseases that may be related to pesticide exposure in children
- Know how to prevent and treat children's pesticide exposure

<<READ SLIDE.>>

## OVERVIEW

- What are pesticides?
- Origin, environmental transport and fate of pesticides
- Routes and circumstances of exposure
- Exposure levels
- Toxicokinetics and toxicodynamics
- Target organs and systems
- Diagnosis and treatment of poisoning
- Prevention of pesticide exposure and poisoning

<<READ SLIDE.>>



Pesticides have numerous beneficial effects. These include crop protection, preservation of food and materials and prevention of vector-borne diseases.

For example pesticides may be used in the prevention of malaria, which kills up to 1 million children per year, and for preventing other vector-borne diseases such as dengue, leishmaniasis and Japanese encephalitis.

Pesticides are toxic by design – they are BIOCIDES, designed to kill, reduce or repel insects, weeds, rodents, fungi or other organisms that can threaten public health and the economy.

Their mode of action is by targeting systems or enzymes in the pests which may be identical or very similar to systems or enzymes in human beings and therefore, they pose risks to human health and the environment.

Pesticides are ubiquitous in the environment and most are synthetic.

There is growing concern about children's exposure to pesticides and their special susceptibility. Children are not little adults, and may have higher exposures and greater vulnerability at both high and low levels of exposure.

*Ref:*

**<<READ SLIDE.>>**

a) First use of synthetic pesticides: 1940

b) Consumption increased substantially over time, for example, in the USA, the use of pesticides doubled from 1960 to 1980, but total use has since remained stable or fallen. Most pesticides are used in agriculture, but in 1999 about 74% of households in USA were reported to use at least one pesticide in the home.

c) Use has risen in developing countries and the fastest growing markets in Africa, Asia, South and Central America, Eastern Mediterranean. There is a high pesticide use on crops grown for export (Dr. N. Besbelli, WHO, personal communication).

d) Although developing countries use only 25% of the pesticides produced worldwide, they experience 99% of the deaths. This is because use of pesticides tends to be more intense and unsafe, and regulatory, health and education systems are weaker in developing countries.

Pesticides are used in different settings.

**<<READ SLIDE.>>**

•It is important to consider the presentation, concentration and formulation of the products, as the toxic effects depend on the physical state of the product and also on the characteristics of the solvent or other substances contained in the formulation. "Chalk" pesticide has been sold illegally in the USA, it may contain pyrethroids. (See US EPA website.)

•The rate of absorption depends upon the presentation of the product: volatile pesticides and fine powders are more easily inhaled than dense products and coarse granulated materials.

•Concentrated solutions are much more dangerous than diluted ones; solid baits may be colourful, attractive and sweet, and may be easily ingested by toddlers.

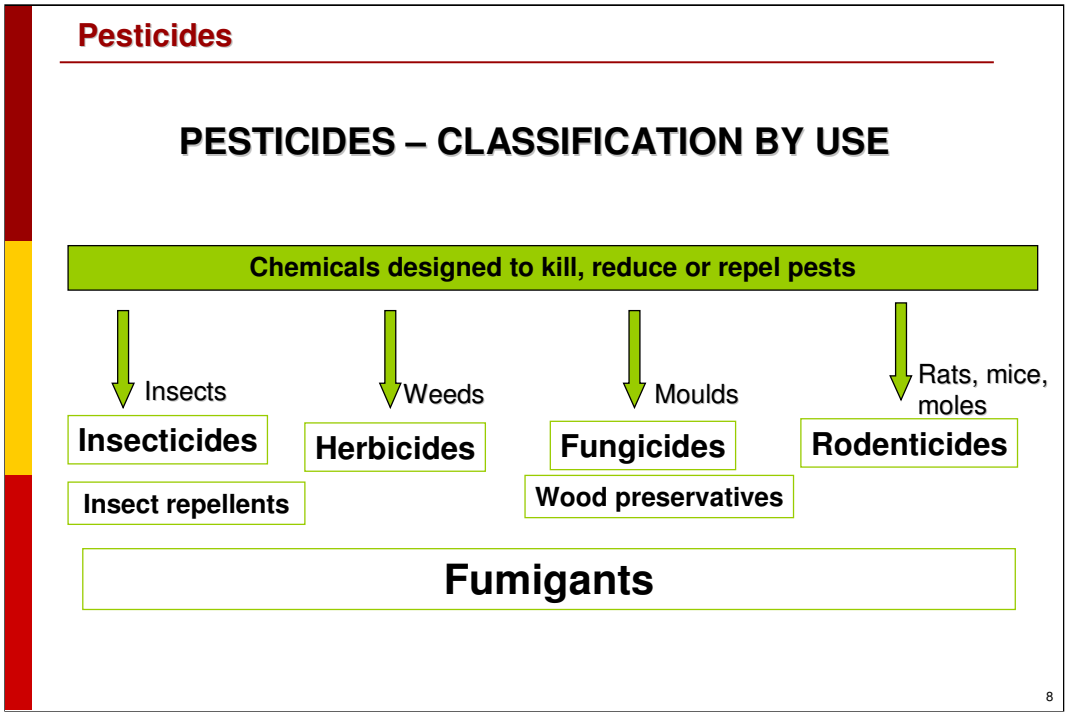
•In some cases, if the concentration of the active compound is less than 2% (as is generally the case for pesticides for household use), the toxicity in cases of human exposure may be due to the solvent (e.g. kerosene or paraffin) and not to the active ingredient.

*Refs:*

•IPCS. *The WHO Recommended Classification of pesticides by hazard, Guidelines to Classification 2000–2002* (www.inchem.org/documents/pds/pdsother/class.pdf)

•Tomlin C. *The pesticide manual, 11th ed.* British Crop Protection Council Publications, 1997.

•"Chalk" pesticides information at www.epa.gov/opp00001/health/illegalproducts/chalk.htm



There is a large variety of pesticides designed to kill specific pests – those most widely used are listed below.

•**Insecticides** (for killing insects) such as organochlorines, organophosphates and carbamates. This category also includes insect repellents such as diethyltoluamide (DEET) and citronella (of natural origin).

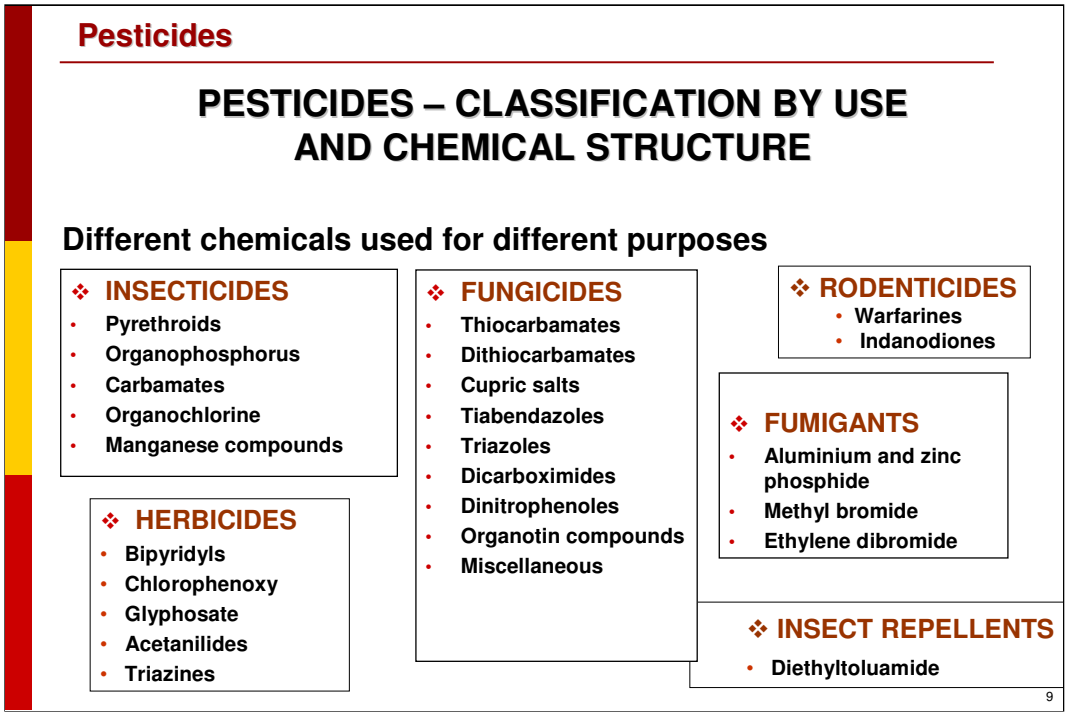
•**Herbicides** or weedkillers (e.g. paraquat, glyphosate and propanil).

•**Fungicides** (to kill mould or fungi): when applied to wood, they are called wood preservatives.

•**Rodenticides** (to kill mice, rats, moles and other rodents).

•**Fumigants** are pesticides that exist as a gas or a vapour at room temperature and may be used as insecticides, fungicides or rodenticides, especially in closed storage places – as they kill every living organism. They are extremely toxic, due to their physical properties, rapid environmental dissemination and human or animal absorption (examples include cyanide, aluminium phosphate and methyl bromide).

•**Other pesticides** include algaecides (to kill algae), miticides (to kill moths) and acaricides (to kill ticks).



There are many groups of chemicals used as pesticides. There are hundreds of different active principles or main ingredients of pesticide groups (e.g. approximately 300 in Uruguay and 900 in the USA).

**<<NOTE TO READER: insert the number in your country/region.>>**

Some domestic, agricultural or veterinary products may contain more than one chemical belonging to the same or a different chemical group.

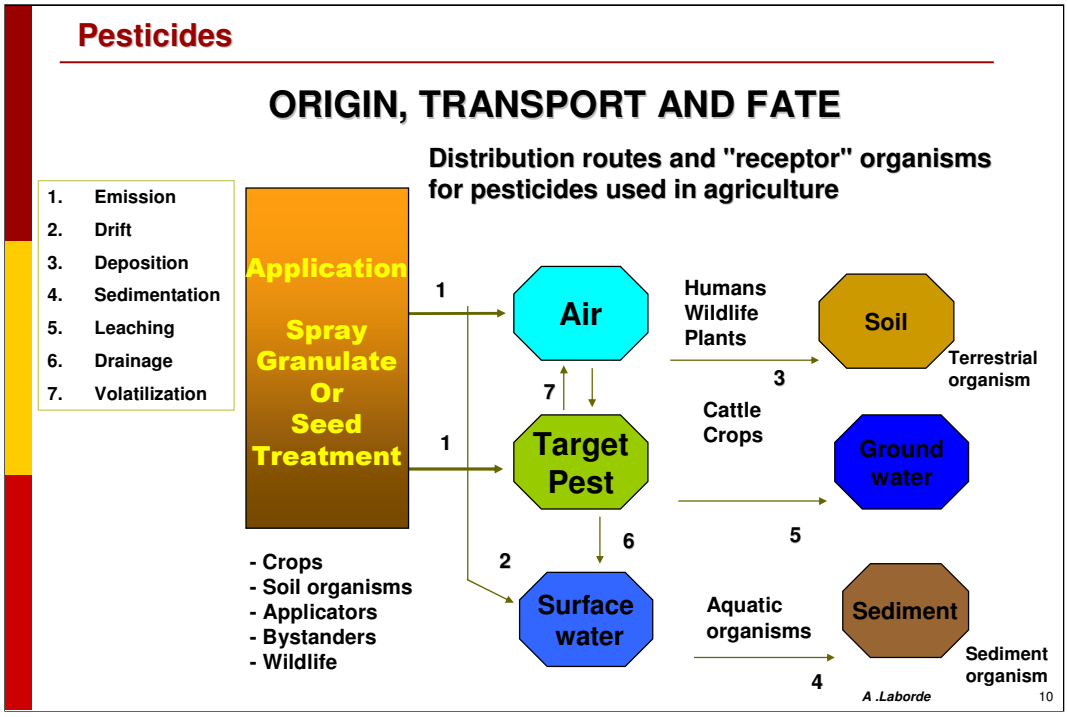
Exposure or emission into the environment can occur from on-site exposure through spraying or application of solid formulations to different targets. For example exposure can occur in children during:

- agricultural use (spraying fields) or seed treatment;
- use in cattle dips and in animal husbandry;
- use as household insecticide (indoor), or in gardens;
- sanitary indoor use in schools, offices, hospitals and other institutions;
- public health use (outdoor or indoor): in parks and urban areas and for vector control (e.g. malaria, Chagas disease, dengue and onchocercasis);
- medical human use: to treat head lice or scabies; and
- veterinary products for pets (e.g. to treat infestations with fleas or ticks).

*Refs*:

•IPCS. *The WHO recommended classification of pesticides by hazard. Guidelines to Classification 2000-2002* (www.inchem.org/documents/pds/pdsother/class.pdf).

•Tomlin C. *The pesticide Manual, 12th ed.* British Crop Protection Council Publications, 2000.



Pesticides have different distribution and persistence patterns in the environment, even if all of them are distributed in some way through air, soil and water. This should be addressed to gain an understanding of how acute and chronic exposure may occur because air, water and soil are the media of exposure.

This scheme illustrates the routes followed by an agricultural chemical (spray, granulate or seed treatment) that is applied to a given site, representing a risk to applicators, bystanders and wildlife.

When a pesticide is applied directly to a target pest (plant or animal) the whole site is affected including crop plants, soil organisms and, potentially, humans and wildlife in the immediate area. In addition, part of it goes to the air or to surface waters, due to emission (1) or drift (2). Once on the target site, the pesticide may "drain" (6) into surface waters or volatilize (7) into the air. From the air it may deposit (3) on humans, wildlife or plants or on the soil. From the animals or plants where it was applied the pesticide may leak (5) into groundwater.

Pesticides in surface water may go into aquatic organisms, and by sedimentation (4) into other organisms that remain in the sediment.

The persistence of the pesticide depends on its physical and chemical properties (partition coefficients, degradation rates, deposition rates) and the characteristics of the environment.

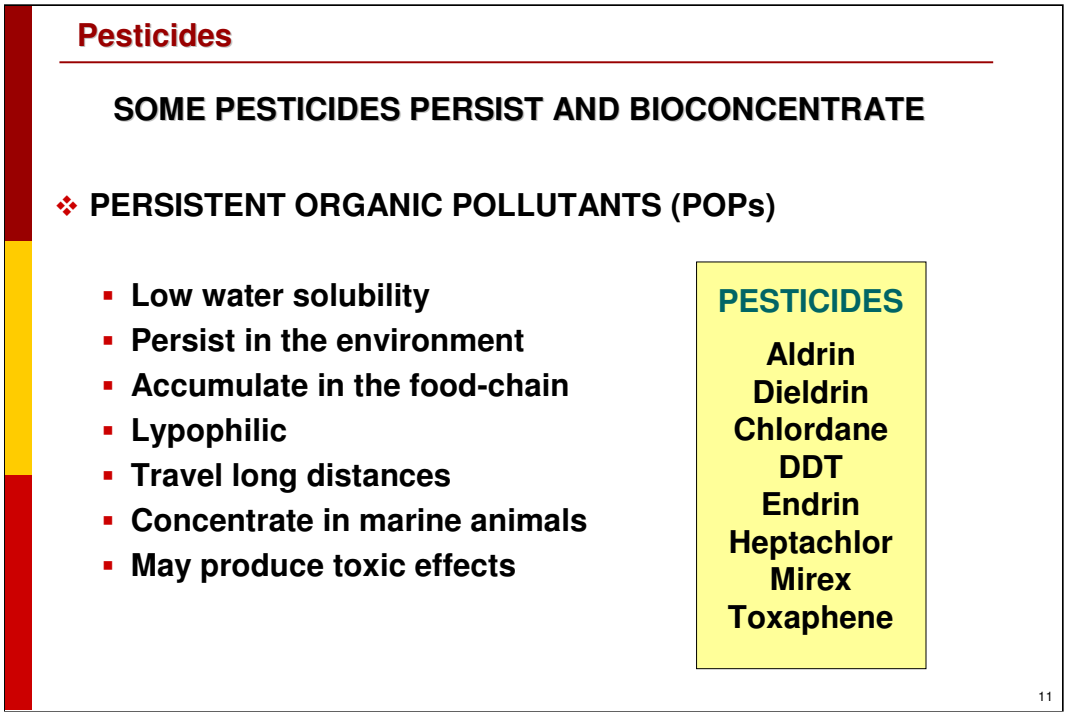
Climate characteristics also play a role in persistence. Studies in the Arctic have shown that insecticides and herbicides persist 3 to 8 times longer in cold climates than in temperate ones.

The most persistent pesticides are termed “persistent organic pollutants” (POPs) and are addressed in a separate module.

*Refs:*

•*Children: a CICH profile, 3rd ed.* Canadian Institute of Child Health, 2000.

•Health Canada. *Health and the environment: handbook for health professionals.* Ottawa, Ministry of Public Work and Government Services,1998.



Some pesticides are characterized by being very persistent in the environment. They may represent long-term dangers as they biomagnify up the food-chain. Humans, and particularly breastfed babies, are at the top of the food-chain.

•Most POPs (persistent organic pollutants) (these will soon be considered as persistent toxic substances or PTS) are organochlorine pesticides, namely, aldrin, endrin, clordane, DDT, heptachlor, mirex, toxaphene and hexachlorobenzene.

•They have been banned for agricultural or domestic uses in Europe, North America and many countries of South America in accordance with the Stockholm Convention (ratified in 2004). However, some organochlorine pesticides are still used – e.g. DDT is used to control malaria in some developing countries.

•Other POPs (and PTSs) include industrial chemicals (PCBs, HCB) and unintended byproducts (dibenzodioxins, dibenzofurans), and other chemicals.

•These persistent chemicals are controlled under the Stockholm Convention.

•POPs and PTSs are typically lypophilic compounds, with low water solubility, that are resistant to environmental breakdown and accumulate in adipose tissue.

•They bio-concentrate in fish, wildlife and human tissues.

•The highest levels are found in marine mammals.

•There is concern about potential endocrine and developmental effects of the POPs and PTSs, especially in children.

Pesticides

## CHILDREN'S EXPOSURE

### A cause of concern

- Multiple chemicals
- Multiple sources of exposure
- Multiple routes of exposure
- Multiple effects

WHO

15

Pesticides are considered an important environmental threat to children's health in rural areas. This is because:

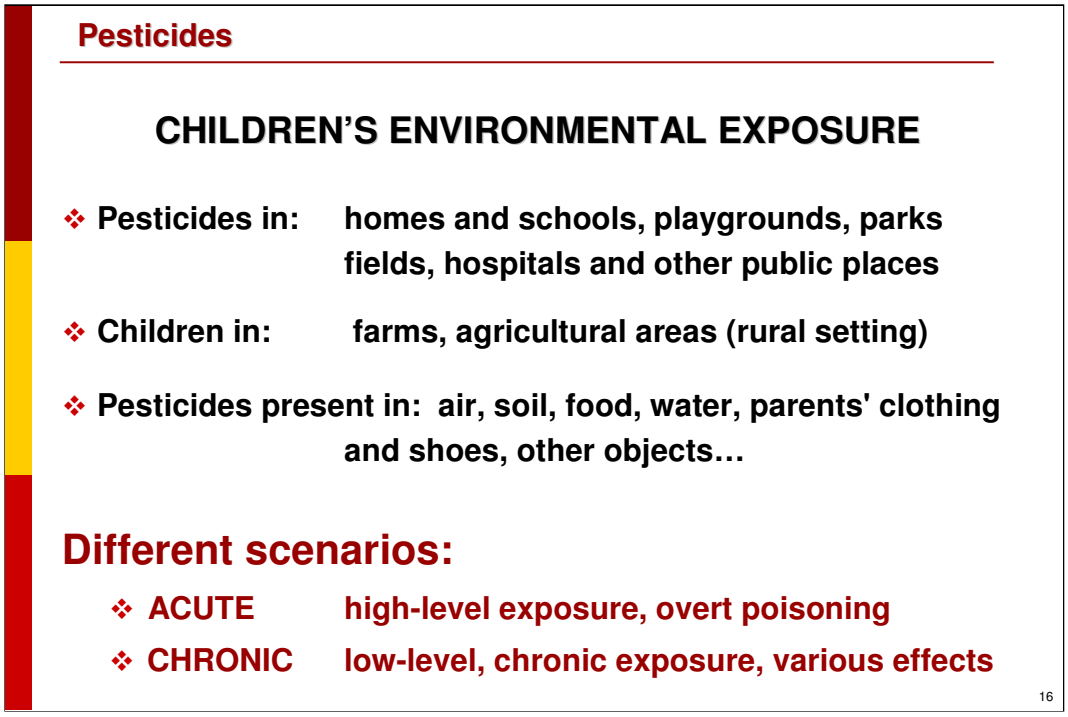
• A large variety of chemicals and mixtures are used as pesticides.

•Many pesticides are used at the same time in the same place (agricultural regions).

•They are ubiquitous in the environment – and in individual environments (micro-environments) of children – there may be several sources of exposure to the same or a different chemical.

•Multiple exposures may occur from the preconception period throughout the child's growth into adolescence and adulthood.

Pesticides may also be heavily used indoors in urban areas, so this is not solely a rural issue.



Children are exposed in different settings and by a variety of routes.

•Pesticides may be unsafely used in the home, by parents who want to protect their children from mosquitoes, cockroaches or rodents. Different pesticides may be stored within the reach of children. They are used in schools and playgrounds (in treated wood) and in green areas (parks and playing fields) to destroy weeds. Hospitals are intended to be places of healing, yet many are using hazardous pesticides

•Living on farms or in agricultural areas, where pesticides are frequently and heavily used, is a high-risk scenario for exposure.

•Potential for "take home" of pesticides on parents' clothing or shoes.

•Pesticides may be present in food and water, either as residues from treatment of crops or at higher levels, as a result of contamination.

•In some areas, there is a potential for release into the environment during production and formulation of pesticides (in factories).

•These are the circumstances under which children may receive **acute and high-level exposure leading to poisoning** or **chronic, low-level exposures** linked to more subtle, developmental and other effects. (See next slide)

## Pesticides

# SOURCES AND SETTINGS OF EXPOSURE...

**HOME, SCHOOL, DAY-CARE, INSTITUTIONS, ...**

WHO

**Indoor and outdoor application**

- Mosquito control
- Professional/domestic application

**Health uses**

- Lice or scabies
- Fleas or ticks on pets

**Pesticide residues**

- Dust, soil, furniture, carpets, toys, food…
- Playgrounds, playing fields, lawns, gardens
- Wood preservatives in play structures (e.g. PCP: pentachlorophenol)
- Long range transport of POPs (e.g. DDT)

17

A survey by the U.S. Environmental Protection Agency regarding pesticides used in and around the home revealed some significant findings:

•Almost half (47%) of all households with children under the age of five had at least one pesticide stored in an unlocked cabinet, less than 4 feet off the ground (i.e., within the reach of children).

•Approximately 75% of households without children under the age of five also stored pesticides in an unlocked cabinet, less than 4 feet off the ground (i.e., within the reach of children). This number is especially significant because 13% of all pesticide poisoning incidents occur in homes other than the child's home.

**Pesticide application**

•Professional application of pesticides both indoors and outdoors is used increasingly commonly for the control of rodents, cockroaches, ants, termites, earwigs and other pests. Signs and symptoms of pesticide-related-illnesses have been described after indoor and outdoor spraying.

•Domestic use of insecticides is also a source of exposure. Insecticides formulated as sprays, strips and baits are widely available.

•Certain topical pharmaceuticals for direct application on children's skin or scalp contain insecticides to control lice or scabies. Their use carries a risk of acute (chronic if repeated) overexposure. High doses or applications lasting a long time have caused acute poisoning. There are many pharmaceuticals described in the *International pharmacopoeia* that contain organophosphorus (malathion) and organochlorine (lindane) pesticides still being used to treat head lice. Such products may contains up to 2% of pesticide.

•Dogs and cats are often treated with insecticides to control fleas or ticks. Veterinary products can be as concentrated as agricultural ones. Pet dips for treatment of flea infestations usually contain organophosphate and pyrethroid pesticides. Children are often involved in pet care.

**Pesticide residues**

•Insecticides may persist in house dust, in soil tracked in from outdoors, in carpets, toys, food and furniture.

•High levels of insecticides have been measured for weeks after professional application.

•Residues of organophosphorus insecticides sprayed in indoor environments have been reported to occur on floors, carpets, children's toys, furniture, bed covers and in dust.

•Poor hygiene habits or houses that are difficult to clean increase the risk of exposure.

•Playgrounds, playing fields, lawns and gardens may be routinely sprayed in order to keep insects away.

•Pesticides are found in recreational waters (lakes, rivers and in pools (algaecides)).

•Persistent wood preservatives such as arsenic/ copper/chromium mixtures have been used on play structures.

•The persistent organic pollutants (POPs) include nine pesticides.

## Pesticides

### SOURCES AND SETTINGS OF EXPOSURE

**Children living on farms or in agricultural areas are exposed to:**

- **pesticide drift from sprayed fields**
- **contaminated dust & soil**
- **contaminated equipment and clothes**
- **treated fields**
- **parents spraying**
- **animal dips**
- **child labour**

*Corra*

19

The rural setting is of particular importance for children and young adults.

Children may be exposed to pesticide drift from fields that are being sprayed.

Acute “unintentional" poisoning, is possible when small children play with pesticide bottles and colourful containers that have been discarded in their playing areas.

Highly concentrated pesticides may be stored in rural homes.

Parents who are farm-workers or applicators may bring pesticides into the home through contaminated clothes, shoes or equipment.

Children may accompany their parents to the fields and help them with their tasks.

Infants who are still being breastfed are often carried by their mothers in the fields.

Children may help with agricultural tasks or may be allowed to play around the sprayed field.

Re-entry intervals (the time required before it is safe to return to a treated area) are not always respected or may be established on the basis of criteria that ensure adult safety only.

Concern is increasing about child labour and young workers.

Although few data are available, it is generally assumed that children make up a substantial part of the agricultural workforce in developing countries. They could be at a higher risk because they are less experienced and assertive than adults; they may lack protective equipment and receive less training or none at all.

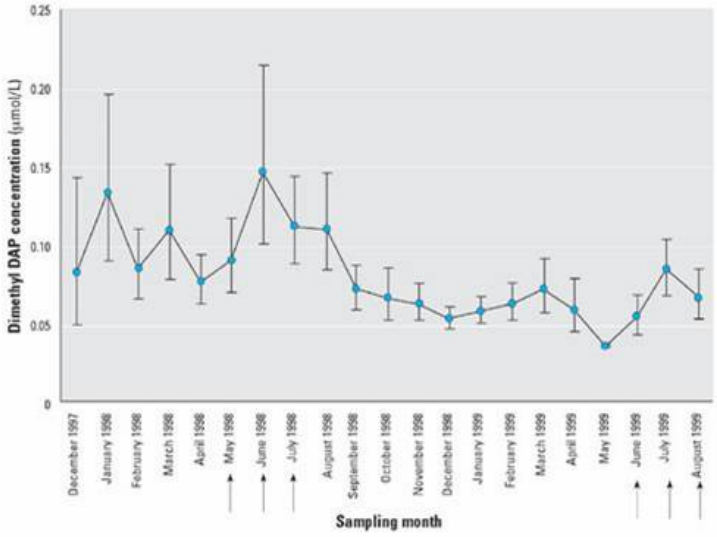
## Pesticides

# CHILDREN'S EXPOSURE IN RURAL SETTINGS

**Increase in the levels of organo-phosphorus (OP) metabolites (DAP) paralleling pesticide spraying in a rural area**



Koch *EHP*, 2002, 110 (8): 829

20

Numerous studies on children's exposure have demonstrated the absorption of pesticides.

Pesticide metabolites are used as biomarkers of exposure, and children often have higher levels than adults.

Younger children may have higher levels than older ones.

Levels of pesticides were associated with residence in rural areas AND with domestic use of pesticides.

The figure shows levels of dialkylphosphates (DAP) in children living in agricultural areas. Levels were measured in many samples taken over 1 year and were found to increase in parallel with periods of pesticide application.

*Refs:*

•Aprea C et al. Biologic monitoring of exposure to organophosphorus pesticides in 195 Italian children. *Env Health Perspect* , 2000, 108:521.

•Koch D et al. Temporal association of children's pesticide exposure and agricultural spraying: report of a longitudinal biological monitoring study. *Env Health Perspect,* 2002, 110:829.

*We measured organophosphorus (OP) pesticide exposures of young children living in an agricultural community over an entire year and evaluated the impact of agricultural spraying on exposure. We also examined the roles of age, sex, parental occupation, and residential proximity to fields. We recruited 44 children (2–5 years old) through a Women, Infants, and Children clinic. We collected urine samples on a biweekly basis over a 21-month period. Each child provided at least 16 urine samples, and most provided 26. We analysed samples for the dialkylphosphate (DAP) metabolites common to the OP pesticides. DAP concentrations were elevated in months when OP pesticides were sprayed in the region's orchards. The geometric means of dimethyl and diethyl DAPs during spray months were higher than those during nonspray months (p = 0.009 for dimethyl; p = 0.018 for diethyl). Dimethyl DAP geometric means were 0.1 and 0.07 micro mol/L for spray months and nonspray months, respectively (57% difference); diethyl DAP geometric means were 0.49 and 0.35, respectively (40% difference). We also observed differences for sex of the child, with male levels higher than female levels (p = 0.005 for dimethyl; p = 0.046 for diethyl). We observed no differences due to age, parental occupation, or residential proximity to fields. This study reports for the first time the temporal pattern of pesticide exposures over the course of a full year and indicates that pesticide spraying in an agricultural region can increase children's exposure in the absence of parental work contact with pesticides or residential proximity to pesticide-treated farmland.*

## PESTICIDES IN DIFFERENT MEDIA

### Air

- Respirable particles contaminated with pesticides
- Respirable aerosols during spraying
- Vapour from volatile residues of pesticides

### Soil

- Hand-to-mouth behaviour
- Crawling on the ground
- Dermal contact

Some pesticides are volatile and can be inhaled over a period of hours or days because of the volatilization from contaminated surfaces.

Particulate material under 10 micrometres is breathable, and the smaller particles are more dangerous because they can reach the alveoli. Children can be exposed when they are around the spraying area.

The persistence of pesticides in the soil depends on their chemical characteristics and many pesticides used in homes have been found, many days to weeks after the application, in house dust.

The behaviour of children (e.g. crawling and hand-to-mouth activities) facilitates exposure.

## PESTICIDES IN DIFFERENT MEDIA

**Water**

- **Pesticides in drinking water: tap, well**

**Food**

- **Crops routinely sprayed:**
  - **fruits, vegetables, grains**
- **Bioaccumulation in animals and products**
  - **fish, meat, eggs, dairy**

WHO

Once used or spilled, pesticides may contaminate the water used for drinking or bathing.

Pesticides can contaminate nearby groundwater and surface water.

There is increasing concern about dietary ingestion of pesticide residues by children, in both plant and animal products. Please note that the benefits to children of a diet rich in fruits and vegetables should be emphasized. There are preventive and regulatory measures on this issue. (See additional slides)

*Picture: WHO, C. Gaggero. Nutrition child, Peru.*

**<<READ SLIDE.>>**

## PESTICIDES IN DIFFERENT MEDIA

### Food residues

- Many food products have detectable levels of pesticides
- Guideline levels of pesticides in food (MRL)
- Guidelines to limit the population exposure: acceptable daily intake (ADI)

WHO 23

All industrialized countries have food monitoring programmes that measure pesticide residues.

Levels exceeding the maximum established limits have been reported occasionally in monitored food.

Maximum limits for residues have been established only for certain pesticides.

Although a single pesticide may be considered safe at a particular level, foods may contain residues of several pesticides at the same time (see the next slide for an example of the pesticide application scheme in apple trees) and to understand the effect of multiple exposures.

Locally grown food may not be properly monitored or controlled for residues of pesticides.

Families who eat food directly brought in from fields may have higher pesticide exposure.

A study of cumulative dietary pesticide intake in children from an agricultural community showed that up to 56% of the children exceeded the acceptable chronic dietary doses *(Fenske, 2000)*.

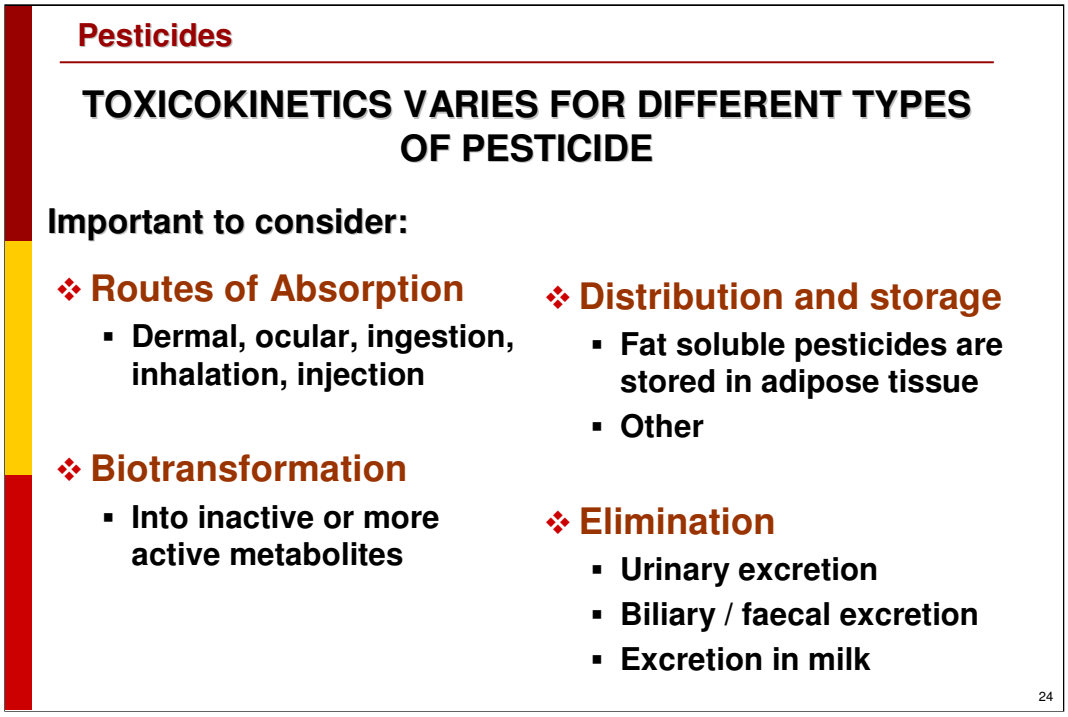
*Picture: WHO (L. Taylor), Nutrition, 1994*



Toxicokinetics depend on the specific pesticide, its chemical characteristics and formulation.

Routes of absorption are explained in the following slides.

•The biotransformation of most pesticides involves a combination of several chemical reactions including oxidation, reduction, hydrolysis and/or conjugation, producing different metabolites that may be more or less active (toxic).

• Biotransformation of some organophosphate pesticides involves oxidative activation (e.g. parathion = paraoxon).

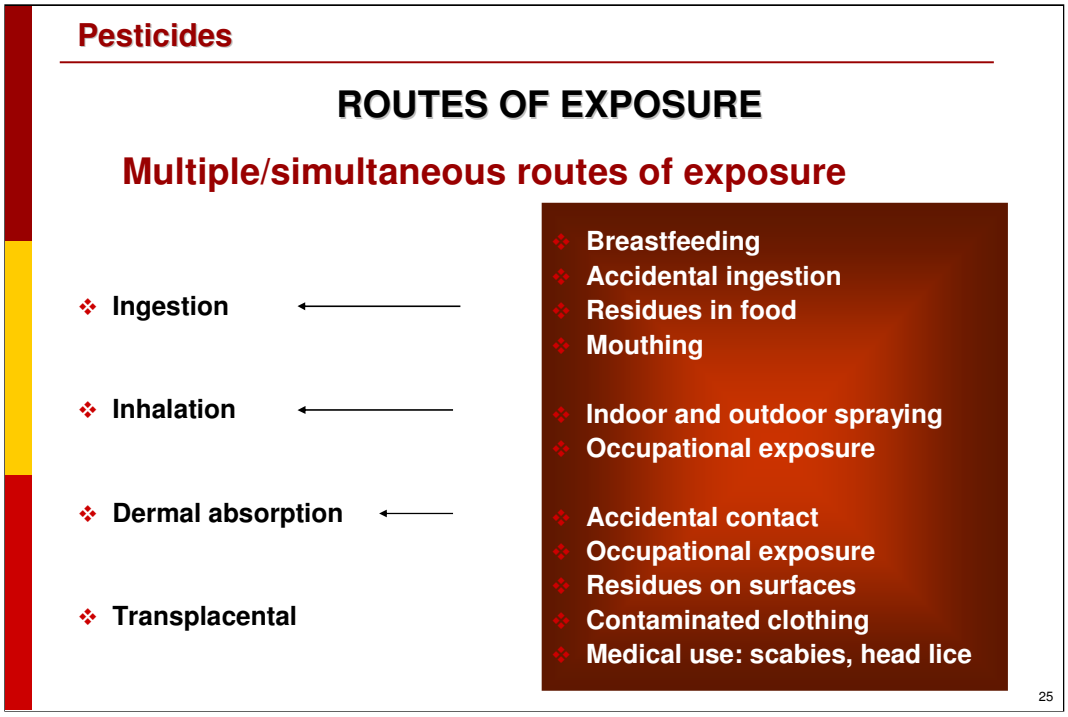
•Pesticides may reach different organs and tissues. Many pesticides accumulate in the adipose tissues.

•Elimination is urinary, biliary and faecal.

•Excretion in milk has been experimentally found to be proportional to blood dosage for DDT, dieldrin, aldrin, heptachlor and other organochlorine pesticides.

*Ref:*

•Hodgson. Metabolism. In: *Hayes, Handbook of pesticide toxicology*. San Diego California, Academic Press Inc. 1991.



Almost all pesticides are absorbed by these routes.

**<<READ SLIDE.>>**

Different routes are associated with different settings and media of exposure. However, there are settings in which more than one route of exposure can occur (e.g. in an occupational setting).

Pesticides can cross the epithelium of the skin and mucous membranes that exchange gases (alveoli) or nutrients (gastrointestinal mucosa).

The rate of absorption depends on the chemical properties, amount of the chemical, length of exposure and the physical state of the molecule. There are also other factors that may contribute to increased absorption. Skin absorption is higher when there is vasodilatation (e.g. in summer, or with heating). Respiratory absorption is many times higher when respiration is more rapid (e.g. when playing or running).

(Transplacental exposure is considered in the next slide.)

In relation to their body weight, children have a larger skin area than adults, breathe in more air and drink and eat more. These aspects and certain childhood behaviours such as putting fingers and objects in their mouths allow exposure to larger amounts of pesticide per kilogram of body weight. Modifying diets and assuming their variety could be a way of reducing exposures...

## Pesticides

### ROUTES OF PERINATAL EXPOSURE

- **Mother's intake and body burden is transferred across the placenta**
- **Breast milk may be contaminated**
  **"The very top of the food chain"**

WHO 26

Pesticides can cross the placenta:

•They have been detected in the amniotic fluid and body tissues of human foetuses even during early stages of prenatal life.

•Pesticides have also been found in the meconium.

•Measuring organophosphate compounds (OP) metabolites in meconium is considered a good biomarker of prenatal exposure because meconium starts to accumulate in the 16th week of pregnancy and is eliminated following delivery.

Breast milk may be contaminated and represents the very top of the food-chain:

•Residues of organochlorine pesticides and POPs have been detected in breast milk (including DDT, HCB and HCH isomers) in contaminated areas.

•There is currently no developed method to measure OPs in breast milk.

(Please see the module on Children and Chemicals.)

## Pesticides

# METABOLIC PATHWAYS

- **Organophosphates metabolize into:**
  - **Oxones**
  - **Specific inactive metabolites (ME)**
  - **Non-specific metabolites: dialkylphosphates (DAPs)**

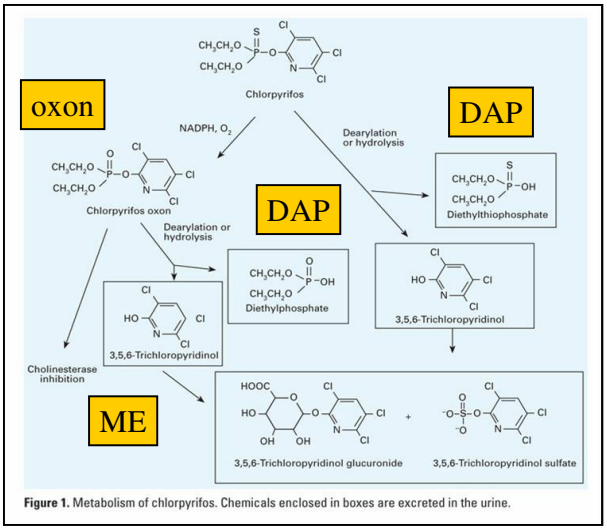

**Figure 1.** Metabolism of chlorpyrifos. Chemicals enclosed in boxes are excreted in the urine.

*Wessels, EHP (2003) 111 (16): 1939*

27

Metabolism may either activate or inactivate the chemical.

Therefore, immature metabolic pathways may be protective or increase the danger from specific chemicals.

As an example, organophosphates are metabolized to oxones (active metabolite), but also to other specific inactive metabolites (ME) and to non-specific metabolites (the dialkylphosphates (DAPs)) (shown in the figure).

DAPs are used as biomarkers of environmental exposure to all kinds of organophosphate pesticides because DAPs are metabolites of all these pesticides.

## MECHANISMS OF ACUTE TOXICITY

- Irritation (most of the pesticides)
- Allergic sensitization (e.g. fungicides)
- Enzyme inhibition (e.g. cholinesterases and OPs & carbamates)
- Oxidative damage (e.g. paraquat)
- Inhibition of neurotransmission (e.g. organochlorines)
  - Calcium ($Ca^{2+}$) homeostasis alteration
  - GABA inhibition
- Uncoupling of oxidative phosphorylation (e.g. glyphosate)

Several mechanisms of toxicity have been described and these differ according to the specific properties of the pesticide. They are summarized below.

•Irritation is a local effect due to contact of the pesticide with the skin, eyes or other mucosa.

- The effects are usually redness and pain.

- Respiratory irritation can produce nasal, laryngeal or pulmonary effects.

- Most herbicides and fungicides are strong irritants.

•Allergic sensitization is a common effect of pesticides, especially fungicides.

•Enzyme inhibition (e.g. cholinesterase activity is decreased by exposure to organophosphorus compounds and carbamates).

•Oxidative damage (e.g. paraquat is a promoter of superoxide radicals).

•Inhibition of neurotransmission (organochlorines inhibit the GABA system and cause alteration of calcium homeostasis.

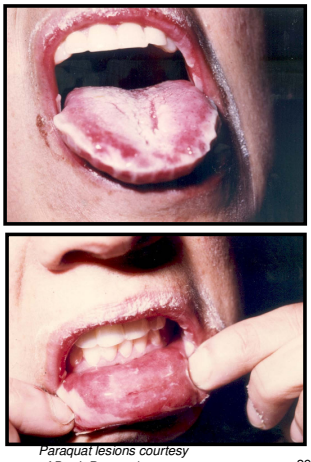
•Uncoupling of oxidative phosphorylation (e.g. glyphosate).

OP: organophosphorus compounds

## Pesticides

### ACUTE PESTICIDE-RELATED ILLNESS

- Dermal and ocular irritation (or allergic response)
- Upper and lower respiratory tract irritation
- Allergic responses / asthma (fungicides)
- Gastrointestinal symptoms
- Neurological symptoms
- Specific syndromes
  - Cholinergic crisis (organophosphorus pesticides)
  - Bleeding (warfarin-based rodenticides)
  - Caustic lesions and pulmonary fibrosis (herbicide, paraquat)



*Paraquat lesions courtesy of Dr. J Pronczuk*

29

The signs and symptoms of pesticide poisoning depend upon the pesticide involved and the type and magnitude of exposure.

In general the signs and symptoms are:

•dermal and ocular irritation (or allergic response)

•upper and lower respiratory tract irritation

•allergic responses and asthma

•gastrointestinal symptoms: usually vomiting, diarrhoea and abdominal pain

•neurological symptoms: excitatory signs in the case of exposure to organochlorines, lethargy and coma; also polyneuritis

•specific syndromes:

- cholinergic crisis (organophosphorus pesticides)

- bleeding (warfarin-based rodenticides)

- caustic lesions and pulmonary fibrosis (paraquat)

**<<NOTE TO USER: Refer to those pesticides commonly used in the country/area.>>**

## Pesticides

### ACUTE POISONING BY "ACCIDENTAL" INGESTION

- **Storage of leftover pesticide in a medicine or soft drink bottle**
- **Confusion with pharmaceutical**
- **Pesticide container reused for storing drinks or food**
- **Pesticide container present in the child's environment**

*Bottles containing pharmaceuticals and the pesticide chlorpyriphos*
*Laborde, CIAT, Montevideo*

30

Acute poisoning results from "accidental" (non-intentional) exposure in toddlers and small children.

Ingestion occurs, for example, when:

•Pesticides have been stored in a medicine or soft drink bottle.

•The pesticide bottle is similar to a bottle used for pharmaceuticals.

•Pesticide containers are reused for storing drinks or food.

•Pesticide containers are easily accessible in the child's environment.

*Photo: Bottles containing pharmaceuticals and the pesticide chlorpyriphos*
*Courtesy of Laborde, CIAT, Montevideo*

Pesticides

## DIAGNOSIS OF EXPOSURE

- **History of exposure**
  - **Availability of pesticides**
  - **Recent application**
- **Signs and symptoms**
  - **May be misdiagnosed!**
- **Laboratory tests**

WHO

31

**<<READ SLIDE.>>**

The diagnosis is based upon the history of exposure (e.g. pesticides are available in the home, recently applied, or child was found playing with containers), signs and symptoms of exposure (see next slides) and laboratory measurements. Diagnosis also requires a high index of suspicion. Even after acute exposures, pesticide poisoning may be misdiagnosed as a viral illness (e.g. infectious diarrhoea rather than organophosphate poisoning) resulting in inadequate treatment and potentially returning children to a setting where exposure will be ongoing or recur.

Pesticides and/or their metabolites can be measured in samples of blood, urine, breast milk, amniotic fluid or meconium. This can confirm the diagnosis.

Laboratory tests are available to assess exposure to organophosphates, organochlorine, dicarboximide fungicides, carbamates, dipyridyl herbicides (e.g. paraquat) and pyrethroids.

## Pesticides

### LOW-LEVEL CHRONIC EXPOSURE

**Growing body of epidemiologic and animal data and research studies suggests a link between long-term exposure and:**

- **Abnormal growth and development**
- **Impaired neurobehavioral development / functions**
- **Cancer**
- **Increased susceptibility to infections**

35

The mechanisms of action thought to produce chronic toxic effects include genotoxicity, endocrine disruption and immunotoxicity.

Effects may be seen when exposure occurs during critical windows of development, particularly the prenatal period. See additional slides.

## Pesticides

### PRECONCEPTIONAL PRENATAL EXPOSURE

**Pesticide exposure before or during pregnancy has been associated with increased risk of:**

- **Infertility**
- **Perinatal death**
- **Spontaneous abortion**
- **Premature birth**
- **Fetal growth retardation**
- **Congenital malformations**
- **Early childhood cancer**

WHO 36

Exposure of either **mother** or **father** to pesticide before conception, or exposure of the mother during pregnancy, has been associated with an increased risk of fetal death, spontaneous abortion and early childhood cancer.

There is increasing evidence that *in utero* exposure increases the risk of growth retardation: a small-for-gestational age baby, low birth weight, reduced length and small head circumference (see photo).

Significant increases in the risk of congenital anomalies have also been reported. These include**:** eye defects, limb reduction, urogenital defects, hypospadias, cryptorchidism, orofacial clefts, central nervous system defects and heart defects.

Exposure during brain growth may exert subtle, permanent effects on the structure and function of the brain. These include:

•neuronal and axonal differentiation;

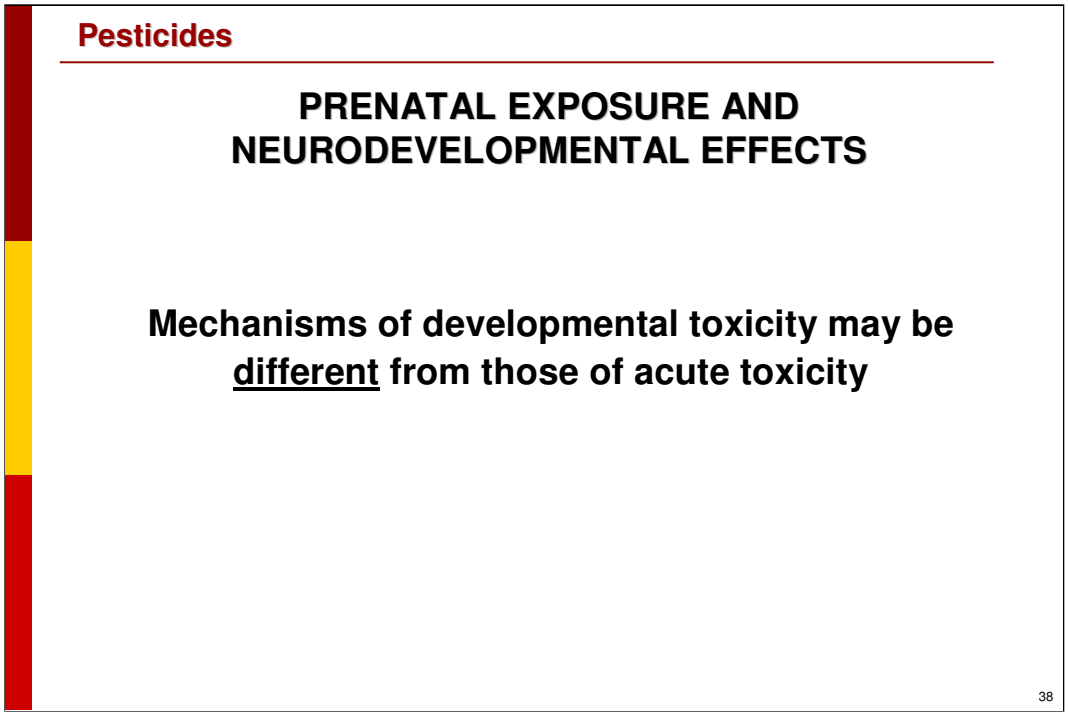
•alteration of serotoninergic system; and

•altered synaptogenesis and programming of synaptic function.

*Ref:*

•Slotkin TA. Guidelines for developmental neurotoxicity and their impact on organophosphate pesticides: a personal view from an academic perspective, Neurotoxicology, 2004, 25:631.

*The appropriate regulation of drugs, chemicals and environmental contaminants requires the establishment of clear and accepted guidelines for developmental neurotoxicity. Ideally, these guidelines should encompass the ability to assess widely disparate classes of compounds through routine tests, with high throughput and low cost. Increasingly, however, the progress in primary research from academic laboratories deviates from this goal, focusing instead on categorizing novel effects of toxicants, development of new testing paradigms, and extension of techniques into molecular biology. The differing objectives of academic science as opposed to those of regulatory agencies or industry, are driven in part, by the priorities of the agencies that fund primary research. Recent work on organophosphate pesticides (OPs) such as chlorpyrifos (CPF) illustrate this dichotomy. Originally, OPs were thought to affect brain development through their ability to elicit cholinesterase inhibition and consequent cholinergic hyperstimulation. This common mechanism allowed for parallels to be drawn between standard measures of systemic toxicity, gross morphological examinations, and exposure testing utilizing an easily-assessed surrogate end-point, plasma cholinesterase activity. In the past decade, however, it has become increasingly evident that CPF, and probably other OPs, have direct effects on cellular processes that are unique to brain development, and that these effects are mechanistically unrelated to inhibition of cholinesterase. The identification and pursuit of these mechanisms and their consequences for brain development represent new and exciting scientific findings, while at the same obscuring the ability to sustain a uniform approach to neurotoxicity guidelines or biomarkers of exposure. In the future, a new set of test paradigms, relying on primary work in cell culture, invertebrates, or non-mammalian models, followed by more targeted examinations of specific processes in mammalian models, may unite cutting-edge academic research with the need for establishing flexible guidelines for developmental neurotoxicity.*



Acetylcholinesterases are enzymes that play a direct role in axonal outgrowth and neuronal differentiation. Exposure to organophosphorus pesticides inhibits the enzymes and may therefore interfere with this function. The pesticides chlorpyrifos and diazinon alter axonogenesis, synaptogenesis and programming of synaptic functions. The mechanisms of action postulated are: serotonergic system alteration and inhibition of RNA synthesis in neurones and glial cells. Data suggest that some of the toxicity is from the parent compound rather than the active metabolite and occurs independently of the cholinergic systems that are responsible for acute toxicity.

And, these neurodevelopmental toxicities occur at exposure levels too low to cause overt symptoms of cholinesterase inhibition in the pregnant animals.

## Pesticides

# CHRONIC NEUROLOGICAL EFFECTS

- **Neurological sequelae of acute poisoning**
- **Neurological symptoms due to high indoor levels of pesticides**
- **Subtle changes in memory and attention**

39

It may be difficult to differentiate the effects of prenatal exposure from exposure in early childhood, or sequelae of non-fatal acute poisonings.

Chronic neurobehavioural and neurological effects after acute poisoning with organophosphorus pesticides have been reported in adults.

Memory and concentration problems, unusual fatigue, irritability and depression, visual difficulties and delayed polyneuropathy have been described.

In a well-documented case of chronic organophosphorus pesticide poisoning, the house of an infant with hypertonia, first diagnosed as cerebral palsy, was found to have high levels of chlorpyrifos weeks after a professional application (*Wagner, 1994*).

Few studies have examined the neurobehavioural effects of postnatal exposure to pesticides.

Subtle changes in short-term memory and attention may be associated with application of organophosphorus pesticides in the home.

There is increasing evidence, particularly from animal models, about neurobehavioural effects of long-term exposure to low levels of pesticides.

*Refs:*

## PESTICIDES AND CHILDHOOD CANCER

**Some studies have found an association between postnatal pesticide exposure and an increased risk of paediatric cancer**

- **Brain tumours**
- **Acute lymphocytic leukaemia**
- **Non-Hodgkin lymphoma**

A number of epidemiologic studies have found a significant association between cancer and domestic exposure to pesticides.

Evidence is increasing, but still limited because of the methodological weaknesses of the research.

Investigations in children living in the rural areas of developed countries have also produced limited evidence.

*Refs:*

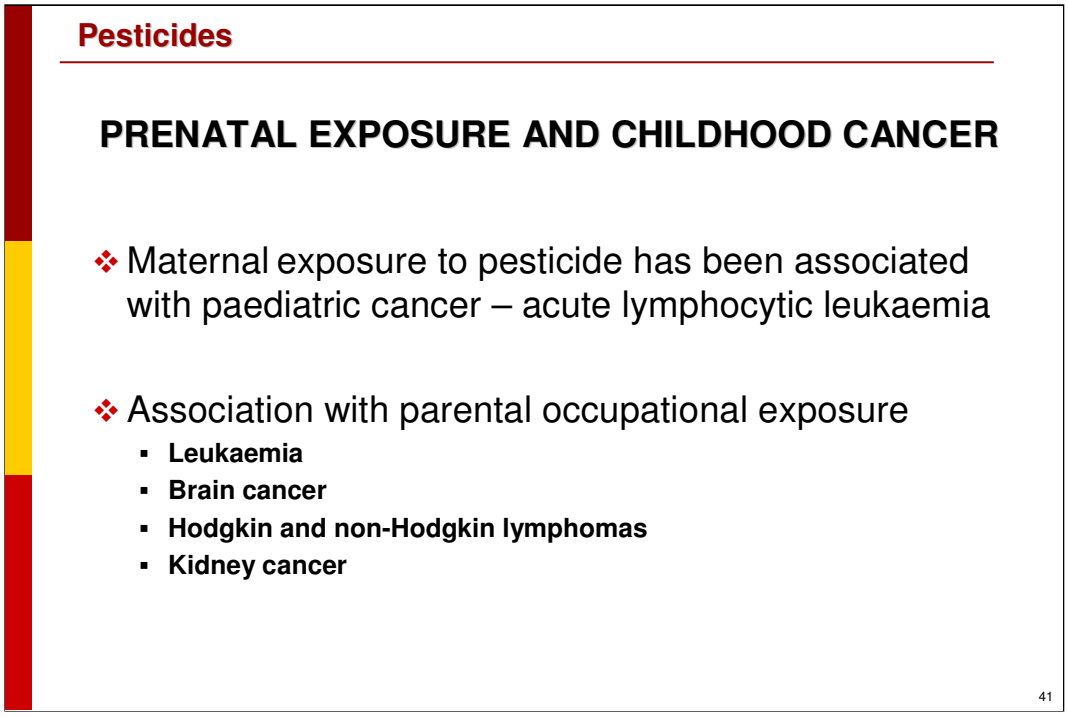
•Borkhardt A et al. Congenital leukaemia after heavy abuse of permethrin during pregnancy. *Arch Dis Child Fetal Neonatal Ed.* 2003, 88:F436.

•Daniels JL et al. Residential pesticide exposure and neuroblastoma. *Epidemiology,* 2001. 12:20.

•Leiss JK et al. Home pesticide use and childhood cancer: a case-control study. *Am J Public Health*, 1995, 85:249.

•Ma X et al. Critical windows of exposure to household pesticides and risk of childhood leukaemia. *Environ Health Perspect*, 2002, 110:955.

•Pogoda JM et al. Household pesticides and risk of pediatric brain tumors. *Environ Health Perspect,* 1997, 105:1214.



Prenatal exposure has been associated with leukaemia in a newborn after intensive use of permethrin at home by the pregnant mother. Children with certain metabolic enzyme polymorphisms have an increased risk of acute lymphocytic leukaemia when exposed to pesticides *in utero* or during pregnancy (particularly 2,4-D herbicide). Brain cancer appears to be associated to maternal exposure during agricultural activities. There are some controversial studies that suggest an increased risk of cancer in children whose parents had occupational exposure to pesticides.

*Refs:*

•Efird JT et al. Farm-related exposures and childhood brain tumours in seven countries: results from the SEARCH International Brain Tumour Study. *Paediatr Perinat Epidemiol*, 2003, 17:201.

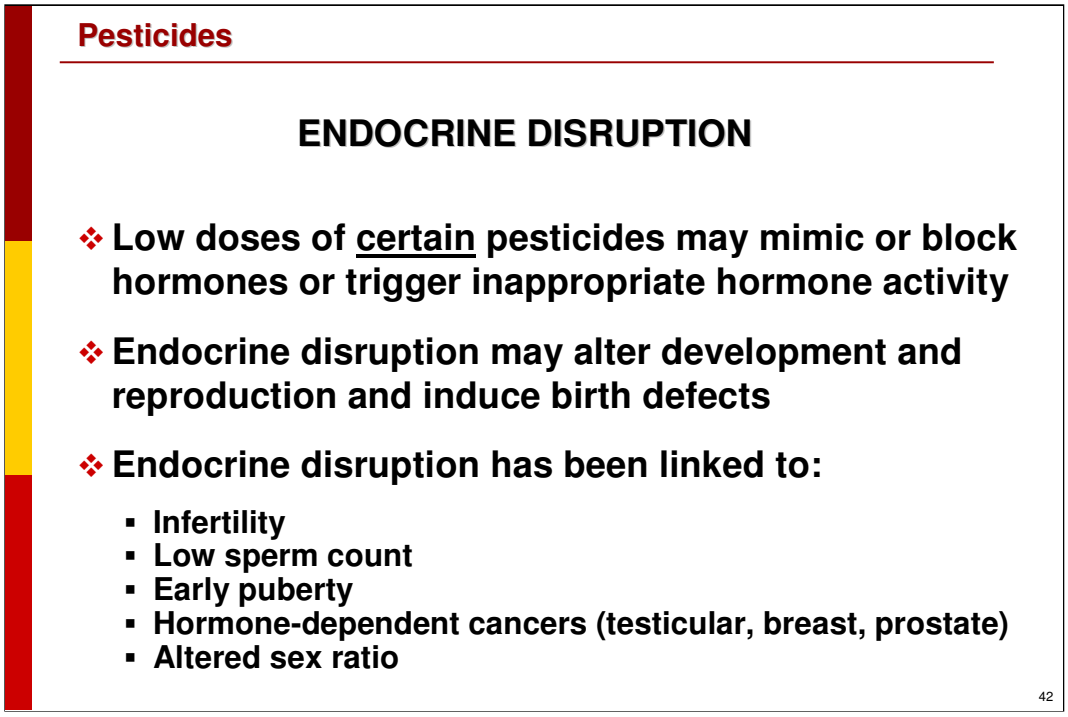
•Zahm SH et al. Pesticides and childhood cancer. *Environ Health Perspect*, 1998, 106:893.



Endocrine disruption is not an effect, but a *mechanism* of toxicity that may have different effects.

Evidence of the effect related to this mode of toxicity in children is still limited.

There is experimental evidence of endocrine disruption. Pesticides may have:

•estrogenic effects (DDT, dieldrin, endosulfan, methoxychlor)

•anti-androgenic effects (DDT, vinclozilin, procymidone)

•anti-thyroid effects (ethylenethiourea (ETU), maneb, zineb metabolites)

•anti-progestin effects (DDT).

Synthetic pesticides may interfere with the natural process of development.

## Pesticides

# IMMUNOTOXICITY

- **Immunotoxicity is suspected, but evidence is limited**

**Studies in Arctic zone:**

- **Higher incidence of ear infections**
- **Cytokine panel abnormalities**

*www.smithsonianmag.si.edu/smithsonian/issues04/jan04/images/topdogs_mush_jpg.html*

43

Evidence on the immunotoxic mode of action and effects is limited. Studies from the Arctic zone and Europe are beginning to provide some evidence. Children contaminated with chlordane and heptachlor had cytokine panel abnormalities.

Inuit infants from the Artic exposed *in utero* and to breast milk contaminated with *p,p´*-DDE, hexachlorobenzene and dieldrin had an elevated risk of otitis media.

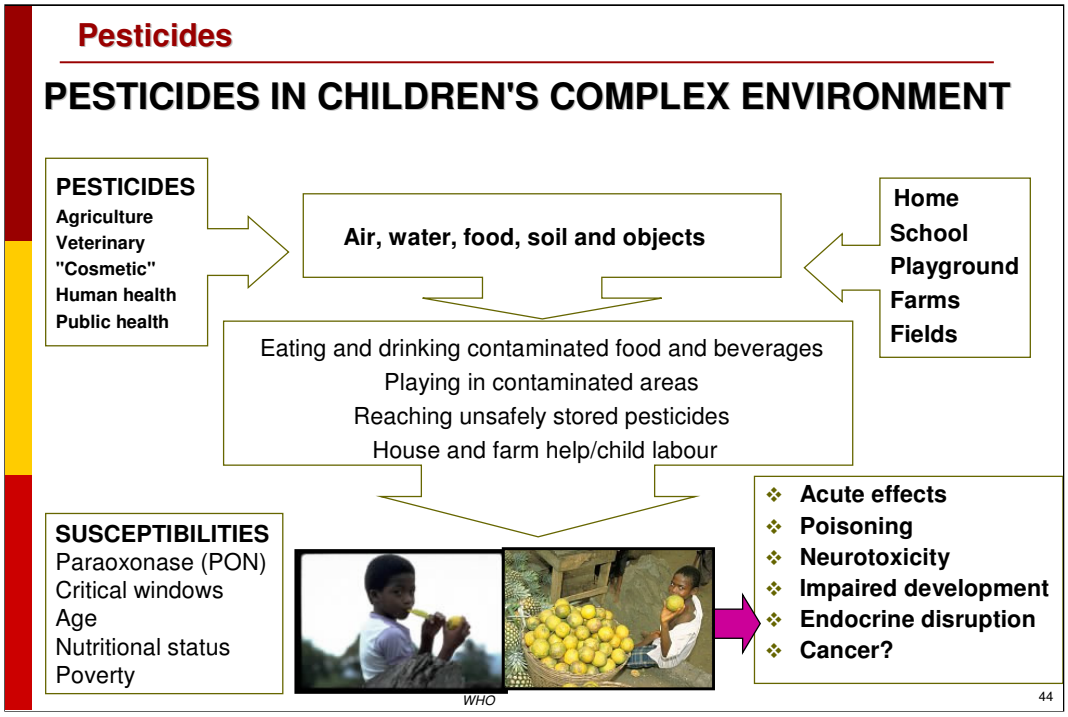
*Copyright © Smithsonian Institution, 2002. All rights reserved.*



This summary slide shows the complexity of the issues related to children's environmental exposure to pesticides and the effects on their health.

Pesticides used in agriculture, treatment of animals, on lawns ("cosmetic"), and for protection of human and public health may enter the air, food, water and soil in the places where children spend most of their time (e.g. at home, at school, in playgrounds, on farms and in fields) and may also contaminate their toys, floors, carpets and materials in their playgrounds.

Children become exposed by:

•eating and drinking contaminated food and beverages

•playing in contaminated areas

•gaining acces to unsafely stored pesticides, or pesticides stored in attractive, colourful containers

•helping in the house and on the farm or as child labour

•Contact with clothing or shoes of working parents

**Children have special susceptibilities related to:**

•paraoxonase (PON) - it catalyzes the hydrolysis of toxic metabolites and can protect against pesticide toxicity, which then depends on the PON genotypes

•critical windows of susceptibility

•age

•nutritional status

•poverty

Exposure may lead to:

•acute effects including irritation of the skin or eyes, coughing, lacrimation

•poisoning, with systemic effects

•neurotoxicity

•impaired development

•endocrine disruption

•cancer

## Pesticides

# OBSOLETE PESTICIDES

Obsolete pesticides are pesticides that can no longer be used for their intended purpose or any other purpose.

They may include:

- Pesticides in liquid, powder or dust, granule, emulsion form.
- Empty and contaminated pesticide containers
- Heavily contaminated soil
- Buried pesticides

Causes of obsolete pesticides:

- Use prohibited for health/environmental reasons
- Product deteriorated as result of improper or prolonged storage
- Product not suitable for intended use and cannot be used for other purposes, nor can it easily be modified to become usable.

Obsolete, unwanted and banned pesticides are serious environmental hazards. Leaking and corroding metal drums filled with obsolete and dangerous pesticides dot urban and rural landscapes of developing countries around the world. These chemical leftovers have become villains in the agricultural world they were designed to help, affecting not only a nation's agriculture and its environment, but also fundamentally the health of its people and consequently development in general be it in rural areas or under urban conditions.

This global environmental tragedy is a direct result of several decades of mishandling and misuse, but is most dramatic in the developing world where there is no awareness of the inherent danger of pesticides. The unaware therefore draw water from contaminated site for own survival and that of their animals.

Obsolete pesticides may include: **<<READ SLIDE>>**

Most of the affected countries are under tropical conditions where agricultural and vector pests flourish both in diversity and numbers. Migratory pests such as locusts, grasshoppers, grain eating birds, storage pests, rodents, etc. inflict untold damage to agriculture and bring about hunger or misery when they are at their peak.

Poor nations have been led to believe that the only alternative to combat pests agricultural or otherwise effectively is only by using pesticides. The poor or the unaware never think for a moment that pesticides are poisonous and that they are dangerous to life. Most believe that pesticides are like medicines. They consider that they kill pests selectively and are therefore less harmful to humans, animals and plants. Governments save budgets to purchase pesticides on regular basis. Also constantly plead to donors and organizations for assistance either for direct supply of pesticides or for contributions of financial support for purchasing them. In response, donors and organizations supply pesticides.

Recipient countries anxious to minimize pest damages to the minimum or, being less aware of the negative consequences, usually receive pesticides from every possible source and direction. This leads to uncoordinated influx of pesticide donations and trading, subsequently giving rise to excessive supply. While some of the donations are genuine, others take the opportunity to dump unwanted and illegal pesticides on the poor and unsuspecting countries. Pesticides reach individual farmers or household dwellers that value pesticides dearly. They keep them in their houses, with their food and animals. Pesticide vendors take the opportunity to promote pesticides aggressively. It is not uncommon to find pesticides being stored in the open or in heavily populated zones and usually in substandard stores and sold along with food and drinks, etc. Children are used in advertising sales of pesticides and often get easy access to pesticides.

They play with empty pesticide cans and use them for drinking water or milk. Most pesticide cans litter high streets or are simply dumped in open municipality dumps for subsequent open burning leading to serious emissions of dioxins.

Common causes of obsolete pesticides include the following:

•Use of the product has been prohibited or severely restricted for health or environmental reasons (e.g. through banning; withdrawal of registration, or policy decision by relevant government agencies)

•The product has deteriorated as a result of improper or prolonged storage and can no longer be used according to its label specifications and instructions for use, nor can it easily be reformulated to become usable again.

•The product is not suitable for its intended use and cannot be used for other purposes, nor can it easily be modified to become usable.

Other possible reasons for why we have obsolete pesticide include:

•Banning of pesticides that are still kept in store.

•Aggressive pesticide sales, promotions and distributions by the Chemical Industry.

•Difficulties in forecasting outbreaks of pest.

•Inappropriate assessment of pesticide requirements.

•Insufficient application capacity.

•Inappropriate formulations or substandard containers.

•Excessive donations: these are usually inappropriate because they are not received when needed most (i.e. late arrival of donations or out of season delivery), or are uncoordinated with similar donations from various sources. Such are tantamount to dumping.

•Inadequate storage facilities and lack of staff trained in storage management (i.e. poor stock taking and lack of records).

•Ineffective distribution or poor marketing systems for pesticides (government or private sector or both).

•Lack of awareness of the inherent dangers of pesticides.

•Misuse of pesticide containers (e.g. for a variety of domestic uses, water containers, food storage, use for pot plants, etc.).

Notes from FAO: www.fao.org/WAICENT/FAOINFO/AGRICULT/AGP/AGPP/Pesticid/Disposal/index_en.htm

## OBSOLETE PESTICIDES

Disposal of obsolete pesticides:

- United Nations Food and Agriculture Organization has developed a set of guidelines for disposal.
- Contact your local authorities for advice on disposal.

FAO

Disposal of obsolete pesticides:

•In many countries, obsolete pesticides are a problem. The United Nations Food and Agriculture Organization have developed a set of guidelines for disposal, available at: *www.fao.org/WAICENT/FAOINFO/AGRICULT/AGP/AGPP/Pesticid/Disposal/index_en.htm*.

•Contact your local authorities for advice on disposal.

*WHO Recommended Classification by Hazard* contains a table of active ingredients (available at: www.inchem.org/documents/pds/pdsother/class.pdf) believed to be obsolete or discontinued for use as pesticides.

**<< NOTE TO USER: Do you have stockpiles of obsolete pesticides in this country? If so, what is the reason for it?>>**

*Notes from FAO:*
*www.fao.org/WAICENT/FAOINFO/AGRICULT/AGP/AGPP/Pesticid/Disposal/index_en.htm*

Pesticides

## PREVENTION OF EXPOSURE

**What can be done to prevent pesticide exposure and poisoning ?**

WHO

❖ **Take action at**

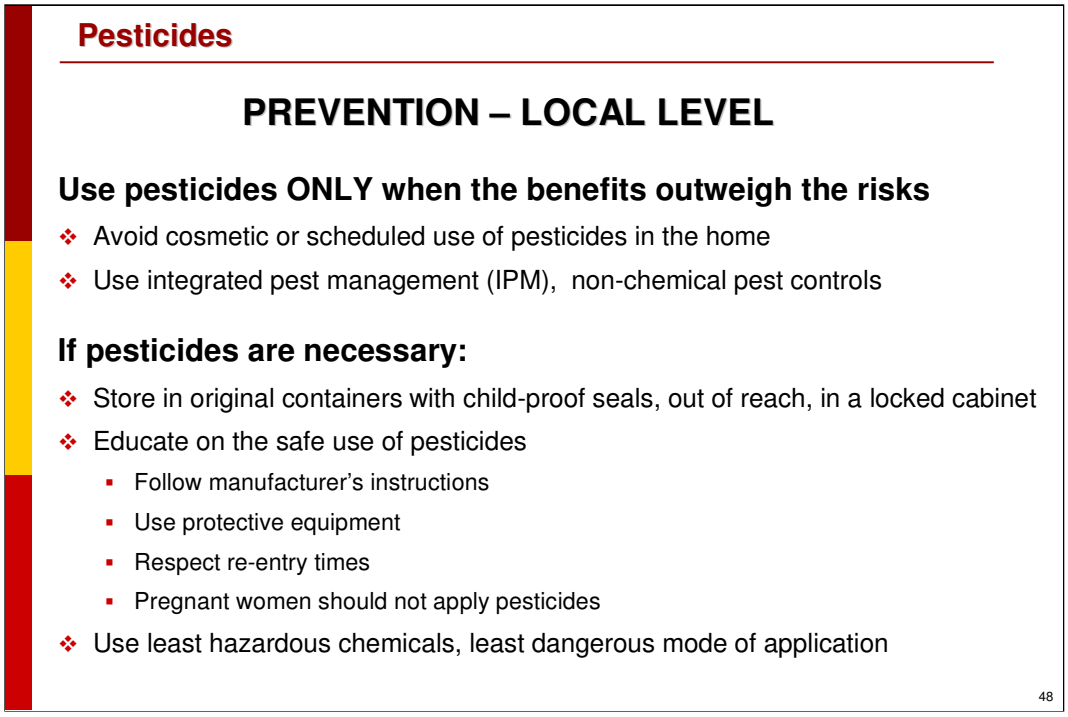
- **Local level**
- **National level**
- **International**

47

**<<READ SLIDE.>>**

Because of the potential for long-term damage to critical structures such as the nervous system, immune system and endocrine system, prevention of all acute poisoning events as well as of exposure to low doses during development is a high priority for ensuring children's environmental health. There are many steps that can be taken at the local/practice level, national/government level and international treaty/trade levels to decrease exposure to pesticides and related illnesses.

*Picture: WHO, L. De Toledo. Ethiopia*



Pesticides should be used only when the benefits outweigh the risks, and non-chemical pest control procedures have failed.

Cosmetic use of pesticides, that is their use to control aesthetically unpleasant plants or non-dangerous insects such as crickets or house millipedes, should be completely avoided.

Integrated pest management (IPM) procedures which include hygiene, sealing of cracks and crevices, screening of doors and windows, and other measures should be the first line of defence for pest management.

If pesticides must be used, they should be stored only in their original containers with manufacturer's labels intact, preferably with child-proof seals, out of the reach of children and in locked cabinets or cupboards.

Users should always follow the safety precautions specified by the manufacturer and observe all safety recommendations including use of gloves, masks, protective clothing and observation of re-entry times (the time when it is safe to return to a treated area).

Pregnant women should not apply pesticides and particular care should be taken to determine appropriate re-entry times for pregnant women, infants and small children. These times may be considerably longer than for less vulnerable individuals.

If chemicals are required, the least hazardous chemical (when there is scientific evidence of less toxicity) should be used with the most contained mode of distribution considered effective. For example, fogs and bombs should not be used. Bait stations are preferable to baseboard sprays or crack and crevice treatment. Granules and bait stations should be used only if they are inaccessible to babies, toddlers and small children (and pets).

# PREVENTION – COMMUNITY LEVEL

- **Integrated pest management (IPM)**
  - **Homes**
  - **Schools**
  - **Public buildings**
  - **Health centres**
  - **Public parks**
- **Community activities**
  - **Community campaigns**
  - **School activities**
  - **Local awards or contests**
  - **Pesticide-free "zones"**
  - **Support organic farming**

*WHO*

49

Many organizations (especially FAO and WHO) promote alternative non-chemical forms of pest-control and there is increasing engagement in non-pesticide dependent agriculture and integrated pest management (IPM).

A variety of local initiatives involving the community can help to create an environment that promotes decreased dependence on pesticides in homes, schools, public areas, health facilities and parks.

Examples of community activities include:

•community campaigns and school activities

•local awards or contests

•pesticide-free "zones“

•support for organic farming

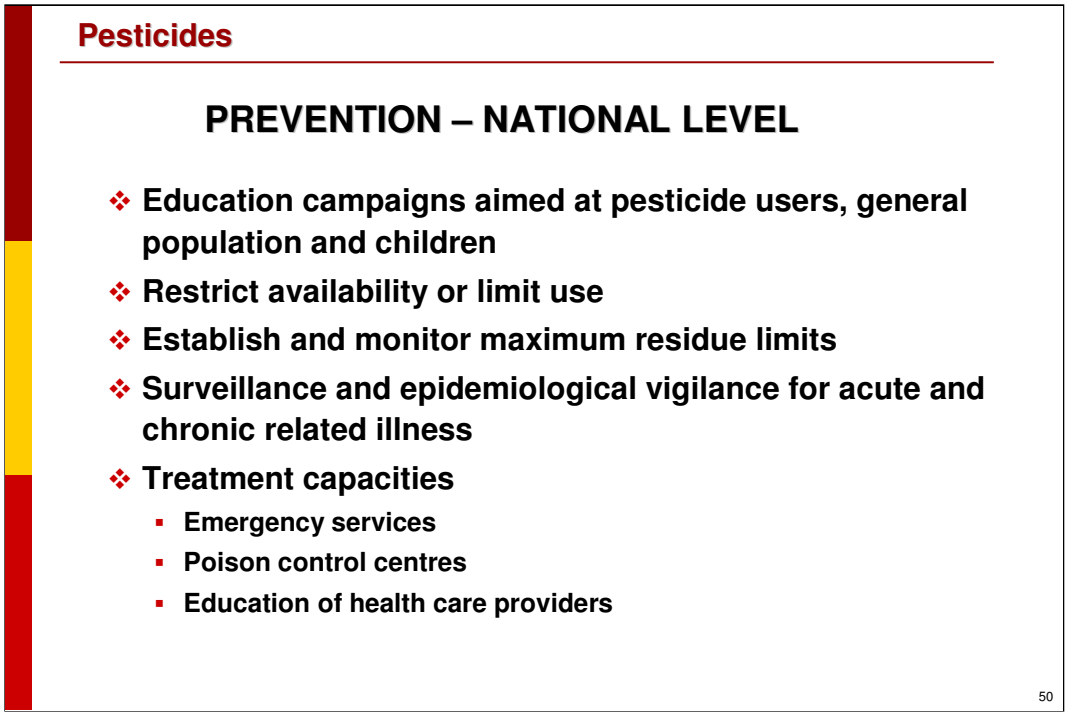
**<<READ SLIDE.>>**

*Picture: WHO, P. Virot. Plants at the Biofarm, Ethiopia, June 2002.*



Education is a key component of safe pesticide use and prevention of toxic exposures. Farmers, pesticide applicators and their families need to be informed and educated on how to recognize and prevent pesticide poisonings. Trained or licensed pesticide applicators can maximize preventive measures.

Bans and restrictions on use of pesticides found to be highly toxic or persistent in the environment have been successful; severe poisonings are seen less frequently than in the past. For example, organochlorine poisoning no longer occurs in countries that restrict their uses to a specific agricultural application and have banned domestic use.

A major change in regulatory approaches to pesticides occurred when the US Congress passed the Food Quality Protection Act in 1996. This law requires the US Environmental Protection Agency to set residue levels for foods to protect the most vulnerable populations, specifically infants, children and fetuses (pregnant mothers) from harm due to cumulative exposure taking into account all routes of exposure. This law has led to the restrictions on use and voluntary withdrawal from the market by manufacturers of several previously widely used pesticides (e.g. chlorpyrifos and diazinon).

Pesticide manufacturers and governments should follow the voluntary FAO International Code of Conduct on the Distribution and Use of Pesticides.

## Pesticides

### PREVENTION – INTERNATIONAL LEVEL

- **Persistent organic pollutants (POPs) Stockholm Convention**
- **Hazardous chemicals and pesticides Rotterdam Convention (PIC)**
- **International organizations: WHO, IFCS, FAO, ILO**

Pronczuk 51

Nine of the 12 persistent organic pollutants (POPs) included in the Stockholm Convention, are pesticides (aldrin, chlordane, DDT, dieldrin, endrin, heptachlor, mirex, toxaphene and hexachlorobenzene). This convention, under the auspices of United Nations Environmental Programme became effective in May 2004, after it was signed by 50 countries.

The Rotterdam Convention on the Prior Informed Consent (PIC) procedure for certain hazardous chemicals and pesticides was adopted in September 1998, and has been signed by 73 countries. The convention establishes a first line of defence against toxic chemicals, giving importing countries the power to receive information and decide which potentially hazardous chemicals they want to receive. It also covers labelling requirements. The convention includes 22 pesticides.

Other international organizations such as the Intergovernmental Forum for Chemical Safety (IFCS), the International Labour Organization (ILO) and others are working towards safer use and monitoring of pesticides at the global level.

IFCS: Intergovernmental Forum for Chemical Safety

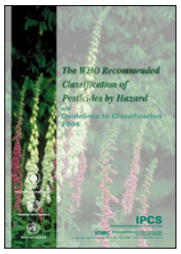
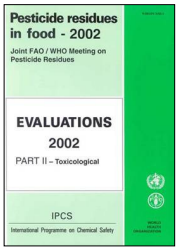
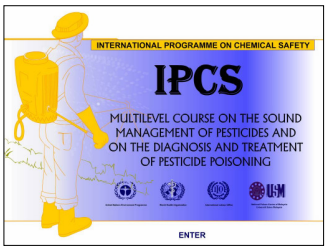
# PESTICIDES AND CHILDREN: ACTIVITIES IN WHO

1. **Guidelines for the classification of pesticides by hazard**
2. **Joint FAO/WHO Meeting on Pesticide Residues**
3. **International pesticide limits in water**
4. **Training manual on pesticides**
5. **Poison centres and pesticide exposures**







*WHO*

52

1. WHO guidelines for the classification of pesticides by hazard. The WHO Recommended Classification of Pesticides by Hazard was approved by the 28th World Health assembly in 1975 and has since gained worldwide acceptance. Guidelines were first issued in 1978, and have since been revised and reissued at 2-yearly intervals. *Ref: IPCS. The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification 2000-2002.* Geneva, World Health Organization, 2002.

2. The Joint FAO/WHO Meeting on Pesticide Residues (JMPR) is an international expert scientific group that is administered jointly by the Food and Agriculture Organization of the United Nations (FAO) and the World Health Organization (WHO). JMPR, which consists of the FAO Panel of Experts on Pesticide Residues in Food and the Environment and the WHO Core Assessment Group, has been meeting regularly since 1963. During the meetings, the FAO Panel of Experts is responsible for reviewing information on residues and analytical aspects of the pesticides under consideration, including data on their metabolism, fate in the environment, and use patterns, and for estimating the maximum levels of residues that might occur as a result of the use of the pesticides according to good agricultural practices. The WHO Core Assessment Group is responsible for reviewing toxicological and related data and for estimating, where possible, acceptable daily intakes (ADIs) for humans of the pesticides under consideration.

*Ref:* www.who.int/ipcs/food/jmpr/en

The Codex Alimentarius Commission was created in 1963 by FAO and WHO to develop food standards, guidelines and related texts such as codes of practice under the Joint FAO/WHO Food Standards Programme. The main purposes of this Programme are protecting the health of the consumers and ensuring fair trade practices in the food trade, and promoting coordination of all work on food standards undertaken by international governmental and nongovernmental organizations. Ref: www.codexalimentarius.net/web/index_en.jsp

3. International pesticide limits in water. WHO produces international norms on water and health in the form of guidelines.

## CRITICAL ROLE OF HEALTH AND ENVIRONMENT PROFESSIONALS

WHO

- Diagnose and treat
- Publish, research
  - Sentinel cases
  - Community-based interventions
- Educate
  - Patients and families
  - Colleagues and students
- Advocate
- Provide role model

Health and environment professionals have a critical role to play in maintaining and stimulating changes that will restore and protect children's environmental health, and protect them from pesticide exposure.

Health care providers can do something. At the one-to-one level with the patient, they can include pesticide poisoning in the differential diagnoses and in preventive advice. They can be dissatisfied with the diagnosis of "idiopathic" in cases of paediatric disease and look harder for evidence pointing to pesticides as a potential cause of disease and disability. They can ask specific questions about the use of pesticides within the home, in the garden or farming areas, or about potential pesticide residues in fruit and vegetables. Which pesticides are being used? When? Where? How? What safety and hygiene measures are being taken? Are the instructions being read and followed?

They can publish sentinel cases and develop and write about community-based interventions in relation to pesticides. They can educate patients, families, colleagues and students didactically to diagnose, treat and prevent pesticide poisonings and exposures. They can discourage chemical pesticide use and encourage integrated pest management. They can also provide information about the local Poisons Centre or other sources of information on pesticides.

As professionals with an understanding of both health and the environment, health care providers are powerful role models who can practice integrated pest management, be advocates for strict pesticide laws and regulations, proper labelling of pesticide products and child-proof containers for all pesticide products.

# POINTS FOR DISCUSSION

**<<NOTE TO USER: Add points for discussion according to the needs of your audience.>>**

## Pesticides

# CASE STUDY

- **A family with two children ages 8 months and 6 years are referred to the clinic with concerns of pesticide exposure.**
- **They are worried because their apartment was sprayed with pesticides for termites 3 times when the mother was pregnant with her 6 year old son. She remembers feeling dizzy and fatigued during that period but attributed it to the pregnancy.**

**<<READ SLIDE>>**

The setting is present day New York City, United States. This family is poor and lives in low income housing that was likely sprayed multiple times for termites. The most commonly used pesticide at that time was chlorpyrifos.

## Pesticides

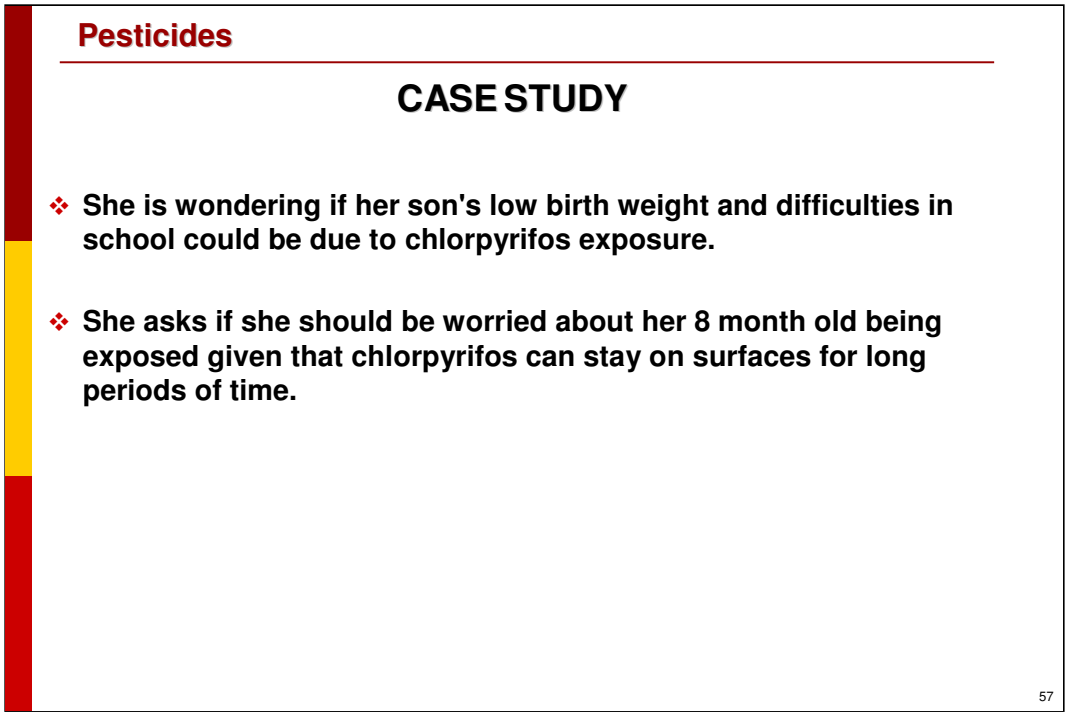
### CASE STUDY

- **Her six year old was born at low birth weight for gestational age and has been behind in meeting developmental milestones. He now has behavioural problems and is behind in reading in school.**
- **She recently read in the newspaper that chlorpyrifos is not being used in residential settings in the US because it stays on surfaces for long periods of time and may have harmful health effects.**

56

Read the Slide

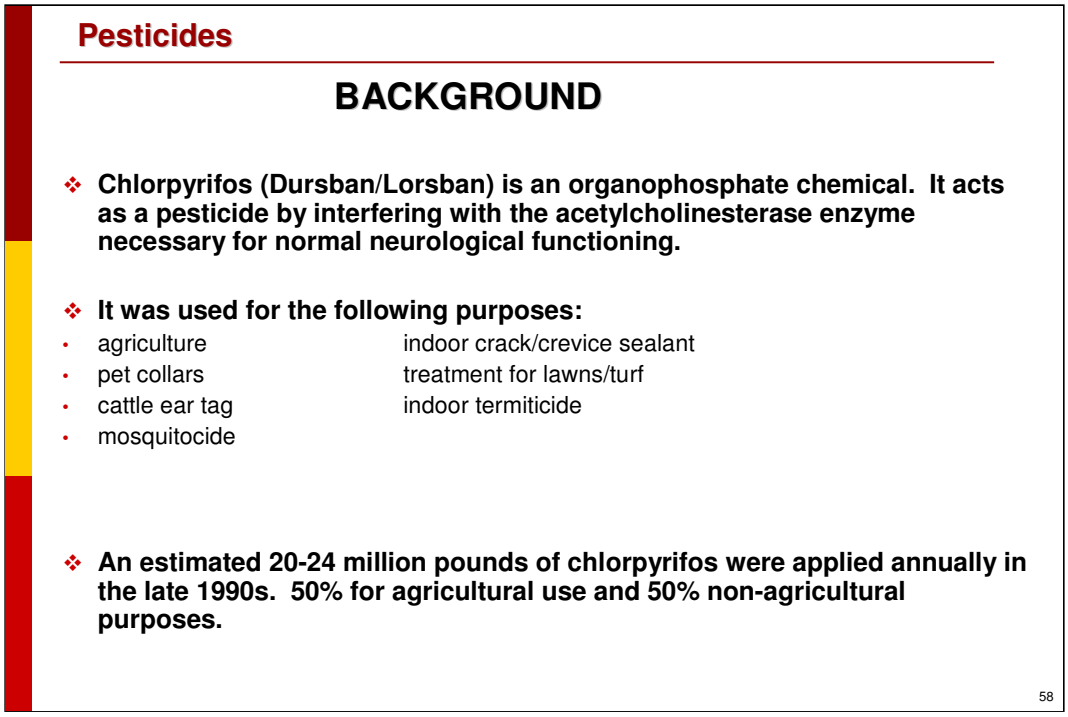
The mother was told by someone at work that there was a newspaper article on a pesticide (chlorpyrifos) that was widely used in their part of New York. It stated that the the US Environmental Protection Agency phased out its use because of adverse health effects. The article pointed out that mothers who were exposed to chlorpyrifos prenatally may have delivered low birth weight babies.



As we know, pediatricians treat the entire family not just individual children. This case brings up a number of interesting points regarding each family member.

Pre-Test

1. What are the problems lists for the 6 year old and 8 month old?
2. What differential diagnoses would you consider for the 6 year old?
3. What further history do you want?
4. How would you further evaluate and manage these patients?
5. What is the likelihood that prenatal chlorpyrifos exposure is related to the 6 year old's health problems?



Chlorpyrifos is in the organophosphate family of chemicals. It is a known human toxin that persists in the environment for decades. Chlorpyrifos is released into the environment and can travel through waterways and sediments to enter the food supply by way of farming or the fish/animal supply. It is ubiquitous in all parts of the world.

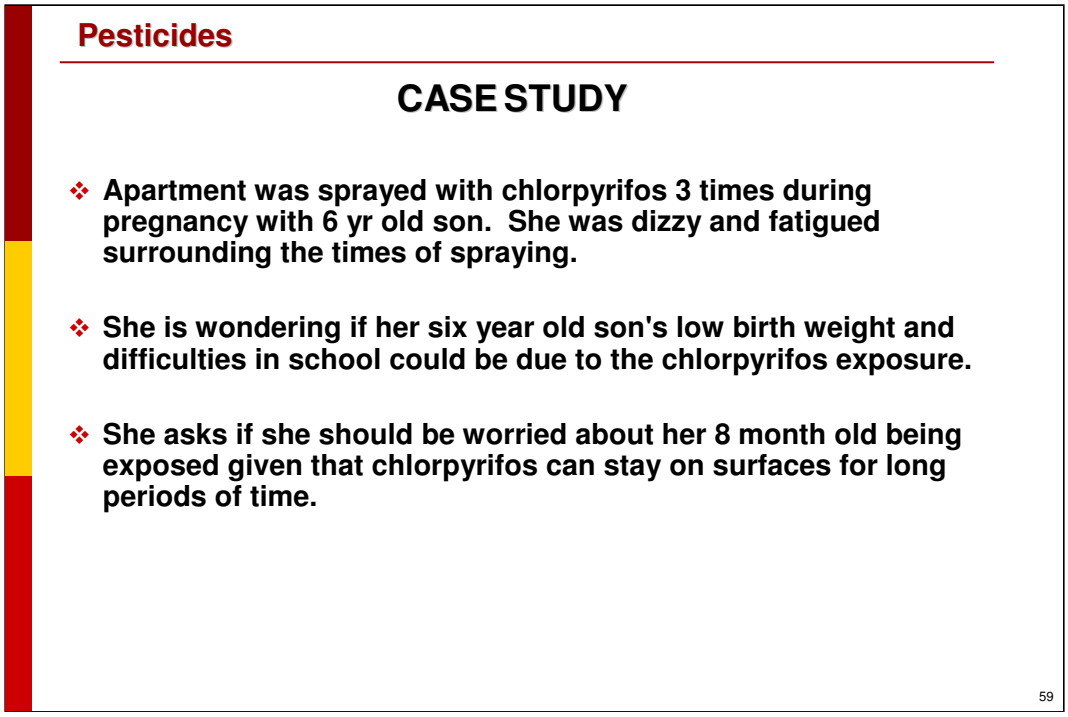
It has been used in farming extensively as a pesticide thereby exposing numerous food crops to its residues.

It has been used as an insecticide for termites and mosquitoes. It has been used as an indoor crack/crevice sealant, for pet collars, and as treatment on lawns, turf or pastures.

US EPA estimates that 20-24 million pounds of chlorpyrifos were applied annually in the late 1990s. Mitigation measures were put into place in the US in 2000 to phase out uses near or in schools, homes, parks, and daycare centers and to restrict uses in agricultural settings.

*Ref:*

US EPA Website Organophosphate Pesticide Information



Now, let's go back to the original case.

What does this information tell you and what more do you want to know?

1. First, this mother was exposed when she was pregnant. We would like to know the exact chemicals used and have documentation of the exposure. Also, we need to take a thorough environmental history:
- Exposures to other environmental toxicants (there may be other substances in the household contributing to her health effects during pregnancy)
- What are the occupations of the parents? Are there potential environmental exposures at work?
- When is/was the exposure? Is it continuing currently?
- What are the main effects? We would like to know more about the mother's symptoms during pregnancy (although there does not need to be overt clinical symptoms for low level toxicity).

2. In terms of the six year old son – we would like to know his birth weight, length, and head circumference
- How has his growth has been?
- What is his developmental history?
- What are his activities and what he might be exposed to in the environment?

3. In terms of the 8 month old, we would like to know if he is crawling currently (exposure to floor, carpets, furniture).
- Is he still breastfeeding?
- How has his development been?

**ANSWERS**

Overall, there are not clear cut answers in low dose exposure toxicology as compared to acute exposures. All answers must weigh the scientific evidence of the toxicant against the clinical history and physical exam findings of the patients.

1. Chlorpyrifos exposure in high doses is associated with dizziness and fatigue. The differental diagnosis for her symptoms is long and, it is difficult say whether the mother's symptoms were due to this exposure given that most residential chlorpyrifos sprayings were not associated with overt toxicity.
2. Her son's low birth weight and difficulties in school may be due to a number of factors. Chlorpyrifos has been associated with low birth weight and decreased birth length in inner city newborns whose mothers were exposed during pregnancy. Long term neurodevelopmental outcomes have not been studied to date.
3. The 8 month old is crawling and being exposed to many surfaces in the home. The data has shown that higher levels of chlorpyrifos are inversely correlated with time from application to testing. Most of this data shows that residues persist for 1-2 wks after spraying but with multiple exposures, residues may persist longer.

# CASE STUDY

**What recommendations would you give to this family?**

- **Primary prevention!**
- **Encourage home dust/furniture testing if they think exposure is ongoing**
- **Encourage blood testing for acetylcholinesterase if they are worried about ongoing exposures**
- **Encourage alternatives to pesticides for the future**

## Pesticides

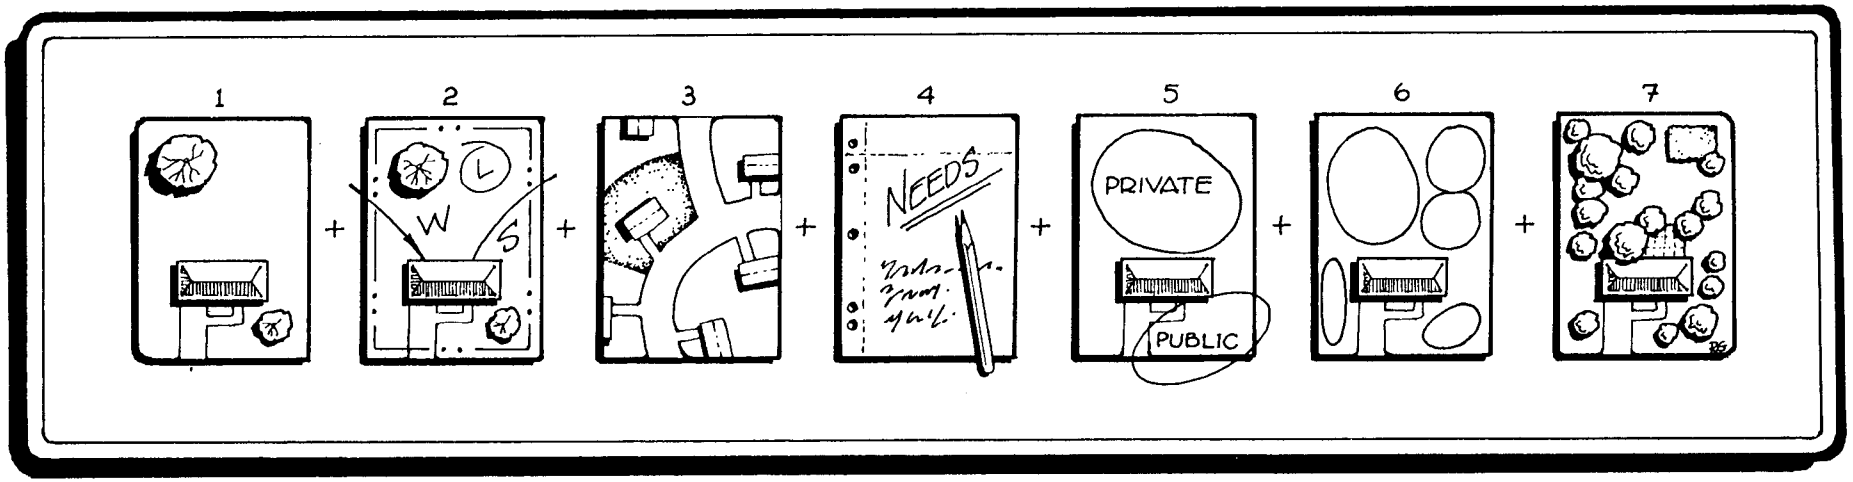
# Introduction

The area around your home is an important part of your living environment. Attractively and functionally landscaped, it can add to your enjoyment of your home. Landscaping can also increase property value, invite wildlife into your yard and conserve energy.

Successful landscaping does not just happen. It requires careful planning and some knowledge of landscape design. You have to consider your home's architectual features, neighborhood landscape character, the effects you want to create, and how you want to use your outdoor living space. It may take several years of planting and construction to achieve your goals, but the first step is planning and designing what you want to end up with.

This publication will guide you step-by-step through planning and designing a landscape appropriate for you and your home. It was written with only slightly landscaped or unlandscaped homes in mind. We emphasize "conventional" landscape design, which usually includes flowers, shrubs, trees and structures arranged in various patterns.

You can get many other landscaping ideas from books, magazines and other publications. Some homeowners may prefer to have a professional landscape architect or landscape nurseryman develop a landscape design.



# Landscape Style Options

In the past, most home landscapes were either formal or informal. Formal designs are geometric and symmetrical, with plants and landscape structures precisely spaced and arranged. Informal designs make use of more natural-appearing, irregularly placed plants and structures.

Today, more people want their home landscape to meet physical and social needs. Partly as a result of the environmental movement, which fostered a greater appreciation for nature, we tend to be more interested in informal or naturalistic designs.

The geometric forms of buildings and natural landscape characteristics both suggest design patterns. As a result, a home landscape that blends geometric and naturalistic patterns is often successful. Today's landscape styles can be divided into categories in which varying proportions of geometric and naturalistic patterns are combined:

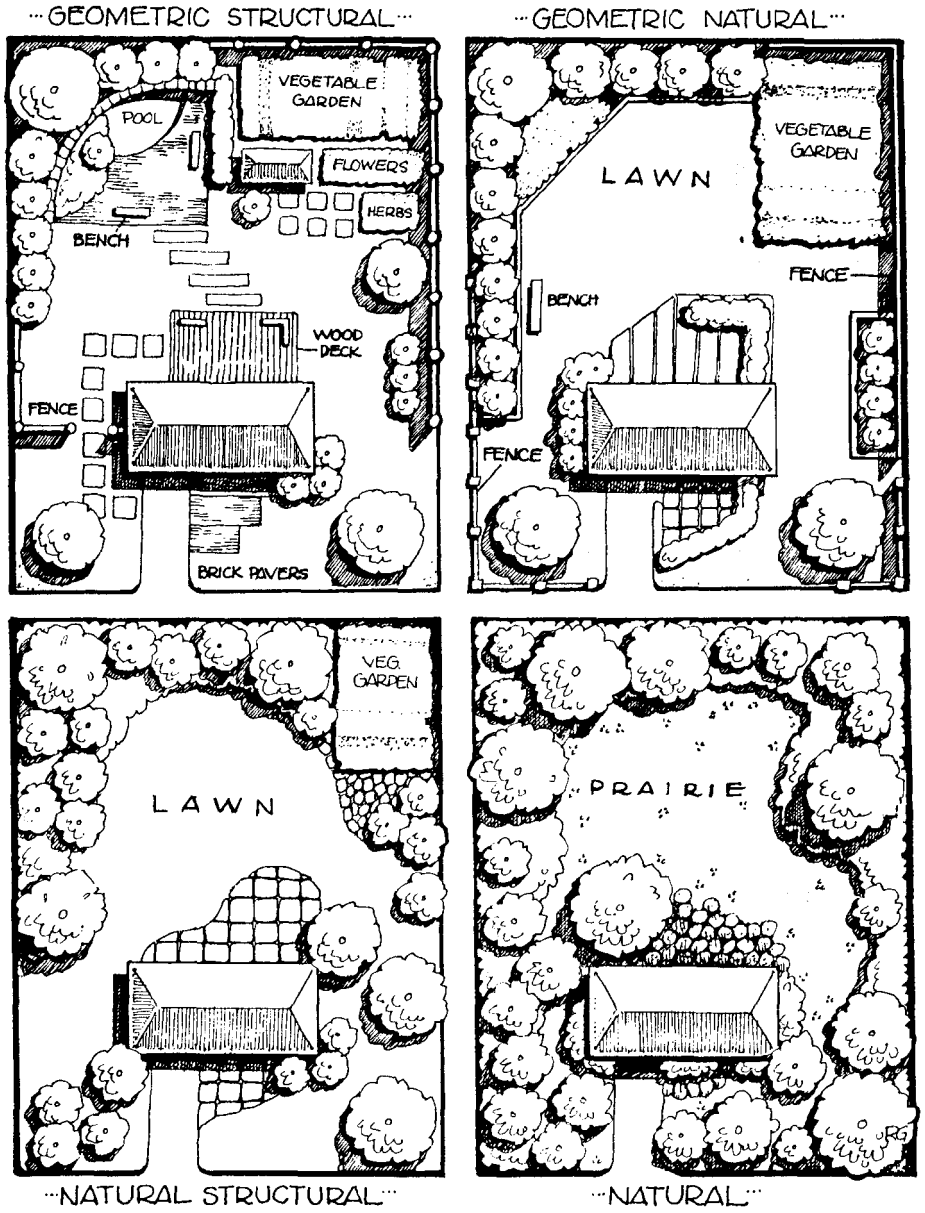
**Geometric-Structural –** geometric structure is primary and plants play a minor role.

**Geometric-Natural –** structure dominates, but plants and other natural elements play an important, perhaps nearly equal role.

**Natural-Structural –** plants, rocks, water and earth forms dominate, but there is a clear sense of geometric arrangement.

**Natural –** natural elements and materials dominate and there is no obvious human-determined form or structure.

As you go through the planning and design steps that follow, you should have in mind which of these general design styles you want to achieve.

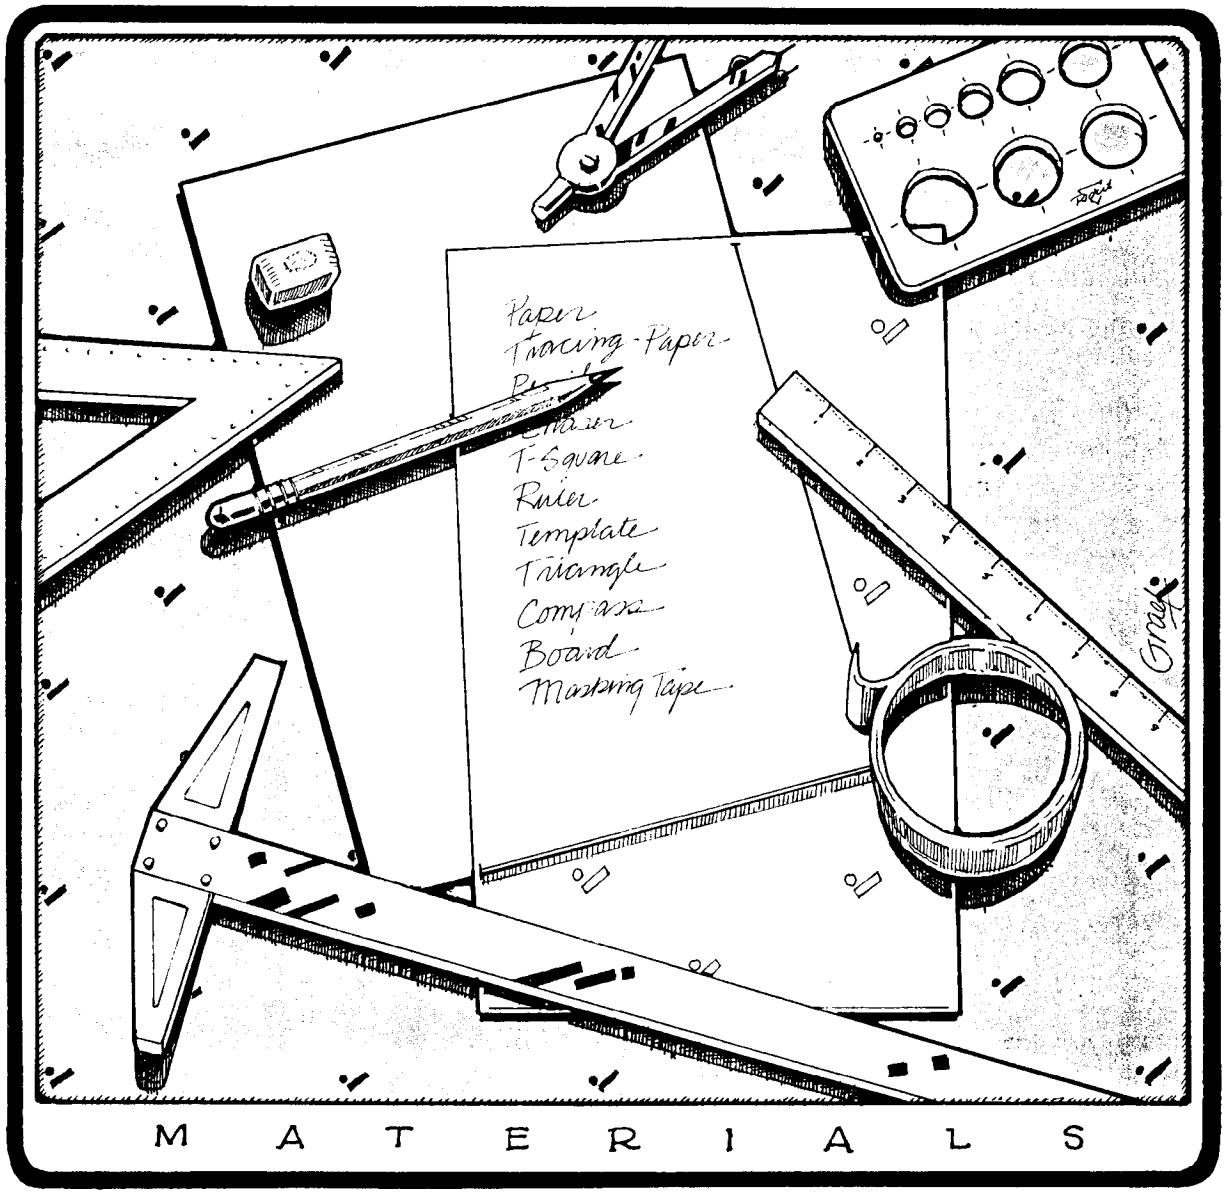


# Landscape Planning

Too often, homeowners plant before they plan. Careful planning will help you avoid errors that may interfere with your final landscape design, such as improper plant selection or placement.

This section takes you through the required planning steps. You will find these items helpful:

–Large white paper or 1/10 or 1/8 inch graph paper (graph paper is easier to use)
–Solid table or board to draw on
–Masking tape to hold paper in place
–Ruler or scale marked in eights or tenths of an inch
–Lead pencil
–Eraser
–Lightweight, “see-through” tracing paper
–T-square, triangle, circle template and compass



## Step 1. Draw a Base Map

If you own a new home, you probably have a lot or plot plan that shows your home in relation to the property boundaries. If you do not have such a plan to work from, you'll need to determine accurately – with a tape measure – where the house is located on the lot. In addition, determine:

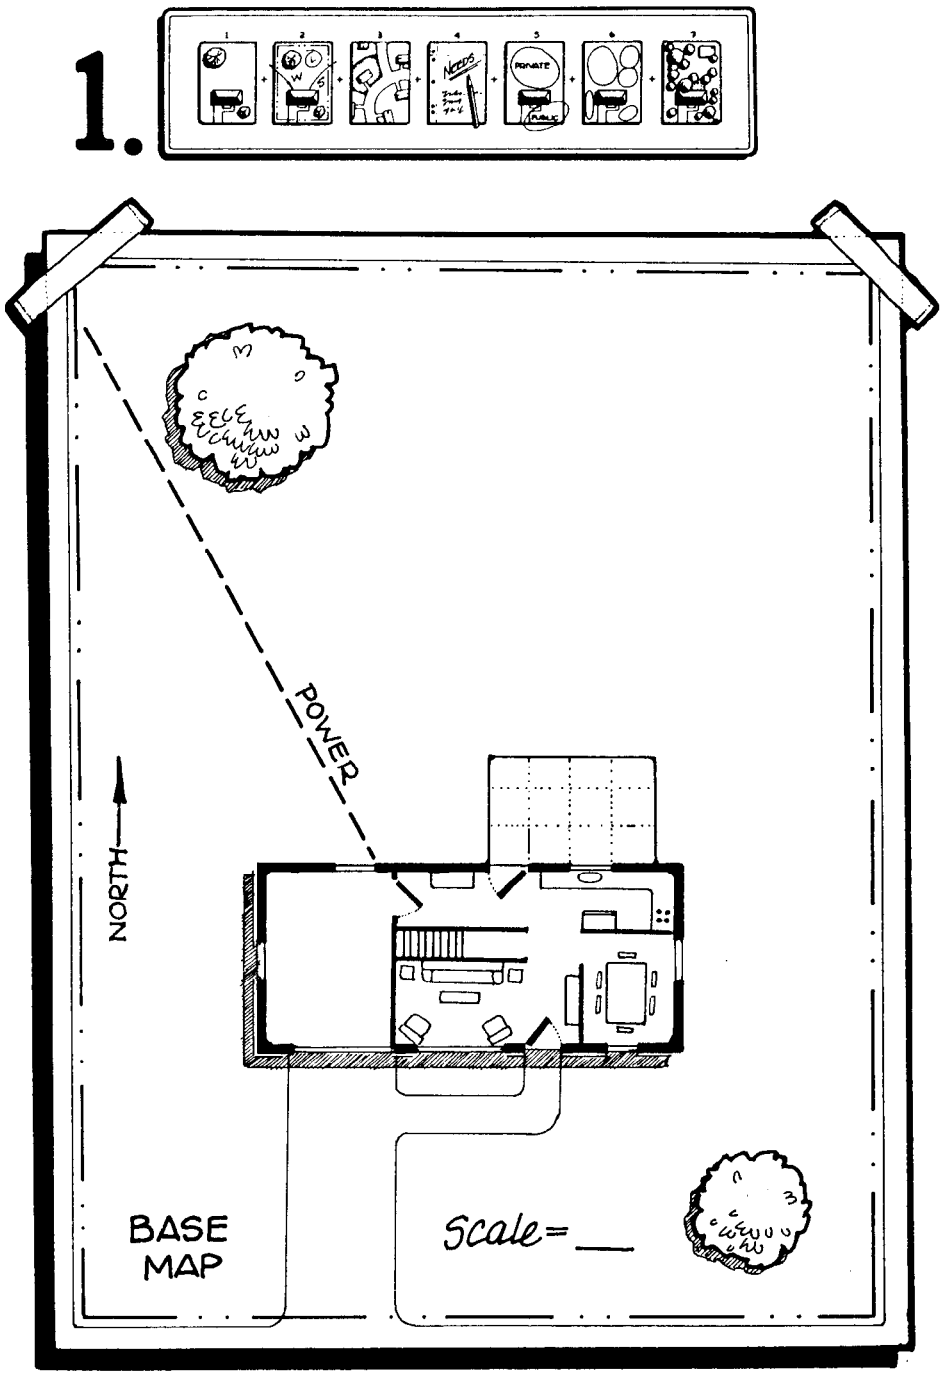
–Outside house dimensions
–Overhang dimensions
–Window and door locations
–Height from ground to bottom of windows
–Locations of water faucets, dryer vent, air conditioner, window wells, downspouts, electric and gas meters and fuel fill spout.
–Any other important exterior house features

Draw your lot lines on the paper. If you live on a large parcel of land, limit your base map to the area you plan to landscape. It's usually most convenient to draw at a scale of 1/8 or 1/10 inch per foot–1/8 inch or 1/10 inch on the paper equals 1 foot on the ground. In one corner of the paper, indicate which direction is north and the scale of your drawing.

Next, draw the location of your house, using the same scale. Indicate windows, doors, overhang and other exterior features. You'll need this information later to develop a successful planting design. Also sketch in interior room arrangements; this part of the drawing will help you consider views from inside the house and patterns of movement between yard and house.

Still using the same scale, draw in existing lot or yard features, including:

–Garage, if unattached
–Other buildings in the area to be landscaped (such as barn, silo and storage shed)
–Driveways and sidewalks
–Underground and overhead utility lines: electric, telephone, water and gas
–Septic tank (or drywell), drain field and vent or sanitary sewer lines
–Trees, shrubs, and other plants to be preserved (don't bother noting those you plan to remove)



## Step 2. Analyze your lot or farmstead

To develop the best design, you need a physical and visual analysis of your lot or farmstead that takes into account both natural and man-made features.

Inventory the following categories of natural features on your lot:

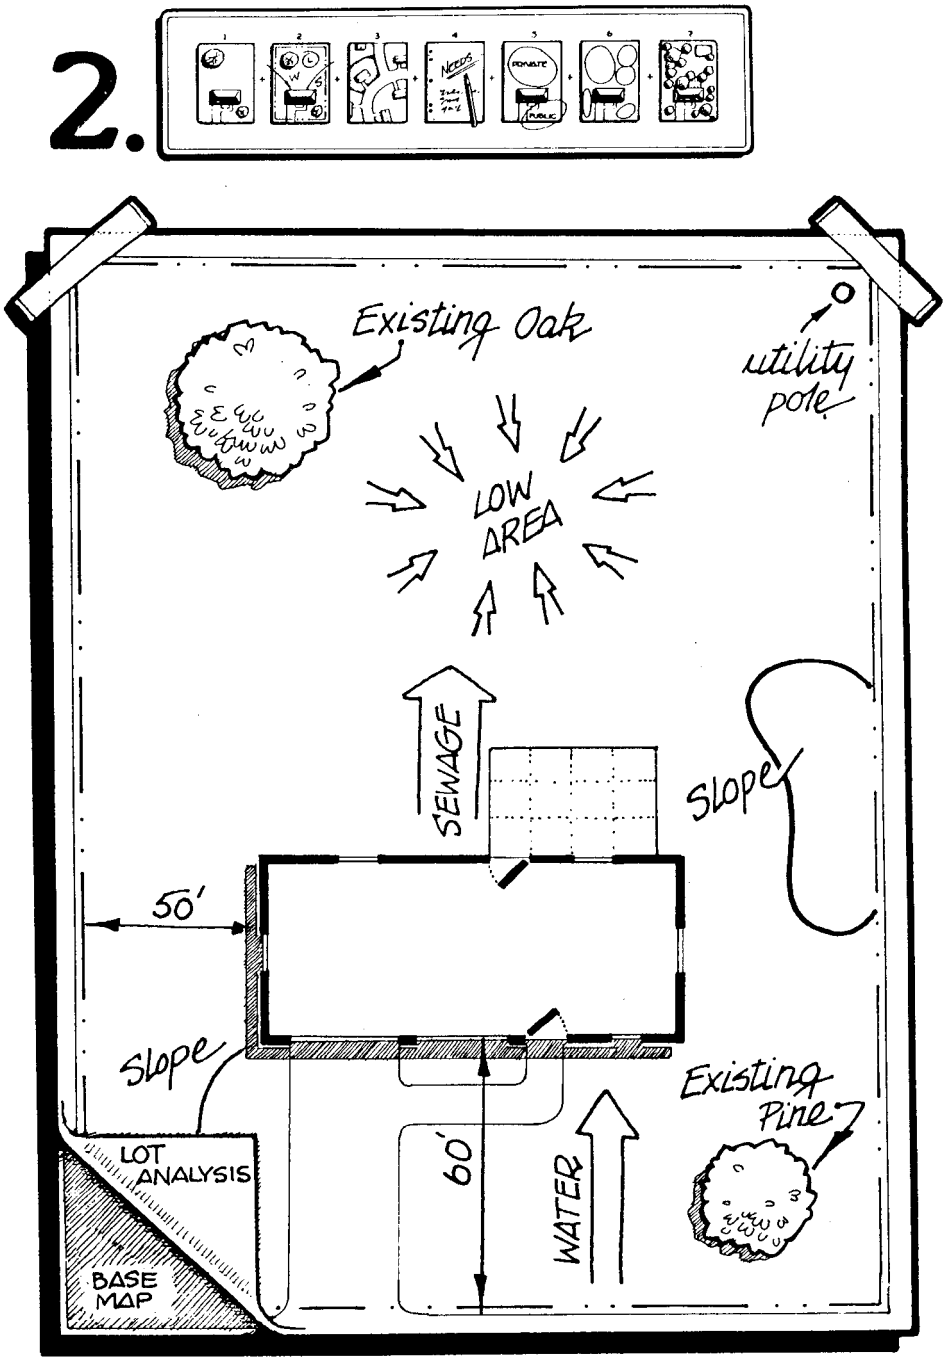
**Vegetation.** Your homesite may already have trees, shrubs or other plants. Before deciding whether to include them in your landscape design, you must know what kind of plants they are – some may be considered "weeds," while others may be valuable. Consider also the general appearance or quality of the plants, whether they interfere with the rest of your landscape design, and the shade and sun patterns they create.

**Topography** refers to the shape of the land's surface. Some lots are flat, while others have a variety of ground forms. It's important to decide whether the existing topography can be preserved or whether it must be modified to meet your family's outdoor needs.

The **drainage** patterns on your site may greatly influence your home landscape design. Note the direction of runoff and low spots where water may collect. Monitor drainage carefully to make sure that outdoor use areas will be suitably located, that water will move away from buildings and that plants will grow well where you place them.

Your lot or farmstead's **soil** is important because it must support both plants and man-made structures. Soil tests, available through your county Extension office, will tell you whether your soil has the proper chemical makeup for good plant growth. Your county Soil Conservation Service can determine whether the physical properties of your soil are suitable for landscape structures.

**Climate** will influence your landscaping plans in several ways. Winter temperatures determine which plants are hardy enough to grow on your lot. Spring and fall frost dates determine length of growing season. Average precipitation (about 30 inches for most of Wisconsin) may not be enough for some plants; but you can supply additional water. Humidity affects the spread and severity of plant diseases. In Wisconsin, prevailing winter winds are from the northwest, and most summer breezes come from the southwest. You will want to provide winter wind protection and to take advantage of summer breezes. The U.S. Weather Bureau and county Soil Conservation Service and Extension offices can provide climate information more specific for your location.



During your analysis, take into account man-made structures and natural landforms seen from your house and lot. You will probably want to screen from view such off-site “nuisances” as highways, power lines, industrial centers and junkyards while keeping or enhancing good views. You may also want to block out annoying noises from automobiles, trains and other sources.

It helps to take pictures of your lot or farmstead. Often we see only what the mind “wants” to see, rather than what really exists. Photographs or slides help you see the site as a visitor would. They also serve as reminders of what the house and site look like while you are working on your design.

Photos should include views of the house from all sides. Photos of off-lot views, from both inside and outside the house, will help you identify those you want to keep or enhance and those that should be screened for beauty or privacy.

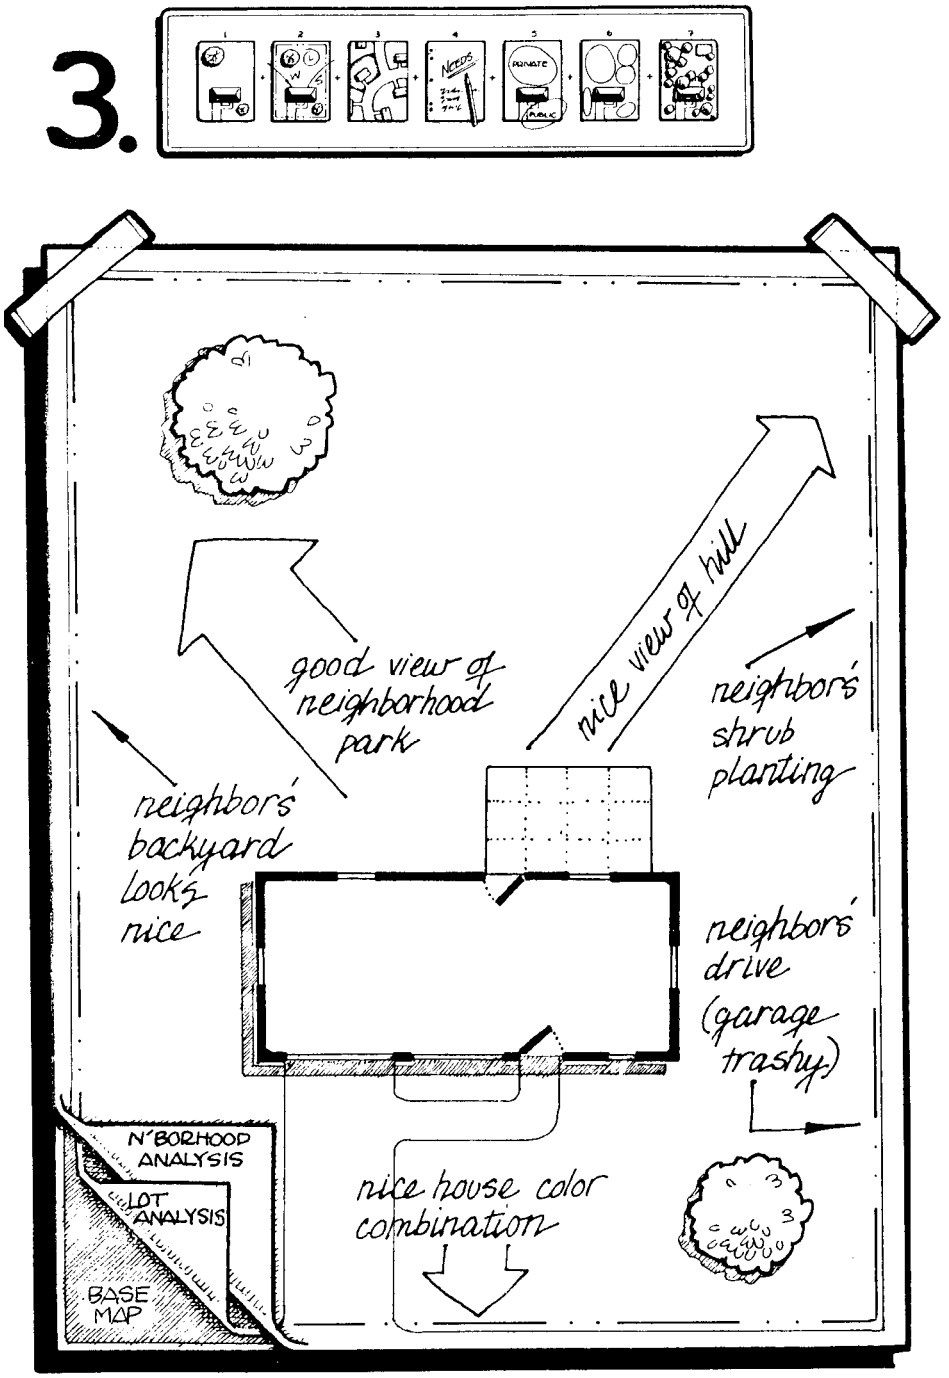
Record lot features by sketching them on tracing paper placed over your base map. On the tracing paper, indicate with arrows or other symbols:

–Major differences in land surface elevation – include hills, depressions and rock outrcroppings
–Topography and drainage patterns
–Prevailing summer and winter winds
–Good views to be kept or enhanced.
–Poor views and annoying sounds to be screened
–Other features that seem significant

## Step 3. Analyze how your Lot or Farmstead Relates to the Neighborhood

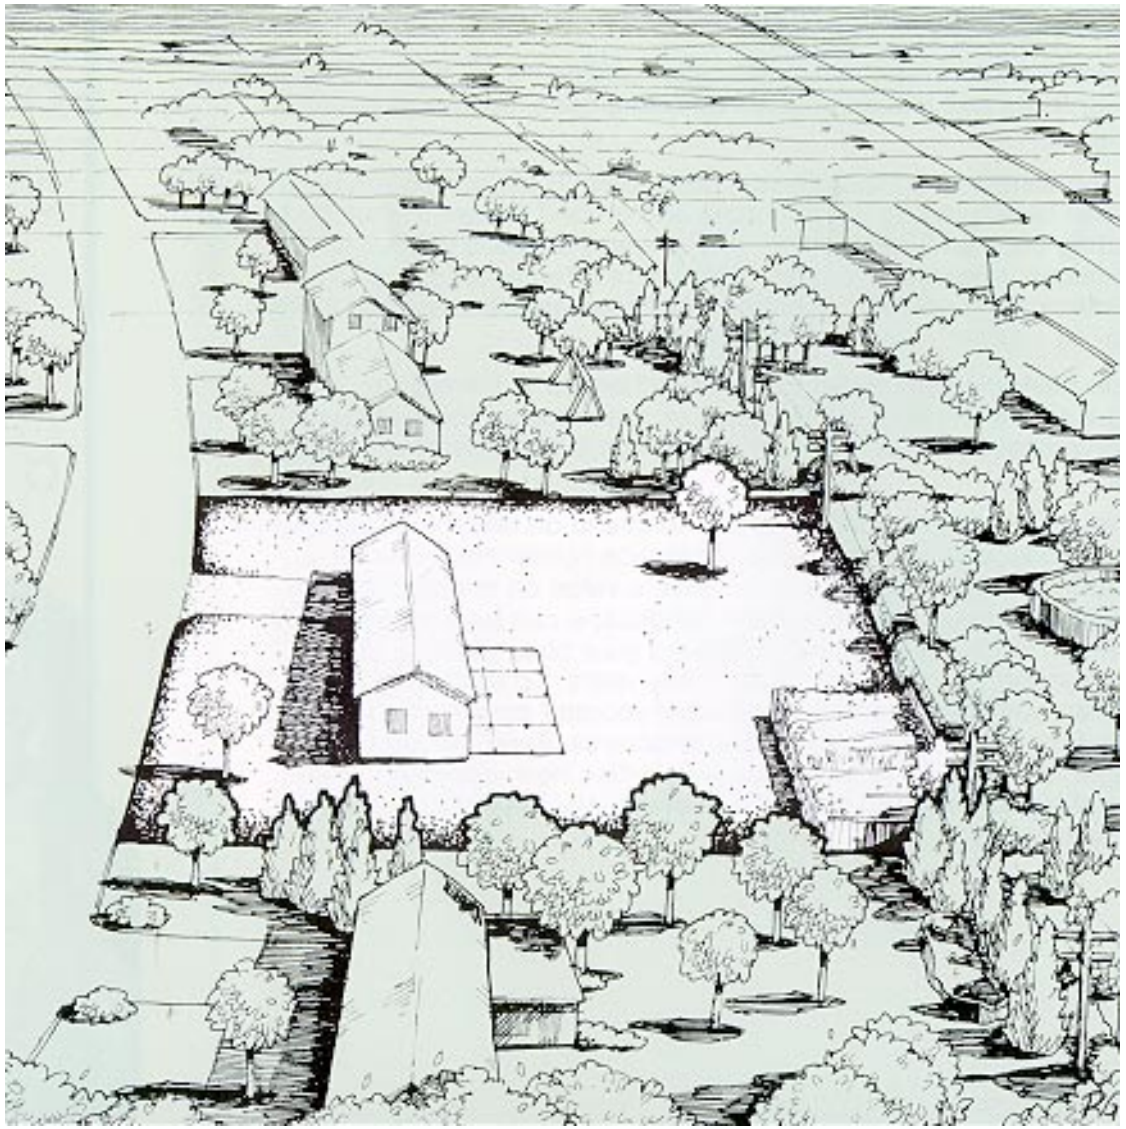
A survey of your neighborhood will suggest landscape possibilities. It will also help you avoid developing a design that is out of place.

Don’t be limited by neighborhood examples, but if you do decide to use a very different kind of design, do it unobtrusively-you may want to restrict its full impact to the back yard, for example. You may also want to share your plans with neighbors to gain their understanding and to get their suggestions.

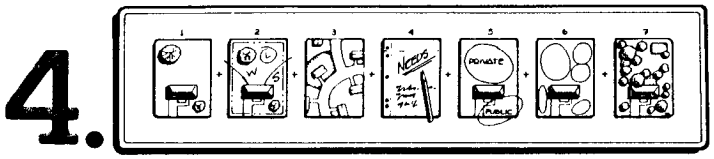


What building materials, colors, plants and types of screening have others used? Which home landscape in the neighborhood do you like or dislike? Earth-tone home colors, dark roofing materials, organic mulches and uniformly green foliage usually create a visually pleasing neighborhood.

Some communities have zoning, building setback and fencing and planting restrictions you should know about before making landscaping plans. Check with your town, village or city clerk or zoning administrator. You should also check deed and subdivision restrictions for other possible landscaping constraints.



## Step 4. Analyze your Needs



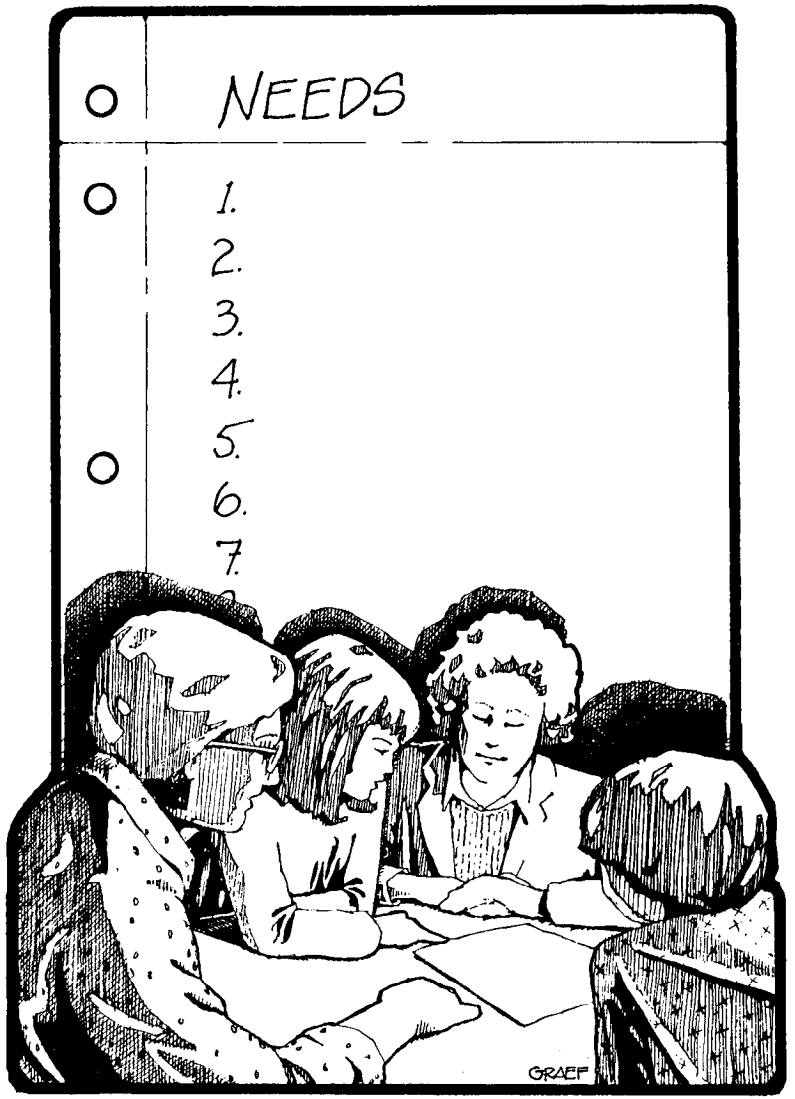
Now is the time to stop and think about how you want to use the space you plan to landscape. Do you want an outdoor living area? What will you use it for? Eating, cooking, sunbathing? A patio, deck or grassed area would be appropriate for these and other uses. Do you want a vegetable or fruit garden, outdoor play area, kennel, sports area or flower bed? You need to list all your activities and space requirements.

Do you want to attract birds and other wildlife? If so, plan to use lots of trees and shrubs, including fruiting ones, in your landscape design.

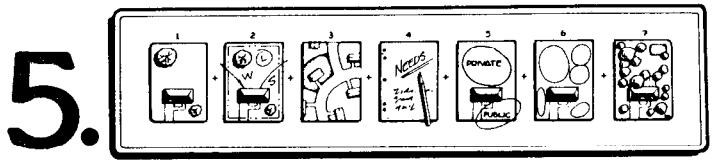
Do you want a low-maintenance landscape? If so, consider having a small lawn, placing trees, shrubs and ground covers in mulched planting beds and using plants that are well-adapted to your site conditions. Improperly designed plantings often require a lot of maintenance. Low-maintenance landscapes are discussed in more detail in another section of this publication.

If you plan any substantial landscape changes in the future – adding a swimming pool, tennis court or greenhouse, for example – reserve space now so you won't have to move plants or structures later.

Consider how much you can afford to spend on home landscaping. Many landscape architects and landscape nurserymen recommend investing about 10% of a house's value on the landscaping around it, although an acceptable landscape can be accomplished for much less. Once you've completed your plan, planting and construction can be spread over many years. To reduce costs, you can buy small plants and get do-it-yourself construction plans for patios, walks, decks and other structures. Even though your budget may limit your landscaping activities now, consider everything you want to accomplish eventually in your present landscape planning.



## Step 5. Plan Outdoor “Use” Areas



The location and design of outdoor use areas will depend on family needs and preferences. The particular uses planned and amount of space available will determine use area size. Consider relationships between indoor and outdoor activities. You’ll want to keep areas near bedrooms quiet, while locating noisy outside areas near the kitchen, or perhaps away from the house if space permits.

Two general areas should be part of any home landscape design – public and private areas.

The **public** area usually includes the front yard, driveway, sidewalks and entrance to the house. On a corner lot, the public area may also extend into the side or backyard areas.

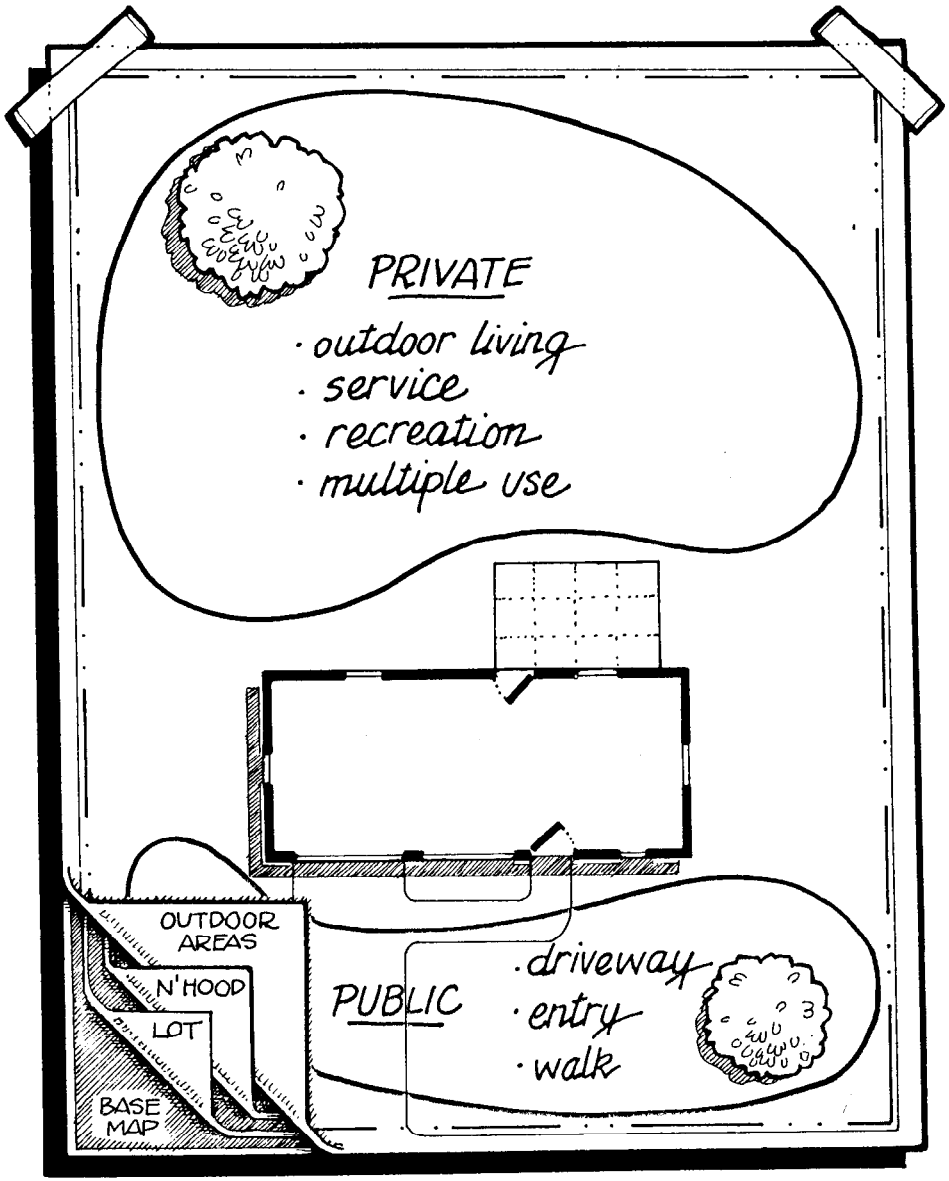
The entrance and front yard are the most public parts of most peoples’ yards. You can design the entire front yard for public viewing or – because of small lot size or a need for privacy – enclose parts of it with plants, fencing or both. Remember that your entrance and front yard contribute to overall neighborhood appearance – trees, shrubs, flowers, lawns, fences and other landscape structures should fit in with the neighborhood’s character.

Driveways and sidewalks link your home to neighborhood streets. Consider safety, topography and lot character when locating them. Keep grades as gentle as possible and make as few road cuts as possible. Remember the need for snow removal and landscape maintenance. Keep in mind how you want visitors to move from your parking area to the main entrance.

The **private** area of your yard or lot consists of living, service, recreation and multiple-use areas, depending on the needs you identified earlier.

An outdoor living area may include such features as terrace, deck, patio, screened porch and grassed areas for outdoor cooking, sunbathing, entertaining and just relaxing. Try to estimate the number of people who might use the area at one time so you can design it accordingly

Many homeowners like to have a service area for such things as vegetable and fruit gardens and wood and garbage storage. Choose these areas carefully. Vegetable gardens and many flowers need full sunlight and suitable soil. Wood and garbage storage areas should be accessible, but out of view.



You may want outdoor recreation areas for lawn games, swimming pool, tennis court, greenhouse or other purposes. Lot size, family needs and finances will determine how much space you can devote to outdoor recreation.

In many yards, space is limited. You may need to use the same area for several activities. Multiple-use areas may serve as living, recreation, and service areas at appropriate times.

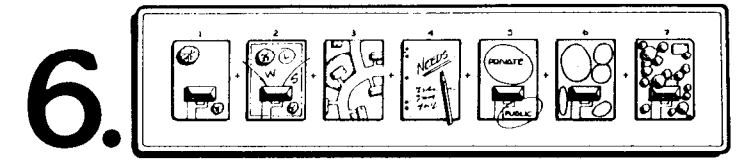
## Step 6. Make Use Area Sketches

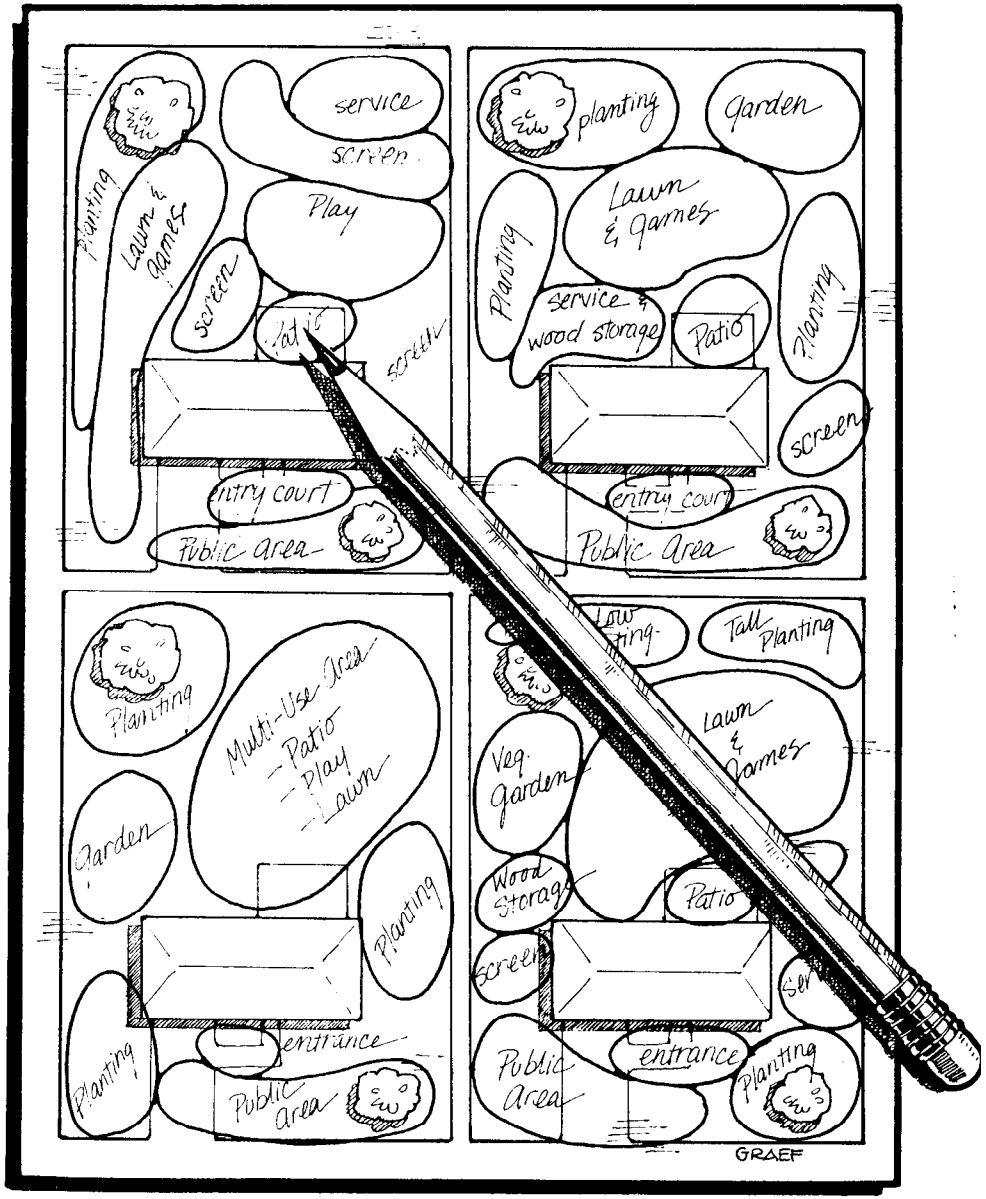
Now, after the necessary analyses (Steps 1-5), it's back to the drawing board! With tracing paper on top of your base and lot analysis maps, make a number of alternative general use sketches, fitting the use areas together in ways that take into account site features and family needs. Use circles, ovals and rectangles to locate specific spaces within your public and private areas. Keep the sketches that seem to suit your lot and family needs. Discard those that do not.

While making your sketches, consider these questions: Does the existing vegetation that you wanted to keep still fit into your plans? Is the slope of your property appropriate for your proposed outdoor use areas? Do your use areas make the most effective use of sunlight? After answering these questions, you may want to discard some use area arrangements and consider alternatives.

Grassed or hard-surfaced travel routes must be planned to provide convenient movement between different use areas. Indicate these routes with arrows on your plans.

So far, you have been collecting and combining information about your homesite and your needs. To give specific shape to the general use areas and to complete your landscape design (Step 7) you will need some understanding of design and composition principles. The next two sections give an overview of these principles.

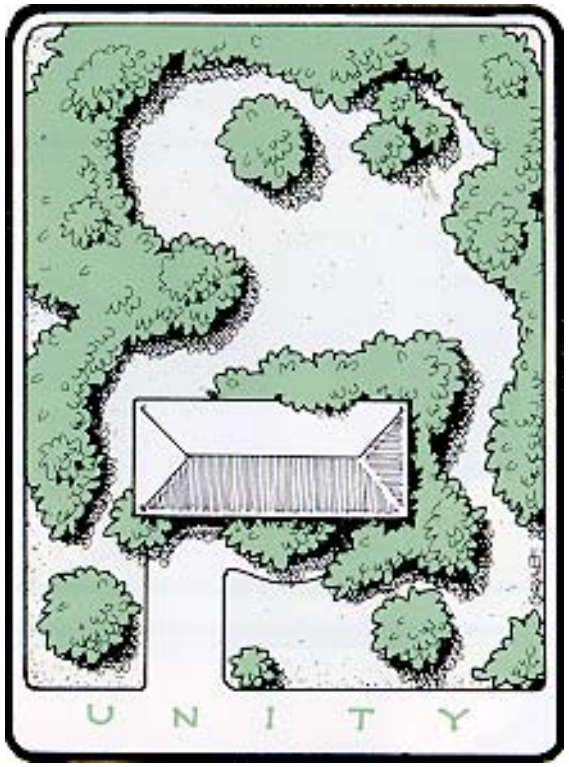


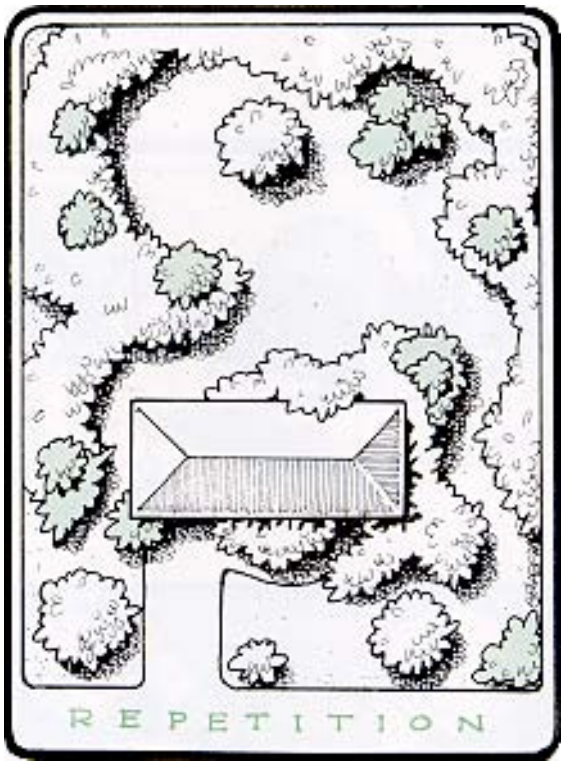


# Landscape Design Principles

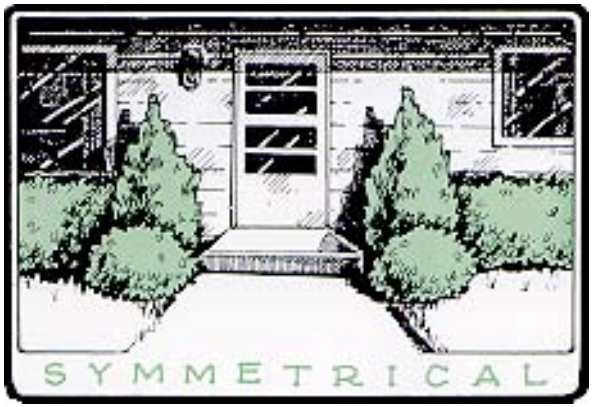
Home landscape designs vary according to family needs and preferences, but successful designs have certain underlying principles in common.

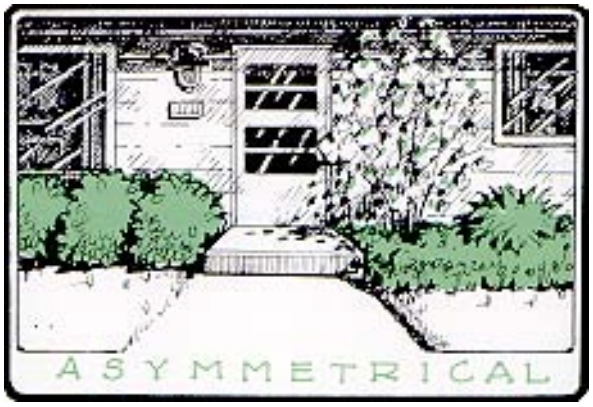
A landscape has **unity** when its predominant features have some visual characteristics in common. For example, plants with similar forms, colors and textures can create unity, both on your lot and in your neighborhood. This is also true of lawns and paving materials. Repeating a design pattern, color or texture in several different locations helps create unity.





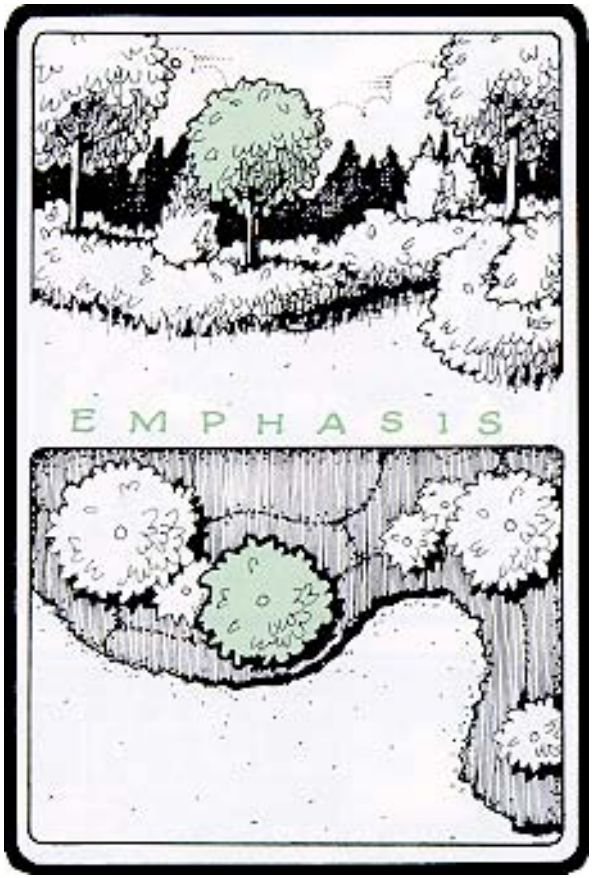
Plants and landscape structures of similar visual importance help create **balance** in a landscape design. With color, form, texture, size and other features, you can direct attention to several areas of the yard. Balance may be symmetrical ("formal"), in which each side of the yard is similar in pattern, or asymmetrical ("informal"), in which each side attracts the same attention even though objects and spacing are not repeated.

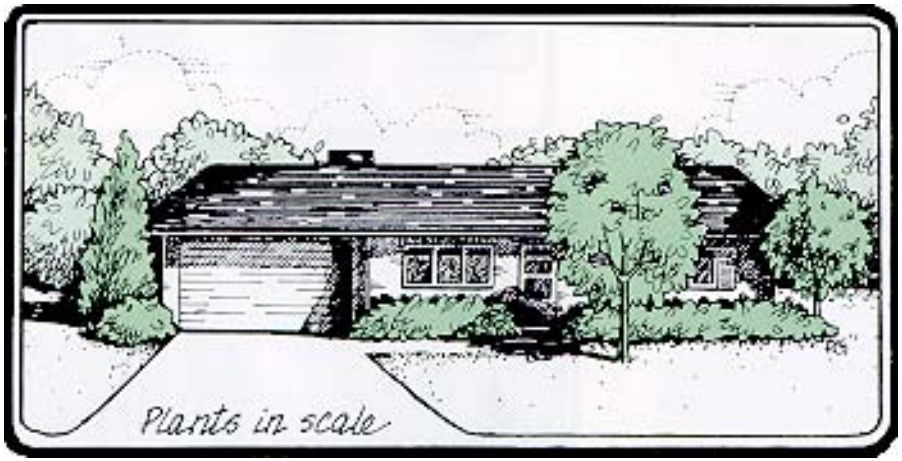




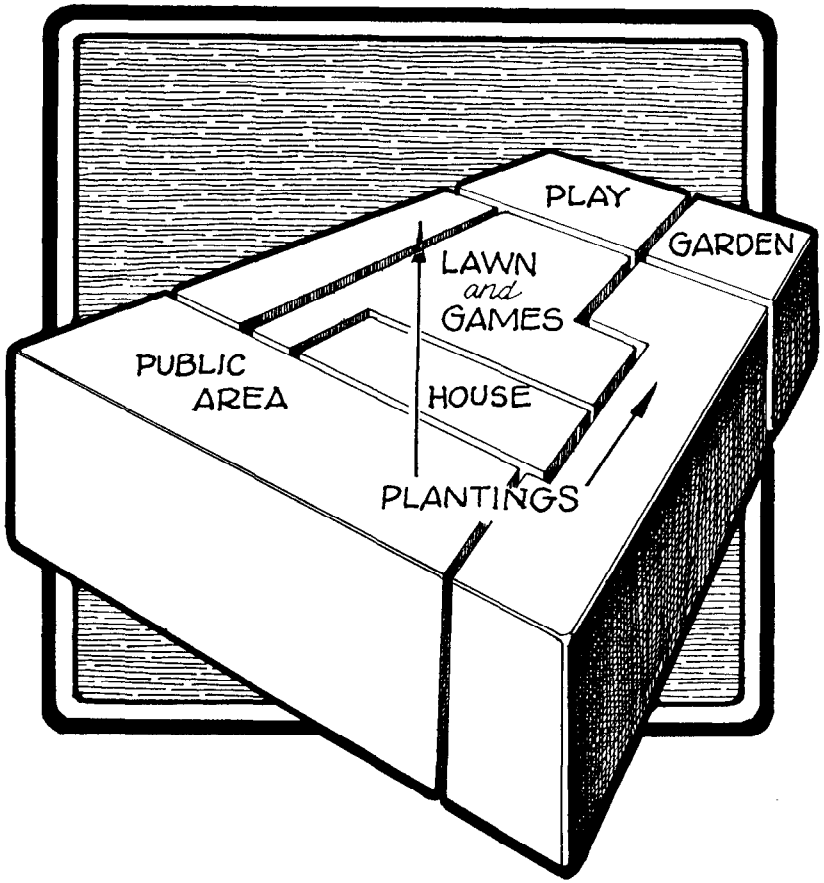
Accent areas or focal points to which attention is drawn create **emphasis** and keep a design's unity and balance from becoming monotonous. A single contrast in color, texture, form or height – such as provided by a bench, tree, pool, or flower bed – can provide emphasis.

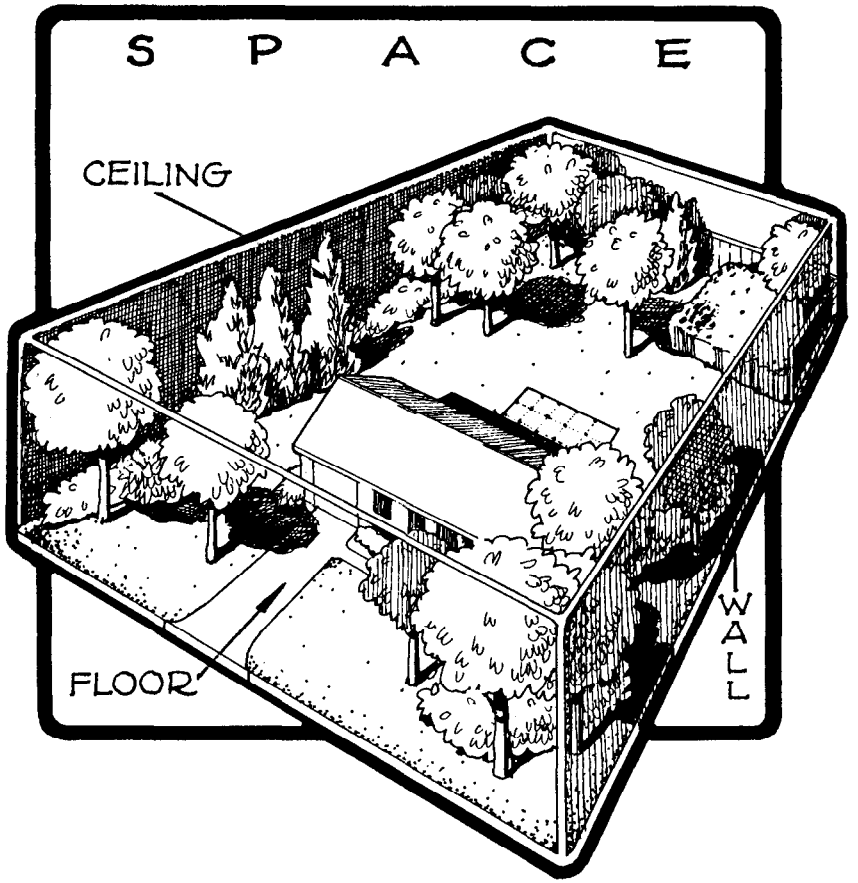
**Scale** refers to the size relationships among plants, structures and open spaces. A 4-foot-high shrub with a 4-foot spread may be too large – and therefore out of scale – in front of low windows. Next to a high-rise building, however, the same shrub would be out of scale because it is too small. In some home landscape situations, group plantings will compensate for plants with too-little spread.





**Space.** Your entire lot can be considered a block of space with dimensions of length, width and height. Plants, fences and buildings are used to divide the lot into smaller living spaces analogous to the rooms of your house. These outdoor "rooms" should have separate identities and should meet your use area needs. The "rooms" should have openings that direct movement from one to another.



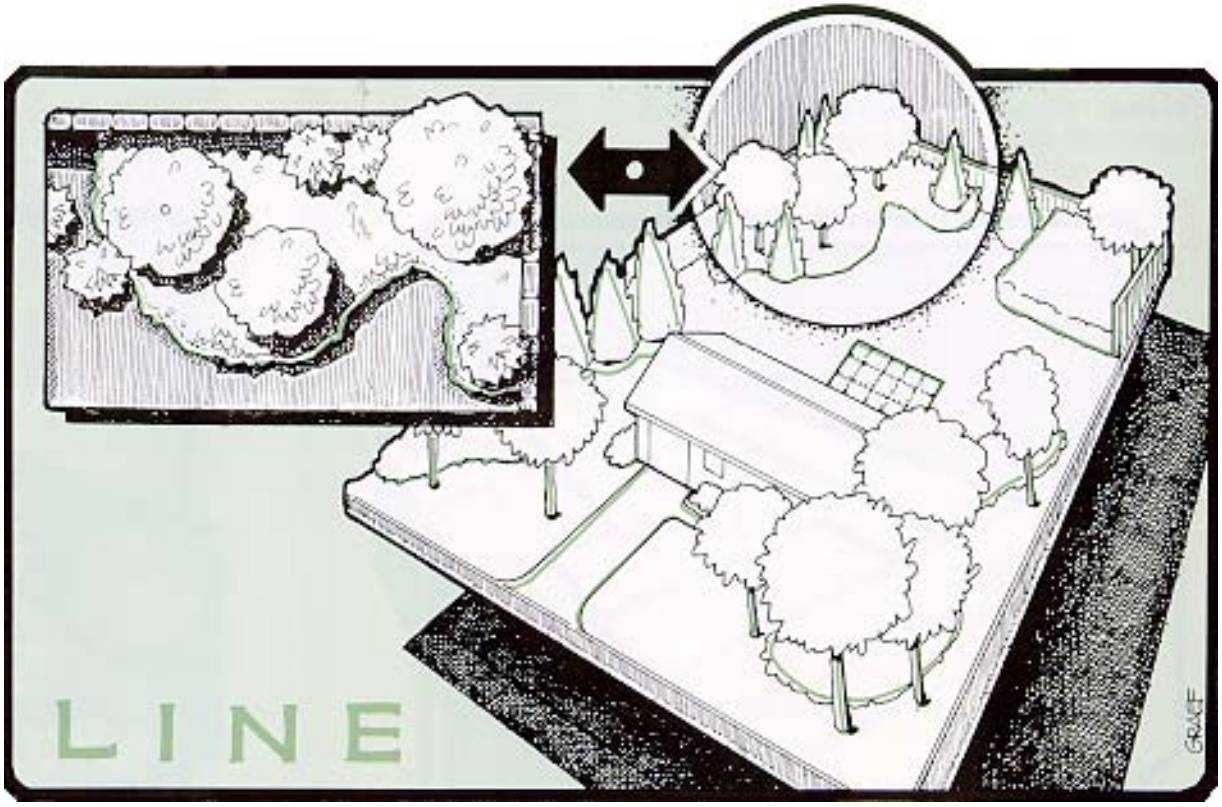


**Lines** may be straight or curved. Landscape designers frequently lay out patios, decks and planting beds using straight lines that extend – or parallel – house and lot lines. Equally successful – and more naturalistic –- designs can be created with curved lines. Straight and curved lines can be combined in a design, but it is difficult for the beginning designer to do this successfully.

These design principles will help you give specific shapes to the areas you identified in your general use sketches. But you can't design a landscape based only on placement and size of plants and structures – the main components of home landscape. You must also select the appropriate plants and construction materials.

In other words, from design principles you may arrive at the proper location and shape for a planting bed. But you must also decide what plants to put in the bed. In the same way, you have to decide what to surface a patio with as well as where and how big the patio should be.

Both plants and building materials can be selected for their form, texture and color. You will need to keep these elements of landscape composition in mind as you proceed toward your final landscape design. We discuss them further in later sections of this publication.



# Selecting Landscape Plants

There are three things to consider in selecting plants. They are, in the order you should consider them: plant hardiness, site conditions and suitability for your landscape design.

Wisconsin is divided into hardiness zones based on lowest winter temperatures. Many plants cannot survive Wisconsin winters.

All plants require a certain set of growing conditions. The conditions your site offers will determine what plants will grow well there.

**Soils** vary greatly in acidity, drainage, and fertility. Sandy soils are usually well drained, while clay soils may become water logged. Few plants do well in both situations. Use the soil information from your lot or farmstead analysis in selecting plants. It's better to select plants for your soil than to try to change the soil.

Plants vary in their **sunlight** requirements. For example, the Japanese yew does well in shade, but junipers need full sunlight to grow well and look their best. As you evaluate alternative landscape designs, consider shade patterns created by buildings and existing plants.

Some evergreen trees and shrubs will not tolerate the drying effect of winter winds. On the other hand, most hardy deciduous plants (those that drop their leaves in fall) will tolerate full exposure.

**Topography.** Some plants have adapted to cooler northern slopes, while others do better with hot, dry, south-facing exposure.

Be aware of possible air and soil **pollution** when selecting plants. De-icing salt damages many plants, either as a soil contaminant or as a spray created by traffic or snow plowing. Pollutants from industries and automobiles, such as sulfur dioxide, ozone and fluoride, also damage plants.

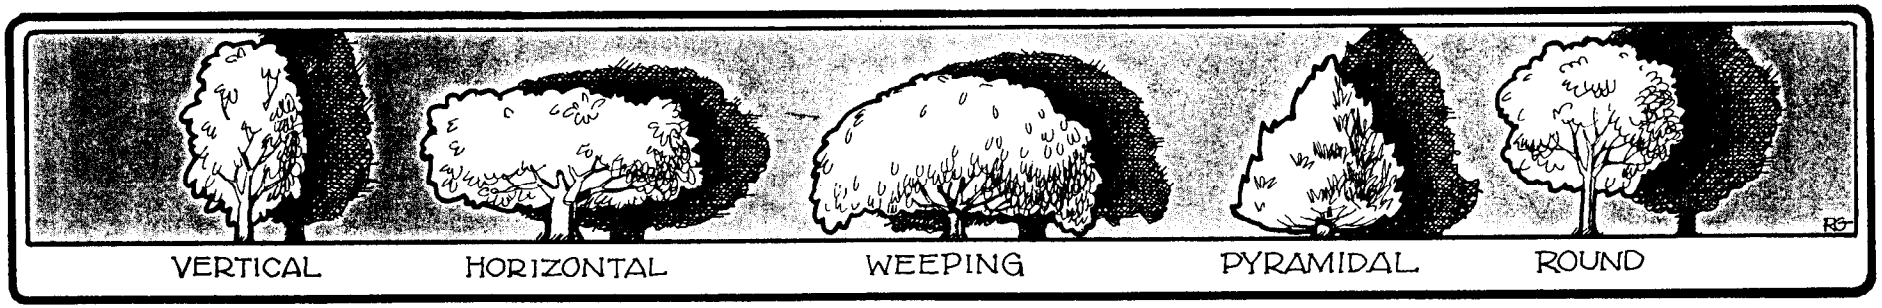
You must select plants that will grow well under your conditions or you'll have trouble keeping them healthy from the outset.

Extension publications A2865, "A Guide to Selecting Landscape Plants in Wisconsin," and A2970, "Salt Injury to Landscape Plants," contain more information on these subjects.

## Design considerations

Plants have different **forms,** or growth habits. Basic forms and their common uses are:

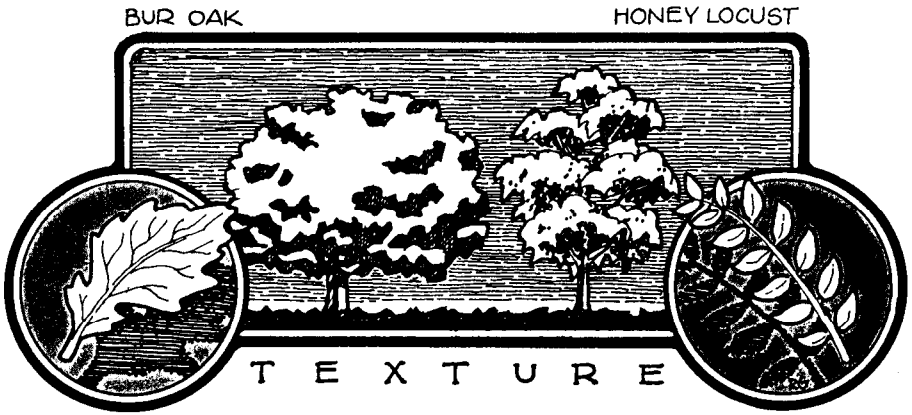
–vertical – usually used sparingly as accents or to provide height
–horizontal – used to provide width and to "attach" structures to the ground
–weeping – usually used only as accents
–pyramidal – used as accents or combined with rounded and horizontal plants
–rounded – used to create large masses, borders or enclosures

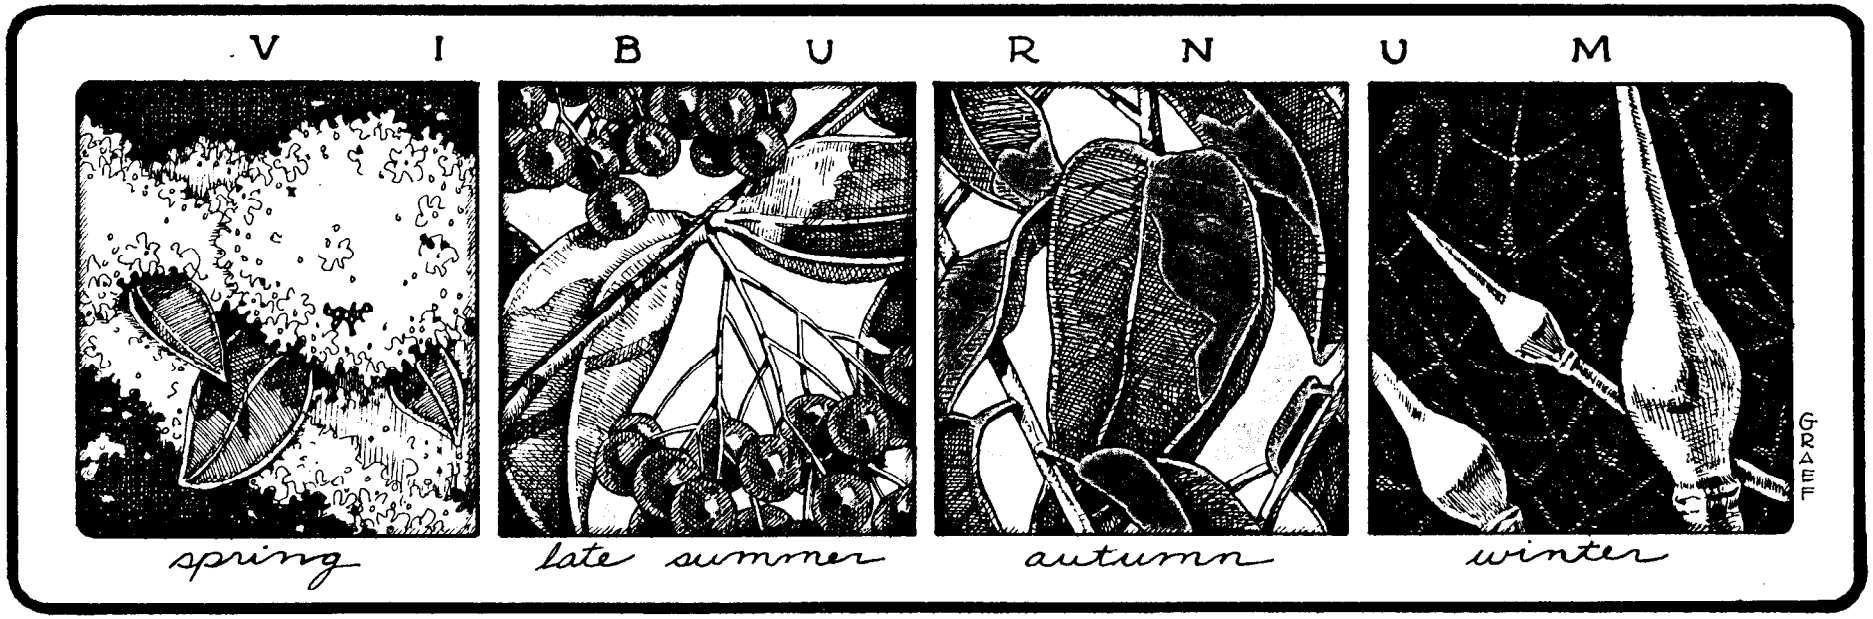


The size of a plant's leaves, twigs and branches determines its **texture.** Fine-textured plants have small leaves and twigs, coarse-textured ones have large, and medium-textured ones in between. You may want to select plants of all three textures. Often, the size of a landscape space will determine what texture is appropriate – a small space will seem larger with fine-textured plants than with coarse-textured ones, for example.

The dominance of one **color** helps provide harmony in a home landscape as well as throughout an entire neighborhood. For most people, green foliage creates a restful landscape. But you may want to select plants with particular fruit, bark and fall leaf colors to serve as accents as the seasons change.

You may want to consider using some native plants in your design. Plants native to Wisconsin are just as beautiful as non-native ones and are often better adapted to our growing conditions. Honeysuckle, buckthorn and other ornamentals that have escaped to the wild have actually forced some native plants from natural plant communities. Certain varieties of buckthorn are disease carriers for a rust that affects oats.





## Trees

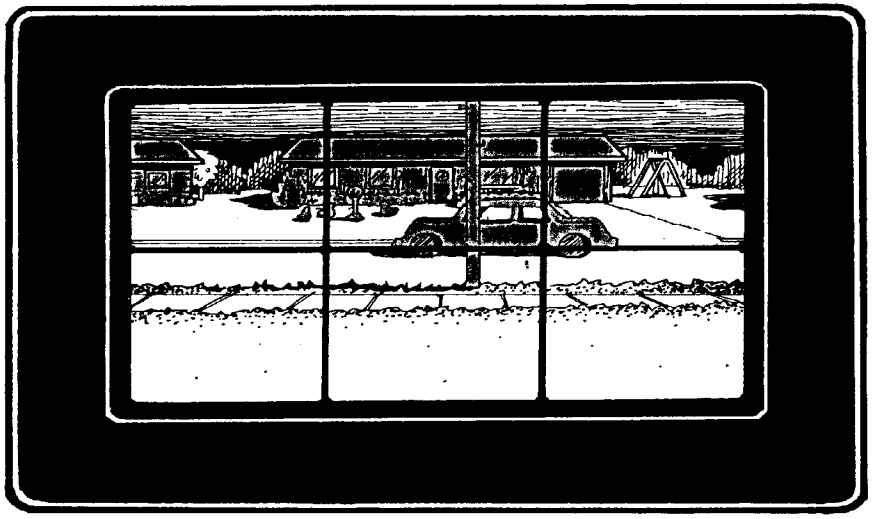
Trees – both deciduous and evergreen – help put a house and its surrounding into proper scale. They should be planted where they will enhance the overall appearance of your home's setting as well as provide shade in summer and wind protection in winter. Frequently, trees are used to frame a good view or screen a poor one.

A variety of small to medium-sized trees may be used as accent plants. You can base your choice on a combination of visual characteristics, including foliage and flower color, fruit, bark, fragrance and texture. Fruit trees may be used as accent plants, but remember that they can be messy and require regular spraying for insect and disease control.

Consider planting several kinds of trees to minimize the risks of insects and diseases. But don't overdo it – too many kinds of trees may deprive your landscape of unity. A compromise – planting several representatives of several different types – will provide both a measure of insect and disease resistance and design unity.

Plant individual shade trees 30-40 feet apart. Or, for a more natural, forest-like landscape, vary tree spacing from 5-50 feet. To obtain the best shade patterns and to avoid foundation damage, plant trees 15-25 feet from the house. Irregular tree placement creates an informal setting.

In urban areas, check with municipal officials before planting trees in the terrace between street and sidewalks.



## Shrubs

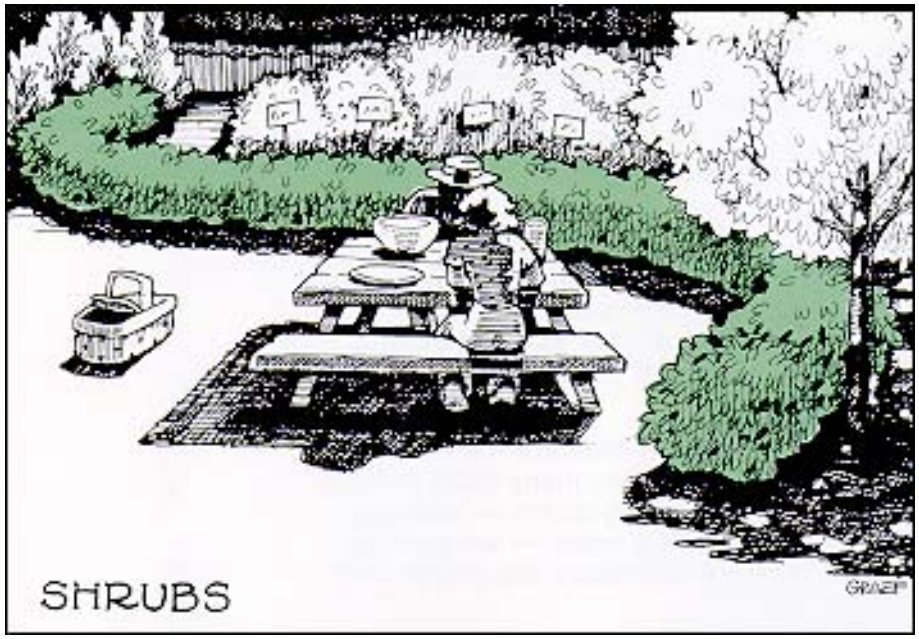
Deciduous and evergreen shrubs are an important part of most home landscapes. Planted in groups, they create screens and barriers or serve as foundation plantings or understory plants beneath trees. Although most shrubs work best in groups, they may also be used as accents – accent shrubs can help lead visitors to your entrance, for example.

Masses of shrubs effectively delineate different use areas in the yard, much as walls delineate the rooms of a house. A heavy planting of shrubs at house corners softens the transition between vertical walls and horizontal ground lines.

Foundation plantings should enhance your overall landscape design. Generally, it's not good design practice to surround a house completely with foundation plants unless you need to screen an unsightly foundation. For under windows and eaves, select foundation plants that will not be too tall when mature.

Taller plants may shade out understory plants, so select shade-tolerant shrubs for use as understory plants.

You can create seasonal variety with combination plantings of evergreen and deciduous shrubs. Remember that landscapes have a more unified appearance when green-foliaged plants predominate. Shrubs with red, purple, yellow or silver summer foliage can become unintended "focal points" and detract from your landscape design. It's better to select accent shrubs based on flower, fruit, bark and fall leaf color. You can unify your landscape by planting the same kinds of shrubs in several different locations.



Avoid planting shrubs too close together – size at maturity should determine spacing. Don't give in to the desire to achieve the mass effect of a group planting too rapidly. A mature landscape cannot be created in one growing season. It will require at least three years, perhaps five, before a group planting achieves its intended effect.

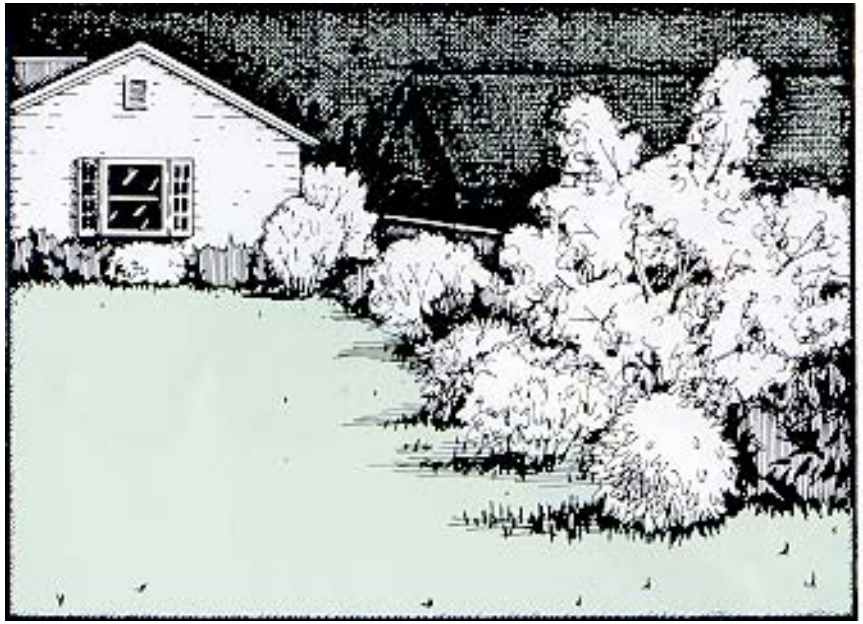
Tall shrubs are usually planted 5-7 feet apart, medium shrubs 3-5 feet apart and low shrubs 2-3 feet apart. Place shrubs slightly more than one-half their ultimate spread away from the foundation so they can attain their natural forms.

## Ground Covers, Vines and Flowers

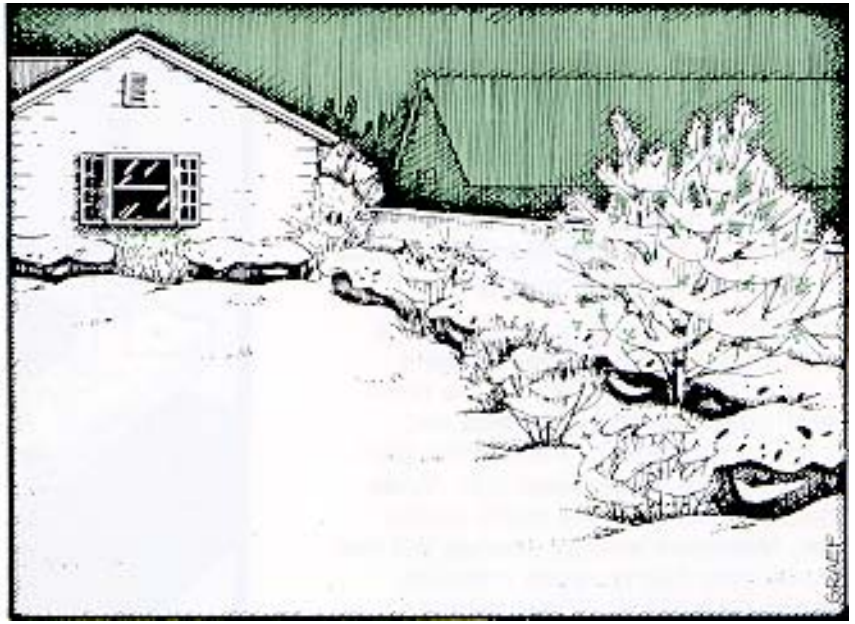
Ground covers, vines and flowers complement most home landscape designs.

Ground covers help unify tree and shrub plantings and provide a contrast between lawn and planting beds. Mass plantings of perennial ground covers reduce landscape maintenance.

Vines soften the texture of brick and stone as well as shade house walls. They will cover chain link fences and help provide screening where space for trees and shrubs is limited.



S U M M E R



W I N T E R

Flowers add color to your yard. They can be planted in beds and borders, in front of shrub masses and to fill in open areas while shrubs are growing. Flowers look best against a simple background, such as a fence or shrub planting, so they're not recommended for the middle of a lawn. Both perennial and annual flowers require a lot of maintenance.

## Lawns

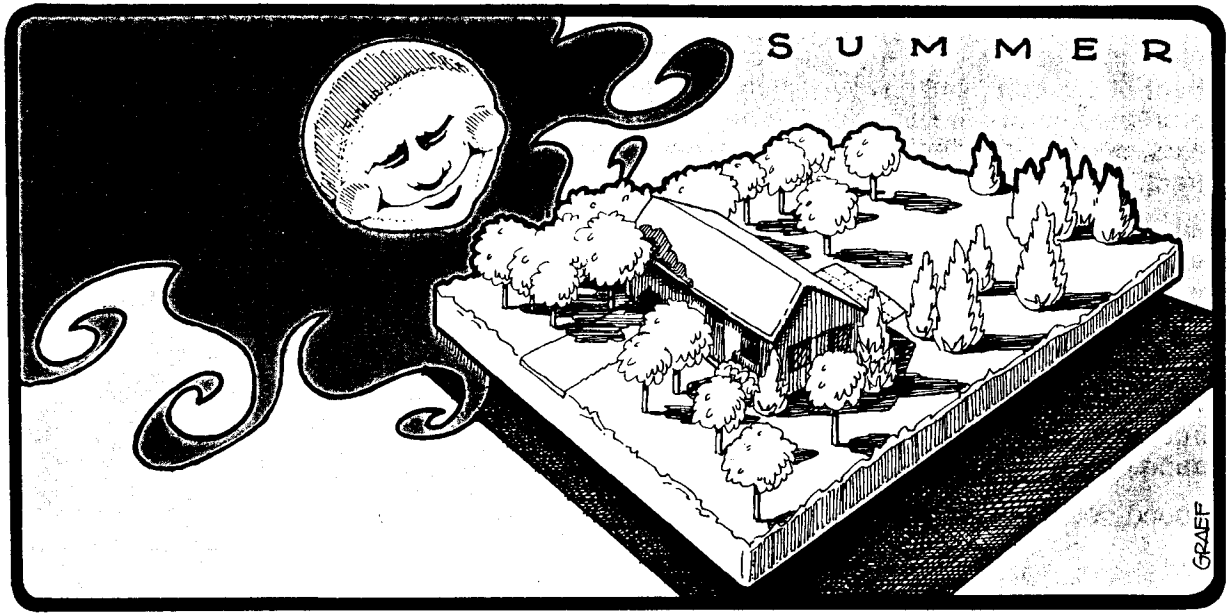
A lawn adds unity to a landscape design by linking together the various "rooms" of a landscape. It is also a good ground cover for recreation and service areas and for travel routes between use areas.

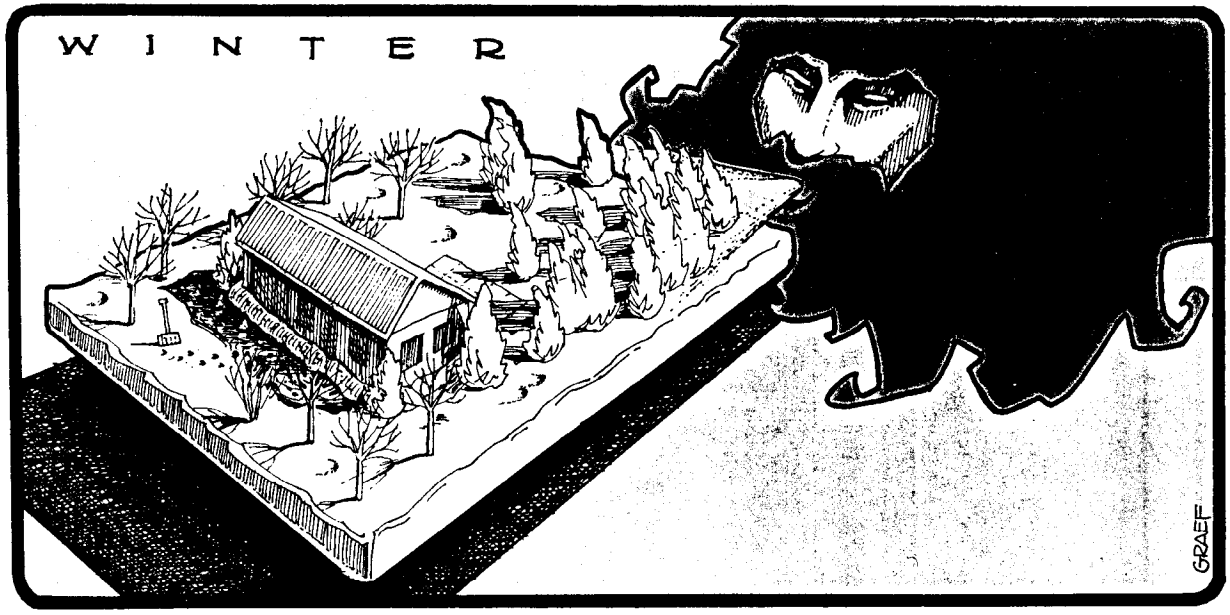
Publications on planting and maintaining lawns are available at county Extension offices.

## Planting for Energy Conservation

Proper selection and placement of plants can reduce home energy consumption. Deciduous trees planted 15-25 feet away from the house on the east, south and west sides shade the roof and walls in summer, reducing surface temperatures. After the trees have dropped their leaves in fall, winter sunlight can reach the house to provide passive solar heating.

Windbreaks, mainly evergreen plantings, located four to six times their ultimate height away from the house on the north and west sides can reduce winds and winter fuel consumption. Foundation plantings also reduce winter heat loss. Vines can shade and cool house walls during summer. Maximum energy savings will not occur until your plants reach maturity. Publication G81N1178; "Designing an Energy – Efficient Home Landscaping" contains more details.





# Landscape Structures

Most libraries, book stores and garden center offer a variety of publications that contain detailed construction plans and material suggestions for landscape structures. We discuss only the more common structures in this publication.

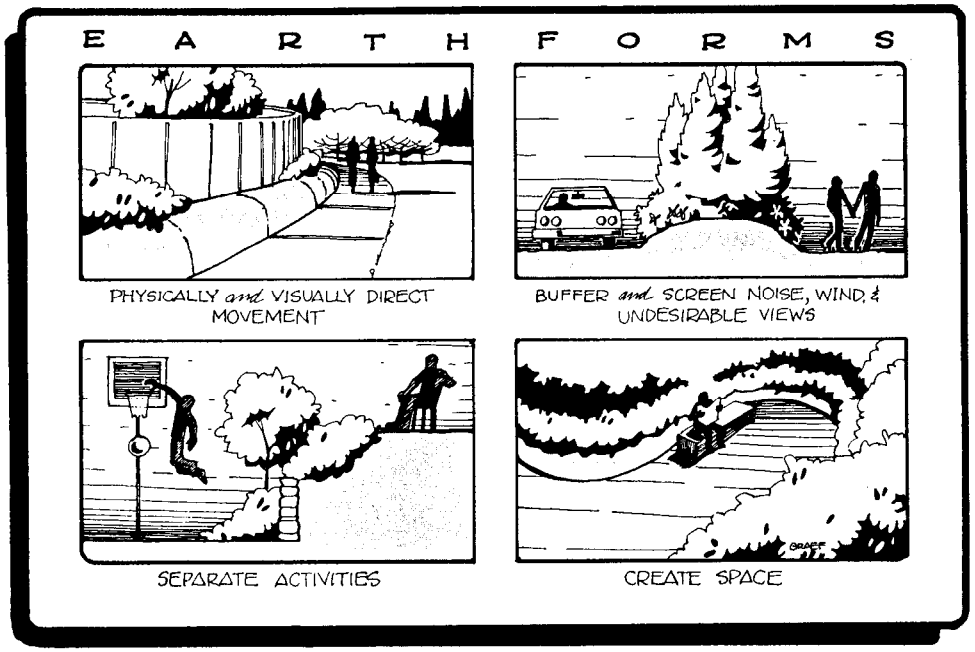
## Grading

If your homesite is already graded and even partially landscaped, you probably won't want to change its contours. But if the final grading has not been done, you may be able to create the topography most appropriate for your landscape design.

Actually, the best time to think about changing a homesite's topography is before building begins. This is also the best time to decide whether shade trees and other plants already there should be saved. Mature trees and shrubs add thousands of dollars of value to residential properties.

If you want to keep existing plants in your landscape design, they should be protected before constuction begins. Construction equipment can damage and kill trees by compacting soil in their root zones. A simple fence erected just beyond the branch spread of a tree will protect both roots and trunk from damage.

If you change the grade around an established tree, you must avoid changing the amount of air, water and soil nutrients reaching it. See Extension publication A3072, "Preserving Trees During Construction", for details on how to accomplish this.



During rough grading, the topsoil should be stockpiled away from the immediate construction site. To protect this valuable soil from erosion for a short time, spread weed-free straw or marsh hay over it. If the topsoil is to be stockpiled for more than one season, seed the pile with annual rye grass, oats or another annual plant. When construction is completed, the topsoil should be spread evenly over the lot. A 4-6 inch layer is ideal, although two inches may be adequate if it is incorporated into the top six inches of soil.

Mounds, berms and changes in ground contour great enough to require steps or retaining walls help create an interesting landscape. But they should perform a specific function, such as outlining specific use areas or other lawn spaces, buffering noise or screening unwanted views. Mounds should blend into the surrounding topography and look natural.

Your ground elevation must match your neighbors' at lot lines. You can accomplish this with gradual grading or retaining walls.

## Driveways

The driveway is an integral part of a home's public areas, providing access for both vehicles and pedestrians. At most homes, it is where visitors arrive, mail is delivered, trash is picked up and children play. It should be wide enough to accommodate pedestrians and vehicles at the same time. If you have enough space, consider constructing a turn court and parking area to permit the unhampered – and safe – movement of vehicles.

For safety, the drive should meet the street at a right angle, and plants or structures must not hamper a driver's vision. If the drive has a steep grade, try to design a nearly level area near the garage and at the street intersection.

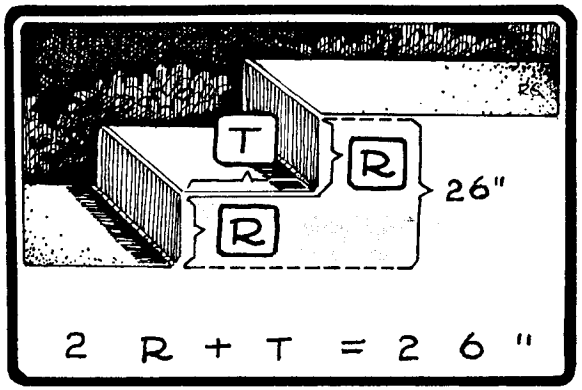
Driveways should have a slope of at least 1% (1 foot rise per 100 feet traveled) for proper drainage. But a slope of more than 10% will be hazardous in winter. Remember to provide space where snow can be placed in winter without damaging plants or structures.

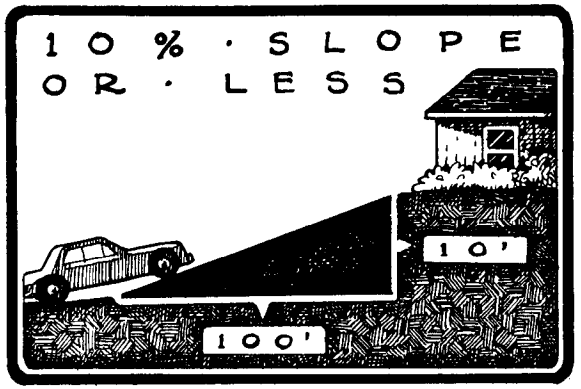
We recommend that homeowners seek professional help to make sure that unusually long driveways or those on steep grades fit harmoniously into the landscape.

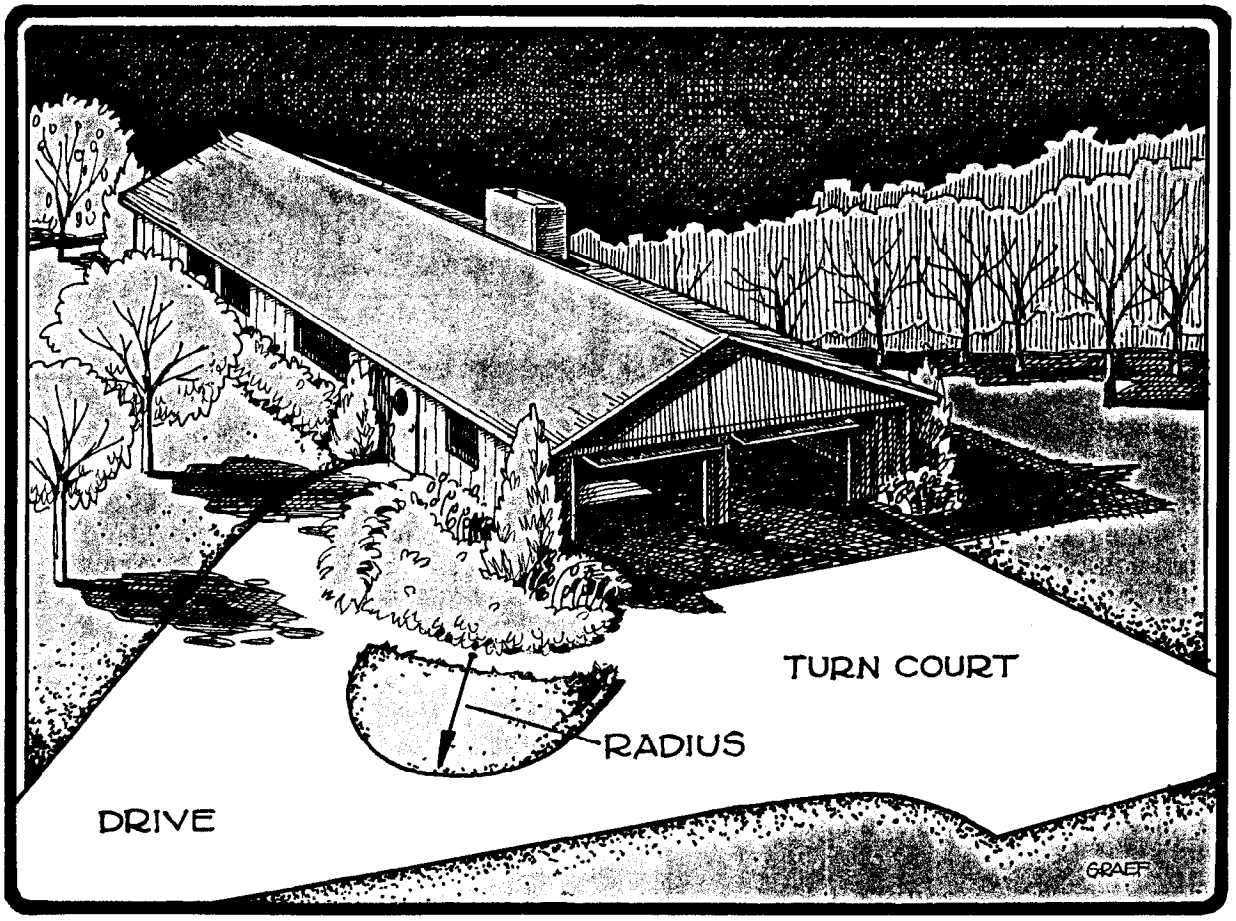
## Walks

Most people find walks already in place when they move into a home. Typically, an entrance walk meets the driveway at a right angle and parallels the house to the front door. Unfortunately, in many cases the walk is too narrow for comfortable pedestrian use and too close to the house for proper plant growth.

An entrance walk should be at least 4 feet wide. A large house may require a 5-foot







walk for proper scale. If you have the opportunity to plan your entrance walk, leave at least 4 feet between it and the house. This will provide enough space for an entrance planting to accent the front door.

As for the driveway, plan the entrance walk for easy access and winter snow removal. A slope of 1-4% is ideal. For safety, the slope should be no more than 6%.

## Steps

Where the ground slopes more than 6%, you will need to install steps to permit people to move from one level to another. No matter what the steps are constructed of, they should meet a long-established standard for safe and convenient outdoor steps: two risers (the riser is the vertical part of a step) plus one tread (the horizontal part) should have a combined measurement of 26 inches. The most common step dimensions are 5½-inch risers with 15-inch treads and 6-inch risers with 14-inch treads.

A pedestrian may not notice only one or two steps, so as a rule a set of steps should have at least three risers. If this isn't possible, use an eye-catching surface material or outdoor lighting to make the steps visible. Handrails make steps safer, especially in winter.

## Decks and patios

If you want a deck or patio for outdoor living, plan for it carefully to make it useful in as many ways as possible.

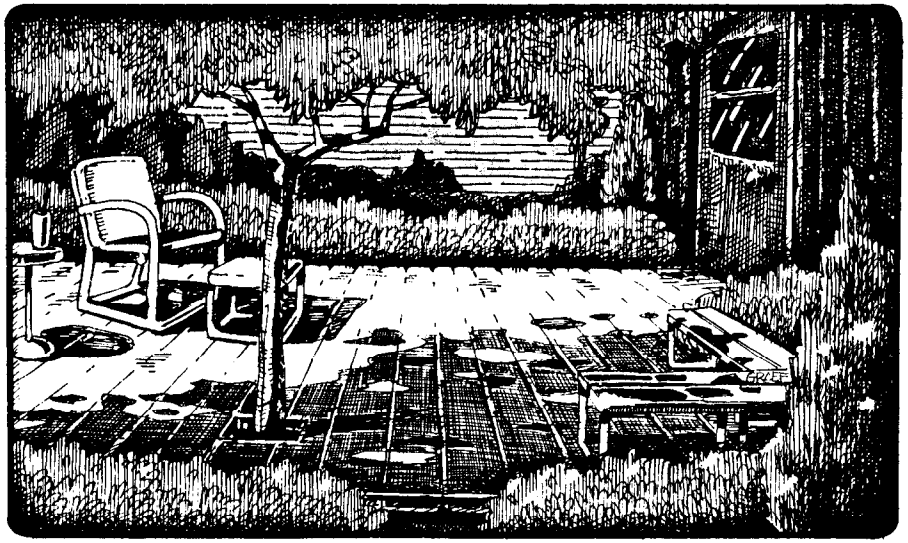
Location is one important consideration. A patio or deck should be convenient to the appropriate areas of your house. If you will use it mainly for sunbathing, you'll probably want it off the bedroom. If you plan to eat or entertain there, place it near the kitchen or family room. Of course, door locations may limit your placement alternatives. Other factors to consider are exposure to sunlight, summer winds, good views and privacy.

Patio size will depend on what you want to use the patio for, yard space available and family size. We recommend about 64 square feet of hard-surfaced patio space for every family member.

A patio should have a 1-2% slope away from the house so water will drain away from the house.

A deck can provide a level outdoor area over steep ground. It should appear to be an extension of the house. Its color and texture should make it harmonize with the house and surrounding landscape.

The architectural lines of your home; choice of construction materials and other aspects of your landscape-design will all influence the shape of a patio or deck.



D E C K

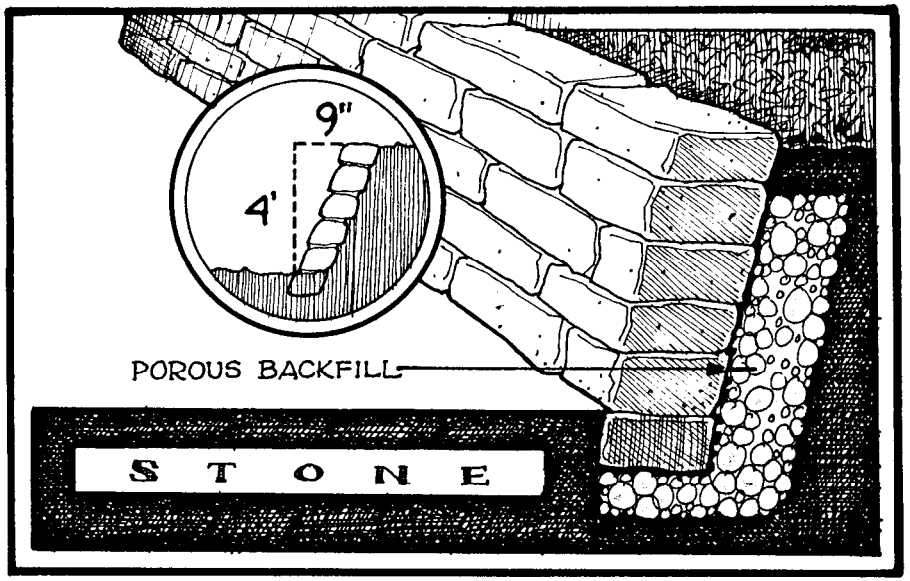
P A T I O

## Retaining Walls

Retaining walls are used to make abrupt changes in elevation, provide privacy and delineate outdoor space. Stone, brick, wood ties, timbers and concrete are the most commonly used materials.

For steep grade changes, a series of low walls is usually better than one high one. The higher the wall, the more it must be reinforced to withstand the pressures created by freezing and thawing in winter.

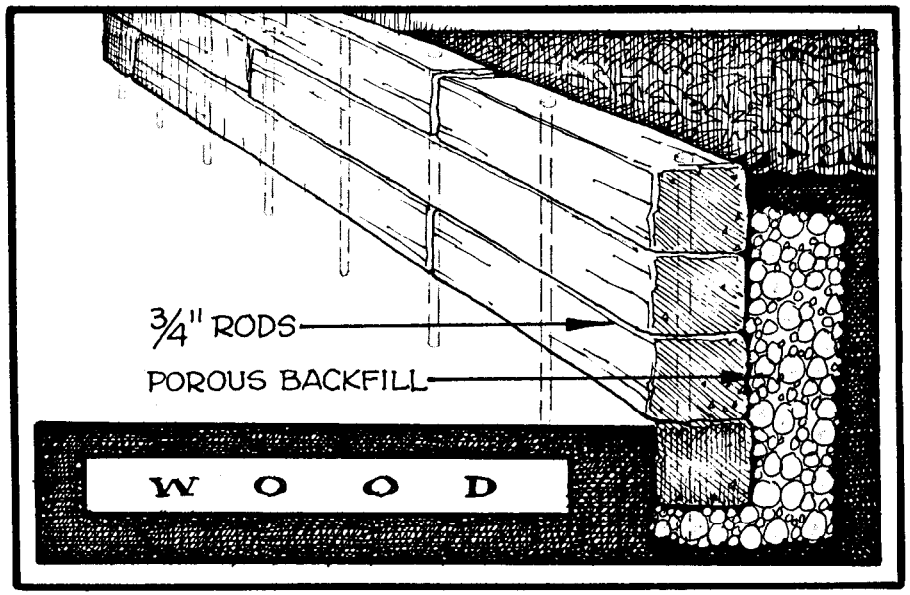
For both dry and mortared walls, careful planning and construction are essential. Consult detailed design books or seek professional assistance if you plan a retaining wall more than 4 feet high.



## Fences

Fences, alone or in combination with mass plantings, provide privacy and enclosure in the home landscape. They also serve as windscreens, "poor-view" screens, accents, space dividers, sources of shade and backdrops for plants.

Fences may be constructed in a variety of styles and from many different materials. If you decide to build a fence, choose a style that complements your overall landscape design. Chain link fences, with or without plastic strips, rarely beautify a yard. Fences made of dark or neutral-colored natural materials usually do.



## Lighting

Outdoor lighting can be included in your landscape design. Lighting walks and entrances makes them safer, especially during dark and slippery winter months. Soft overhead lighting extends the useful hours of patios and decks. With lights, you can highlight particular plants or structures. Low landscape lighting – no more than 3 feet from the ground – can help unify your entire landscape in the evening.

# Low-Maintenance Landscapes

All plants and structures require some maintenance, but you have some choice as to whether your landscape will require a lot of maintenance or a little. Many homeowners enjoy lawn and garden work and knowlingly choose plants and structures that require a lot of maintenance. Others want an attractive and functional landscape, but would rather not spend evenings and weekends weeding, mowing, watering, edging and pruning. If you are in the latter category, you should work toward a low-maintenance landscape.

Mulched planting beds usually require less maintenance than the same area of properly maintained lawn. Two to four inches of shredded bark, wood chips, ground corncobs or similar organic materials control weeds, retain soil moisture and moderate soil temperatures, while blending into the landscape.

We don't recommend placing a plastic sheet under organic mulches, but crushed stone, marble chips and washed gravel must be underlain with black plastic for effective weed control. These inorganic mulches can reduce aeration of heavy or poorly drained soils (while providing only limited moisture retention), and they sometimes reflect enough sunlight to damage plants. Crushed stone and marble chips introduce exotic colors which violate basic design principles in many situations.

For those areas where a lawn is necessary, use a mulching mower to avoid having to rake leaf clippings and to reduce fertilizer needs (by returning plant nutrients to the soil).

Edging around planting beds reduces maintenance time – by separating the beds from the lawn – and helps unify a landscape design. Select an edging material with texture and color that complement the house and other landscape structures – stone, wood, brick, steel and plastic are all available.

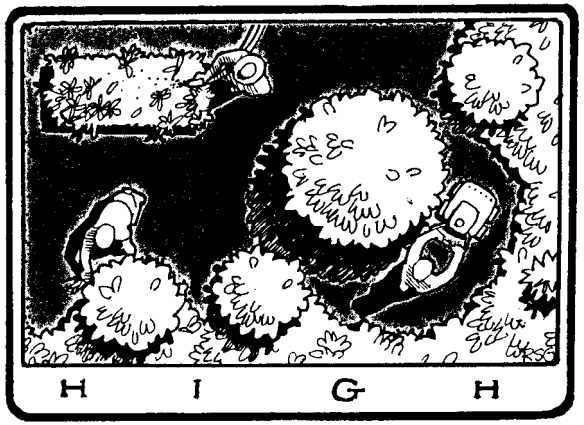
A perennial ground cover under trees and shrubs also reduces maintenance requirements. Most ground covers grow well in an organic mulch and, if planted at the right density, can even be used in place of a mulch.

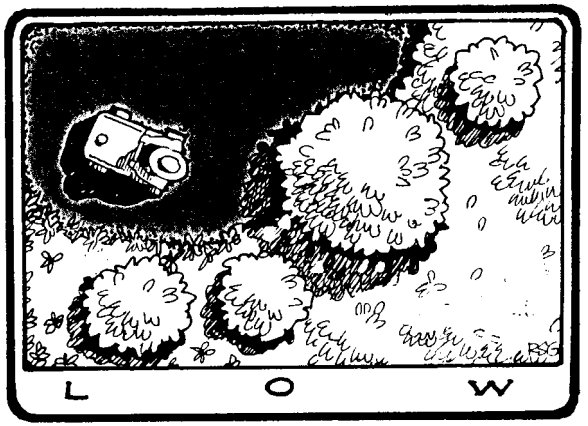
Use well-adapted plants that will require minimal maintenance. It takes a lot of time to maintain unnatural plant forms like topiaries, espaliers and pollards.

Space plants properly during the initial planting. If you overplant, you will have extra pruning, trimming and thinning. If you underplant, you may have to fill in with more plants.

Planting flowers in containers and small planting beds makes annual planting and removal easier.

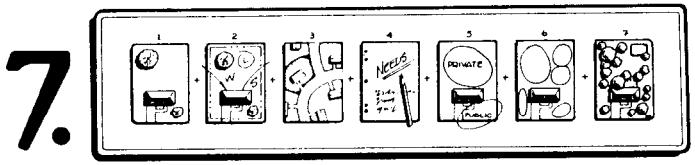
A "natural" landscape usually requires less maintenance than most conventional ones.





# Finishing Your Landscape Design

## Step 7. Putting It All Together



Once again, it's time to go back to the drawing board. Your last efforts there should have produced a number of alternative use area sketches. Now you will give exact shapes to the use areas you want and decide what plants and structures will create those shapes and a pleasing overall landscape design.

If it has been some time since you made the general use sketches you may want to retrace the steps that led up to them, by reviewing the first three sections of this publication. To complete a successful design, you need to have a grasp of lot, house, and neighborhood characteristics as well as general design principles.

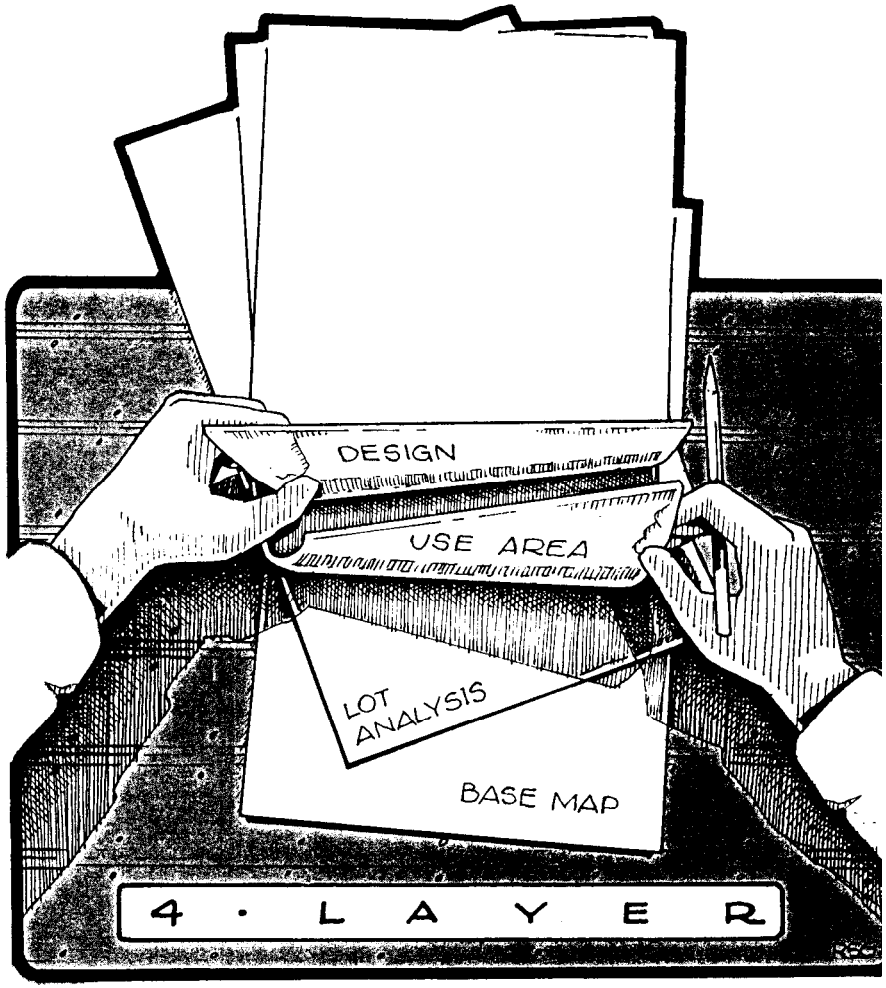
On the drawing board, place the best use area sketch over your base map and lot analysis drawing. On top of this, place a clean sheet of tracing paper.

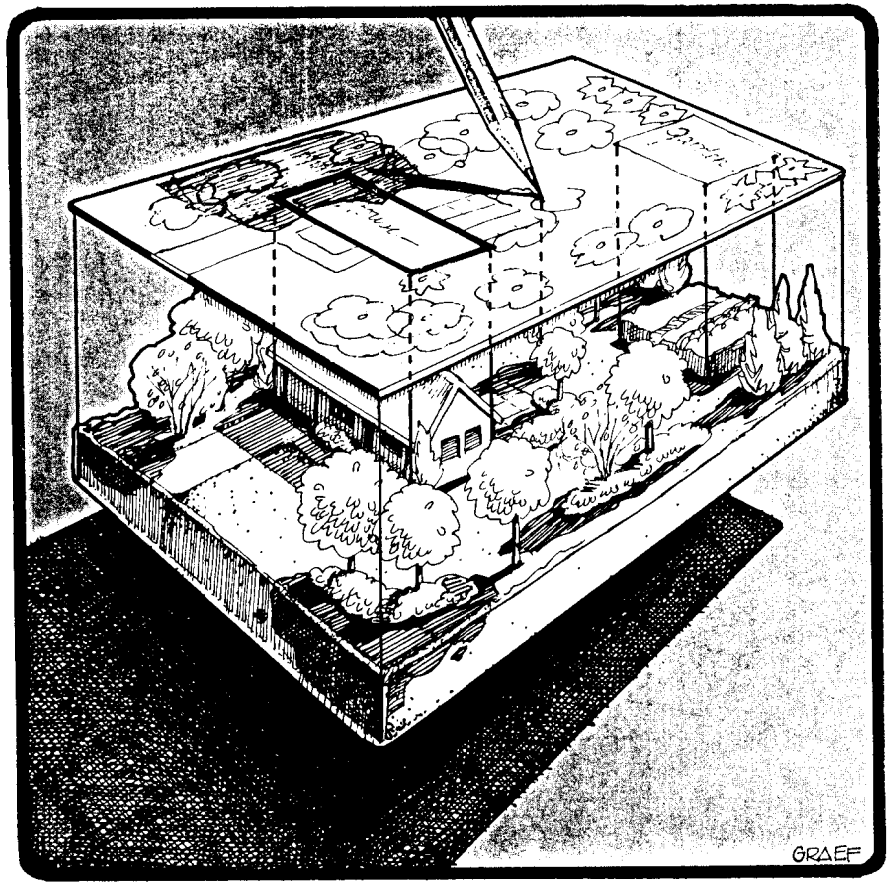
There are three parts to completing your landscape design:

–Draw exact shapes and locations of use areas, planting beds and landscape structures

–Identify specific planting sites

–Select plants and construction materials that meet your design requirements





GRAEF

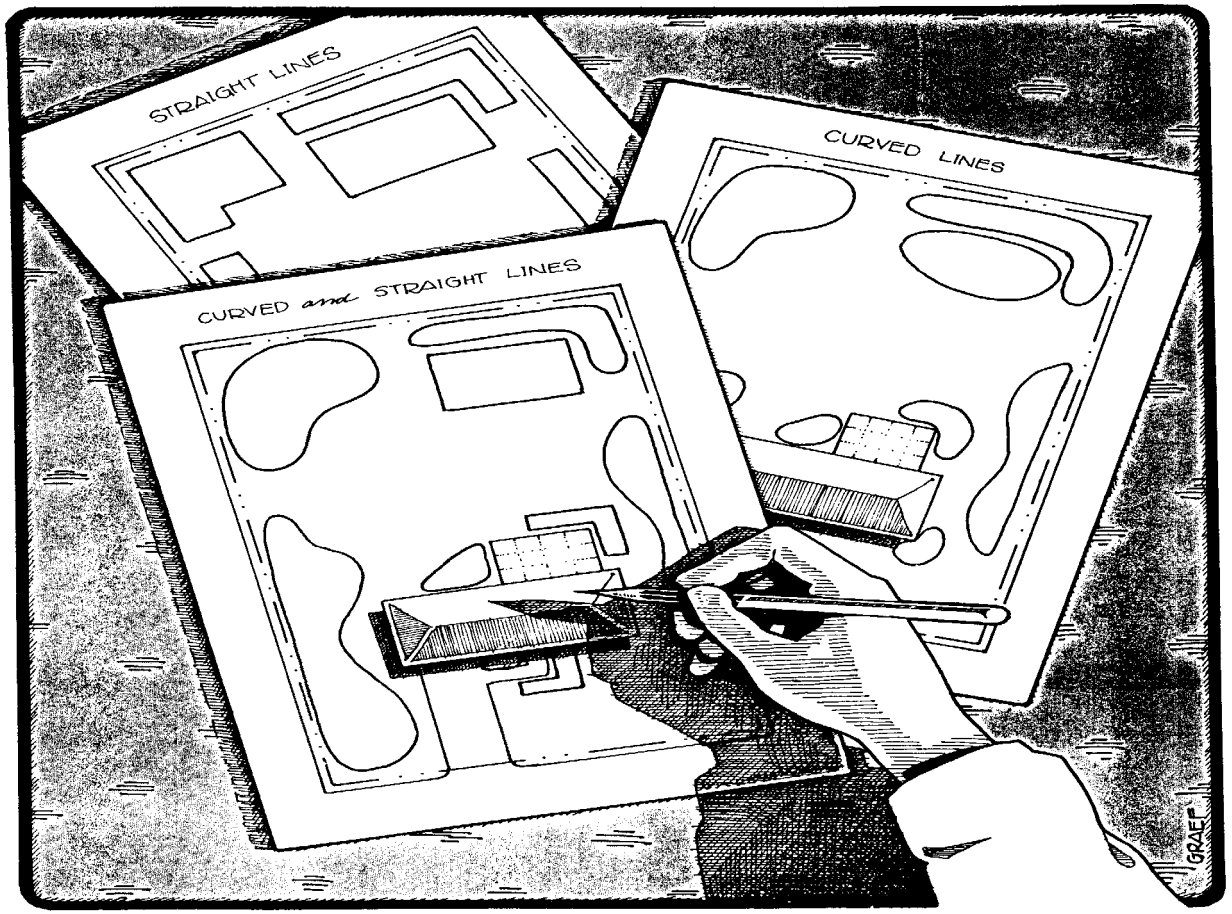
RSG

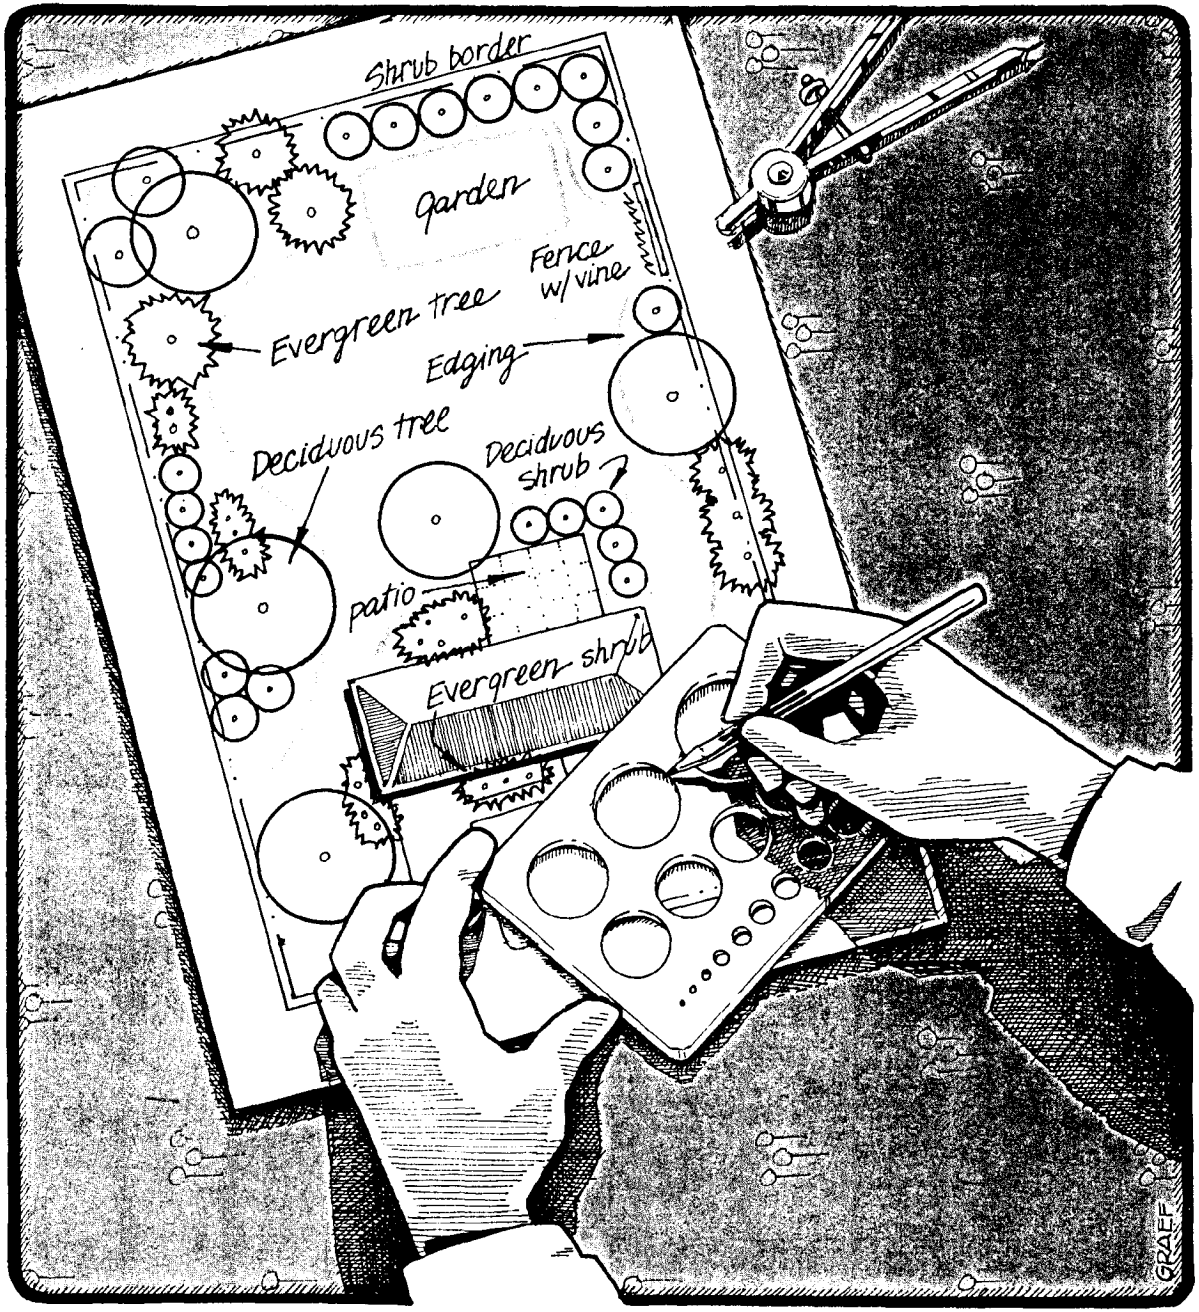
**First,** draw in planting beds and landscape structures that give shape to your outdoor use areas. As you draw, consider both function – energy conservation, screening poor views, enhancing good ones, etc. – and aesthetics – based on general design principles. You may want to review the relevant sections of this publication as you zero in on the most successful design.

Draw planting beds and landscape structures accurately to scale. You'll need some idea of the types of plants that will go into planting beds – deciduous vs. evergreen trees vs. shrubs, etc. – to make the beds the proper size.

Be prepared to draw several alternative designs. Professional designers usually draw several designs, try to improve them, then select the one that is best all-round.

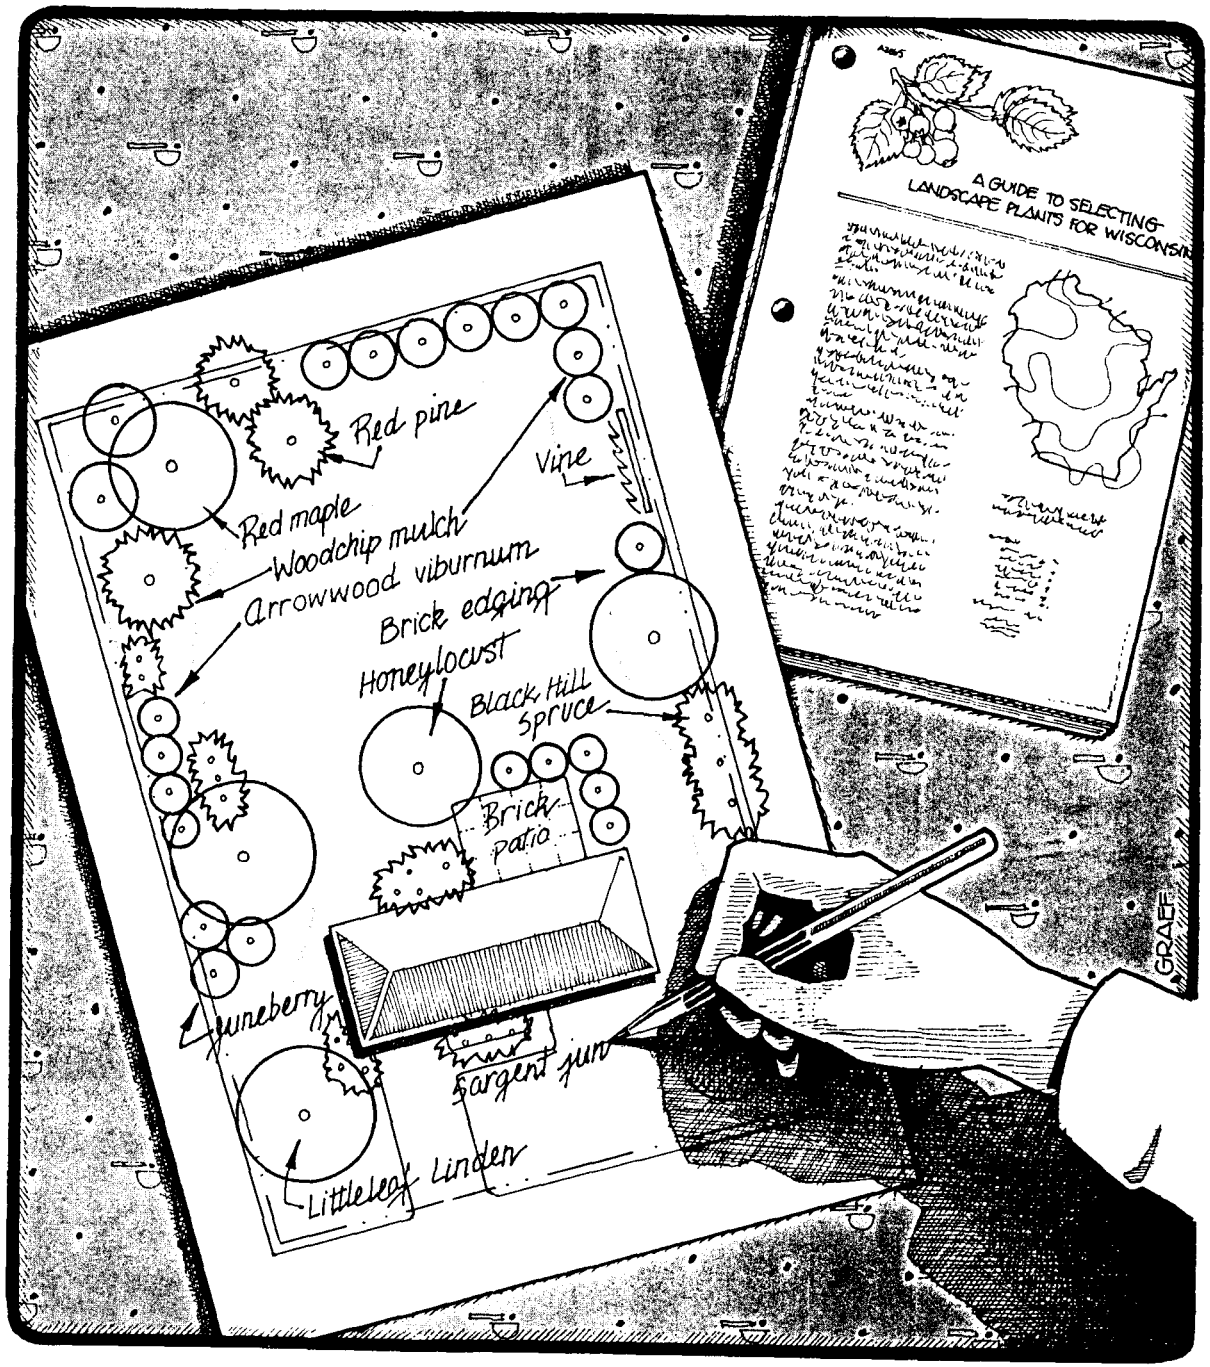


**Second,** identify exactly where plants should go, using appropriately sized circles on your drawing. Except for very large trees, which are usually drawn about two-thirds their maximum size, draw circles representing approximate mature plant spread. Unless otherwise specified in plant descriptions, spread is usually about two-thirds of listed height. You may want to differentiate deciduous and evergreen plants with different symbols.



**Finally,** decide what plants and building materials will fulfill your design requirements. The goal is to select plants that will grow well in your planting sites while providing forms, textures and colors that complement your design.

Also choose building materials whose textures and colors complement your design. Structures should blend in with house and plants. If you have a wood-surfaced house, for example, you'll probably want a wooden fence, and its color should be the same as or complement your house color.



# For Further Reading

Many publications on subjects related to home landscaping are available through UW-Extension county offices.

*Yard Care and the Environment* is a series of publications developed by UW-Extension and the Department of Natural Resources. Titles include:

- *Rethinking Yard Care*
- *Shoreline Landscape Options and Plants*
- *Landscape Practices for Healthier Plants and Improved Water Quality*
- *Lawn and Garden Fertilizers*
- *Lawn and Garden Pesticides*
- *Selecting a Lawn Care Company*
- *Watering*

## Other publications

*Landscaping for Wildlife,* available from the Department of Natural Resources, Box 7, St. Paul, MN 55155-4007. A landowner's guide to developing a beautiful yard that attracts wildlife.

*Livable Landscape Design* (141IB-211), available from Cornell University Distribution Center, Seven Research Park, Ithaca, NY 14850. Provides a fairly detailed reference on the process and principles of livable residential landscape design.

Basic books on home landscape design are also available at libraries, bookstores and garden centers.

# For Assistance

Homeowners who need assistance with developing and carrying out a landscape plan can turn to several sources of professional and technical services:

**Landscape architects** are professional consultants who plan and design the arrangement of outdoor areas. Of all the sources of landscape services, only landscape architects offer assistance with site selection and planning, preparing alternative plans and selecting a final plan that includes plants and hard-surface materials and working drawings. Some states have regulatory laws governing the practice of landscape architecture. Wisconsin does not require licensing, but only a person who has a degree from an accredited program can properly be called a landscape architect. Most landscape architects specialize in planning and design and do not sell plants or other materials or do landscape construction, in contrast to the following segments of the landscape industry.

**Nurserymen** grow plants for wholesale or retail sale. Some may offer landscape design assistance, particularly with plant selection and placement. Some may do the planting. Some nurseries operate garden centers.

**Landscape contractors** specialize in landscape construction They do rough and finish grading, seeding and sodding, concrete work for drives, walks and low retaining walls. They place landscape plants and supply topsoil, asphalt and other construction materials. Some install fences, decks, patios, sprinkler systems and pools. As a rule, landscape contractors do not grow plants, operate garden centers or offer extensive design assistance.

**Garden centers** sell seeds, fertilizer and plants that they may or may not have grown themselves. Most sell a wide variety of materials, including bedding plants, pottery and patio and lawn furniture. Some may deliver large plants, but few install them. Some garden centers offer limited planting design services.

Most **sod producers** sell sod wholesale, but some retail and install sod for homeowners. As a rule, they do not offer landscape design services.

Landscape industries that offer some landscape design services may employ **landscape horticulturists** – trained specialists in ornamental horticulture who may have some experience in planting design – and **landscape designers** – individuals who may have some experience in residential design, but not necessarily any formal training in landscape design.

# Using COLOR to Set the Mood in the Landscape

LandscapingNetwork.com
By: Renee' Brown

## PINK
*Innocent, Soothing*
Coordinating colors:

pink ladies

black iron

These pink cushions bring a playful, feel-good vibe under a somewhat overwhelming patio cover. The bright fabric and black furniture draw the eye into the soothing seating area.

## RED
*Excitement, Romantic*
Coordinating colors:

red

grey timber wolf

The color of this wall makes a bold statement creating excitement and intrigue. At the same time, the privacy and seclusion it affords are perfect for a secluded, romantic space.

## GRAY
*Practical, Reliable*
Coordinating colors:

smoke

burnt carmel

The practicality of simple gray tones need not stay muted. When accented by a warm color such as the carmel walls of this house, gray offers the reliable basis for nearly any design scheme.

## ORANGE
*Energetic, Enthusiastic*
Coordinating colors:

racing orange

azores

The entry way to this residence is bright and inviting. It's welcoming feel gives visitors a sudden sense of energy and excitement for what lies ahead.

## BLACK
*Authority, Sophisticated*
Coordinating colors:

black iron

satchel

The black iron speaks volumes about what this patio is all about. It conjures up a powerful impression in a sophisticated yet fun entertaining area.

## YELLOW
*Happy, Optimistic*
Coordinating colors:

amarillo

ravishing red

A bright and positive entry such as this can't help but brighten your day. The long, narrow corridor to the courtyard gets visitors excited and optimistic that they won't be let down once they get to the end.

## BROWN
*Elegant, Stability*
Coordinating colors:

saddle brown

myan gold

The solid, earthy appeal of brown in a landscape helps bring connection to the garden. The size and warmth in the varying tones of brown, gold, and blue in this fountain add a simple elegance to the soothing sound of water.

## GREEN
*Refreshing, Relaxing*
Coordinating colors:

woodland green

adagio

Natural and rejuvenating, the color green freshens a space. It adds just the right amount of color for this relaxing, mid-century retreat.

## PURPLE
*Dramatic, Motivating*
Coordinating colors:

mystical grape

veranda view

The dramatic impact of an entry filled with purple salvia adds a lot of curb appeal. Contrasting with the bright green tones of the landscape, the effect is inspiring.

## BLUE
*Calming, Serene*
Coordinating colors:

franklin lakes

antique rose

The calm, at-peace feeling of a stroll through this garden is achieved by planting design. The blue agave and grasses create a serene environment suitable for reflection and relaxation.

# TOOLS

## for Homesteaders, Gardeners, and Small-Scale Farmers

*A catalog of hard-to-find implements and equipment*

by the editors of Organic Gardening®, New Farm®, and Intermediate Technology Publications

edited by Diana S. Branch

$12.95
In Canada $14.95

# TOOLS

## for Homesteaders, Gardeners, and Small-Scale Farmers

Whether you are a gardener, homesteader, or small-scale farmer, finding the right tools can be a critical problem. Tools can mean the difference between staying on or leaving the land, between a sense of drudgery and a sense of fulfillment, between a successful crop and a meager harvest, between profit and loss. This catalog was compiled to help you find and use the tools you need to produce food. It attempts to fill the gap brought about by what the late E. F. Schumacher of the Intermediate Technology Group in London termed "the Law of the Disappearing Middle." This law states that as technology steadily moves to higher planes, we are left with primitive, overly simplistic tools on the one hand, and a very complex, sophisticated technology on the other.

The magic of any book is in the possibilities it raises in the imaginations of its readers. There are forgotten tools that could be made again — only better — and future tools not yet dreamed of. The ideas for them could spring from the obsolete tools of the past. Along with the new tools in this book, you'll find pictures of farm tools from old manuals. Studying the anatomy of a 1930 tractor which is especially suitable to the needs of today's farmstead, a handy person might just be persuaded to build another one. Or more.

Some tools now marketed for special purposes have uses for growers that the equipment maker didn't foresee. For example, a supplier of orchard and fruit-farming equipment manufactures a mulch spreader for the commercial strawberry grower. But the mulcher could be used to lay down straw or spoiled hay between raspberry rows, or vegetables, or wherever you need it.

Common lawn and garden tools have uncommon homestead uses, too. A grinder-shredder will chop silage for cattle feed out of corn, pumpkins, mangels, or other plants. It will even grind a crude corn-and-cob meal for cows. A big 10-tined silage hand fork makes an excellent tool for handling mulching materials like shredded bark. The equally large hand forks we used to call barley forks, with tines closer together than those of a silage fork, are good for shoveling sawdust mulch.

This book brings together all these tools and the ways to use them. People say that tools aren't available today for homesteading and small-scale farming. But somewhere in the world or at some point in recent history the technology has existed for these tools. They are being made today, and this book tells you where to find them. Veteran farmers can use this catalog as a source book for hard-to-find implements; novices will find helpful explanations of how to use these tools — the correct way to scythe, for instance.

The future looks bright for tool users and toolmakers in the gardening and small-farming field. Little imaginative thinking has gone into such tools in recent years because technology has been enamored with the concept of Big. But all sorts of interesting ideas await development. This book will help point the way.

# Preface

*Tools for Homesteaders, Gardeners, and Small-Scale Farmers* is a technology sourcebook, not an exhaustive product listing. We want to show you what tools and implements exist to assist the small farmer and where they can be found. But, to be fair, we have to admit that there are many more sources of tools than we've been able to locate in the past year. If we missed a company you know about and trust, please let us know. If you are interested in distributing any of the products listed, we'd encourage you to write to the manufacturers. Many have expressed an interest in opening new markets.

It must be emphasized that the product descriptions in this book are not evaluations of the products. We are, in most cases, presenting the information provided to us by manufacturers or distributors. If we say more about one product than another, it is because somebody told us more about it. The same is true with photographs. We do not intend photographic coverage to be an endorsement of any product. However, we must confess to discriminating in favor of hard-to-find items both verbally and photographically.

# Acknowledgements

Guidance in deciding what to include in this book came from three invaluable sources:

The idea for this book grew out of the Intermediate Technology Publications book, *Tools for Agriculture: A Buyer's Guide to Low Cost Agricultural Implements*, by John Boyd. Its object is to provide a source of information on the availability of appropriate tools for the people in developing countries. As the basis of this co-publication, Intermediate Technology Publications have gladly made their written and visual material available to provide the foundation for this book, to which a mass of further information has been added. As a result, the book should prove of inestimable value to farmers and smallholders, not only in North America, but around the world.

Agricultural Engineer, Dr. Biswa Nath Ghosh provided photographs and the technical groundwork for many introductory sections.

Gene Logsdon, a contributing editor for *Organic Gardening and Farming*, revealed many of the needs of the small farmer in North America based upon experiences at his own farmstead in Ohio and those of other small-scale farmers he's met along the way.

Many thanks to all those who contributed photographs and information to this book. Thanks also to the Rodale Press Photo Lab for assisting with the photographs.

My sincere appreciation to Barb Coyle who persevered with research, follow-up, collation, and keeping me organized.

Finally, special thanks to Jerry Goldstein for his guidance and support throughout.

—D.S.B.

# Introduction

Finding the right tools can be the most critical need for a small-scale farmer or a large-scale gardener. It can mean the difference between staying on or leaving the land, between a sense of drudgery or a sense of fulfillment, between a successful harvest or a meager crop, between profit or loss.

This catalog will, we hope, help you to find and use the tools you need to produce food. The tools and equipment described in its pages were selected primarily for their value to the homesteader, truck farmer, and the small-scale organic farmer, but backyard gardeners should also find things of interest. This book attempts to fill the gap brought about by what the late E. F. Schumacher of the Intermediate Technology Development Group in London termed "the Law of the Disappearing Middle." As technology steadily moves to higher planes, we are left with primitive, simplistic tools on the one hand, and a very complex, sophisticated technology on the other.

This book intends to show that intermediate-scaled farming is one topic in which people of all lands share common interests and common needs. It is built on five important concepts which we believe to be true:

1. that in many instances the developing nations are ahead of the industrial giants in developing appropriate tools and machines for successful farming on a small scale;
2. that although it may not be readily available everywhere, the technology exists somewhere or has existed at some time in the past to accomplish those tasks which need to be done in an efficient way on the small farm;
3. that it is just a matter of implementing existing knowledge to get these tools to those people who want to put them to work;
4. that to satisfy the need expressed by the small farmer does not mean a technological regression to the primitive techniques practiced on yesterday's small farm, but rather a rediscovery of these techniques, a recognition that they retain relevance to today's small farmer;
5. that what is called for is a modernization of these techniques, applying the technological wisdom of today to the techniques employed in the past.

—Diana Branch, Editor

## EXPLORING ALTERNATIVES

Innumerable groups and societies are now concerned with exploring alternatives—alternatives that do not destroy, waste, or pollute our natural resources. More and more individuals are dissatisfied with the mindless repetition of simple tasks imposed by mass production and are seeking greater self-fulfillment and freedom from the tyranny of superficial nine-to-five routines. The movement toward self-sufficiency, homesteading, organic gardening and farming, and natural food is a part of this whole movement.

The problems of agribusiness are also forcing us to explore alternatives. The problems are of both scale and technique: mechanized farming of vast areas with huge machines and widespread use of chemical fertilizers and sprays; the development of food factories; the massive infiltration of artificial ingredients into our foods; the intensive breeding of animals raised in confined conditions for slaughter.

Is more energy being poured into this type of farming than is produced by the harvest? Is the soil's substance being eroded? Do chemical sprays harm the environment more than they benefit the farmer? While surely we need the food, do the means we use to produce it destroy the resources on which we all depend? Are there satisfactory alternatives that could provide as great a volume of production using less-violent means?

These are some of the broad questions that are being asked by more and more people.

There are other related questions, too. As technology moves forward, machines become ever more sophisticated in doing the work of more and more people. In a period of rising unemployment throughout the world, should not this trend be reversed?

Certainly in developing countries, the planners and governments are beginning to have second thoughts. In many cases, the modern high-level technology that was introduced to increase productivity in various fields has proven disastrous for the countries concerned. Western-style technology used scarce supplies of capital and costly fuel, required maintenance beyond the ability of local skills, provided very little employment and even, in some cases, drastically reduced employment. Now, more appropriate alternative methods are being investigated by developing nations. These methods create more employment, use less capital, can be maintained by local skills, increase productivity by successive small increments, and are appropriate to the social and economic requirements of the particular country concerned.

Certainly, the time seems to be ripe for an examination of alternative techniques that could provide some solutions to the mounting concern that is being expressed. There are several lines of investigation that could be followed:

First, existing practices could be modified at the technical level in order to use renewable resources or modify machines so that less pollution is caused and less damage is done to the environment.

The second approach could be to revive and reintroduce an older, tried-and-proven technology using more labor, in which individual skills are needed, providing meaningful work and job satisfaction. These skills may have to be relearned and the technology and tools reworked to suit modern methods and materials.

Third, the scale of modern technology could be changed to meet the needs of a particular area or industry. Centralized production could be changed to small-scale production serving local areas rather than supplying several states. More employment would be provided, with less fuel being wasted on transport. Local preferences could then be catered to, for the establishment of a small industry in a local area has a multiplier effect on the local economy.

In a sense, this book is an amalgam of all three approaches with regard to agriculture and small-scale farming. It contains examples of many different tools and pieces of equipment that can be used in each stage of farming, from plowing to harvesting, from preparing the soil to processing the crop. Some of these tools are based on older, well-tried technologies; some are scaled-down, smaller machines designed for smaller farms; others are designed to use renewable resources to help make organic farming more productive.

This mine of information, carefully gathered and cataloged here, should prove invaluable to farmers, gardeners, and small landholders alike.

Editor, Intermediate Technology Publications

## TOOLS, NOT MACHINES

Throughout the compilation of this book, we have selected the tool over the machine. The difference may be clear-cut in our minds, but not always so distinct in reality, since one and the same product may be a tool *or* machine, depending upon who is using it and how it is being used. A brush in the hand of an artist is a tool. The printing roller that duplicates his painting a billion times into a wallpaper pattern is a machine. There is nothing wrong with a wallpaper machine (though wouldn't it be better if we all decorated our own walls?) just as there is nothing essentially right about an artist's brush. But there is a difference. Peculiar things begin to happen when that difference is extended indefinitely in human activity. The tool remains hand-directed and unhabituated; the machine becomes increasingly more automatic and addictive if its power is not curbed. If you let go of the paint brush, it falls on the floor; the wallpaper machine will go on making wallpaper while you sleep. Because it is so easy to produce with a machine, we inevitably let it produce more than we need. The machine can produce an unlimited supply of wallpaper, but there is never a surplus of art.

Tools humanize; machines dehumanize.

Tools make unique products—each a little different from the other, each speaking eloquently of the tool's user. A machine deals in multiplied sameness no matter who or what operates it. The best machine operators are other machines.

The tool is fragile because it is individual. The machine is powerful because it is collective. In any contest where winning is measured in quantity, it is a mathematical certainty that the machine will win because it can always get there "the fastest with the mostest." As long as economics makes quantity the goal, the machine will devour the tool. And when all the tools are gone, the machine will devour lesser machines. For tyrants, the machine is the ultimate tool.

While our supplies of cheap fossil fuel last, farmers need machines to continue to wrest land away from other farmers for the ultimate aggrandizement of agribusiness. In the new technology, homesteaders, gardeners, and small farmers can live well with tools and have much less need for machines. But they need *lots* of tools.

The magic of any book, we believe, is in the possibilities it raises in the imagination of the reader. There are forgotten tools that could be made again—only better—and future tools not yet dreamed of. The ideas for them could spring from the obsolete tools of the past, so we have included pictures of farm tools from old manuals. Studying the anatomy of a 1930 tractor which is especially suitable to the needs of today's farmstead, a handy person just might be persuaded to build another one—or more.

There is a strong heritage, especially in the United States but elsewhere too, of the farmer as inventor. A large percentage of our inventors came from rural communities, and virtually all the industries which grew up in the United States in the 1800s started on a very small scale, often as one-man operations. Cyrus McCormick, Oliver Evans, Eli Whitney, even Henry Ford—each grew up on a farm. The inventors of tools we still need will most likely come from the ranks of today's small farmers—and their children.

Some tools now marketed for special purposes have uses for growers that the equipment makers didn't foresee. We've tried to include these tools whenever we've been aware of them. For example, a supplier of orchard- and fruit-farming equipment manufactures a mulch spreader for the commercial strawberry grower. The spreader can be placed on a wagon or in the back of a pickup truck. Straw bales are fed into one end and are chopped up and delivered out the back onto the strawberry plants. But the mulcher could be used to lay down straw or spoiled hay between raspberry rows, vegetables, or wherever the farmer needs it.

Common lawn and garden tools have uncommon homestead uses. A grinder-shredder will chop silage for cattle feed out of corn, pumpkins, mangels, or other plants. It will even grind a crude corn and cob meal for cows. A battery-operated hedge trimmer works fine for summer and winter raspberry pruning. A battery- or hand-operated sidewalk edger makes an adequate cutter for strawberry runners. A big ten-tined silage hand fork makes an excellent tool for handling mulching materials like shredded bark. The equally large hand forks we used to call barley forks, with tines closer together than those of a silage fork, are good for shoveling sawdust mulch.

Surely the future looks bright for tool users and toolmakers in the gardening and small farming field. Little imaginative thinking has gone into such tools because technology has been enamored with the concept of Big. All sorts of interesting ideas await development.

We hope this book can help point the way.

—Gene Logsdon,
*Organic Gardening*

# -1- A Picture of the Small Farmer Today

## SMALL-SCALE FARMING*

by Jerry Belanger

Pick up almost any issue of *Countryside* and read about the people who are prospering on small farms. Of course it's possible. We prove it every month.

But we're also careful to point out that it isn't easy. Not everyone who dreams of a small farm is going to make it.

Most farmers would be surprised to learn that anyone could be shocked by having their small-farm dreams shattered by an introduction to agribusiness. After all, everyone must certainly know that our farm population has been cut in half since the 1940s, and that the exodus is continuing even now. Everyone (and certainly anyone interested in starting farming) should be aware that only the larger and more-efficient farms are surviving.

If you haven't heard that wheat is selling for less than it brought in 1949, that cattlemen have been selling below the cost of production for more than a year and a half, or that dairymen have been skirting the same situation for several years, you probably haven't done enough homework to be ready to farm. If you don't know that the average U.S. farm encompasses 400 acres and represents an investment of about a quarter of a million dollars, and that the USDA predicts that it will take half a million dollars to break into farming by 1985, you might want to reconsider.

If that's the case, what are magazines like *Countryside* and *Mother Earth News* all about? Is it, as you ask, all a dream?

No, but let's get a few things straight.

To begin with, it's important to understand the distinction between homesteading and farming. If you're talking about producing your own food and preparing for the hard times ahead, that's homesteading. It can be accomplished on a large farm, a small farm, or in town, and since many people in rural homes do not produce their own food or prepare for the future, they are not homesteaders.

Farming, on the other hand, involves producing food for sale or barter.

In *Countryside* magazine as in the countryside itself, there is a lot of overlapping. Some of our topics cover farming, some cover homesteading, and many include both. If you want to be very technical about it (which we never are in the magazine), if you raise rabbits for your own table, you're homesteading; but the minute you sell a fryer, you're farming.

A chicken farmer, then, could be one who has 100,000 birds in cages in climate-controlled, light-regulated buildings . . . or it could be a person who sells a dozen eggs occasionally from the surplus produced by a backyard flock. It shouldn't take much imagination to figure out which one is going to produce eggs at the least cost.

This leads us to the fact that farming is a business. Obviously, you say . . . but it's not obvious to the dreamers. People who don't have enough business acumen to run a popcorn stand envision themselves as farmers, but it won't work. In fact, without knowing and adhering to business principles, even homesteading won't work! The difference, of course, is one of scale. The loss of a couple of dollars on a homestead can be written off as entertainment or exercise or education or any number of other expenses, but a loss on a farm is a loss, period.

This, perhaps, is at the heart of your concern, so let's examine it in closer detail.

* Reprinted with permission, *Countryside*, September 1977.

Any business, in any field, requires capital. You can't even start a lemonade stand without a lemon (or today, perhaps, a synthetic substitute). Farming takes thousands of dollars, depending on the location and type of enterprise. The average Wisconsin dairy farm today represents an investment of $180,000.

In the lemonade business, you'd probably borrow the lemon from your mother. She might not even make you pay her back and almost certainly wouldn't charge interest. But farm debts today stand at more than $1 billion, and those who lend that money expect to be paid back, with interest. Because they expect to be repaid, they examine the borrower's qualifications closely. If all you know about farming is what you've read in *Countryside, Organic Gardening, The New Farm,* and *Mother Earth News,* you probably aren't a very good risk.

So you need training and experience in the business. With the lemonade stand, you must know how to make lemonade, how to make a sign, how to select a location and a nice hot day, how to make change. Certainly no one would start a grocery or hardware store without knowing something about groceries or hardware, without making some type of market survey, and a great deal more. And if anyone thinks farming entails nothing more than buying some land, getting on a tractor, and going to it, well then yes, they're dreaming.

Will you raise cash crops or livestock? Will your crops be corn or soybeans, apples or celery, cabbages or artichokes? Why? Will you raise pigs or sheep or cows? Will your cows be beef animals or dairy animals, your pig enterprise a farrowing operation or a finishing operation or a farrow-to-finish operation? How much experience do you have in whichever you choose? How much capital will it take to get started, how long will it be before you can expect any income, how much money will you need to carry you through that period, what will your cash flow be, what kind of price will you need to make enough money to make a living, what kind of price can you expect in the future?

What kind of machinery will you need, and what do you know about buying, operating, and maintaining it?

And what about marketing? Is there a local market for your pigs or fat lambs, or will you have to ship them a long distance? Is the goat cheese co-op to whom you'll be selling milk established and well managed, or will it fold just about the time you get your herd built up? Or, if you intend to market milk yourself, how thoroughly have you investigated regulations governing such activity, how closely have you figured costs, just how certain are you of your potential market? If you sold a few gallons to the parents of a baby who's allergic to cow's milk, a guy with an ulcer, and a health food nut and assume that counts as valid market research, we can guarantee that you won't be farming very long.

All of this is only the rawest beginning, yet many people who dream of the countryside ignore even these most basic steps.

Now we come to the question of size. Is it really necessary to have hundreds of acres if all you want is a small farm?

Average size varies with location and type of enterprise. An acre of strawberries or asparagus near a major population center might be profitable; an acre of wheat probably would not.

In most cases, a small farm is at a competitive disadvantage if it produces the same products that a large farm in the area produces. The larger farm can make better use of labor and equipment and can more easily acquire operating capital. But we have seen some exceptions.

If a dairy farmer milks 100 cows with an average production of 10,000 pounds and sells that million pounds of milk per year at $9 a hundredweight, he grosses $90,000. The farmer who milks 10 cows of the same caliber grosses $9,000.

If both farmers had the same lineup of equipment, those costs would smother the smaller of the two. If the large farmer had large, fast, new equipment he would accomplish much more than the smaller one with small, slow, old equipment that constantly required repairs. But . . . there could be compensations. If the larger farmer's equipment and other costs were such that his expenses came to $85,000 a year, he'd only have $5,000 left. And if the smaller farmer could hold his costs down to $1,000 a year, he'd have $8,000 left.

A few years ago it would have been tough to find examples of this. New equipment was relatively cheap, there wasn't as much old equipment available, fuel was inexpensive, fertilizers and chemicals constituted a much smaller portion of the farm budget, land costs were lower, taxes were lower, and so forth.

But today, a new combine costs $40,000 or more: an older, smaller one can often be found for $100. Big farmers want—they need—8-, 10-, or 12-bottom plows costing thousands of dollars. They have no use for the old two-bottom out behind the shed, and they sell it for scrap metal prices. An average-size tractor (now about 85 horsepower) will cost more than $10,000; older, smaller models can often be had for under a thousand.

You'll have to be a mechanic if you own the old stuff, and you won't work as many acres in a day. But you'll get the job done. And you won't need nearly as many bushels or gallons or pounds to cover the cost of capital, to repay loans, and pay interest.

Large farmers are extremely shrewd managers. They have to be. They have large equipment because they know exactly what it costs them and what the alternatives are—and because they make money with it.

Small farmers have to do the same. A piece of equipment is not necessarily right just because it's old and small and cheap. Small farmers require the same type of management skills as large farmers; they only apply them differently.

There are several other angles here that can get us off the track. You, the reader, and I have a somewhat different view of the future than most farmers. For the most part, we believe in organic farming, and we're concerned about chemicals in our food and soil. We can see ecological webs that others ignore or are blind to. We are, perhaps, more deeply aware of the real meaning and nature of the energy crisis and its relation to food. We're uneasy about megafarming and disdainful of the middleman with his processing and packaging and advertising and hauling. We think that somehow this is all wrong and that we can make it right.

If you're serious about farming but lack experience, homesteading is certainly one of the best places to begin learning. Or, you might consider formal training and then working as a hired hand. With more experience, you might be able to farm as a renter or on shares. In all of these situations, you'll have to act like an agribusiness farmer, of course, unless you are fortunate enough to find organically inclined people to work with. It's getting easier all the time.

But perhaps the best alternative of all might stem from this encouraging note: fully two-thirds of all American farmers earn more away from their farms than they do from farming.

In organic and other ecological circles, this is generally taken as bad news. More than half the farmers of the 40s have been forced out, and only one-third of those remaining can be said to be full-time farmers. Ninety percent of our food is produced on ten percent of our farms. And yet, if part-time farming is actually twice as common as megafarming, isn't this a golden opportunity? If we can continue to earn a living in town, it doesn't really matter if the farm makes enough money to support us or not. We can learn. We can improve our land, build up our herds and flocks, settle in with machinery that's proper for each individual farm, build up equity, be organic.

It's not the ideal situation, because proper farming requires careful timing and full-time supervision and surveillance, but it's a darn good second choice. For most of us, it's the only logical choice. With study and practice, with good management and sound financial planning, a part-time farm can become a full-time one . . . and if our hopes that agribusiness can't last should prove to be right, such small farms will be in an extremely enviable position.

One thing more. Most organically inclined people know that it takes three to five years to convert a chemical farm to organic methods. But what many do not know is that many farmers believe that it takes five years, even for an experienced farmer, to get to know how to work a particular farm. Every place is different, every situation is different. This is yet another reason for the greenhorn to be cautious.

Yes, it's possible to make a living on a small farm. But it probably takes about as much training and preparation as a career in law or medicine or any other worthwhile profession.

# SWEENY AMONG THE DALES

by James C. McCullagh

The Sweeny farm rests across a stream
past a huddle of pubs
and the newsstand in Brecon
which points a hurried finger at the green
and barren hills of Wales.
It is Sunday, when farmers never sleep
but slow down their chores
to take stock of their work
and the week to come.
I see the man Sweeny
moving back and forth
between barn and house
like a windmill.
He motions, like a policeman,
for us to come aboard.

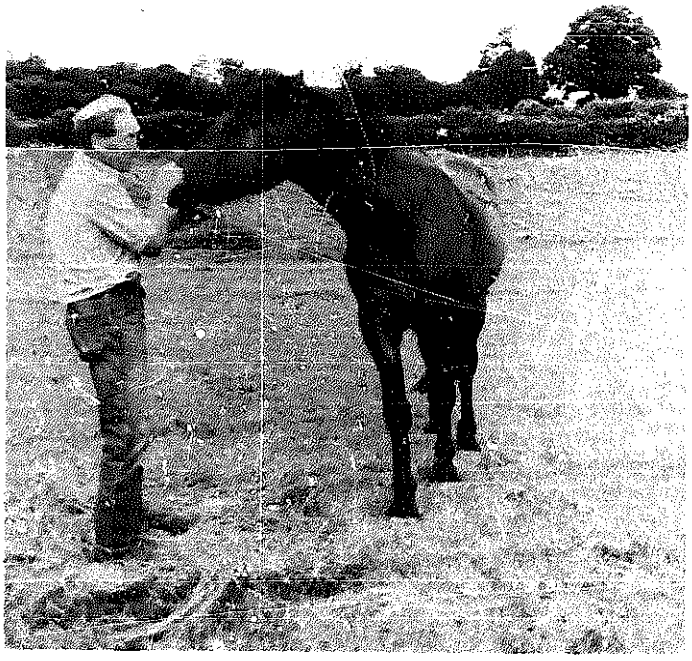
We walk up the snaking hill
like the ones the children draw so well
past the piles of steaming dung
to the courtyard where the ghosts of horses play
among the tools of the fields
graying yet hopeful of return to service.
In the pasture stands a mare
very white against the earth
that knows man Sweeny moves before she does.
"How old," he asks, "do you think she is?"
To be polite and safe I said, "Thirteen."
"Thirty," he said and cradled her
with brown and freckled hands,
feeling her still strong flanks
which have carved the rocky hills for years.
"Horses," Sweeny said, "used to work these hills
before we gave them to the sheep.
But horses are coming back.
I visit auctions up and down the coast
buying equipment for my stable.
Horses are coming back."

On the way to the car Sweeny showed us
a forge "from a local smith who died."
Among the hundredweight of steel,
the hammers and the tongs of silence,
I see a new fist striking the shoe
sending sparks across the dull Welsh earth
igniting fields of harvest wheat
plundered from between the reins.

# FARMING IN WALES

by James C. McCullagh

In the absorbing hills of South Wales rests the ten-acre organic farm of Sedley Sweeny and his wife—a picture book farm, complete with Black Welsh Mountain sheep, an array of horse-drawn farm equipment, and compost piles that steam. But this is not Welsh acreage populated by romantics. If you want straight talk about the rigors of organic farming on inhospitable land, Sweeny is the one to go to. He is uncompromising in his advice; he minces no words.



*Sweeny and friend.*

Let the new farmer (or small-holder, as he would be called in Wales) ponder the following advice from Sweeny: "*hard, long hours* are inescapable, particularly when building up the farm and acquiring the essential skills. The alternative is to accept third-rate results, which, I feel, are the certain paths to failure. One must learn to find recreation in the ever-changing work and the rhythm of the seasons. More leisure should be possible later when the project is running well and one has achieved full co-operation with like-minded neighbors."

Sweeny, an ex-officer in the British Royal Engineers, bemoans the fact that until approximately "a century ago, a peasant child grew up on the land and learned the skills by his father's side. By the age of twelve, the rhythm of the farm life was part of him, and by fifteen, he could tackle practically every job on the holding. He accepted the hardships and joys of subsistence husbandry *because he had no option*. Today, our would-be small-holder jumps in at the deep end with the soft option of the welfare state waiting to rescue him if he fails to swim."

And Sweeny does not underestimate the skill farming demands. "Self-sufficiency farming," he notes, "probably requires more mental and manual skills than most other callings. In olden times, children learned their skills at their parents' knees. But now we have a whole new generation of young people divorced from the land and its traditional crafts. They have to learn from scratch; just like tackling a foreign language, one cannot expect fluency to come quickly to an older person."

While advocating the discipline of self-sufficiency, Sweeny does not romanticize the challenge. "A growing number of people," he remarked, "are opting out of our industrial-economic society in the hope of finding a new and true life of self-sufficiency on the land. The failure rate is high, almost always a result of inexperience and lack of the very considerable skills needed to produce, with certainty, a wide range of products necessary for survival. Our people have become soft and are daunted by the hardship that their grandparents accepted as normal."

Strong words, indeed, but Sweeny practices what he preaches. A center of farm activity is crop production. The three-year crop rotation is a variation of the traditional system used on mixed stock farms in upland Wales. Wheat and rye (one-quarter acre of each) for home milling are autumn-sown by fiddle direct on the inverted sward. Crops are cut by scythe, bound by hand, and placed immediately on tripods to dry and harden. If the crops are carted in time, Sweeny reports that he turns "the hens onto the stubbles for up to a fortnight before cultivating with spring tines. We then sow a crop of grazing oats or rye to provide an early spring bite for house cows."

Sweeny reports that the ground receives a liberal dressing of compost in February or March which is plowed in not more than four inches deep. The ground is then cultivated with spring tines and harrows until a good tilth is obtained. It is then ridged, using a single-furrow horse ridger. Three rows of main-crop potatoes and one-fourth acre of mangolds are sown on the ridge in early May. A single row of peas may also be sown. In late May, a double row of main-crop carrots and in early June, about one-fourth acre of seeds are sown."

According to Sweeny, the dredge corn crop is cut rather green using a scythe of a tractor mower. It is not bound, but put immediately onto a Tyrolean-type three-wire fence so it dries like hay. On the fence, it is quite safe until carted.

Approximately three acres of grass are made into hay. If sufficient material is available, the fields are composted, harrowed, and rolled in mid-April and laid up until cut in early July. The hay is cut with a tractor mower, turned with wooden rakes, put onto tripods, and carted loose when ready.

The individual paddocks are grazed hard by cattle and sheep for five days and rested for up to three weeks, thereby improving the sward and reducing the incidence of intestinal worms in the stock.

Sweeny states that "all grassland is treated with calcinated seaweed, two hundredweight (cwt.) to the acre once every three years; it has also had one dressing of basic slag at ten cwt. in 1975 which has already caused a remarkable growth in white clover."

The Sweenys' one-quarter-acre vegetable garden, in which the crops are rotated on a four-year cycle (potatoes, pulses, cabbage family, roots, and onions), provides practically all-year-round fresh vegetables for the house plus a surplus for sale at the farm gate during the summer. And to extend his season, Sweeny uses an attached greenhouse for early seeding. In fact, he has discovered that he is able to grow tomatoes year-round in his greenhouse, which is quite a feat in Wales where light intensity and sunshine levels are low.

Contrary to how it may seem, Sweeny does not consider his farm a haven of self-sufficiency in a hostile world. He notes that "I am sure that a family could survive on its own in complete isolation, but this would be a rather uncomfortable and insecure subsistence. Three or four neighboring smallholders, working in harmony and pooling their individual skills could live far better. Add a bit of modern technology and life becomes easier, with more leisure time, less drudgery."

And communality is a central feature of the Sweeny experience. For example, his flock of Black Welsh Mountain sheep, consisting of a ram and twelve ewes, graze the acreage on a hillside opposite the farm and are tended unofficially by Sweeny's neighbor. In fact, a spirit of operation seems to pervade this Welsh farming community.

Sweeny acknowledges that when he has hay to cut, he simply has to call his friends. And when he has a sheep to shear, a building to construct, or any formidable task, he does the same thing. And his neighbors do likewise. He is presently equipping a forge, obtained complete from a smithy in the nearby village, which will serve as a communal workshop for him and his neighbors.

Not unlike some farmers in the United States, Sweeny spends some of his time visiting farm

auctions, always on the lookout for good, used farm equipment which will serve his needs. This way he is building up an impressive array of horse-drawn equipment for the time when his farm will be plowed, cultivated, and harrowed by horses which, according to Sweeny, "are part of the Welsh hill tradition."

Sweeny senses a genuine back-to-the-land movement in Britain, something he doesn't necessarily greet with open arms. He firmly believes that people, if they are to be successful on the farm, must receive solid training for the job. Accordingly, he hopes to encourage some British agricultural schools to initiate a formal apprenticeship program for would-be farmers. A number of schools have shown considerable interest in this program.

For his part, Sweeny has an apprentice on his farm who is learning the ropes from the ground up. Sweeny emphasizes that "experience comes only with the time, and I would suggest an inexperienced youngster would be unwise to attempt subsistence farming until he spent two years working on a good, mixed farm."

Not everyone would agree with this approach to farm education. However, few, I think, would argue with Sweeny's success. And if you would like to learn more about this fascinating farm in Wales, write for a booklet entitled "Self-Sufficient Small-Holding," which can be obtained from the Soil Association, Walnut Tree Manor, Haugley, Stowmarket, Suffolk, England. Price, $1.

# AVI—A VILLAGE CONCEPT

**by William R. Lawson**

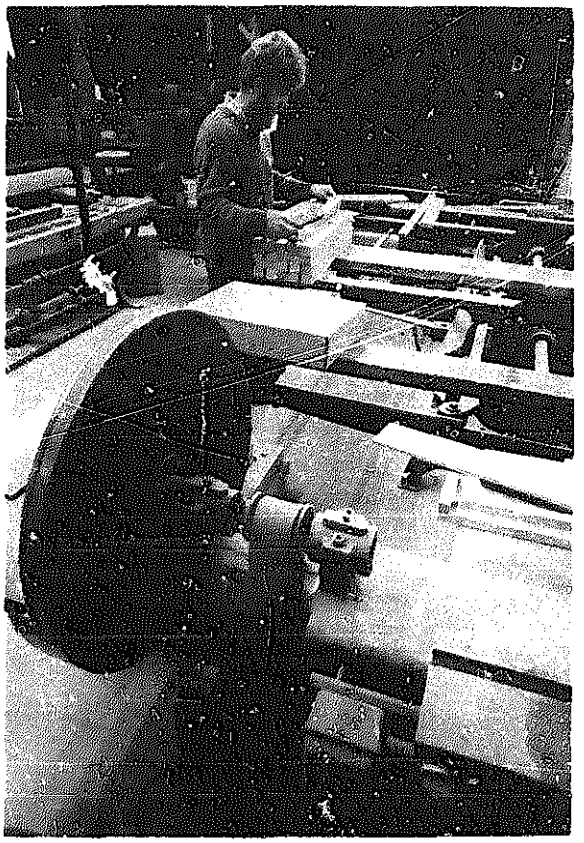
Editor's note: The American Village Institute, teaching the dying skills and concept of self-sufficiency, is a source of hand- and foot-operated tools made from traditional designs and materials.

In many ways the American Village Institute is perhaps the most unusual nonprofit research and educational organization currently active in the field of alternatives. Young, but rapidly growing, the AVI was begun in early 1975 by a small group of dedicated "villagers" who saw the need for a comprehensive institute entirely devoted to teaching people how to become more self-sufficient. Not just to be self-sufficient individuals, but also how to create reasonably self-sufficient communities. It is this emphasis on small-community—or village—development that lies at the heart of the AVI concept.

In order to fully understand the objectives of the AVI, it is first necessary to understand what is meant by the term "village." In brief, a village is defined as a simple composite of family farms, tradespeople, and a marketplace. It is further distinguished by the fact that most of its inhabitants can and do provide most of their own basic necessities, and at least some of their niceties. It is also perhaps the largest form of socioeconomic grouping that can still function entirely on the basis of trade, barter, and the exchange of labor.

With this definition it is easy to see how the village concept can provide a very useful framework for exploring the entire area of self-sufficiency and appropriate technology. By using this village approach, the AVI is developing a broad research and educational program that has many innovative features. One of the most important of these has to do with the study and design of appropriate tools and equipment, and the teaching of the skills necessary to make and use them.

To begin with, the Institute is mostly interested in the development of those tools and methods that are ordinarily associated with traditional crafts, trades, and skills. The reason is simple: no one can be any more self-sufficient than if they can provide their own food, clothing, and shelter, as well as their own tools. [Prior to the industrial revolution that is exactly what most people did—at least within the village structure.] At the same time, the best way to learn these skills is to study them under the guidance of someone who has already mastered them. With this in view, the AVI has begun a comprehensive apprenticeship program that encourages each student to master at least one craft or trade,



*An apprentice at the AVI workshop.*

and gain at least a working familiarity with all the skills necessary to provide the basics of food, clothing, shelter, *and* tools. Although still in the initial phase of development, it is envisioned that each student who completes the entire course will have the knowledge and ability to create a very comfortable, yet highly self-sufficient way of life.

This focus on tools and related technology is not accidental. In fact, one of the primary reasons the AVI was established was because there were no longer any sources for many of the hand- and foot-operated tools and equipment common to rural America up until the 1940s. The object from the beginning was threefold: first, to make available many of these items that have faded into the past (or are collecting dust in antique shops); second, to reintroduce a new standard of quality in design, craftsmanship, and materials; and third, to provide a reliable method of funding for an apprentice-style craft and trade school. Specific products have not only been selected because of their traditional use, but also because they require a broad range of crafts and skills in the making. They also reflect the type and range of products many students will begin producing once they have established their own shops.

In addition to making traditional tools and equipment, the Institute has also begun to develop many of the older methods and processes that were originally used to make these tools. This begins with the basic methods of extracting and refining raw materials and carries through to the last touches on the final product. For the most part, the emphasis is on the use of hand and foot power—though there is also an attempt to recreate and/or improve upon earlier uses of water, wind, and animal power. This work is aimed at developing a contemporary version of all the tools, hardware, and technology that were typical of an average early American village—as well as the knowledge and skills necessary to use them. The object is not to recreate the past out of curiosity, but rather to regain much of what has been forgotten and integrate that knowledge with what is being learned today.

*Three of the implements manufactured by AVI (left to right): a cider press, a corn sheller, and a root cutter.*

In addition to the apprenticeship program, the Institute is also developing a more general course of instruction in applied (appropriate) technology. This program was scheduled to begin in early October 1977 and to include a variety of subjects ranging from organic farming to the design and construction of energy-efficient architecture. The emphasis is on teaching the underlying principles upon which all technology is based, and how to apply those principles in the development of contemporary village-scale communities. The Institute is also beginning publication of a series of technical (how-to) manuals that will cover all aspects of self-sufficiency at both the family and village levels. Other publications, like the Institute's bimonthly magazine *The Cider Press*, are intended to provide a more general view of how self-sufficiency can be related to a contemporary village structure.

Perhaps one of the most unique features of the AVI is its growing membership program. Based on the belief that more people will become self-sufficient once it is technically and financially easier to do so, this program offers members the opportunity to contribute their own time, energy, and talents to the overall AVI effort—and in return, receive all the benefits that this combined effort can produce. In many respects this cooperative approach allows individual members to get back considerably more than they put in. It also dramatically increases the effectiveness of the entire organization. For example, the apprenticeship program is open to all members tuition-free (including room & board); in turn, the products made by the apprentices during the course of their training are available to the general membership for the cost of producing them (no profit is added). This serves the dual purpose of providing free training for those who desire it, and highly crafted, exceptionally low-cost tools and equipment for those who need them.

The membership program also provides a much-needed outlet for the many creative people throughout the country who would like to become involved in Alternative research and education, but have been unable to find an organization that can translate their energies into constructive projects. Much of the Institute's research, as well as material for publications, comes from the more than 3,000 members in the United States and many foreign countries. Participating members from many universities, industries, craftshops, and farms across the country provide the Institute with a steady influx of valuable research information, suggestions, and ideas. In fact, many of these people have since become permanent members of the Institute's faculty and staff.

In brief, the village concept has begun to excite the imagination of people everywhere, in every walk of life. It not only provides a framework for the development of appropriate tools and technology,

but also promises to become the most direct way for many people to achieve a greater level of control over their basic needs. By working within this concept, the American Village Institute has begun to create a new direction that can get people involved in a very meaningful way. Because of this co-operative approach, the AVI has become a powerful catalyst for change.

# MACHINERY ECONOMIZING AND ANTIQUING ON THE SMALL FARM

**by Rosalind Cich**

Schuyler and Rita Case are self-sufficient farmers from Sharon, Wisconsin. The Cases typify a special breed of small farmer in the United States today. They have farmed all their lives, both having grown up on Illinois farms.

Schuyler Case explained their farming operation: "The two of us work our farm alone. We have 85 head of Holstein cattle, 30 for milking. Our milk has been purchased by a local co-op for more than ten years. Our corn and soybean crops are sold through the local elevators. We grow oats and hay for our own animals and sell what's left." To supplement this internal farm income, Case does a little custom silo filling.

Case feels their farm has several advantages over much larger operations: "Because I have a fairly small place, I can plow using one of the 45 horsepower tractors that I bought 22 years ago. With that and my newer 70 horsepower one, I can cut costs. Sure, I only plant 15 acres a day while my larger

*The Case farm: a new home for orphaned machinery.*
Gerald Cross

neighbors are plowing 75 to 100 acres with their 150 to 200 horsepower tractors that cost $30,000 to $50,000, but some of those farmers will never be out of debt. They are working for the bank."

"Not only that—with these older tractors, you just add gas to them and four new spark plugs and they'll run. With the new fancy tractors, you need an engineer to overhaul them if something goes wrong. I'm not condemning the farmer who wants a $50,000 tractor with a cab top; I'll just stay out of the fields on those windy days."

"We've learned many different ways to cut costs," said Rita Case. "We cut our grain with a 45-year-old McCormick-Deering eight-foot grain binder we paid $5 for five years ago. We found it in a machine shed on a farm. It was in such good shape that it still wears its original coat of paint. Since we've had it, all we've repaired are the sickle and reel on it, which were both minor jobs."

"Because I've gotten a reputation for collecting old machinery," interjected Case, "I've been able to accumulate some parts through dealers. The ones who've been in business a long time are often excellent sources of old parts for old machines. One, who had no use for the old pieces his company had been storing, gave me a large quantity of them, like sections that go in the sickle of the grain binder. I also buy and keep some machines that are not operable, solely for their parts."

Mrs. Case added, "We realize that no old machine does the job as well as its modern counterpart does. The old equipment took time and labor, and the modern machines take much less time, but they are also much more expensive. Schuyler cuts grain with that old binder. There's a lot of labor involved, because then the grain has to be put through the threshing machine, whereas with the modern combine, one man can do it all with almost no help."

"Although we generally farm modern, we thresh ancient as a hobby," Case noted. "Each year we hold a thresheree on this farm. People come from all over. Many of them have never seen a steam engine before. Our Advance 1910 steam engine weighs 20,000 pounds, and you have to start it at 8 A.M. to get up the steam. We build a fire with wood until we get a full head of steam. Then we start pouring on coal for greater heat, while its black smoke beckons the neighbors. With 125 pounds of steam we can start threshing as long as we stoke the fire and keep the 225-gallon water tank full."

Rita Case smiled, "Our thresheree is a real show. At least 500 people come every year in August. Sometimes we have as many as 1,000. Most of them come primarily to spectate, but many help. Last

*Weighing 20,000 pounds, the Advance 1910 steam engine supplies power for threshing.* Gerald Cross

*Many volunteers make light work of collecting hand-bound shocks.*
Gerald Cross

*In action, the belt-driven Belle City 28-inch thresher.*
Gerald Cross

year, a lawyer from Milwaukee (more than a 90-minute drive) pitched bundles for three hours. Some work all afternoon, others for 20 minutes. Last year we threshed all afternoon, finishing 12 acres. After we thresh, we have a large dinner to which we invite 100 local people and friends. Everyone brings something. The *Milwaukee Journal* even came to cover last year's event."

The Cases use several machines for threshing. "We have a Belle City 28-inch thresher which is powered by our Advance steam engine. We also use 1932 Case and L. John Deere tractors to pull the wagons. The Case is a C Model, 2-plow, 35 horsepower, and the Deere is 18 horsepower."

"I don't know if you realize that in threshing, the grain is shocked by hand in old twine; you have to use old binder twine because modern baler twine is too heavy. All year 'round, we keep our eyes open for old binder twine at sales. It's still good for use as long as it's been kept inside and dry. Recently, we bought some that was packed in the original bags it came in."

Case continued, "Some of the things we have are too valuable not to take care of. Some of them someday may be more valuable than the enterprise we make our living at. The farmer down the road sold a tractor he bought 35 years ago. He's used it all these years and has taken good care of it. He sold it for $1,100; that's more than he paid for it new. I have two Allis-Chalmers WD 45 tractors that I bought new for $2,200 apiece, 22 years ago. I use them all the time. Even so, right now they're worth $1,200 to $1,400 apiece."

"I have a one-row corn binder in excellent condition. It's a real good one, 35 years old. I would like to use it as a fun thing but it only does one row at a time. It ties the corn into bundles; then they have to be picked up and put into a wagon. Using this machine, it would take ten men to fill a silo in one day, so I just can't spare the time to use it. The one that I use instead is five or six years old, and 110 horsepower. It does two rows at a time; using it, two men can fill a silo in one day. In other words, I don't use old equipment if it's not reasonably efficient. My time is important to me." But, many times older equipment does a perfectly good job.

"I use a hay mower and conditioner that are 15 years old. They're hooked together and pulled with a tractor. My mower is a seven-foot International. My New Idea hay conditioner crimps the hay to dry it sooner. The modern machine that does their work is called a hay bind; it cuts a swath ten feet wide and crimps the hay at the same time. The new machine costs at least $4,000, while my two when new ran about $2,000 together. You could buy used ones for about $500 per pair. Think about it; they're 70 percent as efficient as the new machine. They even have the same operating speed. To me, there's not too much advantage in having a new hay bind."

Rita Case mentioned another machine which could save money for a small farmer: the small

tractor-pulled combine. Case elaborated, "From the thresher, the farmers went to a small combine that one man could pull with a tractor with power take-off (a two-plow tractor, 40 horsepower). A man could farm 150 acres, if he wanted to economize, with one of these. As far as I know, they haven't been made for at least ten years, but one of our neighbors bought a nice one at an auction. It's 20 years old, in good condition, can be pulled with his tractor, and cost him around $500. If he'd purchased a modern self-propelled combine, new, they start at around $26,000 and go up to $50,000."

Case talked about another used piece of equipment that the small farm could find valuable. "The Allis-Chalmers G Model tractor is not the kind of machine for a large crop farmer, but I hear they're very useful for the small vegetable farm. The motor's in the back, and they cultivate one row at a time. Most of the ones I see for sale are about 25 years old, but I hear they can be used for so many different jobs that they are handy to have around."

Rita Case offered some tips on collecting antique machinery. "We don't ever go to antique auctions. The prices are too prohibitive. Instead, we attend family farm sales, and a lot of times find pieces in fantastic condition. Of course, all our friends tip us off when they hear about something we would like to have. Also, sometimes we stop at farms when we see interesting pieces out in the yards. We have a 1929 McCormick-Deering 1020 tractor; we are its second owners. This is its first time off the original farm. And we have an old clover hauler in 100 percent working order. There's even a 1929 steel-wheeled tractor Schuyler cuts grain with."

Schuyler Case added some advice on picking out old machinery. First, he pointed out that the machine in perfect working condition should be efficient in its use or it will be a worthless farm addition, as is his one-row corn binder, which is valuable only as an antique.

The second thing he stressed is that the shopper must use his or her mechanical knowledge to check out the machine. Case pointed out, "Remember that the old machinery runs with chains and gears, whereas the modern ones run with pulleys, bearings, and belts. Those parts make modern equipment run smoother. It's an altogether different method of working."

"You can tell if a gear or a chain is worn out; you can tell if it's good. Use your knowledge in dealing with and repairing other machines to pick out and evaluate farm equipment. Then you won't have any problems. Just keep your eyes open and your ears cocked, and you'll hear of all sorts of useful things that are available. Sometimes we drive hours to look at just one piece."

"That's so true," commented Rita Case. "It's become our major form of recreation."

# HOW TO BUY AT A FARM AUCTION

**by Kennedy P. Maize**

You can buy good used homestead tools at very low prices at auctions. Often you can find tools there that you can't find anywhere else.

In the course of a single year, I've purchased the following items at the following fantastic prices:

- A 20-inch Sears chain saw for $9;
- A 7.6-horsepower Gravely tractor with electric starter for $200;
- A perfect scythe, including snath and grass blade, for $8;
- 35 one-pint fruit boxes for $2;
- An assortment of digging irons for $3;
- A five-gallon metal gas can for $2.50;
- A brand new four-drawer full-suspension file cabinet for $30.

I've seen a wide variety of tools and equipment sold at country auctions—cyclone seeders, corn shellers, spokeshaves, nippers, blacksmith tongs, horseshoe nails, grain cradles, and wire strippers—in short, enough good stuff to equip a homestead several times over.

Beyond simple economics, farm auctions are a common form of entertainment and socializing. Going to auctions is a good way to equip yourself, and a fine way to meet nice folks who share some of the same values you do.

A word of warning here—in fact, several words. I'm talking about farm auctions, not antique auctions. It is usually easy to tell the two apart, because auctions are advertised in the local papers and the ad should provide the clue.

For example, an ad appeared in our local daily recently that read like this:

**PUBLIC SALE OF FARM EQUIPMENT**

Selling for Price Farms, Rodney Dill, and Mr. and Mrs. Jake Scheller on the Robert Mullendore Farm located ten miles south of Hagerstown on the Boonsboro-Williamsport Road four miles west of Boonsboro, and two miles east off Sharpsburg Pike at Lappan's Crossroads on:

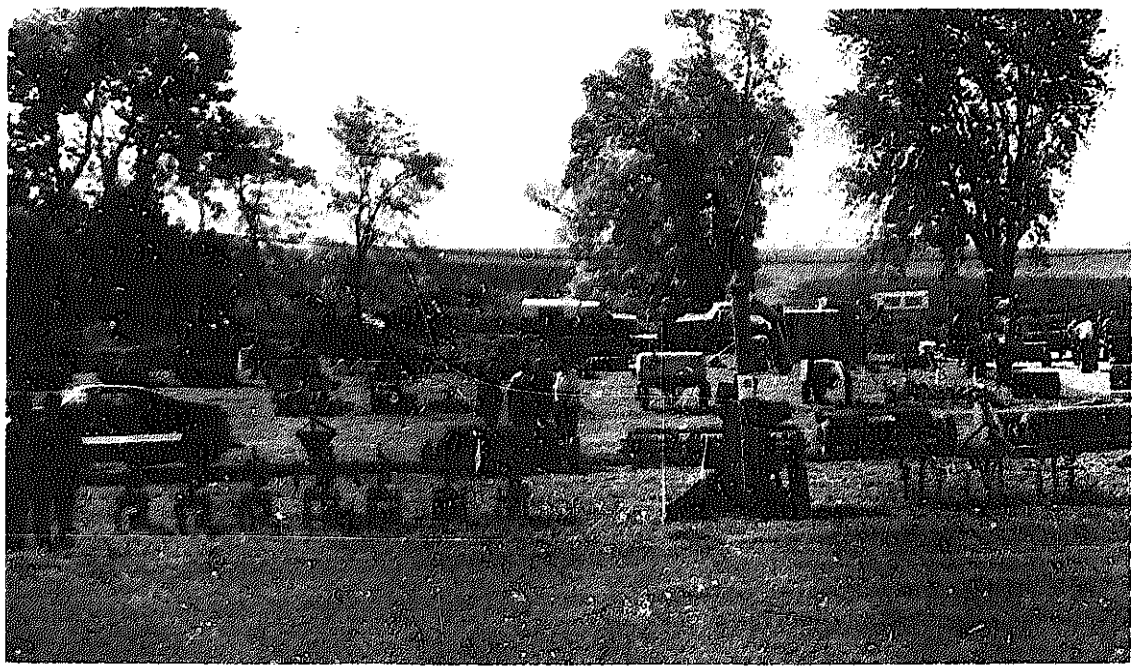
**FRIDAY, FEBRUARY 13**
**at 10 a.m.**

**11 TRACTORS AND FARM EQUIPMENT**

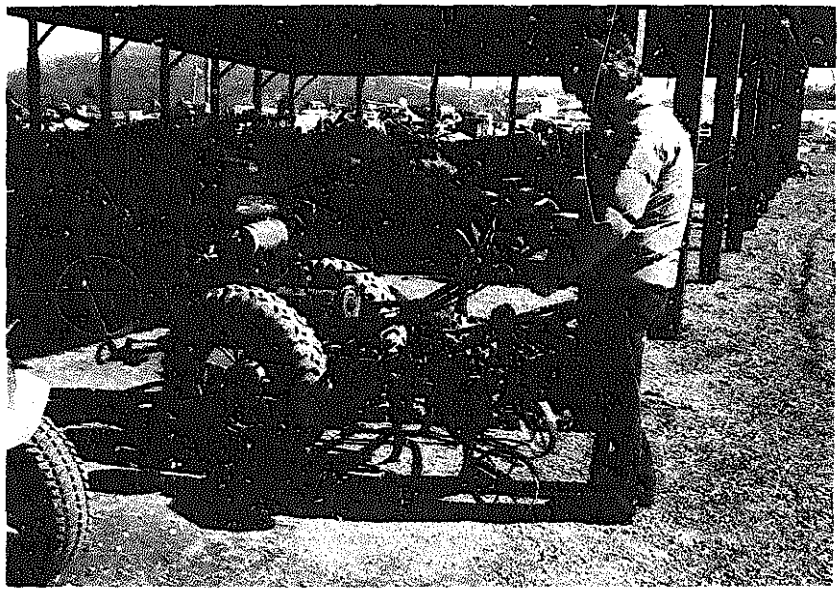
John Deere 5010 turbo; JD 4520 diesel w/1400 hrs; JD 4020 diesel w/power shift; JD 4020 gas; MF 165 w/loader; M. Harris 44, two JD A's, Farmall H w/loader; M. Harris 22, cultivators, and two-bottom plow; Ford 8N w/loader; two JD #38 forage harvesters, corn and pickup heads. . . .

And so on for some six inches of small, dark type describing an assortment of farm machinery including some nice horse-drawn equipment and a wide assortment of hand tools.

That is a farm auction. These ads frequently begin with a poignant phrase such as: "Due to quitting farming, I will offer the following at Public Sale located on the premises."



*Second- or third-hand tractor attachments can often be picked up at reasonable prices at farm auctions.*



*Great "finds" can be made at auctions, though some oil and elbow grease may be needed to get parts moving again.*

In these parts, the small family farm is a dying institution. Except for a few hardy souls and a sprinkling of crazy homesteaders like us, young folks leave the farm as soon as they can. Surveyor's stakes sprout in the fallow fields, soon to be followed by the early signs of suburban subdivisions. It's a familiar, tragic story. But it puts a lot of equipment on the market for the careful homesteader.

You want to stay away from antique auctions, though. Be wary of auctions that advertise a lot of old guns, coins, or glassware. Prices at those affairs run high and are frequently unpredictable. I've seen a corn sheller worth no more than $10 go for $25 because an antique lover wanted to make a lamp, or a toilet paper holder, or something like that, out of it. So be careful at these kinds of auctions.

Care, of course, is a necessity at all auctions. I'm going to give you six tried and true rules for auction buying which should guarantee getting your money's worth at auctions. But before we get into that, there are some preliminaries you ought to know if you are planning to frequent auctions.

First, almost anything can be, and is, sold at auction. In the case of farm auctions, that means everything including land, houses, livestock, canned and frozen goods, equipment, and clothes. Some time ago I went to an auction where a lovely 15-acre piece of mountain with a fine old stone house was sold. Included in the list of items for sale was a Home Comfort wood stove, a forge in good working order, a shelf full of canned cherries, and a complete World War I Army uniform, right down to the puttees.

If you decide you want to buy something at an auction, keep in mind that most require payment in cash on the day of the sale. This usually permits payment through a local check, but it is a good idea to call the auctioneer beforehand. His number is usually listed in the ad. In the case of big items, such as land, houses, and heavy equipment, the full-payment requirement is usually modified. In these cases, the auctioneer generally wants ten percent on the day of sale and the balance within 30 days. This, too, is frequently specified in the ad.

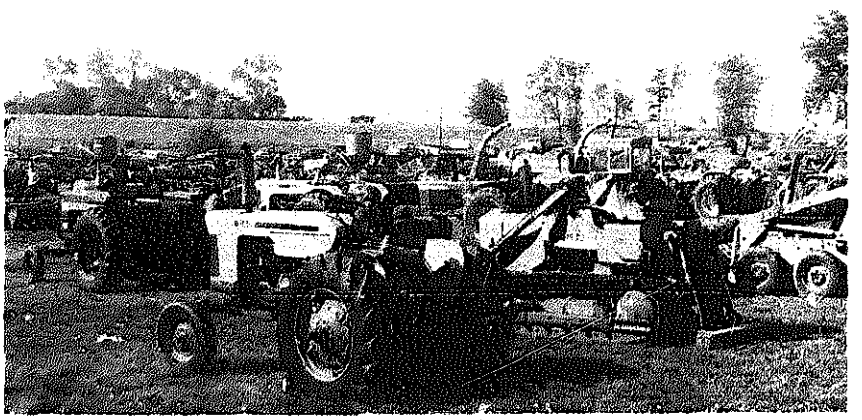
Sometimes the ad will also specify the bidding system. The most common bidding system at farm auctions around here is the number system. The bidder registers his name and address with a clerk on the site. The clerk will then give the bidder a number on a card. Sales are recorded by the numbers of the successful bidders. It's a good idea to record your purchases on your card as you bid, so that you can compare your record with the clerk's when you pay.

With these preliminaries in mind, let's move on to the six rules of buying at auction. I'll illustrate the rules with the story of the chain saw I bought for $9.

Rule number one: know your needs. I needed a chain saw. My ten-acre place has a three-acre woodlot, and another 5,000 acres of hardwood forest surround me. My three wood-burning stoves supply a large portion of the winter heat. I needed a chain saw but didn't have $250 to put into a good-sized new saw, and I wanted more capacity and ruggedness than a $100 minisaw could provide. The point to the rule is to avoid impulse buying at auctions, right from the start. Generally, impulse buyers end up paying more for less. At auctions, an unwary buyer can end up getting far less for far more than anywhere else I know. So, start right by disciplining yourself to know what you need when you read the auction ads.

Second: know the merchandise. This doesn't mean you have to become a manufacturer's representative for Homelite if you want to buy a chain saw. It means you should make some effort to discover the basics of the product. It is enormously helpful to know new models from old ones, good models from bad ones, and safe ones from dangerous ones. So I did some research. By talking to some folks who use chain saws every day, including a man who makes his living felling trees, I learned some valuable product information. I was ready to make intelligent decisions about brands, models, features, and the like. I knew the merchandise.

The third rule is related to knowing the merchandise: know the market. Find out how much the new product sells for and how it depreciates. This also requires a little research. I talked to the dealers, read classified ads, and generally shopped around. I discovered that I could expect to pay a retailer about $90 for a five-year-old saw in good working order. Now I was prepared to make a realistic auction bid.



*Know your merchandise—original cost, present retail price, depreciation. Will it satisfy all your needs? If you're planning to buy a tractor, be sure to get there before the bidding begins, to start it up, look for oil leaks, and kick the tires.*

The first three rules involve processes that occur before you get to the auction to bid. The last three involve decisions you must make at the auction. Once you have identified your needs, done some product research, and analyzed the market, go to the auction and inspect the merchandise. That means getting to the auction early. I read an ad in the local paper that listed a "Poland" chain saw among the items for sale. I was interested and showed up before the bidding began. The saw turned out to be a late model Poulan with a 20-inch blade. It was in good condition. I looked at it carefully, started it, and checked to make sure the blade was straight. I took the spark plug out and looked at the deposits on the electrodes. Remember rule four and inspect the merchandise.

Everything about the Poulan was fine, except the bidding. There were others interested in the saw. The bidding started at $50, I got in a bid at $60, and the price was up at $100 before I could nod again. I was tempted, but I stayed out after it passed my limit of $95. That is rule five: set a limit.

The limit is important because there is a psychology of auctions. The auctioneer, an agent for the seller, is trying to get the highest price he can for an item. He usually has a sound knowledge

of what an item is worth. He tries to get the bidders to compete for the sake of competition and to lose sight of the intrinsic value of the item. The auctioneer hopes to make the chain saw a symbol of victory in the contest, rather than a tool for cutting wood.

Those old situation comedy scenes are accurate. People do get so involved in the bidding that they forget the worth of the merchandise. I saw it happen recently. I had gone to a farm auction to bid on some rolls of American wire. The wire was selling in the Sears catalog for $35 a roll. I had the page from the catalog with me. The auctioneer tried to open the bidding at $50 a roll, came down to an opening bid of $20, and when I left, the price was up to $40 a roll and still moving. You have to set a limit and stick to it. Otherwise, you are going to pay double—once for the merchandise and once for the fun of bidding.

Those five rules—know your needs, know the merchandise, know the market, inspect the merchandise, and set a limit—are adequate for most auction situations. The likelihood of disaster is minimal if you follow them. However, the chance of getting a fantastic bargain is also less than it might be. The final rule will permit you to seize a situation and make a score. It's simple: be flexible.

Don't abandon the first five rules. That's why I put them first. If you follow the first five, you will be adequately prepared to be flexible. It is the person who has learned flexibility without discipline who gets into trouble.

The conclusion to my chain saw story illustrates the importance of flexibility. While looking at the Poulan, I noticed an elderly David Bradley saw for sale. It had a 19-inch blade and didn't run. I looked closer. I'm not much of a mechanic, but I discovered part of the problem. There was no fuel line running from the tank to the carburetor. But there was oily sawdust around the blade and chain, and there was no rust anywhere on the saw. It was obvious that the saw had been running recently. The saw was heavy but well balanced and offered secure grips in all attitudes. I decided to bid up to $25 for it.

The auctioneer tried for a bid of $20 to open, but couldn't get it. I bid $5; someone else said $6; I said $9. I got it.

A piece of rubber gas line, a set of points, and some minor carburetor repairs, and the saw was running. It has been running ever since.

I got the saw because I was flexible and ready to run a risk. But it was a prudent risk, because I followed the rules of buying at an auction. The risk was calculated, based on a pretty good idea of what I was getting.

And now you are prepared to shop at local farm auctions. If you know your needs, know the merchandise, know the market, inspect the merchandise, set a limit, and are flexible, you will come out ahead. And you'll have a lot of fun at it, as well.

# -2- Tools for Cultivation

The most important reason for cultivating is to prepare a firm seedbed. When seed is placed in the soil, the dirt should fit around it snugly, so that moisture is readily available to germinate the seed. If a seed is dropped among clods, it will just lie there until rain falls. If a seed is dropped among loose, partially broken clods, the seed may germinate and sprout, but then the seedling dries out and dies if rain doesn't fall.

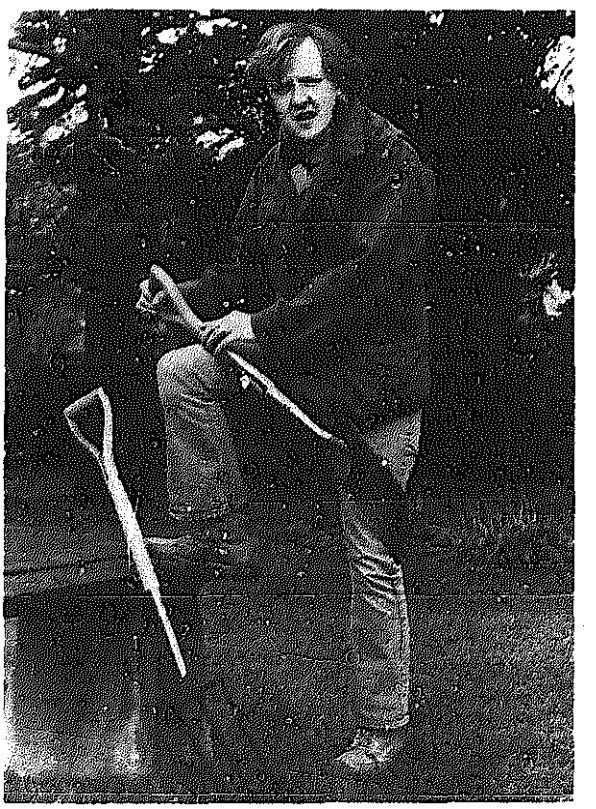
A second important reason for cultivation is weed control. While cultivating for weed control, the soil benefits by being loosened for better aeration and drainage.

When to cultivate is usually the most difficult lesson for the novice gardener or farmer to learn. Soil moisture and temperature are the two gauges to use in determining the proper time to work soil—when the soil is fit, as a farmer would say. Of these two considerations, soil moisture is the more crucial—if soil is worked when it is too wet, especially clay soil, it will become too hard for plants to grow through easily.

## HOES

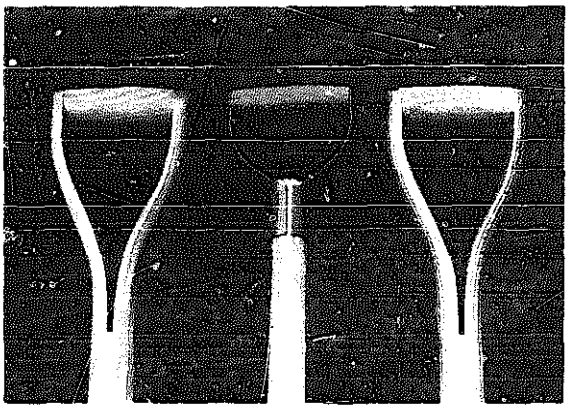
## MASTERING THE LOWLY HOE

**by Hank Allison**



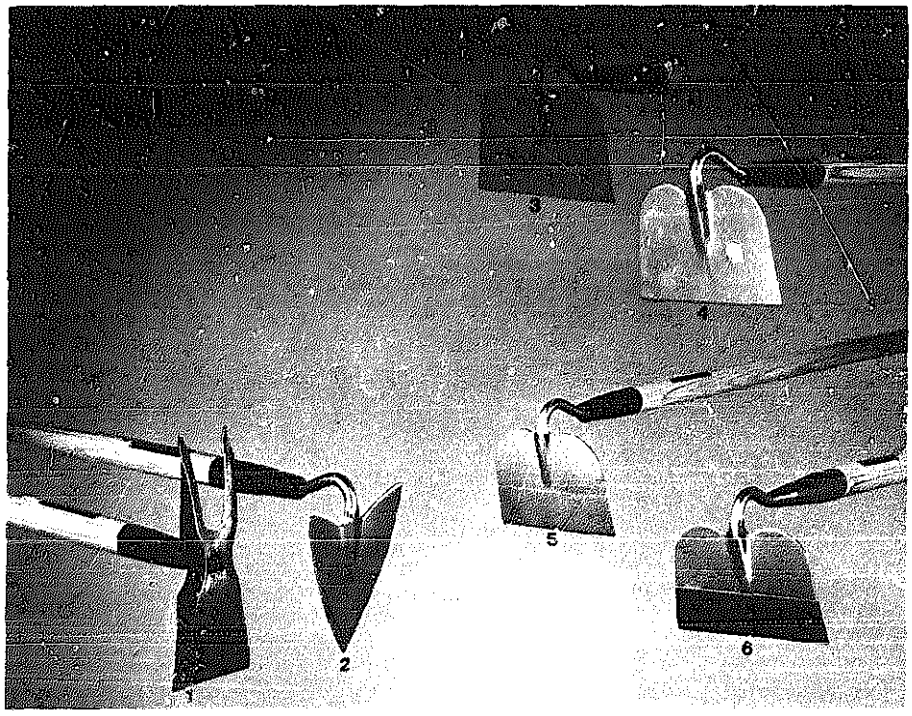
*Anybody who spends much time working a garden by hand will have a real need and appreciation for quality hand tools. The best part about buying good hand tools is that they don't cost that much more than cheap tools, and they'll last you a very long time. If you don't like your rotary tiller, you can still use it because you'll only need it a few times a year but if you don't like your spade, you have a real problem. When buying hand tools, look for quality and a piece that is of the proper proportions for you—something that will work with you not against you. Put on your work clothes and do some spading if at all possible before you buy the spade. It's just like buying shoes—if they don't fit your individual needs, you'll never use them, no matter how much they cost.*

Doing battle with the weeds calls for the right tool, the right chopping method—and the right mental attitude. The right tool should be lightweight, of a handle thickness that's comfortable to you, and a length appropriate to your height. It should be just long enough for you to grasp almost at the end and still be able to stand nearly upright and chop. The longer the handle, the less your leverage on the blade. Keep the hoe sharp. A 45-degree edge slanting toward the handle will make efficient use of your labor and a longer-lasting edge.



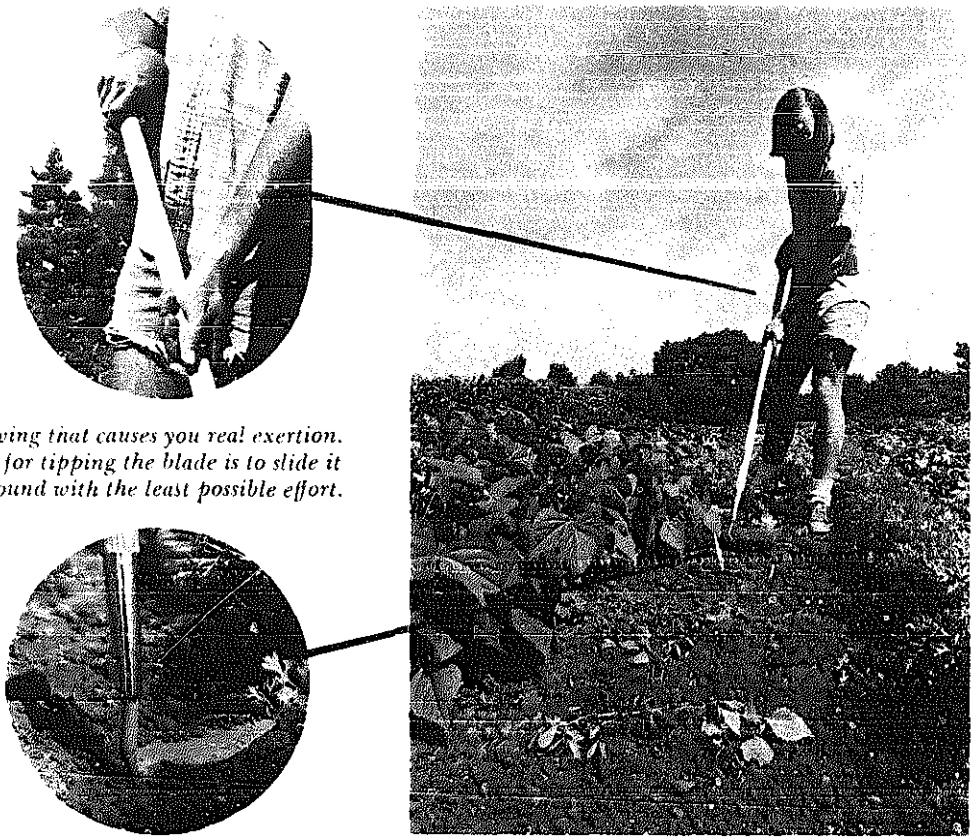
*The handle of a good tool is worth its weight in gold. Here we see two Bulldog tools flanking a standard hardware-store tool. Although all three are of D construction, the Bulldog gives you more gripping area, and room to maneuver your hand. The metal support and the rivet construction on the standard spade are subject to damage and weakening, while the split wood construction of the Bulldog is pinned for safety, stability, and long life. In addition, the natural split wood handle is more pleasing to the eye.*

As for methodology, your aim is to destroy the root system. To do this without getting tired in the first half hour, tip your hoe blade to one side. Now chop an arc from one side of the row to the other, taking short, easy strokes and bringing your blade into contact with the ground as close to flat as you can. When each stroke stops, your blade edge should be about two inches under the surface and should have traveled about six inches through the soil. Now, on the way back to the right, move your arc forward about three inches and repeat. Instead of hitting the weeds head on and actually chopping them, you'll be slicing them off with the sharp hoe blade.



*1) The pronged weeding hoe; 2) the Warren cultivating hoe; 3) the garden hoe; 4), 5), and 6) all-purpose garden hoes.*
True Temper

The trick is to never take a swing that causes you real exertion. If you flail at that one big thistle, you'll run out of energy long before you run out of weeds.



*Never take a swing that causes you real exertion. The reason for tipping the blade is to slide it into the ground with the least possible effort.*

## THE WARREN HOE

### by Paul Koepke

Ever since primitive agricultural man forsook the pointed stick for more sophisticated cultivating tools, the hoe, in its various forms, has been found to be indispensable. No gardener's arsenal is thought to be complete without a standard garden hoe, and many have found the weeding, grubbing, and scuffle types useful on occasion.

Another type, the Warren hoe, has been unjustifiably neglected—in many areas it is almost completely unknown despite its practicality and remarkable versatility.

The Warren hoe was originally developed to make furrows for planting potatoes. Its unique design makes it admirably suited for this purpose. The blade is shaped like an arrowhead with a rounded tip and barbs, and in the standard model, it tapers throughout its six-inch length by curvilinear reduction from four and one-half inches at its base to the slightly rounded tip. In addition, the blade curves inward slightly toward the handle. It is longitudinally convex on the near surface and correspondingly concave on the obverse, with the thickness of the metal diminishing from one-eighth inch near the base to one-sixteenth inch at the tip. Mounted on the handle with the usual gooseneck found on the common garden hoe, it is canted inward at about 20 degrees from the perpendicular for greater efficiency.

This remarkable implement has capabilities far beyond the purpose for which it was designed. It can penetrate both loose and partially compacted soil with ease. Often, only one solid whack is sufficient to bury its head well below the roots of an offending weed, and a gentle tug will expose the interloper in its

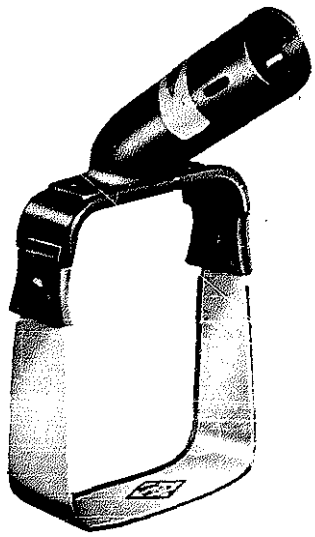
entirety. The pointed tip suits it admirably for pecking at the soil in confined spaces, while the absence of any cutting edge makes it possible for one to work the surface near the base of plants without danger of damaging any tender roots.

The Warren hoe is also an excellent furrowing tool to the depth of six inches, and when laid on its side with the point slightly depressed into the soil, it can be drawn parallel to a row of plants. It is also a well-balanced implement which lends itself readily to one-handed manipulation, leaving the other hand free to pick up and discard undesirable matter.

This excellent gardening aid has only two limitations: it is not an efficient breaker of stubborn clods, and it cannot cut. For those purposes the common garden hoe is without peer. But for quick, clean cultivation, easy furrowing, and delicate weeding, the Warren hoe is a champion.

## SCUFFLE HOES

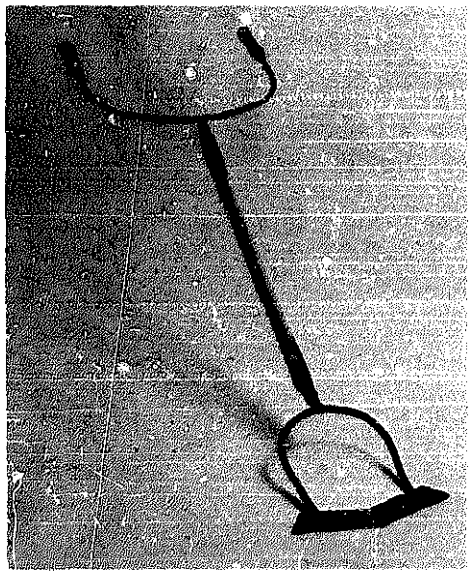
When seed farmer Rob Johnston thinks of cultivating, he thinks of a hoe for his vegetables—the scuffle or action hoe in particular. "It hoes when pushed as well as when pulled. The thin blade rocks back and forth slightly on the handle mounting so that the cutting angle is proper whether pushed or drawn. It is fast and effective on the annual weeds and works well on grass if the blade is kept filed. We were skeptical when we first noticed this hoe on the market, but we received one as a gift and liked it so well that we went out and bought another."



*The Scuffle Hoe*
Polar-Werke

## THE LINCOLNSHIRE LONGHORN HOE

This tool was invented and developed in Lincolnshire, England, 300 to 400 years ago. "The pilgrim fathers may have used a hoe like this around Boston, U.K., before they sailed to America," suggests a manufacturer, David Tonge. Still used in Lincolnshire for larger gardens, small fields, odd corners, and headlands, it was originally used as a tool to fill the gap between the ordinary hand hoe and horse-drawn cultivators.



*The Lincolnshire Longhorn Hoe*

To use it, you stand in between the handles and push the hoe backward and forward while walking forward. The art of using it is to keep the blade one-half-inch deep in the soil while keeping the blade level. "A big selling point," says Tonge, "is that it enables one person to cover a lot of ground in little time. A fit and able man in a seven-hour day should be able to hoe four to five acres in 20-inch rows."

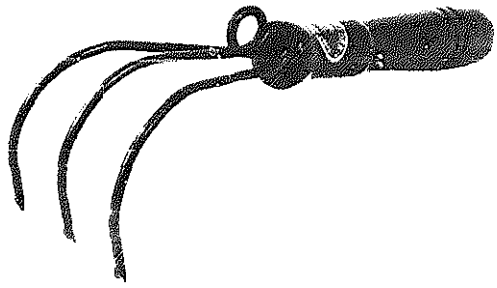
### PRONGED WEEDERS

Most gardeners and small farmers have the need for a three-pronged hand weeder once in a while. They are useful in pulling out perennial grass in vegetable rows and in removing weeds between plants. "The best one that we have found is made by Mechanical Applications in Wiscasset, Maine," says Rob Johnston. "They call these tools Magic Weeders and they come in three handle lengths. They feature spring-steel prongs which have a better action in the soil than the stiff prong types."



*The Magic Weeder*

## SPADES

## SPADING

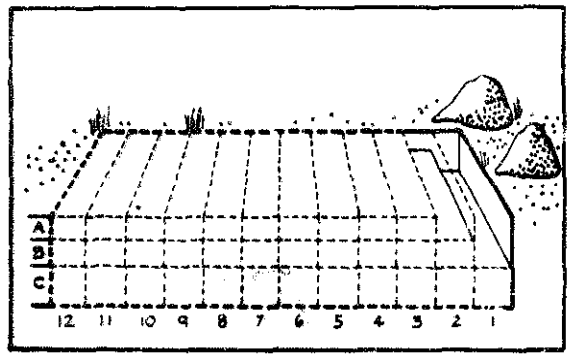
To turn the soil over, a spading fork is usually better than a round-pointed shovel, though both are adequate.

To spade, dig a trench about the depth of the shovel blade or fork tines (the depth to which you can easily plunge a spade). The dirt dug out is put in the wheelbarrow and wheeled to the other end of the plot to be spaded. It will be used to fill in the last trench.

*To spade, dig a trench about the depth of the shovel blade, put the dirt in a wheelbarrow, and save it to fill in the trench left after spading.*

Next, simply dig another trench next to the first one, turning the dirt a spadeful at a time, upside down into that first trench. Tip the spadeful of dirt on its side rather than completely upside down. That leaves the plant residues and other organic matter that were on the soil surface at varying depths of the spaded dirt rather than buried completely at the bottom of the trench. The organic matter will rot faster that way.

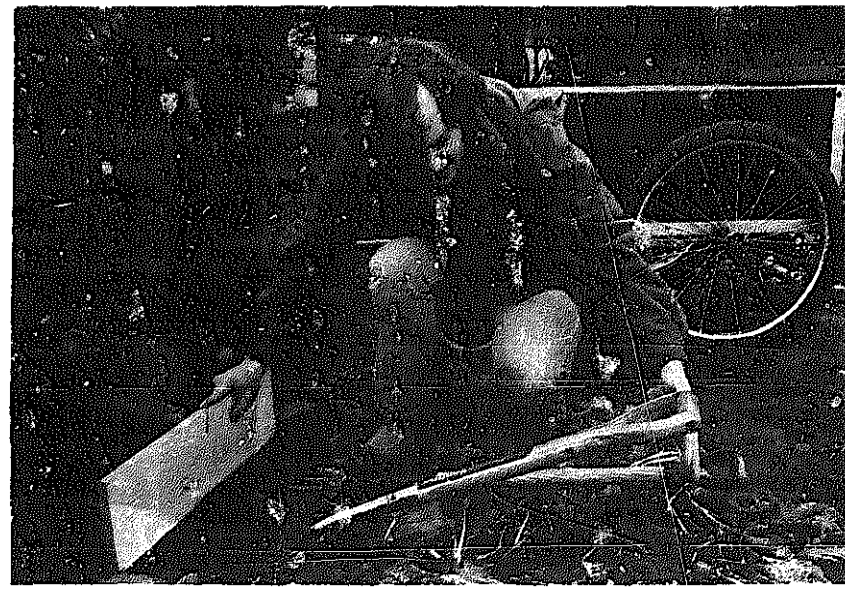
Proceed across the garden in the same fashion, spading, turning, spading, turning. Don't be in a hurry and take too big a bite. Take care to keep the spading side of the trench straight up and down. In sod, the grass mat on top of the soil will make spading more difficult. When grass is still attached to unspaded sod by the roots, use a round-pointed shovel rather than a spading fork; the shovel will cleave the roots better. At the edges of the sod plot to be spaded, mark a line and then go along the length of that line with the shovel, jamming it down about four inches to slice through the grass roots. Then while spading, the shovelful along the edge will lift out easily. This will also clearly mark the edge of the area to be spaded.



*Triple spading is the ideal: the garden soil is carefully spaded and mixed. The top layer (A) is removed from blocks 1 and 2 and saved for eventual use in blocks 11 and 12. Soil is next removed from block 1B and saved for use in block 12B. Next, 1C is spaded to loosen and turn the soil. 2B is moved to cover it, and 3A is used to top off block 1. The sequence continues until the entire garden has been spaded. The process is laborious, and in practice is seldom done.*

When the soil is turned over, give each spadeful a whack to crumble it, or stick the shovel or fork into it and twist. Either maneuver breaks up the clod a little and leaves the surface loose and friable.

If you are spading in the fall or early winter, leave the surface rough after spading. As is true with fall plowing, the rough soil surface will absorb and hold more water through winter and freezes will mellow it better. The soil will also dry out faster in spring. Work the surface as soon



*When you're talking about working in the garden, it all comes down to how much strain you put on your back. Here we see a Bulldog spading fork in the foreground and a standard spading fork in the rear. Notice how when the fronts of the tines are even, and the pivot points the same, the Bulldog gives you a full eight inches less bend to do the same work. Multiply that eight inches across a 25-by-25-foot garden, and you've saved yourself some mighty sore muscles.*

as you can after spading, in spring or early summer, so that finer soil on the surface will hold soil moisture. Don't work the soil deeply, though, as that will only drag sod or other plant residues already spaded under back on top of the ground.

## DIGGERS

### The U-Bar Digger

A 50-by-50-foot plot of land can be dug to a depth of 18 inches in two hours with Eric Brunet's U-Bar Digger. Two handles support a bracket with very long digging tines. To use it, the prongs are forced into the soil with the foot, handles at arm's length. The handles are then pulled back toward the body and rocked back and forth to crumble the soil sitting on the tines. Leverage does all the work. This same action can be used to raise potatoes, turnips, and other root vegetables. No source is available at this time.

*Eric Brunet and his U-Bar Digger.*

### The Grelinette

Similar to the U-Bar Digger is the Grelinette from France. The manufacturer claims it will work ten times faster than ordinary labor and is not as exhausting. "We say that it is a biological tool because it integrally respects the bacterial life in the soil and soil structure, both of which benefit cultivation. This is a new gardening tool offering a rational technique of manual labor to mellow the soil without turning it over."

Besides loosening the soil, the Grelinette can be used for digging potatoes and root crops, fertilizing tree roots without damaging them, planting leeks, and aerating the soil for proper water and nutrient penetration.

## ROTARY CULTIVATORS

**Hoeboy Rotary Cultivator**

Hoeboy is an unusual Danish-built rotary cultivator with 12 blades to penetrate and break up surface soil and lift it in layers to form an air-filled mulch conducive to bacterial action. A knife at the rear cuts through weeds and soil below the surface, causing roots to wither and die. The cutting depth is adjustable and is set so as not to injure lateral roots of garden plants. The compact 8½-inch width makes it easy to work narrow rows and close planting. Knife bars and cutter bar are of spring steel and bearings are of Etronax, requiring little or no lubrication.

Tradewinds, Inc.

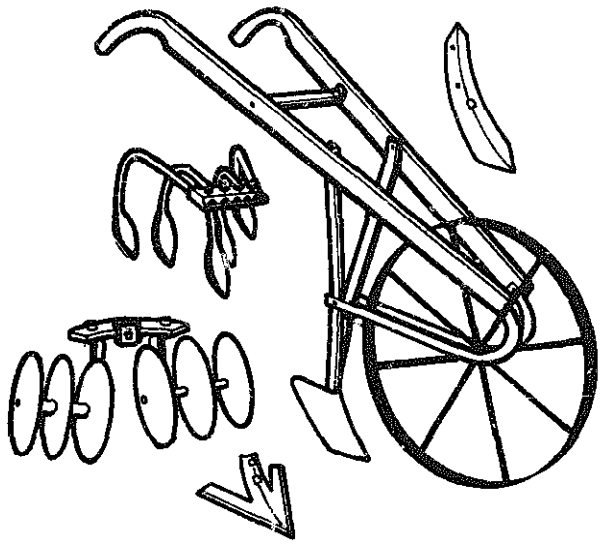
## THE WHEEL HOE

A real cultivation time-saver for small-sized farming operations is a hand-pushed wheel hoe. Essentially a multipurpose tool taking several attachments, it is useful for operations like weeding, hoeing, hilling, furrowing, cultivating, and even cutting roots. The three most popular attachments for accomplishing these tasks include: (1) the turn shovel or moldboard plow; (2) reversible shovel and (3) five-pronged weeder. Many other variations are available.



*The wheel hoe with (top to bottom): shovel, five-pronged weeder, disc cultivator, and sweep.*

Rob Johnston finds the six-inch-long blades to be the most useful attachment when caring for his vegetables. They run just below the soil surface as the hoe is pushed along and weed very close to small plants without throwing soil on them.

Supporting the attachments is a metal, tubular, or wooden frame with either a small or large wheel. The larger wheel makes pushing a bit easier, but a small wheel offers better control over the cultivating attachments. Most units have a straight handle frame bolted to the wheel. However, the overshot frame is advertised as being easier to push.

The wheel hoe is best put to work in the early stages of weed growth. It can be used for a continuous operation if one person pulls by rope while another pushes, but is most often pushed about two feet, pulled back, and pushed another two feet.

Double-wheel hoes are hard to find in North America since Planet Junior stopped making theirs, but they are well distributed throughout the developing nations. These units have a high arch connecting the two sides, permitting the operator to straddle a row of quite tall plants to cultivate both sides at once. A few models of

single-wheel hoes will do all that the two-wheel models do except straddle tall (over eight or ten inches) plants, especially the erect plants like corn, reports Rob Johnston. "To straddle a row with the single-wheel hoe, the wheel is mounted to one side of the frame, instead of on center, and cultivating tools till each side."

When using wheel hoes for cultivation, rows may be sown as close as ten inches apart, showing a clear advantage over layouts which depend on a tiller for cultivation, necessitating wasteful, wide row spacing.

Care and maintenance are two important factors in determining the longevity and performance of any tool. It is important to remember the blade of a hand tool is its most important part. When purchasing a hand tool for cultivation, make sure that the blade is made of carbon or high-carbon steel so that it remains sharp and does not wear out quickly. It is important to keep the cutting edge of the blade sharp; otherwise too much power will be required to work it, and both the quality and total work done in a day will be reduced. The blade should be cleaned after use and a bit of grease applied to the cutting edge before storing.

Tom Ulich has spent many long hours using a wheel hoe on his small farm. He writes, "If I had to choose a single cultivating tool in addition to a hoe, it would surely be the Planet Junior No. 17 Wheel Hoe. These units are easily serviced and extremely durable. They may be used to cultivate any crop in row widths from eight inches on up. They work well on just about any type of good garden soil, and their ease, speed, and accuracy of operation are remarkable. A person in reasonably good physical condition can cultivate faster and more accurately with one of these hoes than with any rotary tiller I have ever seen. (I have cultivated an acre of crops in less than four hours with one of these hoes.) Furthermore, wheel hoes are about the most environmentally sound means of cultivating, besides being an excellent form of exercise. Everyone here on the farm finds using a wheel hoe extremely satisfying and pleasurable—even the children like it."

*The Planet Junior No. 17 Wheel Hoe: The low wheel is more difficult to push but offers more control over the cultivating attachment.*

## NORTH AMERICAN SOURCES OF HAND WHEEL HOES

**Planet Junior**

It is available in either low- or high-wheel models. There is a full line of attachments including seeders and fertilizer drills. The high-wheel model has direct connection of handle to wheel. Low-wheel hoes place attachments right at the end of the handle for best control of the implement. The manufacturer can still replace parts for antique equipment.

Planet Junior Division
Piper Industries
P.O. Box 1188, Freeport Center
Clearfield, VT 84106

**Cumberland**

This model is constructed of 16-gauge tubular steel with painted, baked enamel.

Equipped with a 20-inch, sealed ball bearing wheel with rubber tire, handle grip, and 8-inch sweep. Designed to accept all standard implements for garden use. They also carry Planet Junior models.

Cumberland General Store
Rt. 3, Box 479

# PADDY WEEDERS

These implements uproot weeds and bury them in the soil. They work best in soils covered with a shallow depth of water and are readily available throughout Asia in different sizes to accommodate different row widths. One-row units are usually pushed by hand, but larger two- and three-row units are available with a power unit.

## SOURCES OF PADDY WEEDERS

*IRRI Push-Type Weeder*
International Rice Research Institute

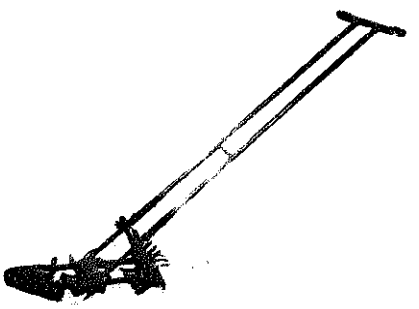
**IRRI Push-Type Hand Weeder**

This is a simple weeder equipped with two spiked wheels rotating in a supporting frame, the front of which forms a skid. The two rotors and skid are made from light sheet metal and are easily dismantled for cleaning and repair. The handle is made of wood. The leading skid serves as a depth control for the wheels. Build-it plans are available from IRRI for this simply constructed implement.

International Rice Research Institute
P.O. Box 933
Manila, Philippines

**Paddy Weeder**

This is a lightweight, all-steel weeder. It is best used on fields where 25 to 50 millimeters (1 to 2 inches) of water is standing. The rotary blades remove weeds and aerate the soil, thus encouraging crop growth. Weight: 5 kilograms.



*Cossul Paddy Weeder* Cossul & Co.

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**Akshat Rotary Paddy Weeder**

Cultivation by this implement between the rows of plants kills weeds and aerates the roots of the crop. It has a front skid and a tubular steel handle which is adjustable for different operators and soil conditions. It is available in two models, the AK-53, 150 millimeters wide and weighing 3.3 kilograms, and the AK-55, 90 millimeters wide and weighing 3.0 kilograms.

American Spring & Pressing Works Pvt., Ltd.
P.O. Box 7602
Malad, Bombay 400 064, India

**Hand-Operated Paddy Field Weeder**

The CeCoCo weeder is U-shaped with a float and two claw wheels, and it has a wooden handle which can be adjusted to suit the height of the operator.

It has a width of 150 millimeters to suit row spacing of 210 to 230 millimeters. Weight: 5 kilograms.

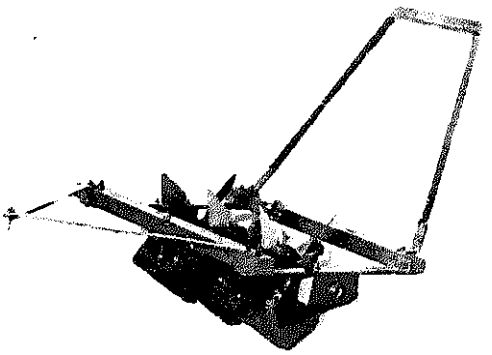
**Bullock-Driven Wetland Puddler**

Covering 3 to 4 acres per day, the Puddler is designed for quick and efficient preparation of paddy fields after first plowing. It reduces the number of plowings necessary and breaks up clods and lumps. The three angular, cast-iron hubs with four blades on each hub churn up the soil and leave fine particles on the soil surface.



*Cossul Bullock-Driven Wetland Puddler*
Cossul & Co.

* All Intermediate Technology publications can be ordered from International Scholarly Book Services, Inc., Box 555, Forest Grove, OR 97116.

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

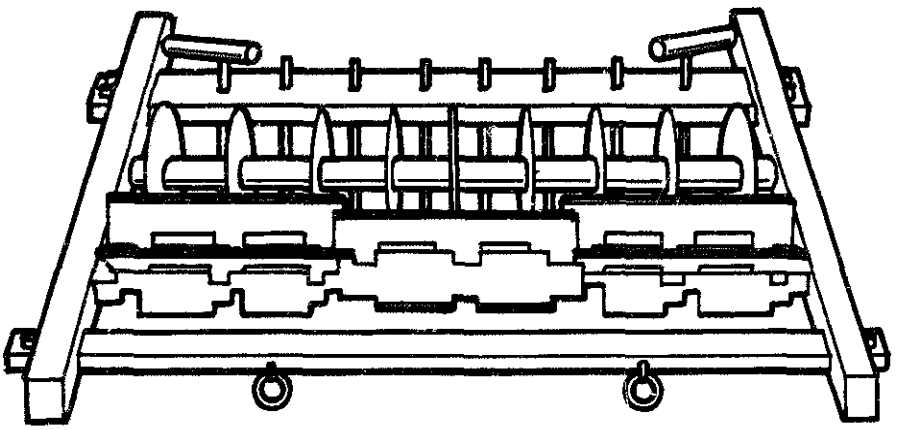
**Animal-Drawn, High-Clearance Rotary Hoe Plans**

The rotary hoe is designed for weeding crops grown on paddy ridges at 75 to 90 centimeters spacing. It cultivates both sides of one ridge at a time and does not require straight and parallel ridges for efficient weeding. Cultivation is done by two gangs of four spider wheels, each having ten backward-curved tines. The rotary hoe can be used for weeding closer to the crop than sweep cultivators without causing apparent crop damage. Performance is good if weeding is carried out while the weeds are small, and the implement is designed to ride over stumps or other obstructions in improperly cleared land.

Intermediate Technology Publications, Ltd.
9 King St.
London WC2E 8HN, England

**Japanese Puddler Plans**

Illustrations for a multiaction paddy field puddling tool with Japanese design reveal a wooden frame. The 8-inch steel rotating discs, cutting knives, and rotating chopper blades are suitably designed for local construction.



*Animal-Drawn Japanese Puddler*

Intermediate Technology Publications, Ltd.
9 King St.
London WC2E 8HN, England

**IRRI Power Weeder**

This three-row power weeder was designed by the International Rice Research Institute for use in lowland areas of developing countries. Many local manufacturers have adopted their design. Build-it plans are available from IRRI.

Manila, Philippines

**Mametora Rice Paddy Cultivators: Shan Shan MRT-3 and MRT-D**

The MRT-3 is a three-row tiller with safety guards. The MRT-D is a cultivator which combines tilling and trenching work. It will till three rows at one time or trench one row in a "V" shape so that roots are not damaged. Both are lightweight, have adjustable handles, and are easy to maneuver. Tilling supplies oxygen and expels nitrogen gas which has generated from straw scattered in the paddies after harvest. The nitrogen must be expelled to prevent root rot and other damage.

A two-cycle, air-cooled, 2.2 h.p. gasoline engine is mounted on the handles where it balances the construction and places weight on the cultivating attachments. Model MRT-3 has a capacity for covering about an acre per hour while the MRT-D will cover the same area in 30 to 40 minutes.

**Turtle Power Tiller**

The Turtle power tiller was invented by a Filipino for the Filipino and designed especially for wet and waterlogged rice fields and fish ponds. It can mow, plow, rototill, and level. Power is supplied by either a 10 to 16 h.p. gasoline engine or a 6 h.p. diesel engine. Fuel consumption is 12 and 6 liters per 8-hour day, respectively. It has front-end drive and is 44 inches wide followed by a skid design body. Length: 55 inches. Capacity: 1.5 hectares in eight hours. (One hectare equals approximately 2.47 acres.)

## FRONT-END TILLERS

# A TILLER'S WORK IS NEVER DONE

**by Gene Logsdon**

After the leaves have been spread on the garden—along with the plant residues, horse manure, rock powders, and other soil amendments—it's time to get out the rotary tiller. The tiller chops them into the top eight inches or so of the soil where plant roots do their foraging and the humus and nutrients do the most good. The tiller is thus the organic gardener's basic humus-building tool, but it is also a lot more.

If you're approaching a weed- and shrub-infested or sodded piece of ground for the first time, intending to turn it into a garden, sample a small area with the tiller to make sure the machine has the muscle to do the job.

Neither front-end tiller nor rear-mounted model will do a good job of primary tillage on heavy sod or dense weed growth in soil that has not been cultivated in recent years. Don't expect the impossible from any tiller, even the heavier rear-mounted ones which generally chop up plant residues better than lighter front-end types.

A front-end tiller will bounce off hard, sod-bound earth just about the way it will bounce off rocks. A rear-mounted tiller won't exactly bounce, but it will lunge forward, jerking you with it. If you have no other way to work such soil, the secret, with either kind of tiller, is to go lightly over the surface repeatedly, skimming off only an inch or less with each pass—slow, hard work.

It's better to plow—or have someone plow—such soil in the fall, then work it in nicely the following spring with your tiller. Or, cover the area with deep mulch in the spring, and when that has rotted away together with the sod under it, then rotary till.

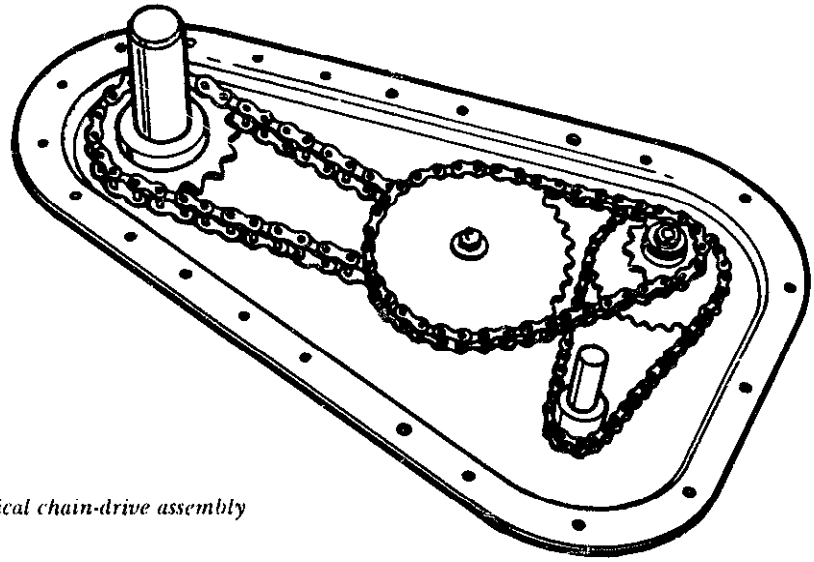
*The rotary tiller earns its keep on the homestead by preparing garden beds in the spring, cultivating crops all summer long, and enriching the soil in fall with compost and cover crops.*

You may be able to chop up and incorporate heavy plant growth like corn with a pass or two of your tiller, but really heavy, dense growth should be mowed with a rotary mower first. That makes the job much easier, because inevitably that dense green stuff will tangle and entwine in the tiller tines, and you'll have to get down and cut it out. A small amount of clogging can be cleared by reversing the direction of the tines while raising them just a wee bit above digging depth.

The kind of tines your tiller is equipped with—and how sharp they are—has more to do with clogging than whether the tiller is front- or rear-mounted. There are at least four kinds of tines: three-bladed chisel tines, four-bladed slicer tines, four-bladed slasher tines, and four-bladed bolo tines. Chisel tines are the cheapest, okay for cultivating, but they tangle the easiest if you try to incorporate plant residues with them. I wouldn't recommend chisel tines for organic gardeners. Slicer tines will dig from six to nine inches deep but will also tangle and clog where there is a lot of plant residue. Slasher tines are designed to cut and chop residue better with less clogging. They are longer than slicers (on six horsepower models) and will dig up to 11 inches deep. Bolo tines can be used on the bigger, six to eight horsepower tillers; these tines are heavier and wider

and move more dirt per revolution, so you can move along at a faster speed. They are also less affected by clogging.

As you shop for a tiller, another choice presented is between gear-driven and chain-driven models. Gear-driven models are usually, if not always, combinations of belt and gear drives. A belt transfers the power from the motor shaft to the worm gear shaft, which then transfers power to the tine axle. Mathematically, the chain drive is more efficient since the transfer of power is more direct. Which is better? It's a toss-up in my opinion, as long as you are comparing models in the same price range. Chain drive will probably wear out quicker but is easier and cheaper to repair.



*Typical chain-drive assembly*

So let's pretend you have bought your tiller, and it's the first day of the gardening season. Preferably, your garden has been cultivated the previous year or was plowed the previous fall if virgin ground. You pick up a handful of dirt, squeeze it into a ball, press your thumb against it. If the ball crumbles apart easily, the earth is ready.

Don't try to see how deep the tiller will dig on the first pass—especially if you have plowed under sod. You don't want to drag those sod chunks back to the surface. Let your tiller dig only a couple of inches on the first pass. If you have the time, let the ground dry a bit before making a second pass. The second time, the tines will bite into the ground more easily and work the ground into a fine, crumbly texture. Dig at least six inches deep, and try for eight to ten, if possible. Set the brake bar at the rear of front-end tillers at a depth that will allow you to push it in and pull it out of the ground with ease, according to the depth you want to dig. Don't fight your machine; let the brake bar and the tines do the work. You push down, the brake bar holds the tiller back for digging; you let up, the tines propel the tiller forward. With gentle pressure between up and down, you allow the machine to inch forward slowly while it digs.

A rear-mounted tiller is even easier to handle. You set it for depth and speed; then all you have to do while the machine digs is guide it.

Work the ground the second time at right angles to the first pass if possible. You may need to go over the ground a third time to get a fine seedbed, but usually twice is enough, if your soil is in good condition.

After planting, your tiller becomes a weed cultivator. It can be used as a harrow for that first important cultivation of deep-sown seed (two to three inches) before the seed comes up, but when weeds are already germinating. This type of cultivation is tricky. You want to go over the ground

very lightly, gently disturbing the soil surface without digging in to disturb the germinating seed. Skim very fast over the row, and you will kill many small weeds you can't even see yet. But don't try this technique on shallow-sown seeds.

As soon as your plants are above ground, you can start cultivating with the tiller between the rows. Unlike shovel cultivators, the tiller tines will not throw dirt onto the new plants and bury them, if you do not dig too deep. For cultivating, deep digging is not necessary anyway and can be harmful. If weeds are growing faster than your plants, however, and you must dig a little deeper to control them, you can buy special plant shields that fit on either end of the front-end tiller axle and prevent the dirt from falling on your plants (Sears has them). The hood on a rear-mounted tiller performs the same job.

When your plants are taller, you want the tiller to roll some dirt into the plant row, if possible, to bury the tiny weeds emerging there. That can save you hand weeding. So, without shields, you let the tiller dig a little deeper than you might otherwise, though not so deep as to cut into your plants' roots.

Front-end tillers can be modified quickly to cultivate between rows as narrow as six to eight inches or as wide as 26 to 30 inches. The narrowest width is achieved by taking the outer tines off completely and turning the inner ones around so the blades point inwards. Two intermediate widths can be attained by either leaving the two outside tines off completely with the two inside tines in regular position, or by replacing the outer tines with the blades pointed inwards and the two inner tines in regular position. Clip bolts, which hold the tines on the axle, are easy to remove, and the tines are easy to slip off the axle.

Remember to allow a few inches more for row width than the width of your various tine positions. If, for example, you intend to cultivate a swatch 26 inches wide, make your rows at least 30 inches wide—if not 32—to accommodate that 26-inch width. Why? You don't want the tines cutting too close to your plant roots; and when the plants grow taller, the whirling tine blades have a way of reaching out and grabbing them if you get too close.

If a tiller could talk, it would probably sigh, "A tiller's work is never done." Attachments turn it into a digger of garden irrigation ditches, or furrows, or rows for planting seeds. There's a hiller attachment for front-end tillers, too. I even know of someone who turned his tiller into a sidewalk edger by replacing one of the outside tines with an old plow coulter welded to a piece of pipe!

Tillers are handy for renovating berry patches and ripping out runners that are getting out of control. The tool is handy for pruning raspberry suckers growing out beyond the sides of the row where they don't belong. For cultivating or incorporating mulch under fruit trees in small orchards, the tiller is better than more cumbersome tractor machinery, and it is handier for cultivating under trellis wires between grapevines. The tiller is superb for running over asparagus beds in fall or spring to kill weeds and volunteer asparagus seedlings growing above the deep-set roots. Just don't dig more than three inches deep.

Some chicken farmers, who raise their flocks on litter, utilize tillers to mix and stir the old litter in place on the coop floor to speed the composting process. Tillers are handy to mix compost in large worm beds, too, before seeding with worms. In any raised bed, or confined greenhouse bed, the tiller is about the only power tool that can be utilized. Lighter models that can be lifted in and out of the beds without back sprains are preferable for this kind of work.

Care of the tilling parts is simple. Keep the oil bath around the worm gear at the specified level. On chain-driven models, the chain and bearings should be lubricated when and if it is necessary.

The motor, the heart and soul of your tiller, requires much more attention. Most walking, self-propelled tillers, if not all, are powered by air-cooled, one-cylinder, four-stroke engines—which, to mechanical amateurs like myself, simply means that they take oil in the crankcase and gasoline in the engine, and you do not mix the two as you do with two-stroke engines. According to Allen Brown, agricultural engineer at Purdue, a properly maintained four-stroke engine ought to give good service for at least five to eight years and probably longer. If an engine fails sooner than that, it usually means improper care. "A main cause of early failure is not keeping enough oil in the crankcase," he says. "Another is failure to change oil as often as recommended, and a third is using the wrong kind of oil."

Brown recommends changing oil every 25 operating hours—or sooner if very dirty conditions prevail. Use SAE 30 weight oil in summer and SAE 5w-20 or 5w-30 in winter (if you use your tiller in cold weather, which is not likely). If you can't get 30w, 10-30 will do. Do not use nondetergent oils with an API classification of MS, SC, SD, or SE.

Clean the air cleaner whenever you change oil, or more frequently. Neglect allows dirt to get into the cylinder and cause bearing failure. There are oiled filters, dry filters, and oil bath filters: follow the manufacturer's directions for your particular model.

Keep the whole motor clean. Don't let dirt and debris clog the cooling fin, as an overheated engine wears out faster.

An old motor can often be given new life by cleaning out the carbon buildup in the exhaust ports. Take off the muffler and you'll find the holes (usually three).

An important rule in keeping an engine running longer is never to run it at top speed for extended periods of time. There's rarely an occasion that justifies roaring around the garden at full throttle. You'll get finished at half-speed just as soon—and with better fuel efficiency. And your neighbors will love you, too.

Perhaps it is surprising to find coverage of the familiar front-mounted Rototiller in a book specializing in the hard-to-find. But surprisingly enough, there is a hard-to-find aspect to tillers which makes them an appropriate consideration for the farm tool collection, and that is versatility. Of course, the simplest models are strictly for tilling; they have front-mounted tines to break and cultivate the soil. But realizing the multipurpose potential of the little tiller as a power source, some manufacturers have produced attachments for a variety of operations. In North America, attachments are designed mainly for cultivation, while European models have a number of working tools for jobs like pumping and spraying.

## TILLER ATTACHMENTS

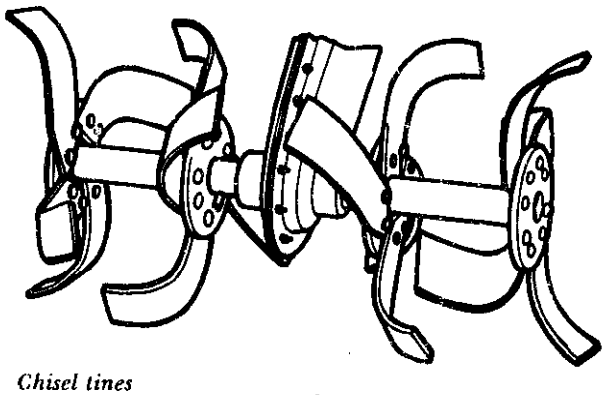
Rather than discuss the many different tillers as power sources, we have decided to concentrate on attachments and their functions. A chart following the tool descriptions explains which manufacturer carries which tool. Manufacturers' addresses are listed in the index.

### Tines

Tines are the blades of the Rototiller which do the actual soil tilling. Many manufacturers have coined their own names to represent their tines as unique. But actually, there are just a few basic designs that most follow.

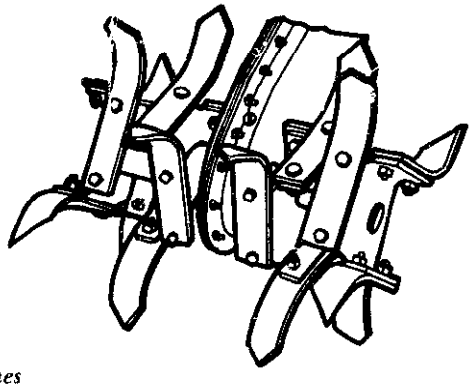
Slicer—A medium-duty, short, knifelike tine.

Slasher—Similar to but more rugged and longer than the slicer, good for breaking up sod on virgin ground; cuts and chops plant residue with little clogging.



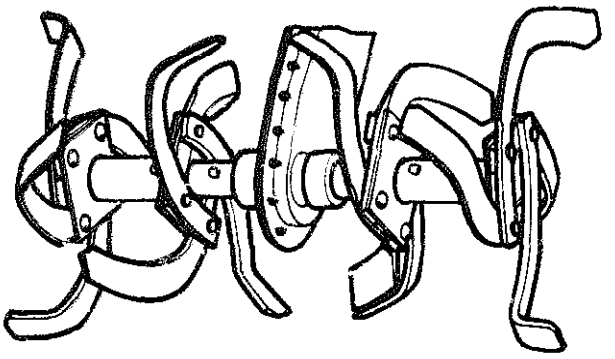
*Chisel tines*

Chisel—Sometimes referred to as pick tines, good for rocky ground, clay, and hardpan. Clogs easily, not good for grasses or weeds.



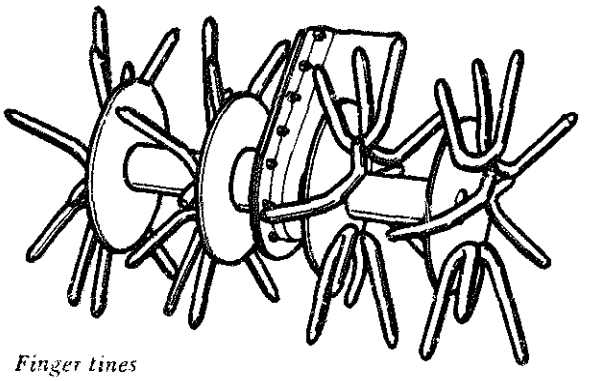
*Slasher tines*

Bolo—Heavy, wide tines good for normal cultivation and mulching without clogging with plant residue.



*Bolo tines*

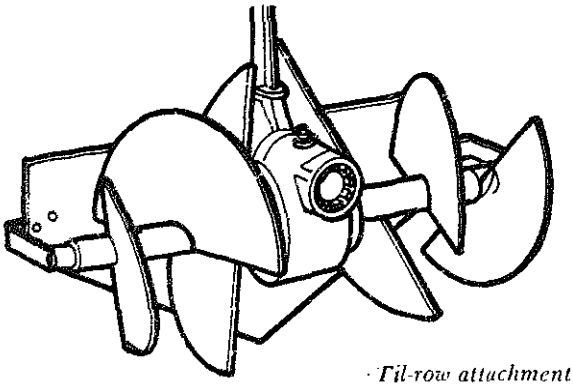
Finger—Provides positive traction, good for cultivating and seedbed preparation.



*Finger tines*

### Til-Row

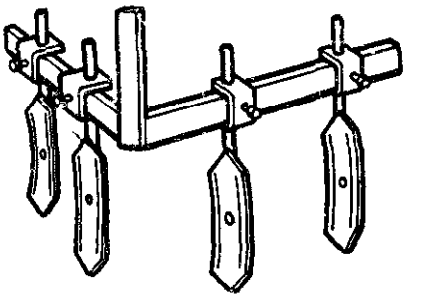
In place of tines, the til-row attachment builds rows, provides a prepared seedbed, and with the back plate removed, it converts to a cultivator. It can also be used to dig irrigation or drainage ditches.



*Til-row attachment*

### Cultivators

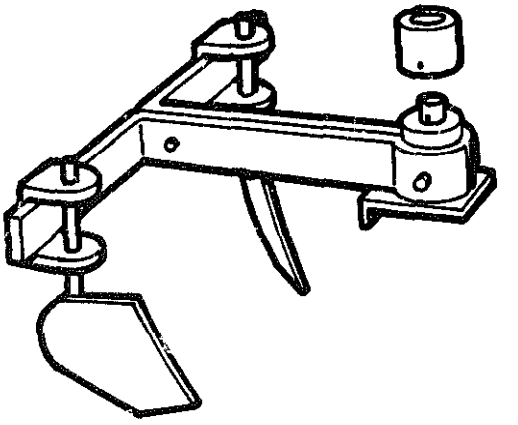
Cultivators appear with many different names and variations on a similar theme. Shovels, spikes, or spring-tooth tines are either fixed permanently on a frame or bolted to a toolbar, the latter being adjustable. Called either cultivators or harrows, they perform the function of removing weeds or preparing seedbeds by being pulled through the soil. Five-tine weeders, plow sweeps, and various hoe designs are available.



*Cultivating shovels mounted on a toolbar*

### Plows

Small-power units have a limited amount of traction and power which limits their plowing capabilities as well. They do best at making furrows or hilling already-tilled soil. A furrow opener will dig a shallow trench for straight line or root crop planting which would otherwise

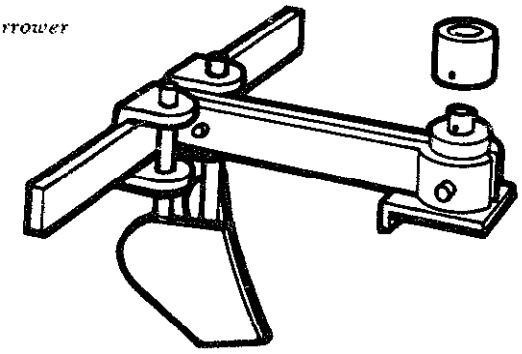


*Hiller*

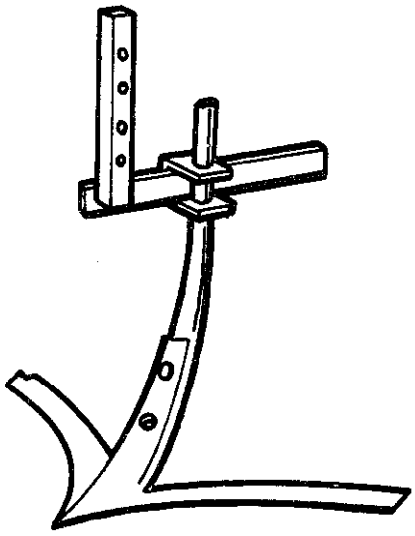
require digging holes. Hillers then fill in the furrow or hill-up around other plants.

It is worth mentioning that a hilling plow is actually one-half of a furrower. Some companies offer a furrower in two parts which, working together, furrow and hill separately. Furrowers are sometimes referred to as moldboard plows and hillers as turning plows.

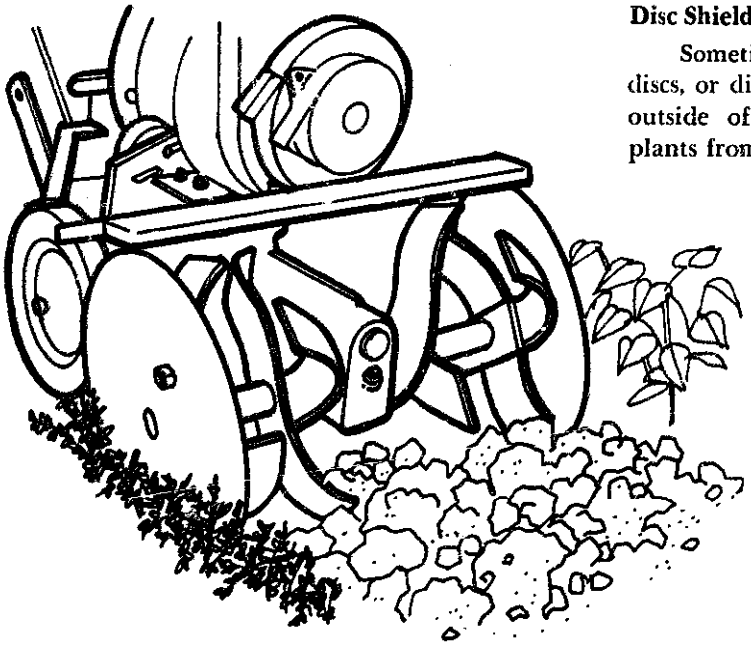
*Furrower*



A sweep plow is another kind of cultivating tool which makes a wide pass to cut weeds beneath the surface of the soil at a desired depth.



*Sweep*



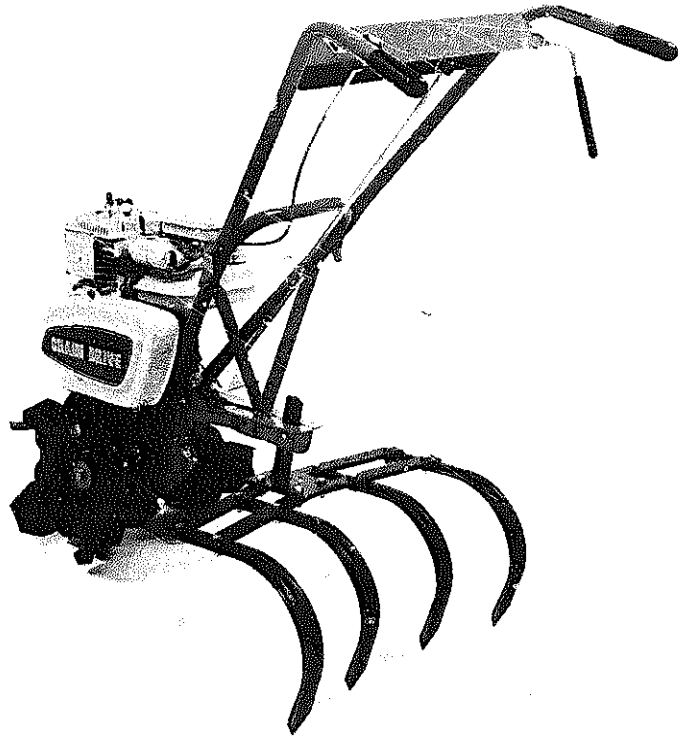
**Disc Shields**

Sometimes called cultivating shields, side discs, or disc shields, these devices bolt onto the outside of rototilling tines to protect young plants from having soil spill over on them.

*Disc shields keep soil from falling onto young, fragile plants.*

**Wheels and Tires**

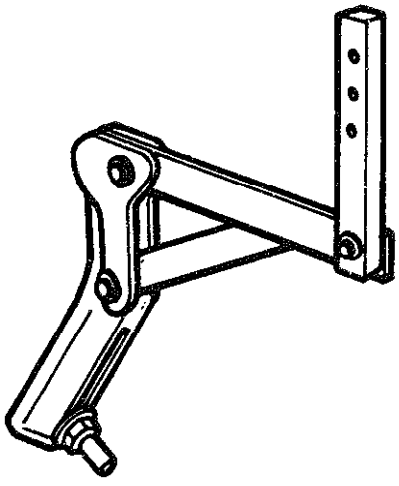
Most small tillers are sold with small semi-pneumatic or rubber tires which offer little traction. These are fine for rototilling since traction is provided by the action of the tines themselves. However, for plowing and cultivating, the extra traction provided by larger pneumatic or rubber tires or steel wheels is desirable. Tire chains, transport wheels, and wheel weights are also available.



*Gilson Model 51104 compact chain-drive tiller with drive wheel and cultivator.*
Gilson Brothers Co.

Small depth gauge wheels are provided with some attachments to offer support and depth guidance.

**Plow Foot and Toolbar**



*Plow foot*

Some attachments mount directly onto the tiller frame, others to a toolbar or plow foot which is mounted to the frame. They offer a means of adjusting tool positioning for both width and depth of work. Bulldozing and snow-plowing blades appear with many of these models. Snowblowers are uncommon.

**Mowers and Lawn Attachments**

Mowers are uncommon to small, North American tiller models because the power take-off is usually limited to use with tiller tines. European models, however, are built with versatility in mind and have attachments for rotary, sickle bar, or spindle reel mowing. The listing of European models is meager here because most tillers are built to perform so many utility functions that they have been included in the two-wheel tractor section.

**Some Unusual Tiller Attachments and Their Sources**

See the Appendix for addresses.

Front-end carrier—Wolseley
Mulcher—Agria
Sprayer—Agria, Hako
Pump—Staub
Roller—Staub
Vine Guard—Auto Hoe
Shredder-Grinder—Roto-Hoe

# THE GROUNDHOG: TILLER FROM A KIT

**by Raymond Trull**

After 14 years of hard work in gardening, my faithful tiller announced its imminent retirement with a chorus of grindings and rumblings and clouds of blue smoke.

What would replace it? In helping others in my gardening family, I'd used many well-known tillers, including Burns, Merry, Snapper, and Gilson. While most had good and not-so-good features, all were durable, hard-working machines. A tour of local dealers and an examination of gardening magazines made me itch to try every super clean, brightly painted new model on the stones, sticks, weeds, and dirty soil of my garden. There was nothing pretty about those tillers' prices—they had doubled in 14 years. To buy without carefully studying both quality and price was a foolish luxury I couldn't afford.

With attachments, many tillers convert to minitractors that plow, cultivate, rake, make planting ridges, harrow, and even move materials with a scrape blade. Could tillers be practical and efficient minitractors for gardens and small area crops? I wanted to know!

The Groundhog, by Heald of Benton Harbor, Michigan, is unique—it's sold as a kit. At $199.95 for a five horsepower, chain-driven model, it's at least $40 less than comparable preassembled models.

*Fresh from the factory, the Groundhog is ready for assembly.*
Raymond Trull

Groundhog's components are made by companies I recognized—engines by Briggs and Stratton and Tecumseh, chain drives by Parmi, and ground-working tools (a good variety) by Brinly-Hardy. More important, by assembling it, I should understand its internal workings and be able to repair it later. The goal—greater self-sufficiency!

Basic assembly included putting the transmission, frame, and tines together, mounting the engine, and attaching control cables and levers—a nine-hour job for this nonexpert fumblefingers. No tasks

were strenuous or very complicated, but some required careful, patient work. A few wrenches, a screwdriver, and Heald's large drawings and careful directions kept the job moving.

With unexpected pride—it started and worked perfectly—I took the Groundhog to the garden for its first trial and my first surprise. At an engine speed just above idle, it cut six inches deep in garden soil undisturbed for six months. To make its task a bit tougher, I added extension tines for a 36-inch-wide cut. Although an inch of leaves and old stalks covered part of the area, the Groundhog easily maintained its tilling depth and forward speed.

A much tougher test came soon. When dozens of volunteer asparagus popped up among the berries and shrubbery, I wanted to add them to our skimpy parent bed. But before preparing the deep, fertile soil needed by asparagus, a thick sod of common Bermuda grass had to be removed. In the South Carolina Piedmont, Bermuda sod is a devil's brew of intertwined, tough surface runners and a thick underground mat of fibrous roots, usually yielding only to hours of toil with a mattock.

With its extension tines in place, the tiller bounced slightly each time its tines struck. But the Groundhog churned forward slowly, leaving a seven-inch-deep layer of soil and vanquished Bermuda sod in its wake. Three hours' labor was over in twenty minutes!

The Groundhog is an actor with many roles: replace the tines with deep-cleated wheels and it's a minitractor that works. Add a drawbar and make furrows with one plow or raised ridges with two plows in the furrower-hiller set. Replace them with the cultivator-scarifier set's four plows, and removing weeds and making dust mulches is safer for garden plants. Most of the weight of a well-

*Optional equipment—here a front-mounted scraper blade and two kinds of rear plows—adapts the tiller for many chores.*
Raymond Trull

balanced tiller is concentrated over its tines to make it dig easily and quickly. That's fine, unless you need to protect plant roots. With the Groundhog's culivator plows mounted at the rear drag bar and partially supported by the operator, plow depth is easily controlled.

Add a bit of imagination, and the Groundhog helps with many chores. Leaving two of the four cultivators mounted, I use it to rake together runners from our all-too-vigorous Japanese honeysuckle. (These make good mulch or a condiment for the compost pile when chopped with a lawn mower.) With the two plows still in place, the front-mounted scraper blade can be added for a gentle, mini-earth-moving machine. To flatten the ridge of an old crop terrace, I loosen soil with the cultivator plows and push it into position with the scrape blade. In addition, it smooths soil after potatoes are dug, distributes leaves and compost for tilling in, and spreads gravel. There are other applications and much more optional equipment.

Any problems with the Groundhog? One, due to personal preference. Rototilling with rear wheels in place—many users remove them—lifts the handlebars too high, even with the Groundhog's fine height adjustment. The solution? One extra hole in the wheel attachment rod brings handlebars down to just the right height.

In the minitractor disguise, the Groundhog runs out of traction and starts spinning long before its engine stalls. A better bite—with dual wheels or wider tires—would help in soft soil.

Overall, the Groundhog is a powerful, useful machine comparable to preassembled models. Its price, performance, quick and easy adjustments, and good design clearly recommend it.

I do have one strong opinion. Many gardeners underestimate a tiller's working ability. Except for turning under a heavy sod or green manure crop, a five horsepower, chain-driven Rototiller is not likely to be stumped when used correctly. Can a tiller with attachments provide most, if not all, soil-working power needed for a large garden and small area crops? Yes!

# REAR-MOUNTED TILLERS

The rotary tiller is an excellent organic cultivating tool. It can take the place of plow, disc, field cultivator, and offset disc—and can be used as a weed cultivator too. The rotary tiller compacts the soil least of all implements. With the tilling blades mounted in the rear and the engine extending to the front, the result is a well-balanced machine which is easy to maneuver and which has efficient tilling capabilities. Rear-mounted tillers also have an excellent compost-shredding action, which is desirable when incorporating organic material into the soil. (Two-wheel tractors, discussed in chapter four, usually have rototilling attachments.)

But beyond tilling, it is quite common for a tiller to convert to a sickle bar mower or snowblower, or to have provisions for pulling a plow, trailer, or cultivator. Some tillers provide a power take-off (PTO) feature for powering a variety of attachments like pumps and sprayers, or even binders and reapers. These are discussed further in chapter four. Handlebars are usually adjustable to either side so the operator can walk beside the tiller rather than in a freshly tilled row.

## NORTH AMERICAN SOURCES OF REAR-MOUNTED TILLERS

### Troy-Bilt

The Troy-Bilt is a popular garden tiller, with several choices of model and horsepower. Attachments are available. Two forward and two reverse speeds are provided by the chainless, power train transmission with worm gear. Depth of tilling can be regulated to seven different levels while the machine is in motion, and the handles are adjustable as well. Attachments include a furrower (for trench composting) and a snowplow.

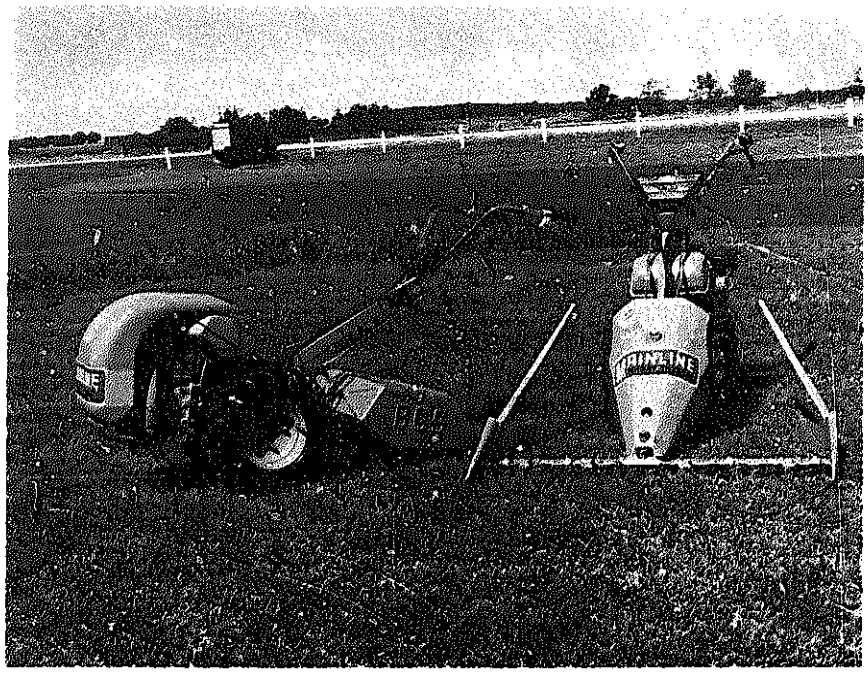
### The Mainline Tiller *

*by Howard Prussack*

Mainline is a rotary tiller of high quality and multiuse adaptability. This versatile rear-mounted tiller helps fill the gap between single-use garden tillers and expensive tractors. The basic unit is an 8 h.p., cast aluminum block engine with Pearlite cylinders.

Pearlite is a graphitic process of cast-iron composition, the product being about 20 times the density of regular cast iron, reborable three times. It has an all-gear-drive transmission—no belts or chains. Its automotive design is completely ball bearing throughout, including both ends of the crankshaft.



*The standard 8 h.p. power unit with tiller to the left, and the same power unit with gear-driven sickle bar to the right.*
Central States Distributors

It is a 20-inch tiller with a heavy-duty cover completely enclosing the tines. There is separate engagement of wheel drive and tiller drive; so the tiller does not rotate (which saves wear and is safer) when transporting. The engine has a power take-off shaft to operate pumps, sprayers, and other attachments that are available, fifteen in all.

The BCS Company, which is in Italy, has been making this tiller since 1963, and it has been designed with the farmer and grower in mind—to take the heavy-duty use and do the different jobs that the attachments make possible.

The extra attachments which make the Mainline more useful for the small grower than any of the other tillers on the market include: a 44-inch sickle bar which can be mounted on the front; combination power hilling and furrowing attachment; a split-row tiller for strawberries and small vegetables; removable tiller so you can add a planter, tool bar, cart, or snowblower.

Mainline tillers come in 5, 8, and 10 h.p. models. BCS also manufactures commercial 16 h.p. rotary tillers which have optional grain binders and thresher attachments. In addition, they make riding tractors which are being imported into this country. The U.S. importer is BCS Mainline in London, Ohio, and the Natural Organic Farmers' Association has contacted them to become the New England distributor.

**Ariens Rocket Tiller**

In the same in-between league as the Troy-Bilt, the Rocket is a 7 h.p. tiller with two forward and two reverse speeds. The rear-mounted tines are 14 inches in diameter and till to a depth of 9 inches. Handles are adjustable for side operation, and the unit is available with attachments for extra-wide tilling and furrowing.

Amerind-MacKissic, Inc.

**Mighty Mac 524-RT**

The Mightly Mac has an 8 h.p., four-cycle engine with a welded steel frame and a chain drive gear. Depth is determined by a manually adjusted drag control bar. Handles are fully adjustable, and speeds include one forward and one reverse. A furrowing kit is available.

Amerind–MacKissic, Inc.
P.O. Box 111
Parker Ford, PA 19457

**Howard Gem**

The Howard Rotovator Company specializes in heavier commercial tillers, both walking and tractor-drawn models. They call them rotovators. The larger hand-controlled Gem model is available in varying widths of 20, 24, or 30 inches. A smaller unit, the 350, comes in 16- and 23-inch widths. The transmission on the Gem has three forward and one safety reverse speed with a maximum forward speed of 2.82 mph. Each model is equipped with double wheels for added traction and a depth control wheel adjustable to 9 inches. The optional attachments and accessories include a furrowing attachment and pickline rotor.

Department 2
Newbury, OH 44065

**Herter's Belgian Model 1100 Tiller**

Modeled after a Belgian tiller but manufactured in the United States is the Herter Model 1100 rear-end tiller. The transmission is worm gear driven and powered by a 6 h.p., four-cycle

engine. The machine has two forward, a neutral, and two reverse speeds. As a safety precaution, it cannot be locked in reverse. The eight-position depth regulator can be adjusted while in motion, and in the traveling position, tines are raised 2 inches above the ground. No attachments are mentioned. The manufacturer is the only distributor.

Herter's, Inc.
Waseca, MN 56093 or Mitchell, SD 57301

### The Simar Morgan

The Morgan is made in Switzerland by the Simar Company and distributed in the United States. It employs a heavy-duty Swill 7½ h.p., one-cylinder, four-cycle engine to power its three forward and one reverse speeds. The unit's weight is 254 pounds. No mention is made of attachments.

### Colt

Of German design, the Colt is a lightweight, rugged tiller for raised benches in greenhouses and outdoor cultivation. It comes with a 10 h.p. engine, an all-enclosed gear drive—no V-belts—and a single power-driven wheel for easy handling. The Colt and the Morgan are available from:

**Mang Tillers**

Weighing 503 pounds, the Mang Model 95 tiller is designed for heavy-duty tilling jobs encountered by landscapers and nurserymen. The overall width is 26 inches, but it only tills 15 inches at one time. The smaller, 380-pound Mang Junior has a tiller cutter width of 21 inches and is powered by a 7 h.p. gasoline engine. With both models, the strain and shock of the toughest tilling are distributed among the eight sprockets and the heavy-duty roller chain. The manufacturer reports that this feature is unlike most other tillers, where the strain is taken by only two or three gear cogs. There is one forward speed, no reverse.

## INTERNATIONAL SOURCES OF REAR-MOUNTED TILLERS

**Agria Model 2100**

A 7 h.p., two-stroke engine supplies power through one front wheel to drive this tiller. Hooded tillers are available in nine different working widths, and depth is adjustable. It is particularly suited for closely spaced rows. Three-speed tooth wheel gearing is shifted from the handlebar. Its weight is 80 pounds, and provisions are available for adding front weight. Attachments include a ridger, a leaf protector, and a cultivator.

Agria-Werke Gmbh
7108 Moeckmuehl
Germany

**Buffalo Tillers**

Three models are available. The 14 h.p. model weighs 335 kilograms, the 9 h.p., 235 kilograms, and the 7 h.p. model, 205 kilograms—

*Tiller attachments come in varying widths, interchangeable for the specific requirements of each cropping situation.* Hako

all without engine. All three have four-cycle, air-cooled, diesel engines, hand-cranked starting, and three speeds for both forward and reverse. With rotary tiller, capacities range from ¼ to 1 acre per hour and with plow, from ⅓ to ⅔ acre per hour.

Three Farmers Machinery Co., Ltd.
No. 37 Min Chuan St.
Wu-Chi Taichun Hsien
Taiwan, Republic of China

**CeCoCo Suzue Power Tiller Model LEC-50**

Two types of engines are available: a water-cooled diesel with 6 or 7 h.p. or an air-cooled, gasoline engine with 6 to 8 h.p. There are six forward and two reverse speeds. Road clearance is a minimum of 178 millimeters, and it weighs 250 kilograms. Power take-off speeds are changeable with two or four steps. A safety device keeps reverse from engaging until the rotary blades have stopped. It has an adjustable handle.

# STATIONARY WINCH-POWERED CULTIVATION

Prior to the invention of the tractor, about the time of World War I, cable cultivation was the only form of mechanized agriculture for about 75 years, and this represented the first use of steam power for cultivation. Because the first steam engines were not self-propelled, a scheme employing a cable and windlass was used to get the plow from one end of the field to the other. The cable usually wound on a horizontal drum beneath the engine which was driven by bevel gearing from the engine shaft.

Though the most expensive initially, the most satisfactory implementation of this technique utilized two steam engines. One engine pulled the plow through the field while the other paid out slack cable and moved ahead into position for the next haul. As steam engines became lighter, it became more feasible to use them as tractors to pull implements through the soil, and the need for a cable disappeared. Today, cable cultivation is used on small, steep plots in France and Italy, and for plowing paddy fields in China. Agricultural engineering researchers recognize the winch as a significant tool worth developing in their quest for simply designed machines to satisfy the worldwide need for economical, energy-efficient field mechanization. Mechanical Engineer Stuart Wilson from Oxford outlines the reasons why.

"The three very considerable advantages of cable cultivation compared to conventional tractor use are:

1. Lower energy consumption due to elimination of both wheel slip and the energy needed to transport the prime mover.
2. No compaction of the soil, an increasing problem with large tractors.
3. Ability to plow in wet or slippery conditions.

The disadvantages include the need for two prime movers if the most effective method is used and the need for some sort of reversible plow."

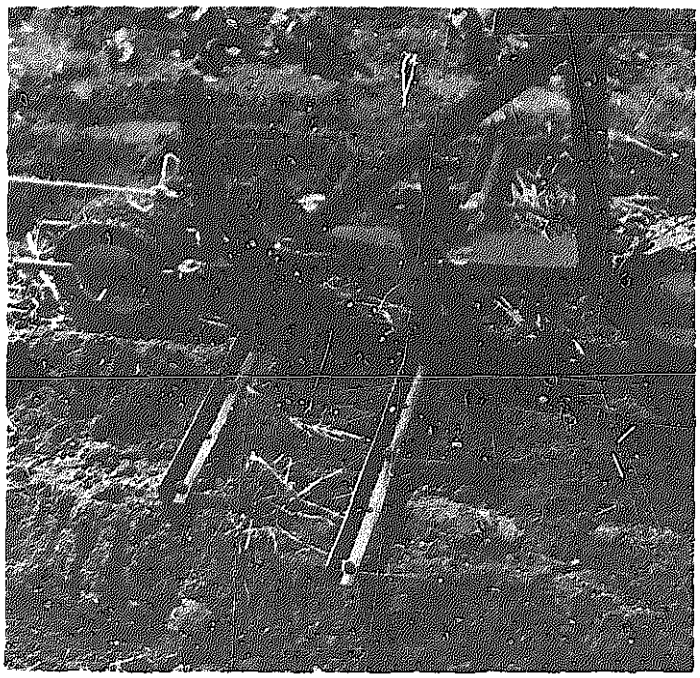
Wilson continues, "However, in light of the fact that plowing is only a small part of the average tractor's use and that most of the remaining duties, especially road haulage, need much less than maximum power, there appears to be a case for evolving a design for a basic tractor of modest power which can be used in pairs for cable plowing when required, but is otherwise capable of performing a variety of lighter duties."

Three designs are on the drawing board to utilize winch cultivation: a pedal-powered Mechanical Mule, a two-wheeled tractor called the Snail, and a three-wheeled tractor, the Spider.

**The Mechanical Mule**

Designed by Rodale Resources, Inc., in Emmaus, Pennsylvania, the Mechanical Mule harnesses the power of the pedal to provide winch-pulling power for farm tilling tasks. The power unit seen in the photo on page 60 is positioned at the head of a row while a toolbar carrier is positioned at the foot of the row.

*The Mechanical Mule*



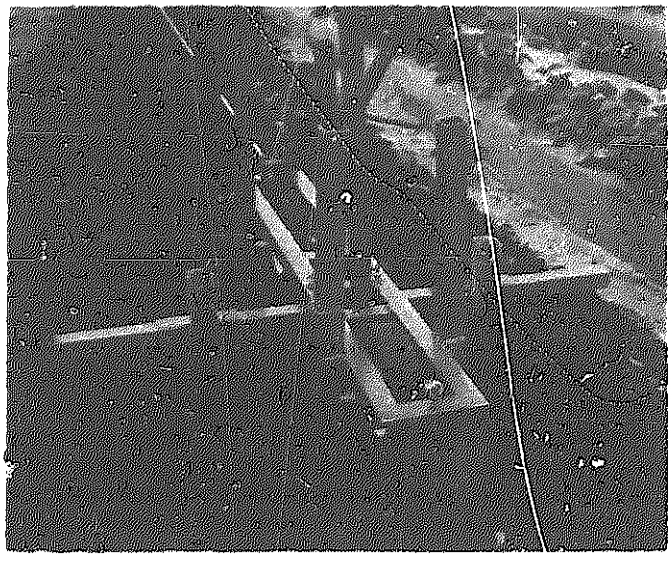
*Mechanical Mule tool carrier with cultivator attachment.*

As the operator of the power unit pedals, a high-test nylon or polypropylene line fastened to the tool carrier is reeled in and the tool carrier, guided by a second person, is pulled up the row.

When one row is completed, the helper walks the tool carrier to the foot of the next row, unreeling the power line as he walks. Simultaneously, the pedaler moves the power unit to the head of the next row. When everything is in place, the operation is repeated. This multipurpose implement can be used for plowing, subsoiling, harrowing, and row-making, as well as cultivating. Tools are quickly interchangeable for tending three rows at a time.

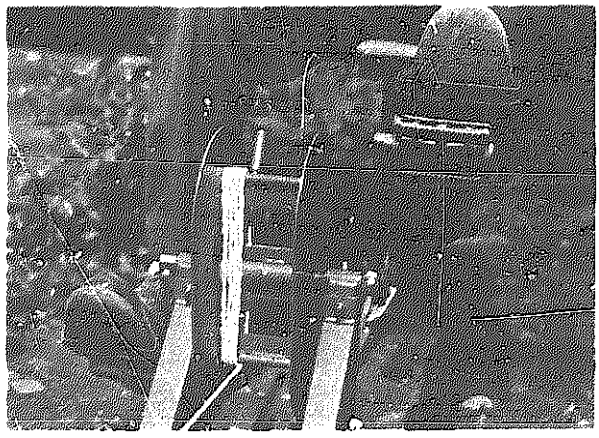
The tool carrier is light enough to avoid compacting the soil and narrow enough for minimal row spacing for intensive crop production. Such intensive cropping systems tend to reduce the need for frequent weeding, as the tightly spaced plants help to shade out the weeds.

Dynomometer tests reveal that an average man can exert a pull of 1,000 pounds with the aid of the Mechanical Mule. From a sitting position, the energy of the strongest human muscles, those of the thighs, is relayed through a bicycle crank mechanism to maximize leverage. With spacer bars on the uptake reel, the effective diameter is increased for reeling in several feet of power line with each revolution of the crank—the equivalent of high gear. For harder jobs, the spacer bar can be removed for reeling in only a few inches of line with each revolution of the crank—the equivalent of low gear. Pulling speed is reduced, but pulling power is about doubled.



*The row-making tool simultaneously prepares three rows for planting 12 inches apart, facilitating intensive cropping systems.*

*Spacer bars on the uptake reel of the Mechanical Mule reel in several feet of power line with each revolution of the crank—the equivalent of "high gear."*



In the interest of safety, to keep the crank from slipping backwards and the pedals from hitting the operator in the shins, a ratchet-brake mechanism was built into the unit. Depressing a clutch disengages the reel from the crank so the power line can be easily reeled out.

### The Snail

The Snail, a primary cultivation device, was developed at the National College of Agricultural Engineering, Silsoe, Bedford, U.K., as a possible solution to the problem of cultivating hard, dry soil in developing countries during the dry season, so as to achieve early planting with increased crop yield the result, reports Peter Crossley.

The machine overcomes the energy constraints of human or animal power, is much cheaper than a large tractor and more efficient than a small one. The principle utilized is that of a self-propelled winch controlled by one operator, together with an implement mounted on a frame and controlled by a second operator. The winch unit is driven forward to the extent of its cable, drive is engaged to the winch drum, and the cable draws the implement towards the winch unit, which is prevented from moving backwards by a self-anchoring sprag.

*The Snail*
National College of
Agricultural Engineering

In tests during the dry season in Malawi, sponsored by the Ministry of Overseas Development, the machine was found to work satisfactorily in most small farm conditions, and would be likely to be economical in areas where alternative cultivation methods were either unavailable or more expensive. It is designed to operate in hard soils and would not be technically satisfactory in wet land or in temperate areas.

### The Spider

The Spider is a three-wheeled, self-propelled winch-tractor which evolved from the Snail and the Kabanyolo. In an article entitled "Are Small Tractors Possible?," * Peter Crossley reports that the Kabanyolo was an example of the "ingenious use of mass-produced components in a chassis which was designed to be manufactured locally from stock materials." He describes the Snail as an example of "a small, self-propelled winch, which provides a much higher draft force than a single-axle tractor of corresponding size and weight." When the limitations of these two units were clearly defined, efforts were directed at combining the best features of both in the design of the Spider.

Still in its early stages of testing, the Spider is being developed at the United Kingdom's National College of Engineering in Silsoe, England.

Crossley states that "the Spider consists of a fabricated chassis, on the front of which is mounted a 6.5 h.p. diesel engine, which drives the two rear wheels by means of a V-belt and

* *World Crops and Livestock*, May/June 1977.

*The Spider*
National College of
Agricultural Engineering

chain reductions. In the center of the rear axle is a winch drum. Steering is tiller operated on a single front wheel, and the rear track is 1 meter wide."

"It was anticipated that light-draft operations would be carried out by direct traction with mounted implements at speeds of up to 4 mph, but that for high-draft work, the machine would be operated in the same manner as the Snail, by driving forward to the extent of the cable and then winching in the implement."

Now, even before testing has been completed on the Spider, plans are being drawn up for an improved design. Crossley continues, "The proposed design is that of a lightweight, three-wheeled tractor having 6.00 x 16 rear-drive wheels spaced at a 2-meter-wide track with a single 4.00 x 12 wheel at the front. The five kw. engine would be transversely mounted in front of the rear axle, the drive being supplied by a chain reduction. Further, enclosed chains would drive each rear wheel from the outer ends of the high-mounted axle, in the right-hand section of which would be mounted a winch drum. Good ground clearance and lateral stability would therefore be obtained. A sprag and guide roller device would act in line with the winch so that the tractor could be driven with the right-hand rear wheel in the furrow, in the conventional manner, for winched operations such as moldboard plowing. A patent has been applied for."

"No differential would be fitted, but as with the original Spider, either or both rear wheels could be engaged by means of dog clutches, thus allowing both wheels to be driven during light cultivation operations, or while moving forward prior to winching. In order to turn at headlands, the inner wheel would be declutched, allowing sharp turns to be made; a reverse gear would not be required. By adding a second primary chain and dog clutch, an additional forward speed could be provided for transport work."

"Although lightweight, the Spider would optimize its performance for low-draft operations by virtue of its axle characteristics and reasonably sized drive wheels. The track spacing and high ground clearance would allow it to work in ridges. During high-draft winching operations, the machine would work slowly but effectively, and with the addition of a second man on the implement, could undertake operations which no small tractor of equivalent size could attempt in poor traction conditions."

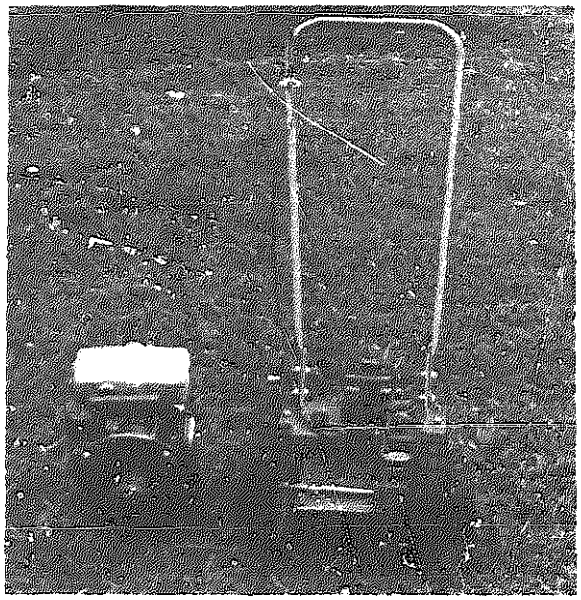
Such design work by the National College of Engineering is aimed at increasing the agricultural productivity in developing countries. One criticism of this final design is the complicated operation procedure. Present thoughts

include considering a switch to hydrostatic transmission which would simplify operation, but increase cost and decrease efficiency.

## UNIQUE CULTIVATION DEVICES

### Kuranda Rotary Cultivator

The Australians have devised a cultivation unit which can be powered by any four-stroke gasoline engine to cultivate to a width of 14 inches. Other attachments are available for quick interchange of the engine, including a posthole digger and litter vacuum.



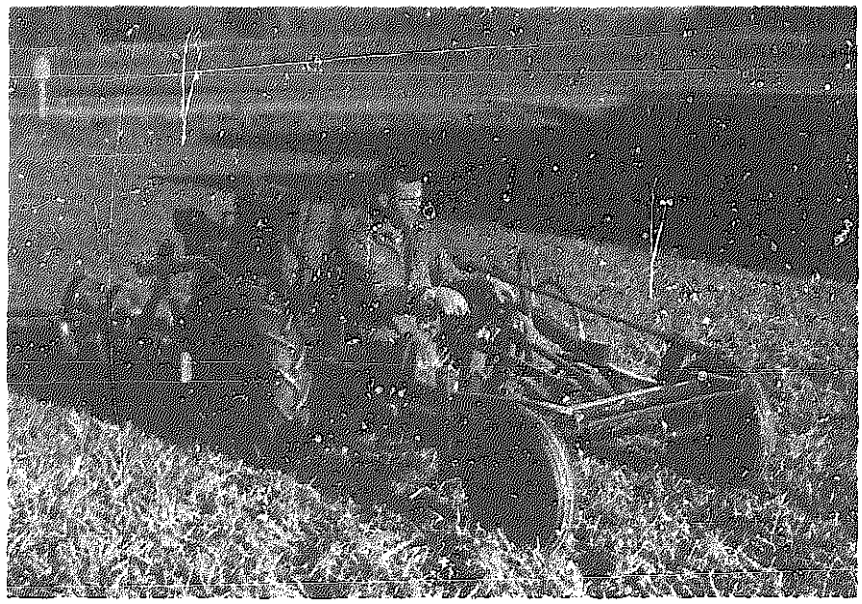
*Kuranda Rotary Cultivator* Kuranda Industries

Kuranda Industries Pty., Ltd.
42 Bank St., P.O. Box 26
Padstow 2211, Australia

### The Friday Self-Propelled Power Hoe

The Friday Self-Propelled Power Hoe is a 9 h.p. tractor specially designed for hoeing around individual plants rather than only between rows. It is guided with individual turning brakes, thus leaving your hands free to operate the controls for the hydraulically powered hoe blades. Though specially designed with strawberry cultivation in mind, it is good for all row crops. It is particularly suitable for the organic farmer who would prefer to cultivate around individual plants rather than use herbicides.

Three different types of hoeing blades are furnished with each machine. An adjustable weeder will comb runners of young strawberry plants without damaging them while dragging out small weeds and leveling the ground. One hydraulic valve raises or lowers the cultivator, weeder, or hand hoes and also controls the fertilizer attachment.



*The Friday Self-Propelled Power Hoe*
Friday Tractor Co.

The 9.2 h.p., air-cooled engine powers one reverse and three forward speeds for a range of ¼ to 7 mph. Low rates of speed are necessary for thorough hoeing. The hoe has a 13-inch crop clearance and weighs 1,210 pounds. A fertilizer attachment and electric starter are available options.

The manufacturer claims that one man can cultivate, hoe, weed, and fertilize a whole acre in 2 hours. At this rate, he can assume responsibility for caring for 25 acres of strawberries.

Friday Tractor Co., Inc.
Hartford, MI 49057

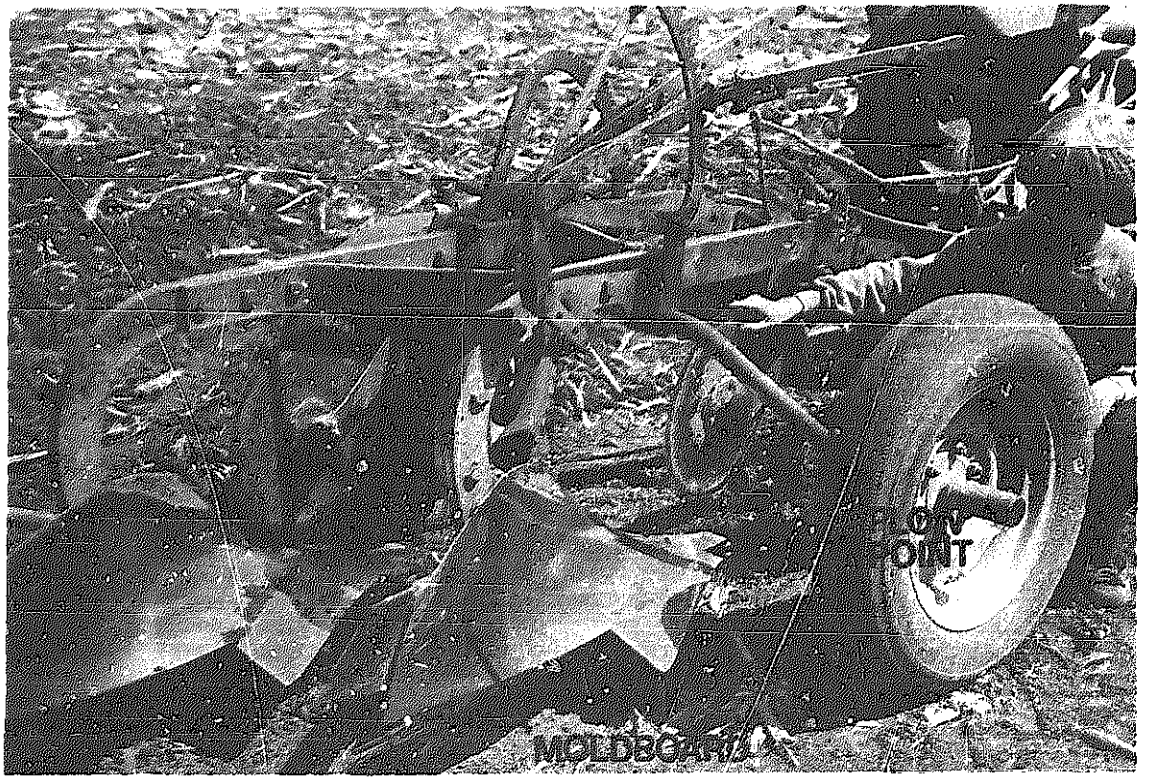
## PLOWS

Farmers through the ages have devised almost every conceivable type of soil-working tool—from nothing more than a tree branch dragged over the soil to level it, to sophisticated, spinning steel knives churning through the ground. Some inventions work; some do not. Some work better in certain soils than in others. Some work better in wet years than in dry, or vice versa. But be assured that whatever idea for tilling soil you may have, someone, somewhere, has the tool for it.

### THE MOLDBOARD PLOW

The moldboard plow is the traditional power tool for opening or breaking the ground in preparation for planting. Characteristically, the moldboard, from which this type of plow gets its name, turns dirt completely over as the plow is pulled along, burying surface plant material and leaving soil bare, loose, and easily worked into a seedbed. Most moldboard plows have solid moldboards, though slotted moldboards are also made and used in some soils.

Some organic farmers think the moldboard plow is an undesirable tillage tool and put their faith in offset discs. This argument has been going on for over 50 years and won't be settled for 50 more. In the meantime, just remember that on a small, noncommercial

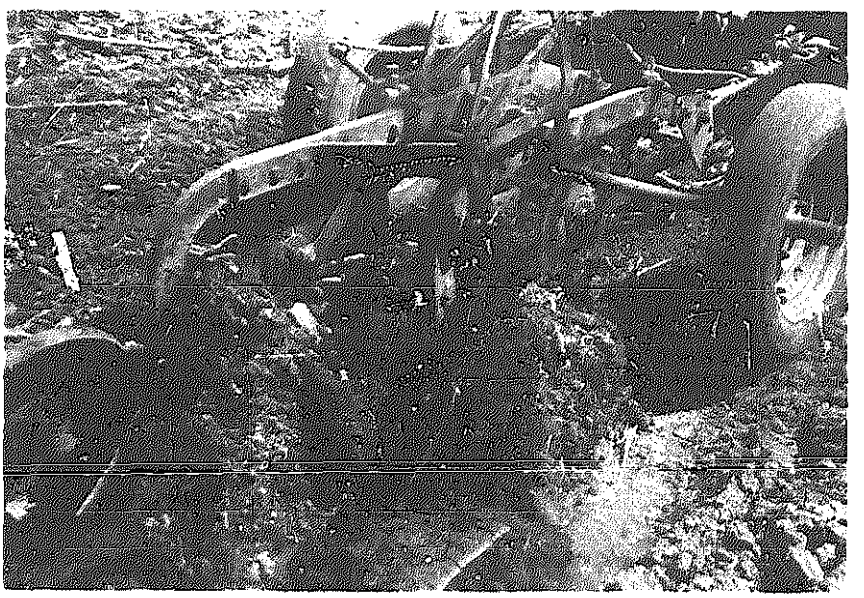


*The only drawback of the moldboard plow is that it can cause greater erosion. The boy has his hand on the slicing coulter.*

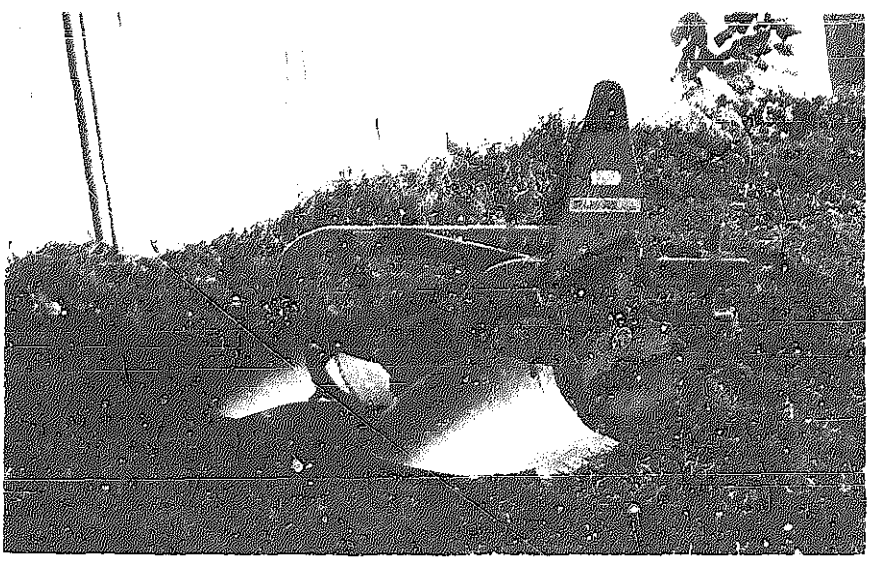
homestead, an old plow costing under $50 is adequate, while even the smallest, used offset disc, heavy enough to really chop up and incorporate crop residue and green manure into the soil, will cost you 10 to 20 times that much. The only drawback to the moldboard plow you will need to remember is that it can cause erosion. Don't plow steep slopes and don't fall-plow even gentle slopes with a moldboard plow.

Size is the first consideration when shopping for a used plow. For a two-bottom (two plows), 14-inch model, you need at least a 25 h.p. tractor, and 35 would be better. (The 14-inch measurement is the width of the furrow each plowshare makes.) A 15 h.p. tractor will pull a single 12-inch plow. (One of the editors of this book, Gene Logsdon, recommends not going smaller than a 14-inch plow for field work, but this is a matter of personal preference. He finds that the smaller plows aren't heavy enough to satisfy him, especially for turning under green manure crops.)

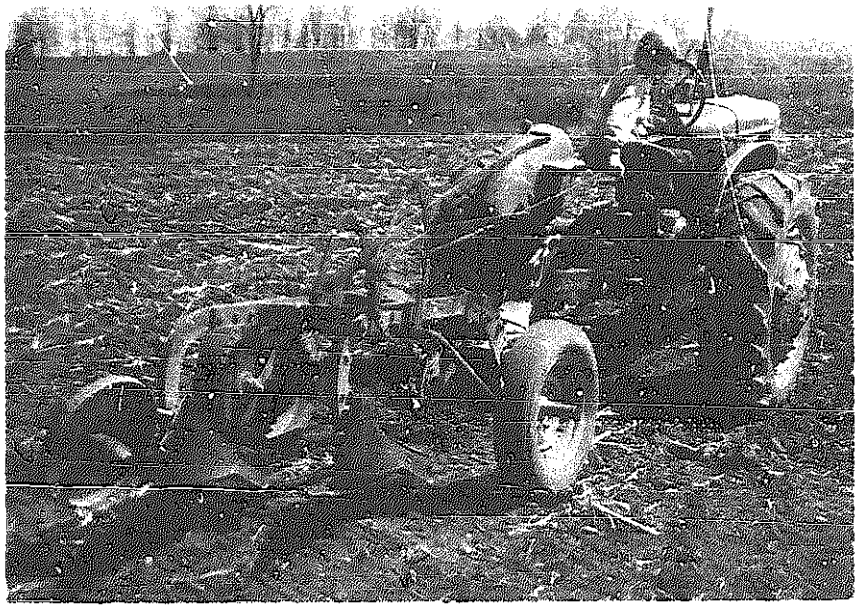
You may also have to decide between a mounted plow and a pull-type plow. Mounted plows attach to the tractor in such a way that



*Coulters cut, moldboards turn the soil over, and a wheel to the rear adjusts the plowing depth.*



*The two-bottom plow does a good job on plots of ten acres or less.*



*Here the pull-type plow is in a raised position with its rear wheel completely off the ground.*

they can be raised completely off the ground for ease in backing into tight corners of small fields or garden plots and in transporting them over the road. They are more difficult to attach to the tractor than are pull types, require a power take-off connection and/or hydraulic pump, and are more expensive.

Pull-type plows hitch and unhitch rather easily by comparison and are cheaper, but they are far less maneuverable. On some two-bottom pull-types, the rear wheel lifts completely off the ground when the plowshares are in the raised position. That's a desirable characteristic, since it lets you back the plow as easily as you can a two-wheeled trailer. When you cannot back up a plow, it is almost impossible to work small areas or tight corners where turning space is very limited.

The older two-bottom plows are all pull types and are perhaps a better buy for the money, even if they are a little awkward. Few of them are worn-out—they just become obsolete. A cog and gear mechanism powered by the revolving left wheel of the plow raises and lowers the plowshares when activated by pulling a trip rope. When you come to the end of the field, you tug gently on the rope and the plow lifts out of the ground. Another gentle tug and it drops into the furrow again. The tripping mechanisms probably wear out sooner or later, so you should check before you buy.

Most likely, the plow points will be dull, and you will have to get them sharpened or buy new ones. When you order new ones, you will need to know the name and model of your plow.

Check the two levers on the plow. Each lever raises or lowers the wheel closest to it. The shorter lever over the furrow wheel sets the depth of the plowshares, while the longer one levels the pitch of the two plows so that they plow evenly at whatever depth. Sometimes the levers are broken, cracked, or bent, especially the shorter one, from trying to adjust plow depth while the plows are in the ground. Always make the short lever adjustment with the plows raised. The long lever can be adjusted from the tractor while you are in motion.

The lever handles have a hinged piece which you squeeze against the main handle to lift the lever pin out of the slot that it's in. With the slot pin lifted, you can move the lever up or down. The lever pin may be rusted tight, or the spring that keeps proper tension on it may have become rusted or broken. All are fairly easy to repair.

Perhaps the most important point is to be sure each plow point is preceded by a coulter—the disc that slices off the soil which the moldboard will turn over. Coulters are easy to take

*This is how to adjust the short lever for depth.*

off of one plow and put on another plow: hence, they are easily lost. An old plow may cost only $10, but if the coulters are missing, replacements are liable to cost you $50 or more.

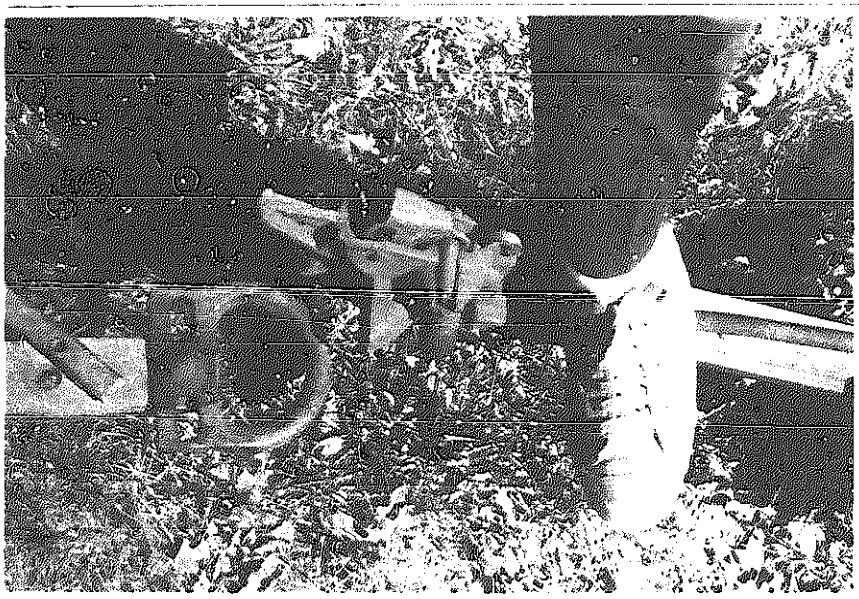
Next, check the condition of the moldboards and plow points. If the surfaces where the dirt slides are very rusty and pitted, you will have a difficult time getting the plow to scour. Dirt will stick to the steel, and the plow won't be effective. If there's only a little rust or shallow rust, it will wear off quickly when you plow, leaving the shiny, smooth steel surface necessary for good plowing. Better yet, an old plow that has been cared for will have its moldboards and plow points covered with a coat of grease or oil when not in use to protect against rust. Be sure you treat your plow surfaces to the same protection between plowing seasons.

A rusted moldboard may be reclaimed with fine sandpaper and rust remover, but if badly pitted, it will never scour very well. Look for another plow.

You want the plow to make even furrows, not every other one higher or lower. If the latter condition prevails on your plowed ground, keep changing the lever positions until the turned furrows all look level with each other. Remember that the right wheel runs in the furrow four to six inches lower than the left wheel if you are plowing four to six inches deep. So when you make your first pass across the field, there is no furrow for the wheel to run in, and therefore you need to adjust the plow depth lower. Otherwise, the front plow won't go deeply enough into the ground. On the second round, you will have to readjust, because then the one wheel will be in the furrow. Likewise, on your last round, when you are finishing a dead furrow, the other wheel will drop lower than normal, and you will have to adjust the depth again. If you don't, you will gouge out too deep a dead furrow.

Pull-type plows require a special clevis to attach them properly to the tractor drawbar. The clevis is first bolted to the tractor drawbar; then the tractor is backed up to the plow tongue, and the clevis is pushed into the hooded plow hitch until it latches—you can hear the click. If you are alone, with no way to lift the plow hitch up in line with the clevis so you can back the tractor into it, you will learn how to stop at just the precise distance from the plow hitch, get off the tractor, lift the hitch or push down on it, and force it into the clevis.

The reason for the somewhat complex hitching mechanism on a pull-type plow is to keep the plow from breaking should you hit a root or stone underground. When that hap-

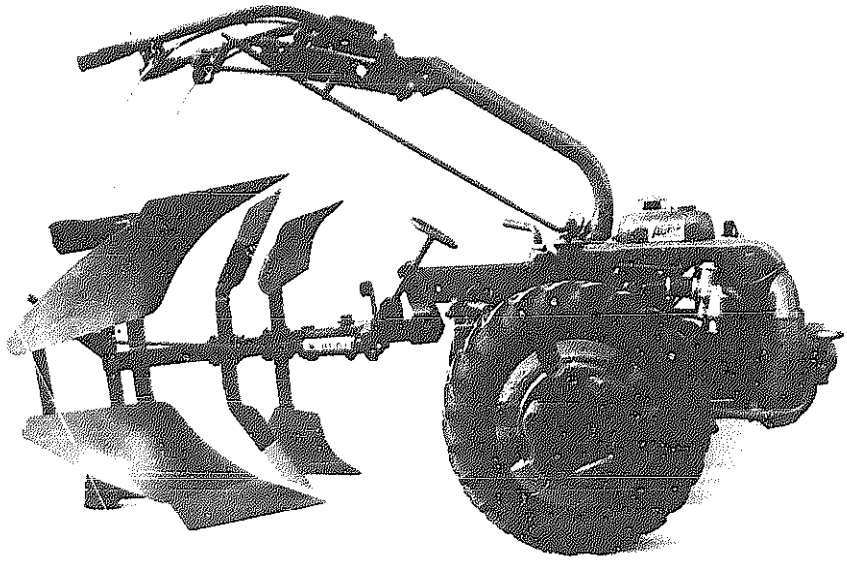


*The plow hitch is seen here just before it is coupled to the clevis.*

pens, the jolt makes the hitch fly open automatically, and the plow, unhitched, stops immediately, saving many repair jobs.

For that same reason, don't tie the trip rope too tightly to the tractor seat. Loop it through a weak hook of wire so that if the plow comes loose, the rope will too. Also, leave plenty of slack in the rope so that it doesn't tighten up and trip the plow when you are turning at the end of the field.

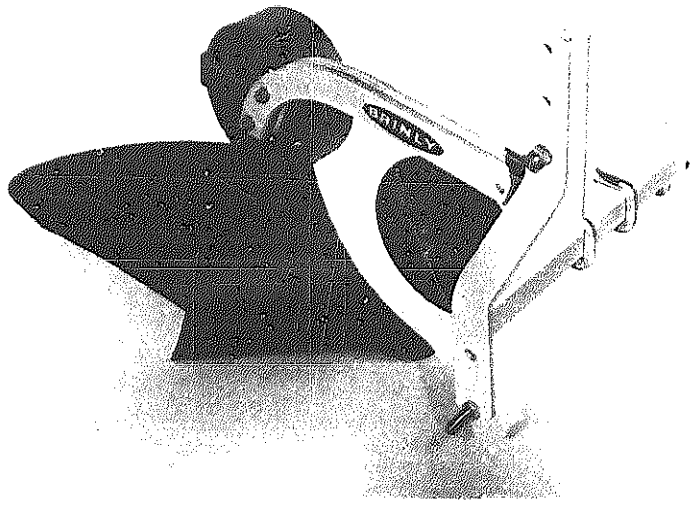
Because of the way a plow works, you can't just root the soil up any way you please. A plow lifts the soil from one place and deposits it eight to twelve inches to the side of its original position. The ditch that is left is called a furrow. After the first pass across the garden or field, the furrow ditch is there to throw the dirt into from the second furrow and so forth. When you are finished plowing, you will have at least one furrow left over. This is called a dead furrow. Naturally, the first time you plow across the field or garden, you do not have a furrow already there. So the dirt turned over by the plow blade falls on the normal soil sur-



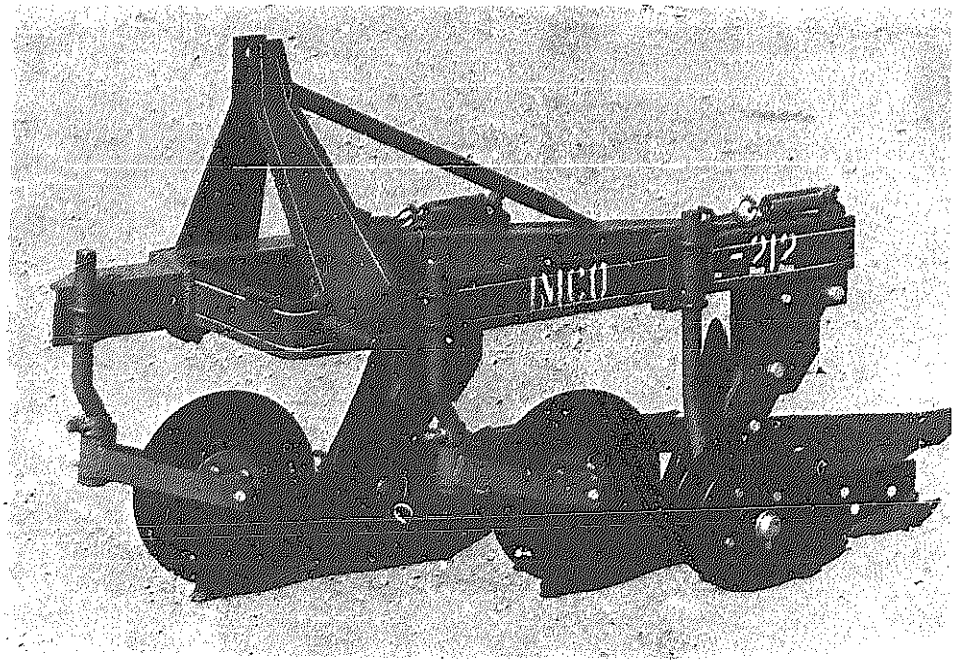
*The Hertecant two-way, reversible plow attached to an Agria two-wheel tractor.* Willem Hertecant

face, leaving a ridge of dirt. This ridge is called a headland. The art of plowing demands that in subsequent years of plowing, you make your headlands fall where last year's dead furrows were, and last year's headlands then become this year's dead furrows. If you don't do that, your field will become less level every year.

Commonly, moldboard plows are one-way plows, but two-way plows are made, and they are often called hillside or reversible plows. A two-way plow has two sets of plows, one above the other. At the end of the furrow, the operator can flip the two over, so the top will swing down in plowing position and the bottom will swing up out of the way. He or she can then proceed to plow back in the same furrow just made, which would be impossible with a one-way plow. The two-way plow eliminates dead furrows and headlands and is very handy when plowing terraces or contours on hillside land.



*For 14 and 18 h.p. garden tractors equipped with category 0 three-point hitch, the Brinly-Hardy 12-inch moldboard plow features an adjustable gauge wheel with scraper to control plow depth in varying soil conditions; a throwaway share for lower replacement costs, 11-inch adjustable coulter, and adjustments for landing and width of cut.*
Brinly-Hardy Co.



*A line of moldboard plows may be used with either the spring trip or as a shear-pin type plow. Coulter blades and gauge wheels are available as optional equipment. Plow models include a one-bottom 16-inch plow, a two-bottom 12-inch plow, or a two-bottom 14-inch plow.*

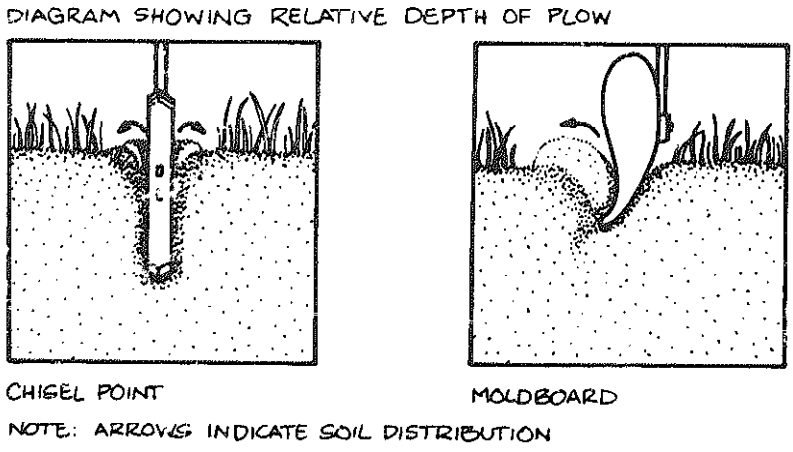
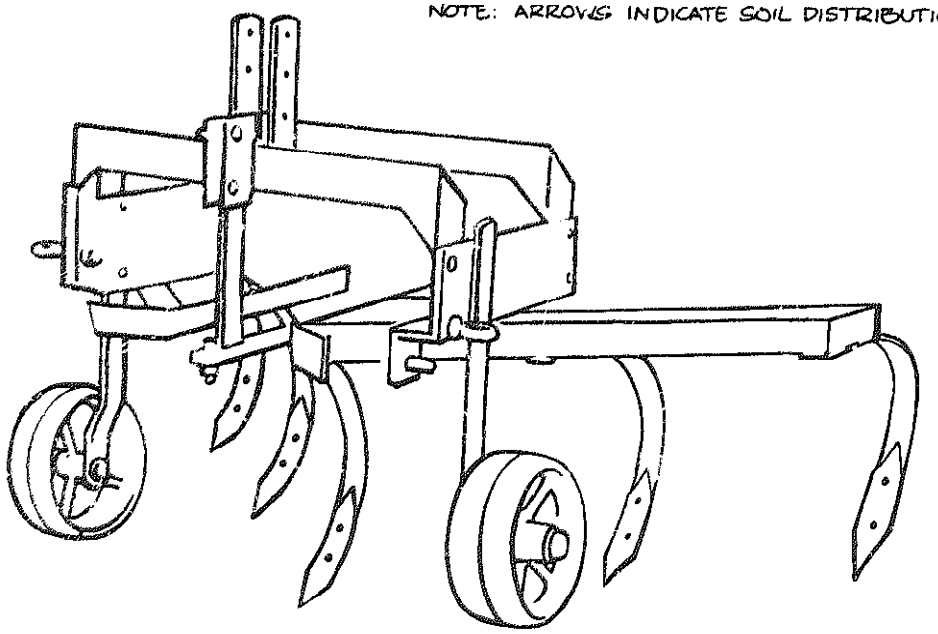
## THE CHISEL PLOW

Challenging the moldboard plow for the lead in farmer popularity, especially in hilly and dry country, is the chisel plow or the very similar field cultivator, sometimes called simply the digger. This plow consists of sets of curved tines or small shovels which dig up the soil to a depth of 12 to 18 inches, loosening and lifting it, but not turning it over like a moldboard plow does. The chisels are shaped in an arc, something like the letter C so that the point penetrates the soil ahead of the shank. Chiseled ground is not nearly as subject to wind or water erosion as moldboard-plowed soil. Some plant material remains on or near the surface to hold the soil in place.

Chisel plows come in several designs, either with twisted shovels or straight shovels. Straight shovels are usually two inches wide, while the twisted ones vary up to four inches wide. Twisted shovels tend to stir and mix the soil more than the straight type and are used when heavy plant residues need to be incorporated into the soil.

Most chisel plows demand big tractor power. A 13-foot chisel operating ten inches deep at five miles per hour requires 120 horse-





*A chisel plow with depth wheels.*

power. However, most chisel plows are put together so that you can remove individual blades (or shanks) to reduce the pulling load.

To avoid jamming plant residues in front of the blades, which can happen where surface trash (organic crop residue) is heavy, manufacturers have combined the disc and the chisel plow—a series of straight coulters in front of the chisels to cut up the plant residues. You don't have to use a stalk chopper or disc ahead of this kind of chisel. But it requires a large tractor to pull it.

# FARMING ORGANICALLY WITH NO-PLOW TILLAGE

After 27 years of organic farming, the Mundt family in Michigan has developed a unique combination of green manuring and no-plow tillage to stop erosion and grow better crops. They're building humus, high-quality soil, on a sandy, hill farm. To incorporate the lush growths of sorghum-sudan grass, the solid-stand corn, and buckwheat, Bill Mundt uses a heavy, offset disc. It almost seems to work miracles in the sandy ground. Two passes, the second at right angles to the first, over a jungle of eight-foot-high sorghum-sudan, and the plants are incorporated into the soil, ready for a broadcast seeding of buckwheat or rye. After the seeding, another pass with the disc covers the seed, levels the surface fairly well, and firms the soil to sprout the seed. But still the ground is thick with chopped organic matter which reduces erosion to a minimum. The soil is so biologically alive that the rotting process of the incorporated leaves and stalks begins immediately. Each year the sand becomes richer in humus. "It works. The best proof I have is that I'm raising fairly good crops right over areas that were stone-filled gullies 30 years ago," says Mundt.

His other main cultivating tool is the field cultivator or chisel plow (some farmers call it a digger or chisel), which can be set deep to open up the ground. On grain stubble, sod, hay field, corn or bean fields after harvest, the chisel can be used as a primary tool to break the ground as well as plow it, but without turning it completely over on the surface and allowing easy erosion. Fall-chiseled soil can be gone over with a disc in the spring and planted. Two chiselings, the second at a right angle or bias slant to the first, can be planted with a drill, pulling a disc ahead of the drill. Or it can be broadcast-

*To prevent loosened plant trash from chiseling the second time through, Bill Mundt uses "beavertail" ripper blades which are six inches wide—wider than regular chisels.*

planted and covered with the disc. "For a plowdown crop, you don't need to have a smooth soil surface. Leaving it a little rough catches and holds moisture better," says Mundt.

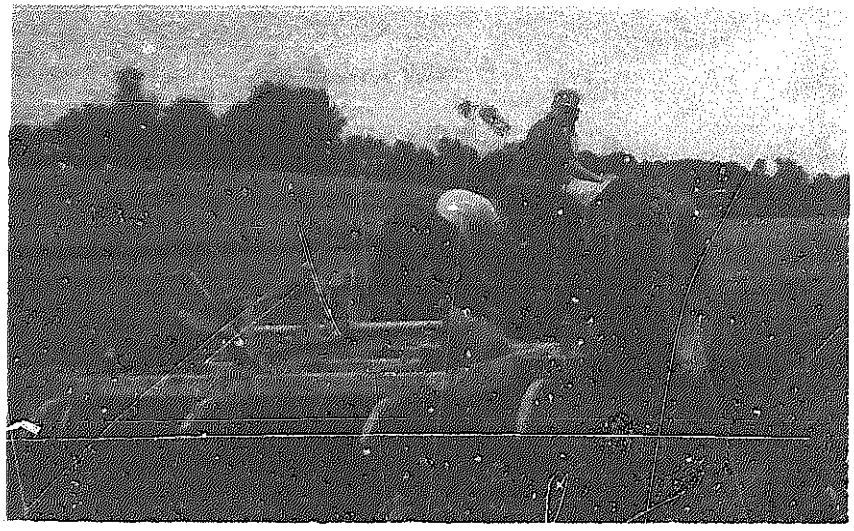
When incorporating heavy trash, field cultivators are apt to plug up. "The first time through you're okay," points out Mundt. "But the second time, the loosened plant trash will collect in front of the chisels. To prevent that, I use what are called beavertail ripper blades. They are six inches wide—wider than regular chisels. What they do is throw dirt ahead of them in enough volume to prevent the jamming of plant material on the blades. You have to drive fast to get the proper action." If plugging still persists, or if you want to dig the ground so deep the tractor won't pull your field cultivator, you can remove every other blade and still do a fairly adequate job of primary cultivation.

Neither offset disc nor chisel is a machine for small tractors. "Figure you need five to eight horsepower for every foot of width of your tool," says Mundt. Since ten feet is about minimum width for standard American offset discs and chisels, you're talking about a tractor of at least 50 horsepower for the smallest models.

Mundt sometimes uses his chisel after the disc. "Where erosion is a bad problem, you can cultivate lightly with the disc a couple of times and chop the trash into the top layer of the soil. Then, with the trash on top to protect the soil, you can go deep with the chisel and open the ground without burying the top mulch."

Working with large amounts of plant matter can cause problems when you are cultivating weeds in row crops. Plant material collects on cultivator shovels. "High-clearance sweep shovels are one way around the problem," says Mundt, "but a better way I've found is the high-speed Danish cultivator. [His model is a Noble from Sac City, Iowa.] This row cultivator has narrow tines for shovels, and when pulled through the ground they shimmy and shake, avoiding buildups of plant debris and clumps of sod. I had no trouble even cultivating corn that I had planted in a field previously sown with orchard grass, which always leaves troublesome clumps of roots when you work it up."

The payoff? Very little erosion, low overhead, and satisfactory crops. "We don't get high yields," says Mundt. "We aren't interested in that. We're looking for quality. We're satisfied with 80 to 90 bushels of corn. We feed it to our milk cows and beef animals and believe they respond with better efficiency than if they were fed highly chemicalized, heat-dried corn. We don't even plant for high yields. I like a plant population of around 17,000 in 40-inch rows for corn."



*The chisel and Danish cultivator are Mundt's alternatives for the moldboard on his highly erosive soil.*

*The Cole 510 system set for chisel plowing with four springs, center spring, and gauge wheels for category 0 and 1 three-point hitches.* Cole Mfg. Co.

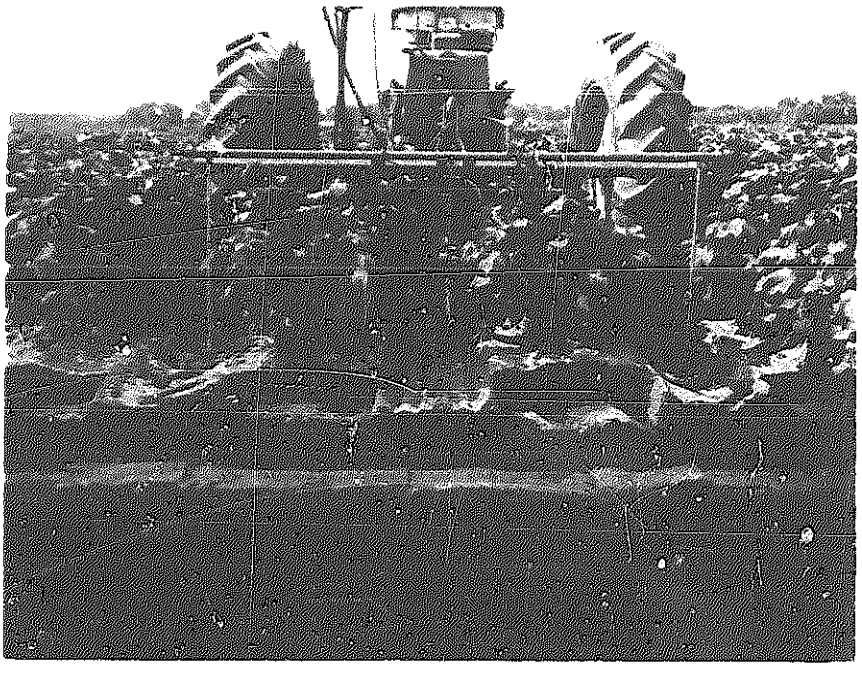
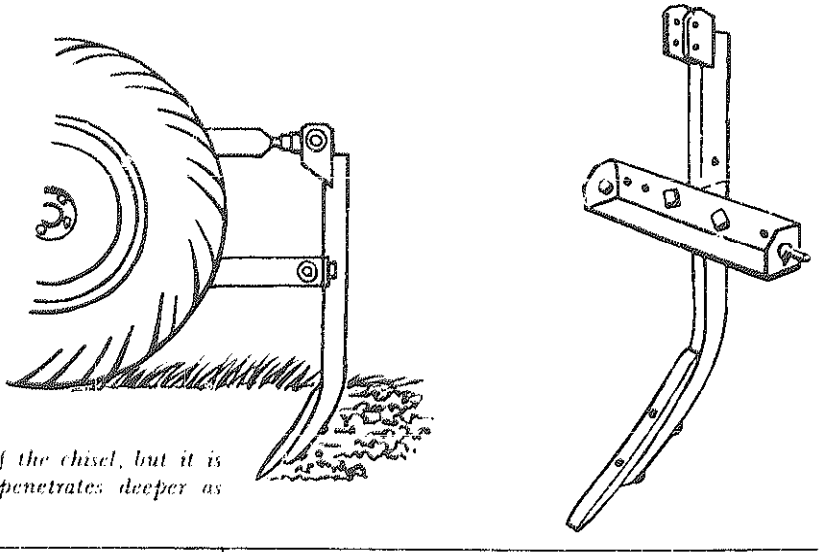
### The Subsoiler

The chisel plow is not quite the same as a subsoil plow, sometimes called the deep chisel, or V-plow, though the actions of the two implements are now being combined into one machine. The subsoiler is a much heavier tool with narrow ripper blades that dig deeply into the soil to break up compacted layers for better drainage and root penetration.

The subsoil plow is a clear indication of the weakness of modern farming methods. It was designed to offset the negative effects of heavy



*Years of moldboard plowing and use of heavy machinery have left this layer of hardpan which only the subsoil plow can penetrate.* National Tillage Machinery Laboratory



*The subsoiler assumes the shape of the chisel, but it is a much heavier-duty tool which penetrates deeper as well.*

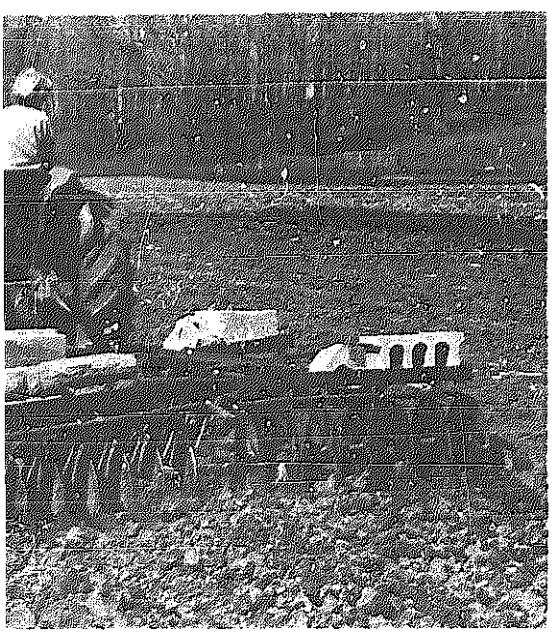
farm machinery and the discontinuation of rotations of alfalfa and sweet clover, whose roots formerly penetrated into and broke up hardpan, a slatelike layer of soil 6 to 8 inches beneath the surface, caused by compaction from heavy machinery.

A cure for hardpan, though only a temporary cure, the subsoiler is a deep-penetrating chiselike plow which requires a tremendous amount of power to pull. A small-scale operator shouldn't plan to pull more than one subsoiling plow with a small tractor, and only a larger small tractor at that.

### The Disc Plow and Offset Disc

Disc plows are a third type of soil breaker or sodbuster. The original kind, which was fashionable in the middle 40s, consisted of from two to six large, heavy discs, which when pulled at a slant, turned the soil over somewhat like a moldboard plow. Though still used in some areas, they are being replaced by the offset disc,

*The narrow sections of this spike-tooth harrow are light and easy to lift for inspection.*



*The narrow sections of this spike-tooth harrow are light and easy to lift for inspection.*

*The cement blocks increase cutting depth on this eight-foot, pull-type tandem disc harrow.*

which resembles the conventional tandem disc, but is much heavier and is composed of only two gangs of discs positioned one behind the other at a bias to each other. (Tandem discs have four sets of gangs, two behind two.) At present, offset discs are very popular with farmers who have experienced erosion problems with the moldboard plow. What's more, the offset disc will incorporate rank, tall stands of green manure better than a chisel plow, and without plugging with crop residue.

### The Disc Harrow

After a field is plowed and before it is planted, the soil has to be worked into a fine seedbed.

The standard tools for fining and leveling a good seedbed are the tandem disc and the spike-toothed harrow. The disc does the fining, and the harrow levels out the gouging marks of the disc. Hand tools in the garden do roughly the same operation when hoeing spaded soil into a finer texture and then smoothing it with a garden rake. Your hoe is the disc, your rake, the harrow.

If you can afford only one tool for this operation, make it a tandem-disc harrow. Old ones are common and often low-priced in the small 6-, 7-, or 8-foot widths. Yours should be wide enough to cover your tractor's tracks when pulling it. If the disc bearings are worn out, though, so that no amount of grease will get the blades rolling smoothly, look for another disc. There's usually one bearing for every two pairs of disc blades. Pump them full of grease and keep them that way.

Old disc blades are equipped with scrapers that are supposed to keep dirt from building up on them. On an old disc, they almost always will be bent out of position or loose. You may have to straighten and/or rebolt them. (Sometimes old bolts and burrs can be tightened, but more often they are rusted solid and have to be cut off and replaced.) Actually, if dirt is building up on your discs, nine times out of ten it means your clay soil is too wet for disking. When the soil is fit and the disc blades shiny—at least on their edges—dirt will seldom clog them.

Mounted discs, like mounted plows, are very nice for cultivating small plots and have the same advantages and disadvantages as the latter. Newer pull-type discs have rubber tires for transport and are raised or lowered to any desired depth by hydraulic pumps. If your tractor is equipped with hydraulic power, its potential usefulness is just about double that of a tractor not so equipped. If you are going to have to move your disc any distance on roads, you will need a fully mounted or rubber-tired disc.

Older discs can move from one field to another only on their disc blades, so the disc

gangs must be adjusted out of cutting position. A disc blade cuts and works the soil when it is slanted slightly sideways from the direction in which it is being pulled. The more slant, the deeper it digs. Moved out of slant completely, the blades roll along like wheels, barely cutting into the soil at all. On old discs, you can make the proper change from the tractor seat by means of a rope attached to a pin on the sliding disc tongue. With the disc hitched to the tractor, you pull the pin out of the slot it is resting in, drive forward, and the disc gangs straighten up. Release your pull on the rope, and the pin falls into another hole. To put the disc back in working position, pull the pin, back up slowly, and the sliding tongue assembly pushes the disc gangs back into slant position. Further adjustments can then be made by turning the crank above the disc tongue. The crank is intended to be turned from the tractor seat on most models, and it will turn much easier when the disc is actually moving.

No matter how much you fuss with your disc adjustment, getting the thing to leave a perfectly level swath is nearly impossible. If the front discs are cutting too deep in relation to the back, the center of the swath is too low, while the edges of the swath stay too high. If the back discs are cutting too deep in relation to the front, you have the opposite effect. The faster you go, the more this uneveness is accentuated. If you don't get your disc in good adjustment, you can just about ruin a field in a few years. The surface will look like the South Jersey surf.

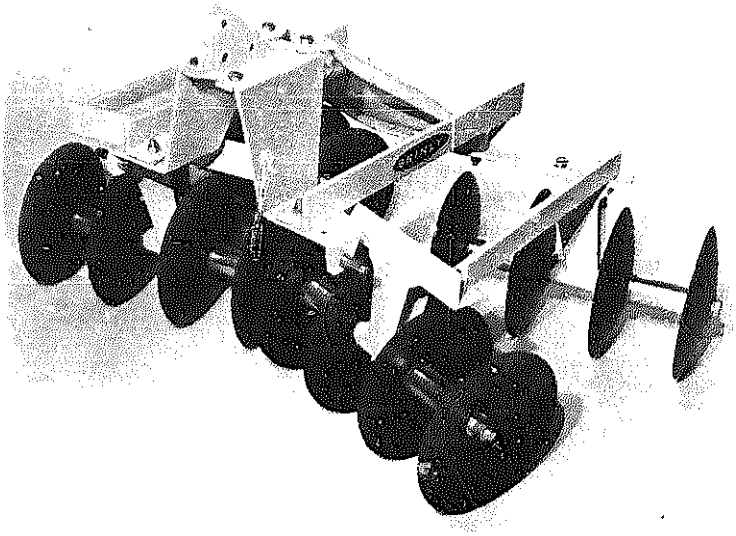
Whenever possible, pull a harrow behind your disc for the finest leveling. (We say "whenever possible" because if you are disking heavy cornstalks, or wheat or bean straw, you can't utilize the harrow behind the disc. It would clog up with the stalks.) Small, two-section harrows of 8 to 10 feet in width are fairly easy to find and can be purchased for anywhere from $25 to $125.

The harrows you will find have levers that adjust the teeth from nearly horizontal to nearly vertical positions. For deepest digging, you set the teeth vertical. For dragging over ground where plant residues would clog the harrow, or for moving over lanes and uncultivated fields, set the teeth nearly horizontal. Someplace between the extremes is usually best for leveling ground behind the disc.

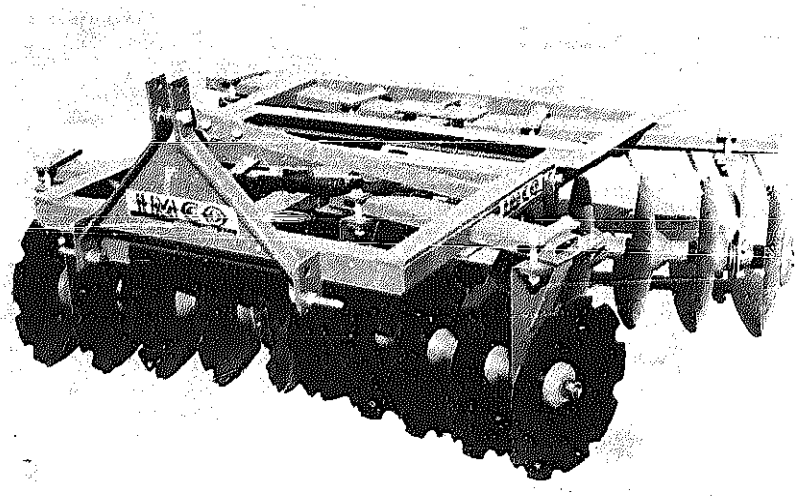
Harrows come in sections usually about 4 feet wide. The sections attach to a front drawboard beam which may be wood or steel. The beam, in turn, attaches to the back of the disc (or tractor or other soil-working tool) by means of a link-chain arrangement. The harrow sections connect to the drawboard beam by chain-link-type steel rings. On old discs, these are often missing or worn out. Or they are replaced by

baling wire. Sometimes the hooks on the harrow or the drawboard beam to which the rings attach are broken off. All that's fixable, but know what you're buying.

The levers are about the only other parts of harrows that wear out. The notch pin may be rusted tight, or the spring may be, or both; or the rod that connects the notch pin to the handle may be broken. Broken levers require welding. If you are really short of cash or time, you can just ignore broken levers if the teeth are already set about right. Yes, broken levers sell cheap.



*The Brinly-Hardy Model DD-1000 tandem disc harrow is equipped with four gangs, each having four 11-inch, heat-treated, steel discs. Gangs may be set at angles of 10°, 15°, or 20°, or moved horizontally. Width of cut is approximately 52 inches. The heavy-duty frame is designed to hold concrete blocks for additional ballast. This implement is designed for 14 to 18 h.p. garden tractors with category 0 three-point hitch. Weight: 182 pounds.*
Brinly-Hardy Co.



*The IMCO Intermediate disc harrow is designed to be used as a medium-weight tandem harrow. It features a welded frame, gang adjustments of 5° to 20° with positive locking in position, 7¼- or 9-inch blade spacing, cutting widths of 5 feet 9 inches to 8 feet 11 inches.*
Independent Mfg. Co.

### Cultipacker

If clods are a problem in your spring-plowed soil, you may eventually want to add a cultimulcher or cultipacker to your repertoire of tillage tools. And, in time, a small chisel plow and/or field cultivator will certainly be in order. But with plow, disc, and harrow, you're on your way. You should be able to handle up to 40 acres of diversified cropland with a 35 h.p. tractor, a two-bottom plow, an 8-foot disc, and a 10-foot harrow.

**The Rotary Tiller**

The rotary tiller can be used in place of a moldboard plow. Heavy ones for farm tractors and medium-sized ones for large, commercial, walking tractors are available, as well as the popular self-propelled garden tillers. The rotary tiller is probably the ideal tool for incorporating organic matter and avoiding soil compaction.

However, it is the nature of the tool that it can only move slowly across a field, and for that reason, it has not gained popularity on larger farms. When heavy stands of green manure have to be incorporated into the soil, the rotary tiller must usually be preceded by a stalk chopper or rotary mower to chop the plant material. Otherwise, rotary tiller tines will frequently entangle with crop residues.

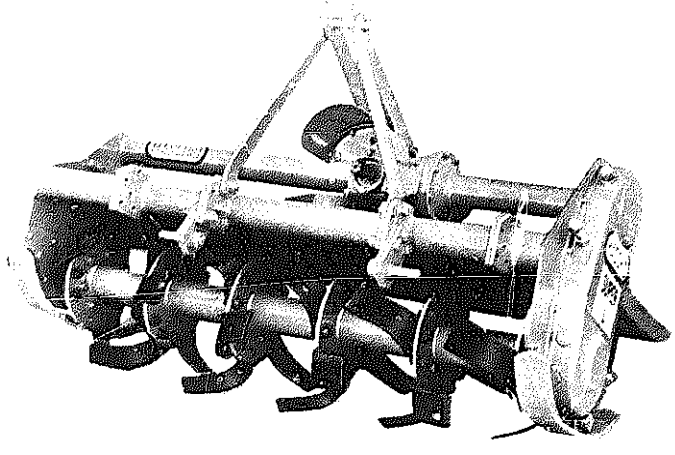
Holder

# THE HOWARD ROTAVATOR

**by Thomas J. Ulick**

The Howard Rotavator is a fine tilling tool available for the small- to medium-sized vegetable grower. It allows you to prepare a seedbed in conditions which would be impossible for other types of tractor-powered or horse-drawn equipment, provides an incomparable seedbed, aerates soil, incorporates crop residues, and so forth. It very well may be used for cultivating, bed forming, and other operations, and may be coupled with planters or drills for one-pass tillage and planting. I have found objections that rotavators require excessive amounts of tractor power unfounded. I operate an 80-inch rotavator with a 45 horsepower, Ford 3000 diesel tractor on about two gallons of diesel fuel per hour. I can easily cover one to one-and-one-half acres per hour, and by making two or three passes am able to work 12 to 14 inches deep under most conditions. Howard Rotavators are distributed by a worldwide network of dealerships, a list of which can be obtained by writing: Howard Rotavator Company, Harvard, IL 60033.



*Visible on this rotary cultivator are the three attaching points of a three-point hitch, the rotovating tines, and the power-take-off connection for hitching to a tractor PTO shaft. This is the Ferrari Super L rotary tiller.*

Ferrari International, Inc.

## THE SPRING-TOOTHED HARROW

The spring-toothed harrow is used principally as a soil leveler behind a disc, though it digs more deeply than the spike-toothed harrow.

The spring-toothed harrow collects surface trash and plant material very easily and is therefore seldom usable in organic farming except after the moldboard plow.

# HARROW IMPROVISATION

**by Rob Johnston, Johnny's Selected Seeds**

There is a tool often called a Scotch Harrow, a fencelike grid of chain, which is tractor-drawn to level a seedbed. Well, I'd wanted one for years but never felt we could afford it. Anyway, we now achieve just about the same effect by attaching a large old barn beam behind the disc harrow with a towing chain. The beam drags along behind the disc, leveling out high spots and filling in the ruts left at the edge of the harrow. If we need a really perfect seedbed for some delicate crop, we take time to go over the piece with a steel garden rake and have found it important to have one with an extra-long handle. This really gets it smooth and permits easy location of surface debris and stones.

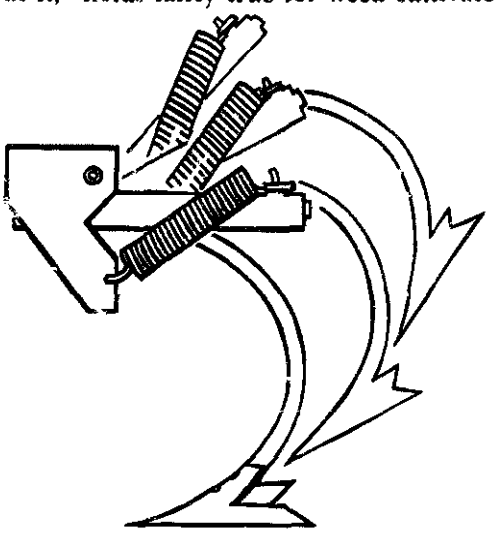
### The Cultimulcher

The cultimulcher or pulvimulcher is a combination of spring-tooth harrow and cultipacker—a set of cultipacker wheels in front and rear, with harrow tines in the middle. It is used (if at all anymore) to put a smooth surface of fine soil on recently plowed ground to prevent moisture from escaping in a dry planting season.

## WEED CONTROL TILLAGE

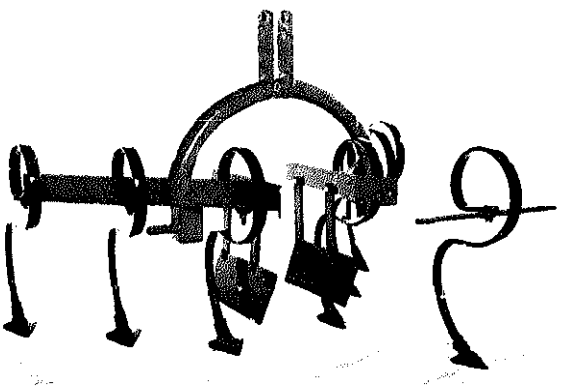
### Cultivating Blades

The old saying, "There are as many opinions on a subject as there are people thinking about it," holds fairly true for weed cultivators.



*The "spring" in the spring tooth protects the tool when it hits a hard object.*

There seem to be as many different kinds as there have been farmers who like to tinker. Some blades are shovel-shaped, some spear-shaped, some almost identical to the teeth of a spring-tooth harrow, some little more than narrow steel bars. All have some kind of spring or give to them. Spring-trip shovels will snap back out of the ground if they hit a root or rock

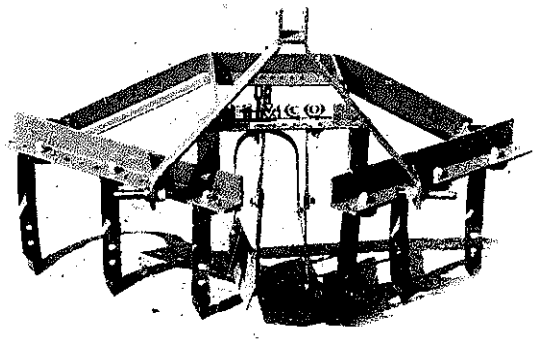


*The Wikomi one-row Vibrating "S" Tine Cultivator with an optional one-row shield. The vibrating characteristic allows the share to vibrate strongly sideways to churn the soil. It provides proper tine spacing with lateral tine spacing adjustment for 20- to 40-inch row spacing.*
Wikomi Mfg. Co.

that will not budge. The very narrow spring-tine cultivators, often called Danish tooth blades, vibrate and wiggle through the soil and seldom collect plant residue.

The rotary hoe is a special tool, consisting of several rows of pointed steel wheels, each about 10 inches in diameter. When pulled at a fairly rapid tractor speed, these wheels will dig out very small, germinating weed seeds without harming sprouted crop seeds if the latter are no more than an inch or two tall. The rotary hoe has become obsolete on farms where the use of herbicides predominates, but it is still an important tool on other farms, since the most important weed control is that obtained between the time a crop is planted and the time it is tall enough to cultivate with a regular shovel or tine weeder.

Rotary tillers convert to effective between-the-row cultivation, especially those with a faster gear than the one normally used for deep tilling. It should be set so it does not dig too deeply when cultivating weeds.



*The IMCO one-row cultivator with reversible, heat-treated shovels. Heavy-duty spring tines and row shield are also available.*
Independent Mfg. Co.

# -3- The Continuing Role of Draft Animals

## FARMING WITH HORSES

by Wendell Berry

A team of horses, living off the hay and grain it helps to produce, is an embodiment of the life of the farm—which, under good care, is perpetually self-renewing. A team is therefore not only a much cheaper source of power than a tractor, but it is also a source that in the long run will be much more dependable. And whereas the wastes from a tractor's engine only pollute the air, a horse's bodily wastes will enrich the ground from which he feeds, thus significantly reducing the farmer's dependence on the fertilizer companies.

And horses, unlike tractors, can reproduce themselves. Many small farmers will find it possible to raise a pair of colts a year from a team of work mares. If the quality of the colts is good, and if the horse market stays favorable, the work team may earn considerably more than its feed bill, and thus provide the farmer with a year of free labor, plus some profit.

In the work itself, horses have certain advantages over tractors. They can be used safely on steep ground, where a tractor would be either dangerous or useless. A horse farmer can get into his fields

*On the decline: as power equipment like this one-row corn harvester took hold, the significance of the draft horse began to fade.* American Society of Agricultural Engineers

more quickly after rain than can a tractor farmer. And horses do not pack the ground as much as tractors. It is generally acknowledged among the tobacco growers in my area of Kentucky that the work of horse-drawn cultivating plows has never been equalled by any tractor.

Beyond these practicalities, there is the satisfaction that one gets from working a good team. A tractor may be handy, always ready to use, untiring, enormously powerful; but it is not alive, and that

is a great difference. To work all day with a well-broke and willing team is a pleasure as well as a job; it is a cooperative venture, a sort of social event. And when the day's work is finished, to stable the team and water and feed them well, or to turn them out onto good pasture, is a comfort and a fulfillment. Between a farmer and a team there exists a sort of fellow feeling that is impossible between a farmer and a tractor, and for me that rates as a considerable advantage.

Another thing I like about working with horses is their quietness. When you work with a tractor you hear nothing but the tractor; it is a kind of isolation. With the engine roaring in your ears all day, you lose awareness of the other life that is going on around you. With horses, unless you are using some noisy implement like a mowing machine, you hear the wind blowing and the birds singing and all the rest of the stirrings and goings-on of the countryside.

And so there is a good deal that can be said in favor of farming with horses. There are, in fact, a few widely scattered farmers who still do farm exclusively with horses. There are many more who keep a team or two for part-time use. And of course there are the Amish, for whom farming with horses is a community ideal and a way of life. Nevertheless, it would be irresponsible simply to recommend to anybody who owns a farm that he should sell his tractor and buy a team. There are difficulties

*The draft horse farmer should be prepared to work a little harder physically than his mechanized neighbor. Here a team of blacks gets started on a morning's disking.*

in the way; it is important that I should now mention them, and that interested readers should consider them with great care.

1. In many parts of the country a good team is difficult to find. And though a good team is less expensive than a good tractor, it will still be costly. At present the price of horses is high, and rising.
2. Most horse-drawn equipment has been out of production for many years. Some tractor equipment, of course, is fairly easily convertible for use with horses.
3. Horses are not standard. No two are exactly alike in looks, size, conformation, or disposition. It is therefore extremely unwise for an inexperienced person to attempt to buy a team on his own. I have said that a good team is a source of pleasure. It is now time to say that a bad one is a curse, a nuisance, a liability—sometimes a danger. Some horsemen will take pride in selling good stock and in satisfying their customers. Some will sell poor stock with extravagant praise.
4. Most important: It is not easy to work with and care for a team. It cannot be learned easily or quickly. A person who can drive a car can probably teach himself to drive a tractor in a short while. To learn to drive a team well, you need a teacher, and you need experience. An inex-

perienced teamster can easily injure or kill his team and can easily get injured or killed himself.

5. Obviously, then, a person inexperienced with horses who wants to farm with them is much in need of the advice and instruction of an experienced teamster whose intelligence and judgment can be trusted. And this brings us to the final difficulty: such people are getting scarce. The last generations that grew up working horses are dying out, and their knowledge is dying with them.

Fortunately, there are some experienced horsemen scattered over the country who have had these problems on their minds. And because of their efforts there begins to be some promise of help for the would-be or the novice teamster.

First, I want to mention, and recommend, *The Draft Horse Journal* (Route 3, Waverly, IA 50677), edited by Maurice and Jeannine Telleen. This magazine is an assembly point for all sorts of information about sales, breeders and dealers, suppliers of equipment, and other items of interest. There are articles on the history, breeding, and care of draft horses. And in the short time that I have been a subscriber, there has been an increasing number of articles on the use of horses for farm work. Anyone interested in farming with horses would find this magazine both a pleasure and a valuable investment.

In the Summer 1973 issue of the *Journal*, I was much interested to see an article which announced the first session of a Teamster's School to be held at Indian Summer Farm in Cabot, Vermont. According to the article, Ted Bermingham had undertaken to set up the school on his farm with the hope of preserving and passing on the knowledge and skill of "the last full generation of working teamsters." For this purpose Mr. Bermingham had rounded up a faculty of experienced horsemen to teach the disciplines of farming and logging with horses. Tuition was $150. This paid for all instruction, stall and board for a horse or team (if any), supper on Sunday night, and three meals a day, Monday through Thursday. Daytime instruction involved working at the chores of farming and logging. Study of the various tools and techniques always took place amid the practicalities of actual use. Students drove their own horses or horses furnished by the school under close supervision of the teachers. They also took part in the necessary stable work. The night sessions consisted of talks on such topics as horse husbandry, logging techniques, breeding, equine genetics, veterinary medicine, horse trading, and shoeing.

Mr. Bermingham and his staff are well aware, of course, that the teamster's art is complex and dependent upon experience, and that no novice could hope to become proficient at it in a few days. The school is meant to offer as full an introduction as possible to skills that the beginner can then practice on his own. There is no doubt that a few hours of work with an experienced teacher can save many hours of expensive and dangerous self-instruction by the method of trial and error. The students I talked to all believed that the school had been thoroughly worthwhile. So did their teachers—and so did I.

I hope that such schools will soon be undertaken in other parts of the country. They would be good for the draft horse business, and they would be good for farming.

The school was sponsored by the Draft Horse Institute, established in 1972 by Ted Bermingham, to collect and maintain the working knowledge of farming and using draft horses before it was lost. For information on the future sessions planned for coming seasons, you can write to Mr. Bermingham at Indian Summer Farm, Cabot, VT 05647.

# POWER FOR FIELD WORK

**by Joseph K. Campbell**

What are the sources of power for field work in the world? According to the FAO (Food and Agriculture Organization of the United Nations), there are approximately 16.9 million agricultural tractors and 267.4 million horses, mules, asses, water buffalo, and camels in the world. Of course many of these

animals are used for transportation, but a large proportion of them are used as draft animals. There are also estimated to be 1,200,000,000 cattle in the world. Most of the cattle are used for meat and milk, with only a few used as draft cows or draft oxen. The distribution of the animals is shown in Table I.

**Table I DRAFT ANIMALS AND AGRICULTURAL TRACTORS**

(in thousands) [a]

| | CATTLE [b] | WATER BUFFALO | HORSES | MULES | ASSES | CAMELS | FARM TRACTORS [c] |

a. Based on tables 102, 103, & 125 of the 1975 FAO *Production Yearbook*
b. Primarily for meat and milk
c. Sum of tracklaying and four-wheel farm tractors over eight developed horsepower and/or weighing more than 850 kilograms

What are the horsepower ratings of these various sources of agricultural power? Before answering this question, let's review the relationship of force, work, power, and energy.

*The original source of the term "horsepower." The Implement Age, 1894*

A force can be visualized as a pull or push which tends to move the subject being pulled or pushed. For example, a force of 250 kilograms may be required to pull a plow through the soil. In agriculture we refer to this force as draft and animals which pull loads as draft animals. Whether the plow is pulled a meter or a kilometer, the draft in this example remains two hundred and fifty kilograms.

The term work includes the dimension of distance. Work equals force times distance. The metric unit of work is the kilogram-meter. The English unit is the foot-pound. Note that work does not state the amount of time required to do a job. For example, to plow a hectare of land requires the same amount of work whether the job is done in twelve hours with a garden tractor or an hour with a large farm tractor. However, the power requirements will be very different.

Power is the rate of doing work. The faster the work is to be completed, the greater the power required. The unit of power in the English system is the horsepower. In the metric system power is measured by the kilowatt and metric horsepower. Horsepower is actually the rate at which a large draft horse can work. When the eighteenth century Scotsman, James Watt, was designing steam engines, he was faced with prospective customers insisting upon knowing the number of horses which could be replaced by a steam engine. So Watt experimented with some draft horses and determined that a horse exerting a constant 150-pound pull walked at two and one-half miles per hour. Watt called this amount of power one horsepower.

## MAN AS A POWER SOURCE

From the food he consumes, a man develops horsepower, but only one-tenth is available for sustained useful work. The remainder is expended in life functions of the body. Thus, as an engine converting fuel to mechanical energy, we are about 20 percent efficient. Our muscles do provide some work overload reserve. For bursts of energy of less than a second, up to six horsepower may be expended. A rule of thumb for useful power for periods of four minutes to eight hours is mathematically expressed by:

$$HP = 0.35 - 0.092 \log t$$ (t is in minutes.)

For example, a man can put out one-eighth horsepower over four hours, but if he is putting out one-fourth horsepower he will last only about 12 minutes. The above rule of thumb assumes a 35-year-old male European laborer. A 20-year-old male will be able to generate 15 percent more useful work while a 60-year-old will generate about 20 percent less.

Man cannot compete successfully with engines or dumb animals as a source of power for constant-load repetitive jobs such as pumping water for irrigation. His low power output places him at a disadvantage. However, man has a unique brain and is well adapted for jobs with a low power requirement but demanding decision-making and dexterity of hand. For example, transplanting rice demands thought as well as dexterity—does the plant have sufficient roots? Is the spacing correct?

## DRAFT ANIMALS

Oxen, water buffalo, horses, and mules are the primary draft animals. Camels and asses (donkeys) are more typically used as pack animals although they are used for pulling carts and tillage tools in some countries. Viewing the draft animal as a machine, we see that it can feed itself, maintain itself, be programmed for automatic control, and reproduce itself—four functions a tractor cannot perform. As a mechanism, the animal is a jointed framework held together with ligaments and muscles. The engine consists of the digestive organs while the products of combustion are removed by the excretory system. The brain and nervous system provide a control system with a memory bank, logic circuits, and feedback loops. Joints and moving parts have a sealed lubrication system. Protecting the mechanism is a covering of hide which is resistant to damage and self-healing as far as minor dents and scratches are concerned.

Unlike the farm tractor, however, draft animals can be purchased in a very limited range of horsepower, cannot be worked continuously, and continue to burn fuel when not working.

An FAO publication states that when used as draft animals, bovines have an energy efficiency of 9 to 10 percent and members of the horse family 10 to 12 percent. However, other experts state that horses have an efficiency of about 20 percent. The difference between investigators is probably due to the breed, type of feed, and whether the work was done by the test animals on treadmills or draft devices. As a reference point, the efficiency of energy conversion for gasoline and diesel engines is 20 to 35 percent.

## POWER SUPPLIED BY DRAFT ANIMALS

| ANIMAL | AVG. WEIGHT KG | APPROX-IMATE DRAFT KG | AVERAGE SPEED OF WORK KM/HR | POWER DEVL. H.P. |
|---|---|---|---|---|
| LIGHT HORSES | 400-700 | 60-80 | 3.6 | 1.0 |
| OXEN | 500-900 | 60-80 | 2.0-3.0 | .75 |
| WATER BUFFALOS | 400-900 | 50-80 | 2.9-3.2 | .75 |
| COWS | 400-600 | 50-60 | 2.5 | .45 |
| MULES | 350-500 | 50-60 | 3.2-3.6 | .70 |
| ASSES | 200-300 | 30-40 | 2.5 | .35 |
| CAMELS | 450-550 | 40-50 | 4.0 | .67 |

Adapted from FAO Ag. Devl. Paper No. 91.

In general, a draft animal can pull approximately one-tenth of its weight. Horses provide a higher output than the other animals in relation to body weight. Just as an internal combustion engine requires high-quality fuel to perform well, an animal requires a sufficient amount of high-quality fuel to develop maximum power. The availability of fuel (feed) affects the choice of draft animal. Oxen, water buffalo, and camels can be thought of as low-octane engines able to perform on low-quality feed such as coarse forages while the horse can put out more power but demands higher-energy fuel in the form of grain. Asses and mules are intermediate on this fuel scale.

Like man, animals can, during a short period of overload, develop large bursts of power. A good pair of draft horses have been able to develop 20 to 25 horsepower for ten seconds while a yoke of good oxen have developed 20 to 30 horsepower over a distance of 100 yards. Compared to the power which a draft animal can produce over a six- to ten-hour day, the maximum power which can be maintained for five to 30 minutes is four times as great while the maximum power which can be exerted over a few seconds is 25 times as great.

Animals must receive periods of rest. In general, horses and mules can be worked eight to ten hours daily but should be given a break at noon. Adult oxen can be worked for six to eight hours although younger oxen or poorly fed animals may only work four hours daily. Water buffalos are worked approximately six hours per day. It is impossible to provide precise data for draft animals since performance depends upon an animal's individual characteristics such as breed, weight, sex, age, health, training, and feed quality.

Harness is the means by which the animal's effort is applied to the load. Poorly designed and ill-fitting harness not only reduces the available power but also causes the animal to suffer. When one animal cannot provide sufficient draft or power, a number of animals can be harnessed together as a team, but at a loss in individual efficiency. In general, if animals of equal strength are harnessed together as a team, the draft of a single animal working alone should be multiplied by 1.9 for two animals; by 2.5 for three; by 3.1 for four; by 3.5 for five, and by 3.8 for six. If six oxen are yoked together, the resultant draft will be double that of two oxen.

# THOUGHTS OF A DESIGNER OF ANIMAL-DRAWN EQUIPMENT

by Jean Nolle

For several years, people have asked me: "Why do you invent new animal-drawn machinery when draft animals have almost disappeared? Why do you persevere in this misguided way when everything proves now that mankind is setting up his future on a highly developed technological base? What are your reasons for dedicating your life to the rescue of draft animals?"

Before I try to answer, I must first correct a mistake in the question. I do not dedicate my life to the rescue of draft animals, but to the development of the forgotten farmers.

That being said, I can explain that for 27 years, I have been involved in agriculture in almost all tropical countries. Since I was working alone, perhaps the modesty of my labor kept me safe from the noise around and allowed me to continue the same point of view for so long a time. Many developments have altered specific actions in machinery design, but there has been no deviation in my intentions.

I developed a new technology in matters of animal-drawn machinery for small agriculture for several reasons. The first was opportunity. In 1950 in Senegal, there were two large farms of 5,000 hectares each. They were set up to grow peanuts, and equipped with heavy-duty tractors and sophisticated implements. Both went bankrupt in 1954. The reasons were said to be climate, soil, plants, and human population.

Both of them were obliged to change their ways. At the first one, located in the Casamance region of south Senegal, the tse-tse flies prevented the use of draft animals so the farm continued its use of heavy-duty tractors, with the farmers using traditional hand tools.

The second, named Secteur de Modernization Agricole (S.M.A.) was located in central Senegal where tse-tse flies were unknown. As this farm was a state enterprise, the government decided to improve the animal-drawn machinery there. I was engaged by the S.M.A. from 1954 to 1958 with *carte blanche* to conceive, realize, experiment with and develop various animal-drawn machines.

I had to discover a formula that made possible the farmers' evolution from extensive methods to intensive ones. I had to find a solution to the width, the length, and the solidity of my future machines. I had to invent some ways to stimulate the curiosity of the farmers in order to make them understand without any teacher the laws of the interdependence between various farming operations.

It was quite a challenge to discover a single formula that could answer these diverse questions. However, it exists. Its name: polyvalence, or versatility.

To be successful in the tropics or with small-scale agriculture anywhere, a machine must be versatile. This adaptability is the strength of tractors with three-point hitches, and it applies to animal-drawn implements as well. In the design of agricultural machines, the main aspects of this versatility are the ability to adjust track width and the ability of the chassis to accept numerous implements. Next in importance is the means used to change the track and to attach the implements.

Single-purpose machines have their own chassis. Multipurpose machines, on the other hand, use the same chassis for many tasks. Of course, if the price of a multipurpose chassis is higher than that of several single-purpose chassis, the purpose is defeated. Likewise, if the device required to fit the various implements on the multipurpose machine is too complicated, farmers will not change them and the machine will be single-purpose anyway.

To meet these requirements, I had to design several chassis to meet the needs of farms ranging in size from two to 20 hectares. While the dimensions of the chassis varied, the hitching device was to be standard. At first, nuts and bolts seemed the simplest solution, but bolts require fixed holes in both the chassis and the tools, thereby limiting their versatility and ultimately weakening the chassis. Nuts and bolts are also subject to rust, and eventually require a hammer and chisel to remove them. In reality, the farmer rarely does this, and the machine becomes single-purpose once again.

My solution was to design a special type of U-shaped clamp. Each branch of the clamp is dug with a square hole, and the bottom of the clamp has an eye screw. Square holes are very helpful as they permit tools to be attached to any part of the chassis without drilling holes in the chassis.

## NOLLE'S EQUIPMENT

Described below are some examples of Jean Nolle's ingenuity at designing multipurpose agricultural equipment for widely varying soil and cropping conditions. The emphasis on economy, ease of operation and maintenance, and versatility is consistent. Additional information on Nolle's machines may be obtained from the manufacturer, Mouzon S.A., 60250 Mouy, France.

### *Polycultor*

The *polycultor* is an ox-drawn chassis adaptable to a wide range of cultivation implements. Designed by Nolle especially for farmers who need a small transport vehicle as well as a universal tool carrier, the polycultor features a hand lever for raising the implements and two handles on the toolbar for steering. The lift is connected to the toolbar by a chain for easy depth adjustment.

*The Polycultor prepared for hoeing cotton in Uganda.*
Jean Nolle

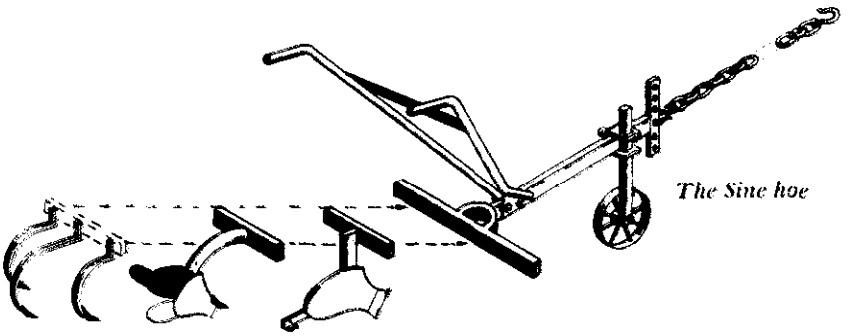
The toolbar is designed to carry from six to 12 cultivator tines. It can carry one or two ridgers, three markers for planting peanuts, a peanut lifter, and a grain drill. The single-bottom plow attaches directly to the axle with a stirrup clamp. Since it is fitted alongside the right wheel, the plow has its own lift. Uniform furrow width is obtained by the right wheel following the previous furrow. The farmer is seated in the middle of the chassis, beside the plow.

Another option is a 500-liter water drum, put in the same place the cart would normally be. Still another is a small mower, driven by the right wheel. The mower is mounted on the side of the platform cart, exactly in its pivot, so that it can be lifted for transport.

One of the chief obstacles preventing more widespread use of green manuring practices in Senegal and elsewhere in Africa is that the traditional moldboard plow with oxen is so difficult to keep in the ground with some of the newer, higher cover crops like sorghum. The stability and weight of the polycultor makes this much less difficult. The long stems are bent forward by the axle, so it is easier for the plow to cover them with earth.

### *Sine Hoe*

Nolle's *polyculteur sine* (hoe) is built with a front bar, a rear bar, and a stirrup in between. This arrangement makes it possible to use the sine as a cultivator, with one short tine on the longitudinal toolbar and two short tines on the rear bar. For use as a hoe, three tines are attached to the rear bar, one long tine is placed in the middle, and two short tines are attached on the sides. The middle hoe is equipped with



*The Sine hoe*

*The Sine as a cultivator in Vietnam.*
Jean Nolle

a duck foot sweep, and the sides with left- and right-hand side shovels.

The rear bar can be adapted to carry a furrow plow, a ridger, and a rigid tooth harrow. Disc and spring-tooth harrows can also be attached.

The width and length of the sine can be modified by means of clamp-on extensions, thereby making it possible to use the tool with two wheels or two skids, with one or two ridgers, with five tines instead of three, and other options. All in all, the sine is a fine example of a machine that is readily adaptable to the job at hand and the strength of the animals.

### *Saloum*

Ranking in size somewhere between the sine and the polycultor, the *saloum* was designed for areas with soils too hard for the lighter sine to penetrate. The square chassis and two forward wheels make it possible to load the saloum with a bag of sand to achieve greater weight for plowing or cultivating in clay soils. The machine was also valuable for harvesting peanuts in heavy soils.

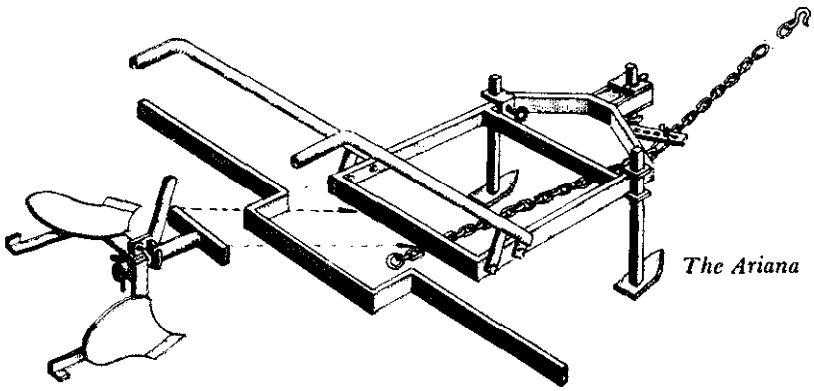
*The Saloum*
Jean Nolle

But the saloum was not without its disadvantages. With the two front wheels, it was almost impossible to steer effectively for hoeing. Since the wheels were not adjustable in height, it was also impossible to plow. Nor was it possible to adjust the width of the track.

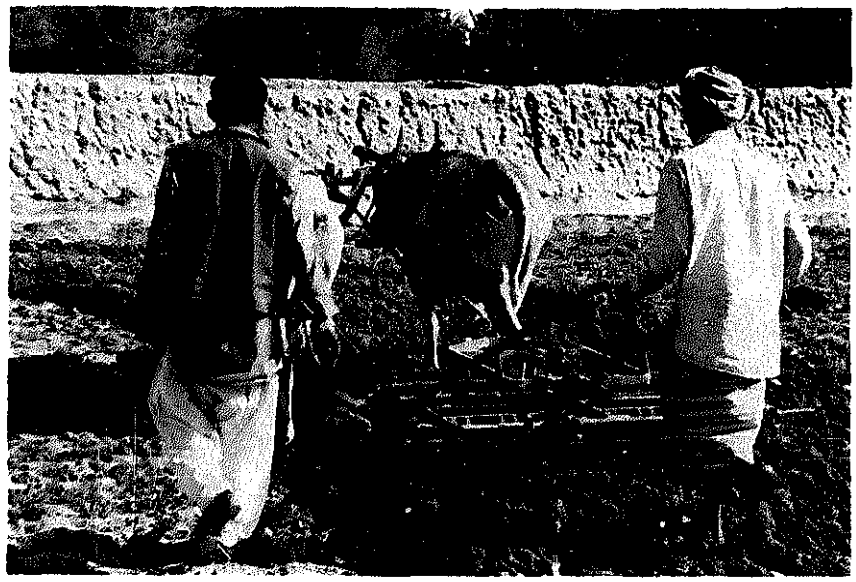
For these reasons, Nolle abandoned the saloum and replaced it with the ariana.

### *Ariana*

The *ariana* belongs to what Jean Nolle terms his second generation of animal-drawn equipment. First conceived in Afghanistan in 1961, the ariana was Nolle's answer to applying the principles behind the sine and saloum to a region in which ridge cultivation (as opposed to flat cultivation) and irrigation prevailed. What was required was a reversible plow that would place the final furrow alongside the field rather than in it. The ridge cultivation also required more clearance under the chassis.



*The Ariana*

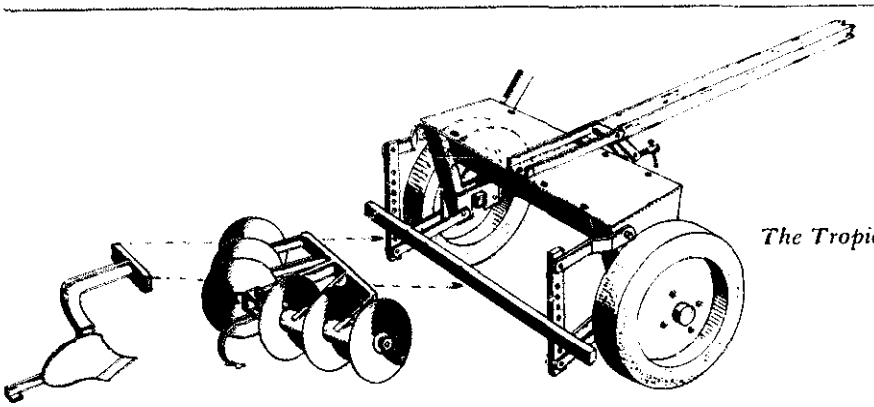


*The Ariana preparing a seedbed with a cambridge roller and a spring-tooth harrow.*
Jean Nolle

On Nolle's ariana, the two wheels for plowing are attached with clamps to the upright bars. Track width is adjustable from 30 to 70 centimeters. Besides the furrow plow and the reversible plow, the machine can be adapted with implements for ridging, cultivating, planting, fertilizing and peanut harvesting. For hoeing and all conventional cultivation work, the two wheels are replaced by a single wheel in the front center.

### *Tropicultor*

Like Nolle's polycultor, the *tropicultor* is essentially a cart that is easily converted into a



*The Tropicultor*

*The Tropicultor plowing in Uganda.*
Jean Nolle

multipurpose tool carrier. Unlike its predecessor, however, the tropicultor is adjustable for rows of varying width, and its chassis is made of two steel pipes making it high enough for use above growing crops.

The angle of penetration of the implements is controlled by an adjustment of the shaft. The ability to lock the toolbar in the low working position represents a real breakthough in the design of multipurpose tool carriers of this sort. It frees the operator from having to constantly lean down on the handles and devise crude weighting schemes for the cart. With a track width that can be adjusted from 60 to 160 centimeters, and a ground clearance of 65 centimeters, the tropicultor can work in almost any soil and cropping conditions. Like Nolle's other machines, the tropicultor offers various extensions and adaptors that permit it to function as a grain drill, disc harrow, mower, reversible plow, planter, and cultivator. All attachments are easily fastened to the toolbar with standard clamps and pins.

All told, the tropicultor will accept 24 different implements that make possible over 30 uses on the small farm. Such versatility greatly enhances the independence of the farmer using the device.

### *Avtrac*

The *avtrac* was invented in 1961 by Jean Nolle in response to a request from the French Ministry of Agriculture to design an improved horse-drawn tool carrier similar to those he had introduced in Senegal. At that time there were a million-and-a-half draft horses in use in France, and the avtrac was essentially an attempt to design three-point hitch implements for draft

Jean Nolle

animals similar to those used with tractor-drawn equipment. There was no one making horse-drawn equipment in France at the time, and a serious shortage prevailed.

The frame of the avtrac consists of a wide transverse pipe, in the middle of which is fitted the support for the shaft. The machine can be pulled by one, two, or three animals, and the equipment used is the equivalent of that designed for 25 h.p. tractors. Each wheel support has a rear-mounted swinging drawbar to receive a standard toolbar or other implements. The third point is in the middle of the chassis.

For pulling a trailer there's a hook mounted on the toolbar. For the mower, manure spreader, and other powered implements, an 8 h.p. engine with PTO is mounted between the wheels.

### *Kanol*

In the early 1970s, Nolle was called upon to develop animal-drawn implements for use in Latin America. Finding that his sine and ariana tools were often unsuited to the hard volcanic clays there, Nolle worked out a simplified version of his tropicultor that used hooks to attach the implements rather than clamps.

The main frame of the *kanol* consists of a shaft connected to a device that contains two levers—one for adjusting the angle of penetration into the earth and another to control balance. Implements are detached by simply lifting a hook.

The kanol carries two categories of tools: narrow tools that do not require wheels (one-furrow plow, subsoiler, peanut lifter, cultivator, ridger, etc.), and wider implements equipped with two wheels for stability (those used in conjunction with 150- or 170-centimeter toolbars and transport uses).

Latin American farmers experienced with the older Asian-type plows were quick to accept the kanol. Those already using a sine or ariana needed only to purchase the main kanol support and toolbar; all the attachments were interchangeable. With the addition of the hooks, it became even easier to change implements than with clamps.

# THE EFFICIENT USE OF ANIMAL POWER

**by Wayne Dinsmore**

Editor's note: This material is excerpted from a paper presented at the annual meeting of the American Society of Agricultural Engineers, December 27, 1921, and published in the February 1922 issue of *Agricultural Engineering*. The information is still valid for small farmers today.

It has been found possible to drive teams 20 miles per day in a ten-hour day on various farm implements and to maintain this rate week after week. This allows two hours for driving to and from fields,

hitching and unhitching, turning at ends, and occasional examination of collars. It requires that teams shall actually be in motion on productive work eight hours per day at an average speed of two and one-half miles per hour. When fresh, horses will exceed this; when weary, they will not equal it, but it is a practical standard, attained where sufficient horses or mules are used to permit steady driving, without stops to rest animals. Whenever teams require stops for rest, not enough power is being used. Put on another horse or a pair, or more if necessary, but add enough so that you can turn 20 miles of soil per day and not overdo the teams. The number of horses needed will depend on the hardness of the ground, the depth to which implements are cutting, the weather, and the age, size, and condition of the work animals used, so that each man must use "horse sense" and gauge his teams according to power needed.

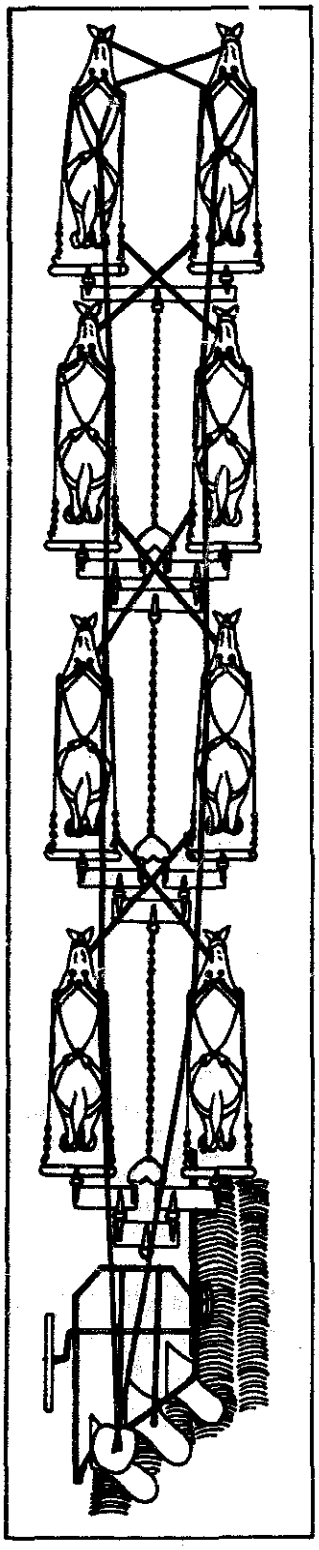
Twenty miles of productive work daily means 5.6 acres plowed with two bottom gangs, 14-inch plows; 24 acres double disked with ten-foot discs and trailer attachment; 70 acres harrowed with six-section harrows (five-foot sections); and as these soil preparation tasks are the ones requiring the most time, they also offer the greatest opportunity for cutting costs by increasing work done per day.

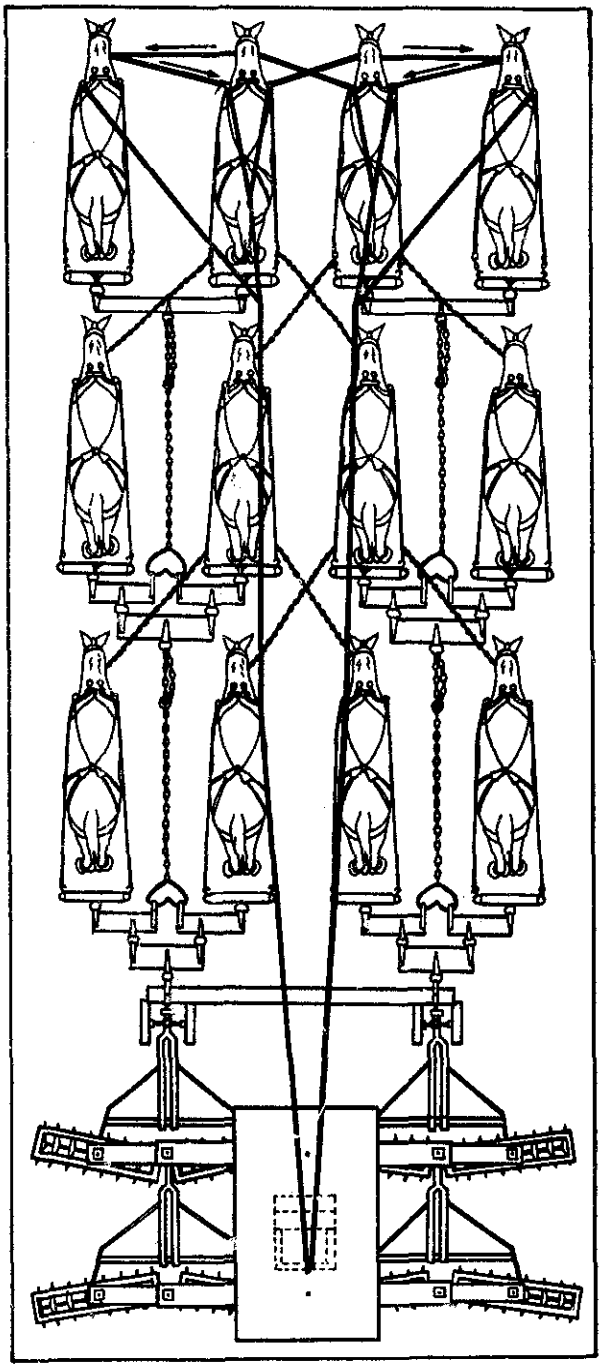
Disking is the greatest labor-saving soil tillage operation. On good farms it precedes and follows plowing. It pulverizes trash, kills weeds, conserves moisture and makes easier and better plowing. The 20-blade, ten-foot discs now available are usually drawn by six horses, but often need eight for steady progress, especially early in the spring when the horses are soft. One rule governs: Use "horse sense," and if you see the load is too heavy for the number of horses you are using, put on more, until there is enough power attached to allow the horses to walk at a good pace all day. You hire men to accomplish work, not to sit out in the field waiting for horses to rest and recuperate, and it is sound economy to furnish plenty of power, especially as one more horse, or a pair, will turn the balance between overload and ample power.

Plowing is heavy work, made worse by the general practice of crowding the horses too closely together and by failure to hitch on the true center of draft. On every plow, whether one-bottom or more, there is a point of hitch termed the center of draft and when the hitch is made at this point, the plow pulls with less exertion than when the hitch is made at a point more distant from the furrow. On a gang plow, two 14-inch bottoms, this center of draft is approximately 16 inches from furrow wall or 23 inches from the center of furrow when plows are cutting full, even furrows as they should. This means, therefore, that the eveners must be of such length, and the horses so hitched, as to give a straight forward pull over the true center of draft. This cannot be attained with four or more horses except by putting a horse or horses on plowed land, or by stringing the horses, so as to put the right-hand horse in the furrow and the others on solid ground. This causes the horses to pull the plows at great disadvantage, and the extra load thus created is called side draft.

Every farmer should recognize that it is just as easy to drive four, five, or six horses as it is to drive two, providing they are properly hitched; and the ease with which eight, ten, and even 16 horses are handled in the West by hired men who never before drove more than two or four is evidence, if proof be needed, that there is no real obstacle to multiplying the amount of work done per man per day. The size of the units, however, must depend largely upon the size of the farm. On a 100-acre farm, there are seldom more than 80 acres in tilled land, and four good horses are ample to operate such acreage. The implements purchased and the hitches used should therefore be based on a four-horse unit. This calls for six-foot discs with trailers (12-disc units), two-bottom gang plows of 14-inch bottoms and four-section harrows, together with seeders not over ten feet in length. Other implements should be proportionate. All these can be handled by four good horses, although if the ground is full of stones or ledges of rock, gang plows cannot be operated satisfactorily. Under such conditions, it is wise to use 14- or 16-inch walking plows with three horses, which are the oldest but most satisfactory plow units for use on such land.

On farms that have around 150 acres in tilled land, six good horses or mules will be needed. Here, with fields of 30 acres or over, six-horse units can be used on discs, plows, and harrows, which are the implements chiefly used in the preparation of the seedbed. It is in soil preparation that the greatest saving





*A hitch for twelve horses on two tandem disc harrows cutting all hoof prints except on turns.*

*A dimension drawing of tandem hitch for eight horses pulling a three-bottom plow to maintain a true line of draft.*

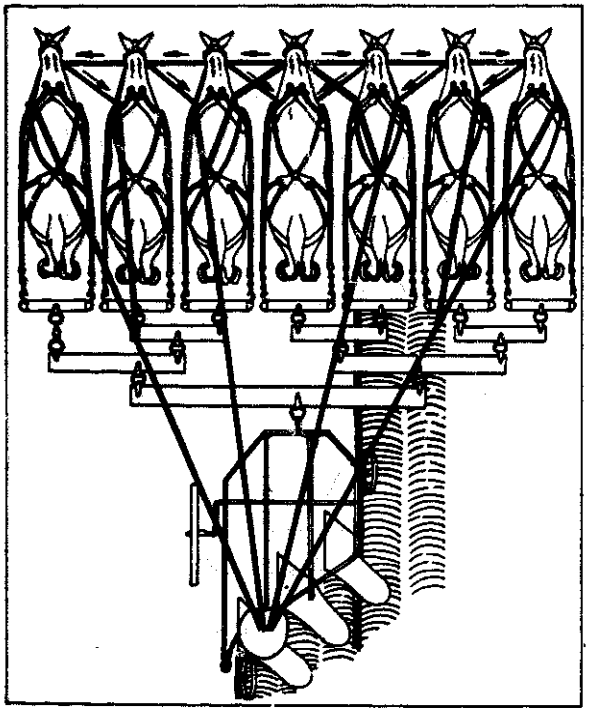
in manual labor can be effected. One man, by using six-horse units wherever possible, can handle all the work on a farm containing 150 acres of tilled land, until time for corn plowing, thus cutting down the need for an extra farm hand to the months of June, July, and August—three months instead of six.

On larger farms of 400 to 1,000 acres, the use of 7- up to 16-horse units on various farm implements is both practical and desirable.

The great advantage about this seven-abreast or nine-abreast hitch is that it gives an absolutely straight pull over the true center of draft and the horses are back next to the plow and are so hitched and driven as to make it possible for anyone to handle the team very easily. The only disadvantage that can be charged against the hitches in question is the fact that they require three or four of the horses to walk on the plowed land. The actual experience of men who have worked these seven, eight, or nine horses abreast on plows shows conclusively that this objection has no serious weight. The strongest, toughest horses, best able to withstand the work, should be put on the plowed land and they will keep pace with the others so that no slackening in mileage per day will result. The details of these hitches are fully shown in the illustrations.

Three-bottom gang plows (14-inch bottoms) will turn 8.4 acres per day; four-bottom gang plows (14-inch bottoms) will turn 11.3 acres per day; two eight-foot discs hitched abreast with trailer attachments (double disking a strip 16 feet wide) will double disk 38 acres per day; an eight-section harrow (five-foot sections) lapping one foot each round, will harrow 94 acres per day, and the three seeders (one 12 feet and two 11 feet) will seed 80 acres per day.

So it was in 1922, and so it can be again now that the population of draft horses is increasing, along with the availability of equipment, as the following listings illustrate.



*Seven-horse-abreast hitch for a three-bottom plow.*

## NORTH AMERICAN SOURCES OF ANIMAL-DRAWN EQUIPMENT*

### *Manure Spreaders*

**The Bowman Model K**

The Bowman Model K comes with a 102-by 18-inch box made of heavy pine floor and 12-gauge steel sides. Apparently the only horse-drawn spreader currently being produced in North America, the Bowman features chain drive, wide paddle beaters that do a good job of breaking up and spreading lumps, and either steel or rubber wheels. Its capacity is approximately 90 bushels.

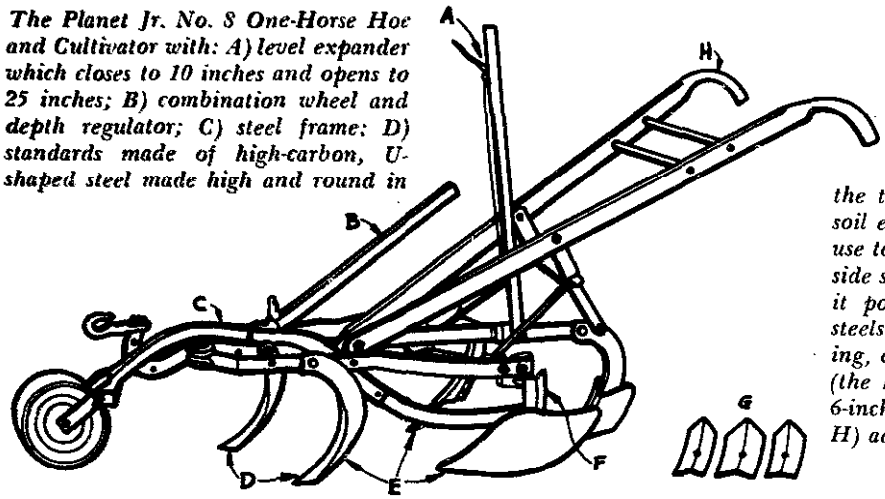
Bowman Model K
Bowman Mfg.
Hawkesville, Ontario, Canada

### *Plows and Cultivators*

**Planet Junior Number 8 One-Horse Cultivator**

The venerable Planet Jr. comes with four 3-inch-by-8-inch cultivator steels, one 4-inch-by-8-inch cultivator steel, two 6-inch hillers, one 7-inch shovel, a level wheel, lever expander, and

* Listings of animal-drawn seeder/planter, threshing, winnowing, and cleaning equipment can be found in chapters five and seven.



*The Planet Jr. No. 8 One-Horse Hoe and Cultivator with: A) level expander which closes to 10 inches and opens to 25 inches; B) combination wheel and depth regulator; C) steel frame; D) standards made of high-carbon, U-shaped steel made high and round in the throat to prevent clogging; E) soil engaging steels which polish in use to prevent soil adhesion; F) two side standards which swivel, making it possible to turn the hillers or steels to any angle desired for hilling, or cutting to or from the row (the hillers are reversible); G) two 6-inch hillers, one 7-inch shovel; H) adjustable hardwood handles.*

depth regulator. Its side standards have the virtue of swiveling to permit turning the hillers to any angle desired for hilling, or cutting to or from the row.

P.O. Box 1188, Freeport Center
Clearfield, UT 84106

### The Reliable Model 60

The lightest draft plow of its type, the Reliable Model 60 does a good job of plowing in any kind of soil and in all conditions. The rear weight of the plow is supported by a rolling landslide which serves as the third leg of a triangular rolling support. Uniform depth and width of furrows is controlled by the front furrow master wheel.

The sulky seat is placed to one side, well to the rear, and low down so that the operator has all levers within easy reach. Right- and left-hand models are available in 14-inch and 16-inch models.

Reliable Model 60 Sulky Plow

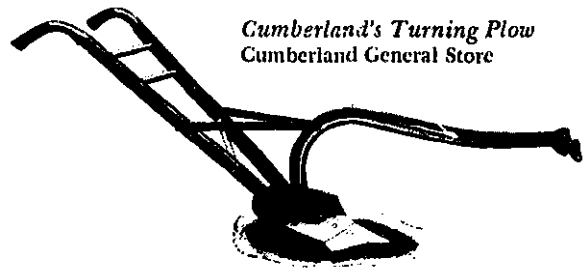
Topeka, IN 46571

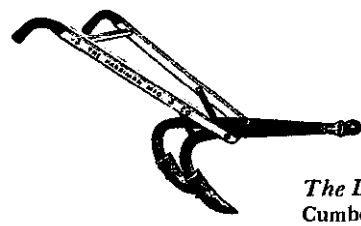
### Cumberland General Store Plows

If you live in an area of the country where most horse-drawn equipment was abandoned and cut up for scrap around the time of World War II, you know that good pieces are hard to find. To help folks in this situation, the Cumberland General Store combs the countryside for used plows in good condition. These are then completely refurbished, with handles, points, and other parts being replaced where necessary. Each unit is cleaned, painted, and made ready for years of useful service. They are generally able to fill orders for turning plows, double shovel plows, and walking cultivators.

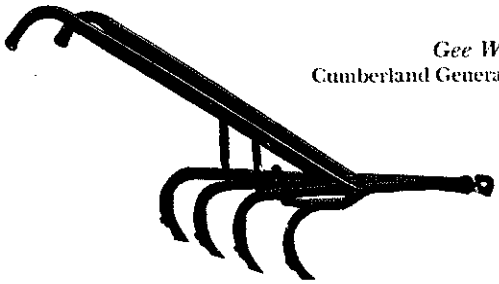
The Cumberland General Store also sells the Lynchburg Chilled Slat Moldboard Plow, a single-bottom plow designed for sticky clay soils where a conventional moldboard plow will not scour properly.



*Cumberland's Turning Plow*
Cumberland General Store



*The Double Shovel*
Cumberland General Store



*Gee Whizzes*
Cumberland General Store

New oak plow handles and plow stocks are also offered. The stocks are of the type that will accept any kind or style of blade that takes a heel bolt.

Other pieces of horse-drawn equipment available through the Cumberland catalog are Ferguson single-row planters, Rex guano distributors, and Old Blue riding-type fertilizer distributors.

**International Modern Machinery, Inc.**

International Modern Machinery, Inc. manufactures this complete set of implements for the small farm where water buffalo, cows, or oxen are used instead of tractors. The set includes: plow, disc, harrow, row maker, cultivator, fertilizer and planter distributing unit, and a piece of equipment used for leveling and draining the field. This set of equipment will allow the world farmer to put in his crop within a six- to eight-day period rather than a forty-five-day period usually required when using his existing equipment and hand labor, leaving enough time for another crop.

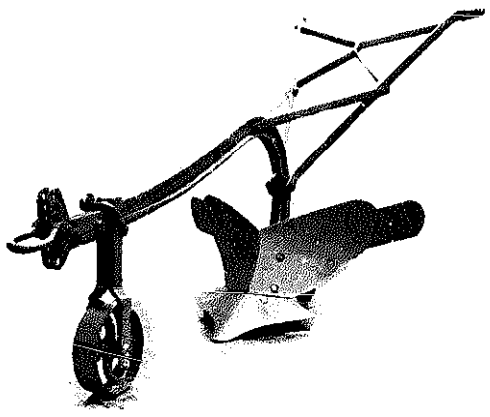
## INTERNATIONAL SOURCES OF ANIMAL-DRAWN EQUIPMENT

### *Ridgers*

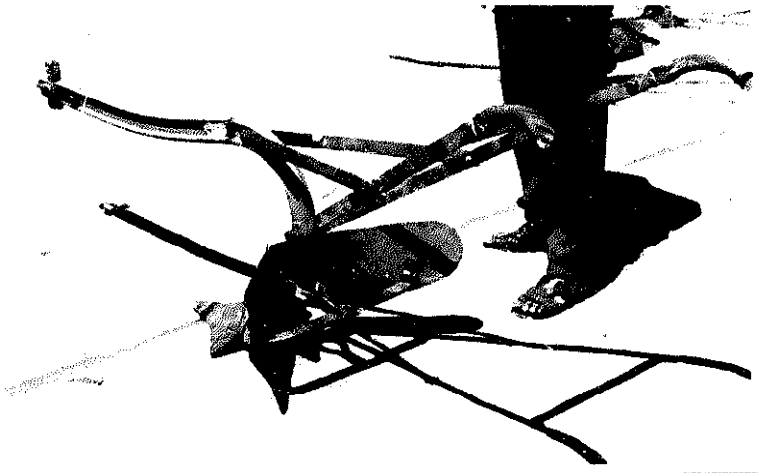
**Kapas (Emcot) Ridger**

The beam, moldboards, and handles of this ridging plow are made from steel. The moldboards can be fitted with extension pieces to increase the working width. Weight: 44 kilograms.

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India



*The Cossul Emcot Ridger* Cossul & Co.



*An Emcot Ridger Plow made by blacksmith Malun Ibrahim Musa of Funtua, Nigeria.*

**Emcot S30B Ridger**

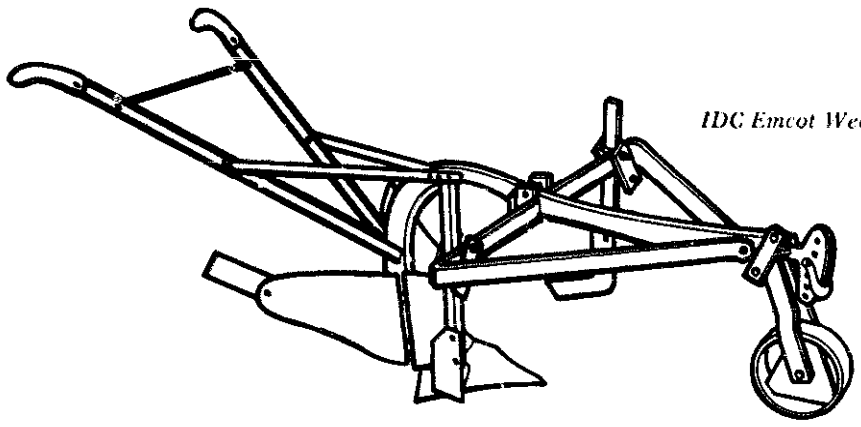
This all-metal ridging plow is fitted with moldboards which are adjustable for widths of 63 to 100 centimeters or, if the moldboard tailpieces are removed, widths of 51 to 74 centimeters.

The body is designed to form a wide-based, rounded-top ridge. The implement is generally pulled by two oxen. Weight: 49 kilograms.

John Holt, Agricultural Engineers, Ltd.
P.O. Box 352
Zaria, Nigeria

**ITDG Plans for IDC Emcot Weeding Attachment**

The weeding attachment designed at the Industrial Development Centre in Zaria for use with the Emcot ridger and one or two oxen consists of a frame which is attached to the Emcot beam and carries two weeding tines, set in front of the Emcot moldboards. The tool standards can be adjusted for height and width according to the row spacing. The weeding knives run close to the plants and dig deep enough to cut down the sides of the ridges. The sides of the ridges are remade by the ridger body following behind. Modifications to the frame were made to simplify manufacture without affecting the functioning of the attachment. Four examples of the modified attachment were commissioned from a local blacksmith and tested by Daudawa Settlement farmers during 1973. The weeding performance was good where the farmers had made uniformly spaced, parallel ridges.



*IDC Emcot Weeding Attachment*

The Emcot ridger with weeding attachment was easy to control if the Emcot depth wheel was used, but Daudawa farmers do not normally use the wheel and were adamant in their refusal to use it during the trials. Without the wheel, the front of the Emcot beam tended to swing from side to side and the weeding tines swung with it, causing crop damage. This damage was reduced in a modification where the tines were set further back on the implement, but this was still not as satisfactory as using the wheel.

### ITDG Report on the Dahomey Emcot Weeding Attachment

A very cheap and simple attachment to the moldboards of a ridging plow, designed and used with success for weeding in the northwest area of Dahomey, was constructed and tested. It was found to function well only in the sandiest fields in the Daudawa area. For the 1973 season, three pairs of Emcot moldboards with these weeding attachments were commissioned from a local blacksmith and sent for testing to Kafin Soli, an agricultural station 150 kilometers north of Daudawa. It was reported that the attachments worked well and seemed to be suitable for that soil type, which is sandier than that of Daudawa and similar to that of the northwest of Dahomey.

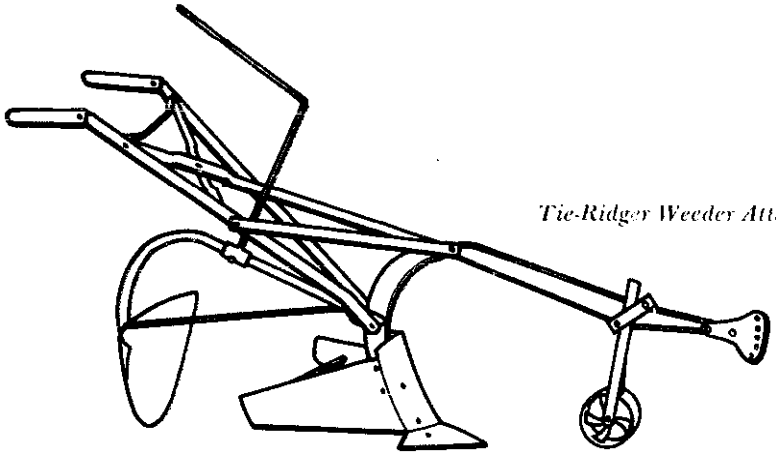
*Close-up view of Dahomey moldboard extensions on an Emcot Ridger Plow.*

### Plans For Ox-Drawn Tie-Ridger/Weeder Implement (Attachment to Emcot Ridging Plow)

This attachment was developed by the International Development Center in Zaria, Nigeria to allow ridged row crops to be weeded by animal power rather than by hand. The plow, with weeding attachment, can be pulled by one or two oxen. Tool standards can be adjusted for height, and also for width according to the row spacing. The weeding knives should be run close to the plants without damaging the roots, and should dig deep enough to cut down the sides of the ridges. The ridges are re-formed by the ridger body following behind.

### Adjustable-Width V-Drag Ditcher/Bund Former Plans

This implement, developed by the United States Department of Agriculture, can be used for making irrigation ditches, and also for con-

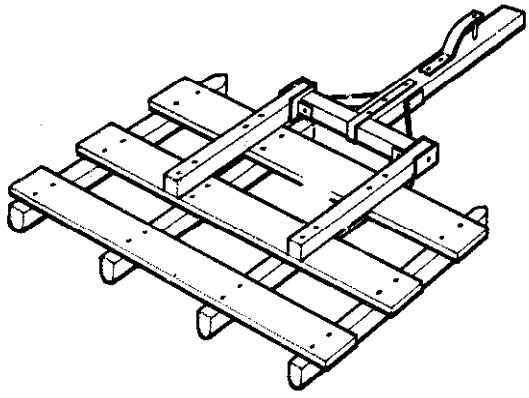


*Tie-Ridger Weeder Attachment to the Emcot Ridger Plow*

struction of low-height contour bunds for border irrigation. When making earth ditches, a furrow is first opened with a plow along the line of the ditch. The V-drag is then used with the runner board riding in the furrow bottom, the crowder board deflecting the soil sideways. When using the V-drag to construct contour bunds for irrigation, a plow is run down and back twice, throwing the soil into the border line. The implement is then run down the line, the crowder board pushing the soil into a ridge.

**Sled-Type Corrugator/Irrigation-Furrow Former Plans**

Designed by the United States Department of Agriculture, this implement can be used to make small furrows or corrugations for distributing water over a field. This implement can be used after the field has been broadcast seeded or before row-crop planting. The design can be modified to suit animal draft or tractor hitching as required.

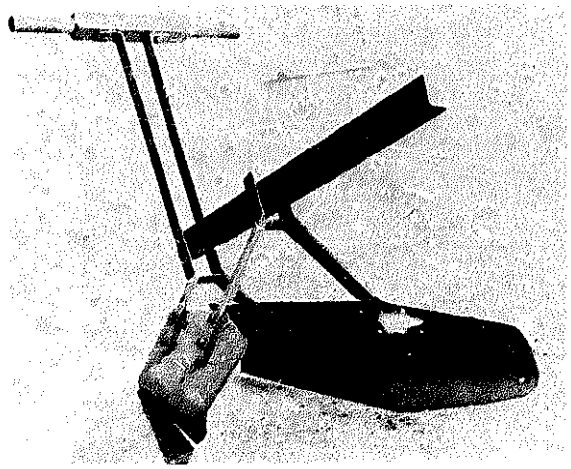


*Sled-Type Corrugator/Irrigation-Furrow Former*

All the above plans are available from:
Intermediate Technology Publications, Ltd.*
9 King St.
London WC2E 8HN, England

**Bund Former**

This is a simple labor-saving implement for forming bunds or ridges in the preparation of a field for irrigation. It is also used in dry farming areas to preserve moisture. On deep slopes bunds are made across to prevent washout during heavy rains. The main parts are a pair of collecting



*Cossul Bund Former*

**Walking Plow**

Designed for light and medium soils. Comes in three sizes ranging from 24 kilograms to 31 kilograms in weight.

Agromet-Unia
Foreign Trade Enterprise
00-950 Przemyslowa 26
Warsaw, Poland

**Walking Plow with Support Wheel**

This horse-drawn walking plow is intended for use in light- and medium-cohesive soils in small fields and gardens. They are also recommended for plowing wedges and other intricate field shapes. Weight: 37 kilograms.

Agromet-Unia
Foreign Trade Enterprise
00-950 Przemyslowa 26
Warsaw, Poland

**Swing Plow—Model V.B.**

This moldboard plow is available with a front wheel or forefoot and with or without coulter, skimmer, or spare share. It comes in three sizes.

W. Hertecant
9200 Kwatrecht
Wetteran, Belgium

**Two-Bottom Plows**

Horse-drawn, double-furrow frame plows designed for light and medium soils. Frame is supported by two wheels. Weight: 96 kilograms.

Agromet-Unia
Foreign Trade Enterprise
00-950 Przemyslowa 26
Warsaw, Poland

**Fixed Moldboard Plow**

Pulled by one pair of bullocks, it plows a furrow 8 to 20 centimeters deep and 12 to 22 centimeters wide. Weight: 36 kilograms.

New Vijay Industries, Ltd.
Vishrambag, Sangli 416 415
Maharashtra, India

**At 35 Plow**

This plow consists of a one-piece forged beam, soil-engaging parts of heat-treated steel, steel handles, depth control wheel, and draft chain. Weight: 23.3 kilograms.

Société Des Forges Tropicals
B.P. 706
Douala, Cameroun

**Moldboard Plow**
Ubungo Farm Implements
P.O. Box 2669
Dar Es Salaam, Tanzania

**Raja and Victory Plows**

These are short-beamed, chain-drawn plows and can be supplied with wooden frame (Raja) or all steel construction (Victory).

Danishmand & Co.
Karkhana Bazar
Lyallpur, Pakistan

**CF 000 P Plow**

This ox plow has steel wearing parts. Working width is 25 centimeters; maximum working depth is 20 centimeters. Weight: 38 kilograms.

Siscoma
BP 3214
Dakar, Senegal

**Punjab Plow**

This is a heavy, short-beam plow designed to be pulled by two bullocks. It is capable of plowing a furrow 125 to 150 millimeters deep and 150 to 20 millimeters wide.

Sharda Engineering Works
105/661 D, Fahimabad
Kanpur 208 005, India

**Turnwrest Plow**

This ox-drawn turnwrest plow was specially developed for use across hilly slopes and for horticultural work where a level seedbed is important. It is normally fitted with two handles and a wheel, and is manufactured in two weights, 33 kilograms (73 pounds) and 40 kilograms (90 pounds).

The body is pivoted under the plow beam and locked in position by a lever.

***Reversible Plows***

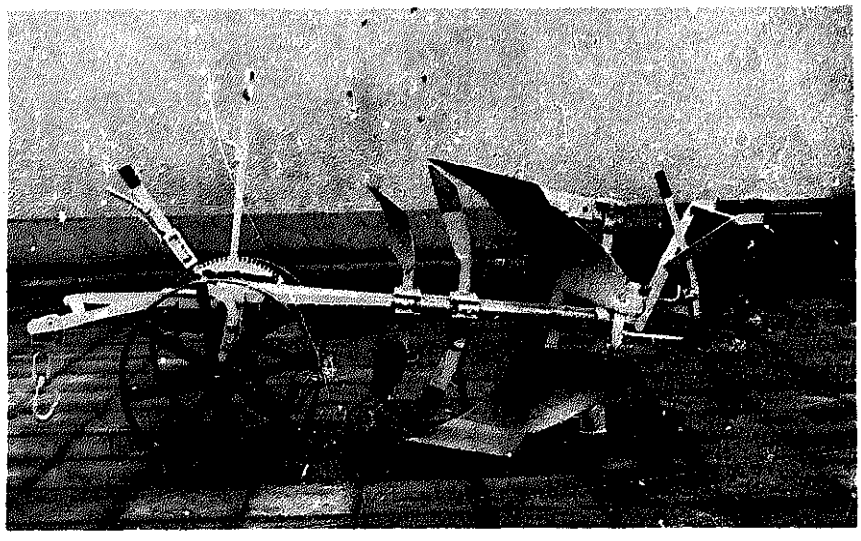
**Animal Draft Reversible Plow**

Available with plain or ribbed moldboard and wooden or steel pipe frame construction.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Turnwrest Plow**

The turnwrest plows are capable of turning furrows either to the right or left. At the end of the furrow the plow bottom can be reversed by releasing the hook at the back of the breast, swinging the body under the frame into corresponding position on the opposite side, and



*Hertecant Reversible Plow LEIE-9*
Willem Hertecant

replacing the hook. The plow is supplied with a double steel handle, steel beam, cast breasts and self-sharpening cast-chilled shares. A headwheel is provided to give required depth. Available in different sizes from 150 to 250 millimeters. Weight: 43.0 kilograms.

**Hertecant Plow—LEIE-9 Model**

Characteristics of this model include a fixed beam and double handle; reversible elements on the rear; three easy adjustments for traction, depth, and angle correction; all wearing parts are interchangeable and skimmers are available as options.

# THE MOCHUDI TOOLBAR, THE MAKGONATSOTLHE

Editor's note: This report from the Agricultural Information Service in Botswana, Africa, describes a localized need and the development of an implement to satisfy it.

For a number of years the Mochudi Farmers Brigade has been working to develop and perfect a multipurpose farming implement suited to local conditions. The need for improved implements arises because those which are currently available for draft animals are not suited to the semiarid conditions of Botswana and are generally of poor design.

Farmers are often hindered when their equipment breaks down and they are unable to find a mechanic capable of making repairs. Some have tried planters but, due to poor construction, failed to get satisfactory results and concluded that planters are useless. Another common problem is an insufficient number of fit draft animals to perform operations in a reasonable amount of time.

Because of these and other constraints, many farmers continue with the traditional broadcast-plow method of cropping. Using this method, only fair yields are obtained even in years of above-average rainfall, and in poorer years, a total crop failure may result.

A farmer can only be successful in growing good crops if his equipment can cope with the work in the time available. It is essential to reduce, if not eliminate, the frequency of total crop failure and at the same time produce good crops in most years. In order to do this in a semiarid climate with erratic rainfall distribution, principles of conservation tillage must be applied.

By combining features borrowed from a number of existing implements and ideas gained from consultation with tillage experts from a number of universities in North America, the design of the present Mochudi Toolbar came about. When the implement was introduced to the public in April, 1973, it was given the local name, the *Makgonatsotlhe,* meaning "the machine which can do everything." The name is considered fitting, since almost any type of cultivation tool can be attached to it, and it can also be used for carting or transporting drums of water. By removing some of the components from the toolbar, a walking model can be obtained which allows inter-row cultivation when crops are taller.

The heavy angle iron frame of the Mochudi Toolbar is supported on two pneumatic tires which allow the frame to be lowered or raised mechanically for depth gauge control by pulling back on a lift handle. The frame will support a planter unit, fertilizer applicator, disc hiller/furrowers, sweeps for stubble mulching, and a transport cart.

Further information is available from:

Mochudi Farmers Brigade
Box 208, Mochudi
Republic of Botswana, Africa

**Donkey Plow**

This very simple, lightweight plow weighs 29 pounds (13 kilograms). It can be fitted with either a moldboard or a ridging body.

ETS. Techine
82400 Valence D'Agen
France

**OD2 Ridger/Plow**

This tool frame can accept either of two types of ridging body, or an adjustable moldboard plow. The frame is of lightweight but heavy-gauge rectangular section steel tube, and is all-welded. The handles are adjustable for height, and on the lister-type ridger the pitch of the body is also adjustable. Either a wheel

*OD2 Ridger/Plow* The Goodearth Group

or a skid is used for depth control. The slade and the steering fin are individually adjustable on all attachments.

Project Equipment, Ltd.
Industrial Estate, Rednal Airfield
West Felton, Oswestry
Salop SY11 4HS, U.K.

**ST21 Plow/Ridger**

The frame of this implement can be fitted with a moldboard plow body or with an adjustable-width ridging body.

Gebruder Eberhardt
D79 Ulm, Donau
B.P. 204, Germany

**Three-in-One Implement**

The frame of this implement is of steel construction. Attachments are supplied for moldboard plowing (three sizes are available), ridging, and hoeing. Two handles and a depth wheel are provided. The angle between the soil-engaging parts and the wooden beam can be easily adjusted by a screw mechanism.

The Goodearth Group
16 Asaf Ali Rd.
New Delhi 1, India

**E.B.R.A. Omniculteur**

This toolbar consists of a backbone-type frame and handles. Clamps allow fitting of a depth wheel, moldboard plow, and a ridging body, wide-sweep tine. Transverse frame extensions can be fitted to carry up to five rigid or spring-type cultivator tines.

E.B.R.A.
28 rue de Maine, B.P. 84
49009 Angers, France

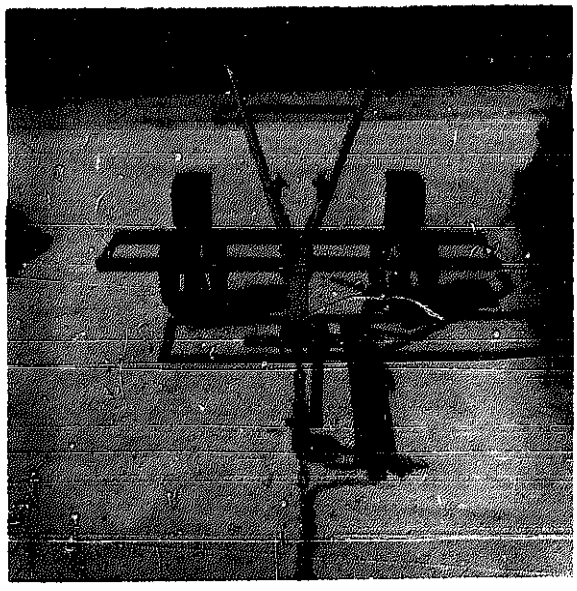
**Arara Multicultivator**

This is a backbone frame toolbar with depth wheel and handles. The following attachments can be fitted by means of two bolts: moldboard plow; ridging plow; groundnut lifter; spring-tine hoe with three or five tines.

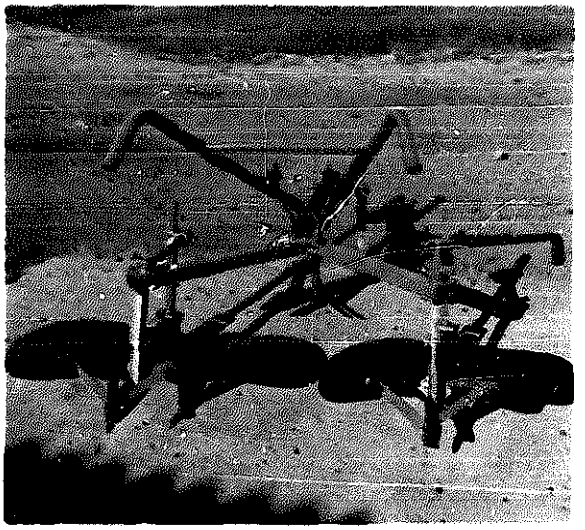
Siscoma
BP 3214
Dakar, Senegal

**Unibar**

This lightweight, multipurpose, animal-drawn implement was designed for use in the more arid areas of the tropics. It is made from square-section bar and square-section hollow tubing and is fitted with two skids for support. The tool can be used for plowing, ridging, ridge splitting, weeding, hoeing, rigid- and spring-tine cultivating, rotary cultivating, planting, row crop



*Unibar with seeder attachments*
The Goodearth Group



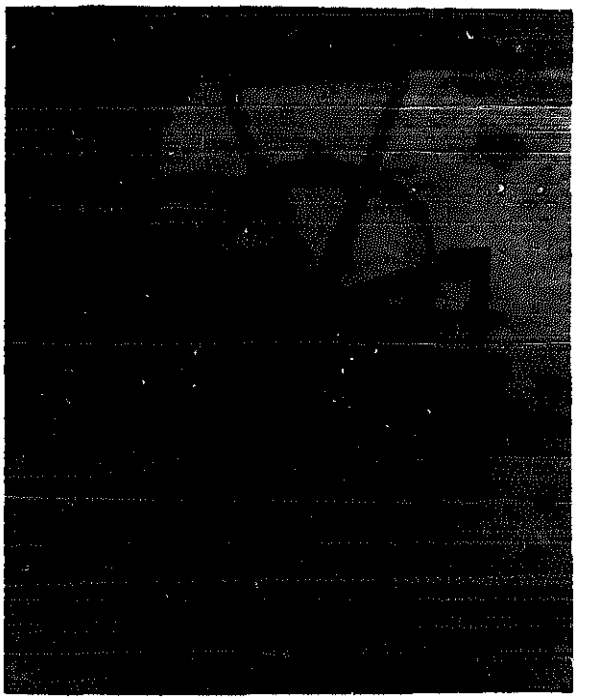
*Unibar with two ridging plows*
The Goodearth Group

lifting, and carting. Originally designed for farming on the ridge, it can be used as a single-row tool for inter-row cultivation up to a late stage in the growth of taller varieties of tropical crops.

Project Equipment, Ltd.
Industrial Estate, Rednal Airfield
West Felton, Oswestry
Salop SY11 4HS, U.K.

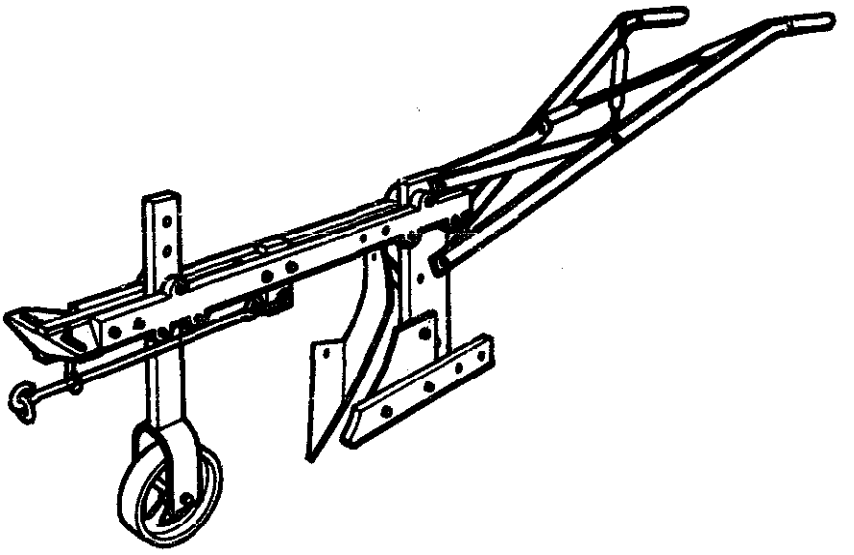
**Heavy-Duty Unibar**

This is a multipurpose, animal-drawn implement designed for heavier soils where extra



*Heavy-duty Unibar with a groundnut lifter*
The Goodearth Group

weight is essential to maintain penetration. It can handle the full range of standard Unibar attachments apart from the transport cart and, in addition, a 20-centimeter-cut general purpose plow, a lister-type ridger, a two-furrow semi-digger plow, and a 1.22-meter-wide 17-tine harrow. Up to four units of a new design of roller/seeder can be fitted behind the harrow so that crops such as wheat, rice, and soy beans can be



*Chitedze Ridgemaster toolbar*

planted in closely spaced rows. On this implement, the hitch and handles are fully adjustable.

Wide or narrow detachable V-pieces are used to carry the side stalks, to which various tools can be left assembled and merely bolted up to the frame when required. For plowing and ridging, the frame reverts to a width no greater than that of a conventional single-purpose plow or ridger.

Project Equipment, Ltd.
Industrial Estate, Rednal Airfield
West Felton, Oswestry
Salop SY11 4HS, U.K.

**Chitedze Ridgemaster Toolbar Plans**

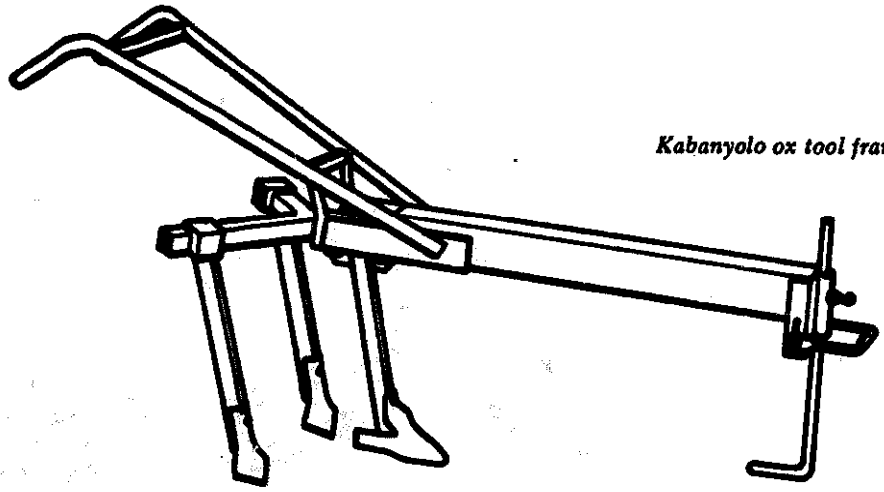
This multipurpose tool bar is shown here and in plan views with a plow body attached, but a ridger or cultivator can also be fitted to the vertical beam. The unique design feature of this toolbar is that it combines lightness with adequate structural strength, the main parts being fabricated from rectangular, hollow-section (R.H.S.), mild steel.

**Kabanyolo Ox Tool Frame Plans**

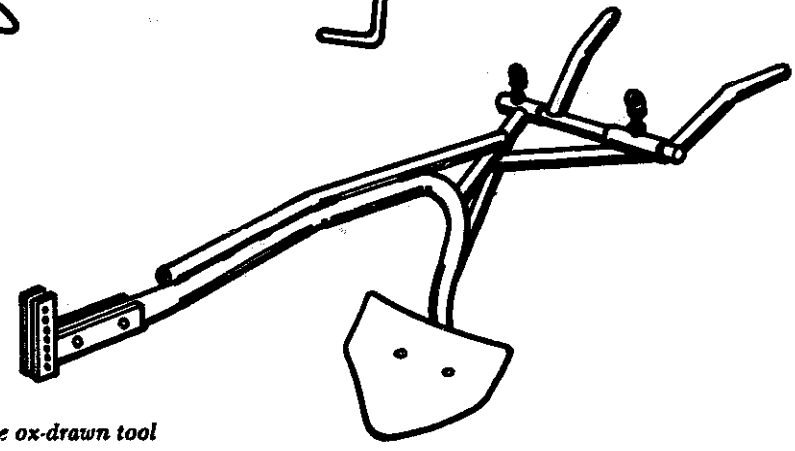
This multipurpose tool frame is shown here and in plan views with a plow stem attached. When fitted with the Y-frame, it can be used as an adjustable-width, three-tine cultivator/weeder. The tool frame is fabricated from flat steel, angle iron, and round bar. A simple skid is used instead of a depth wheel.

**Prototype Multipurpose Ox-Drawn Tool Plans**

Designed specifically for the farmer growing crops on ridges, the share on this multipurpose tool is adjustable to four settings: approximately 40, 55, 70 and 85 degrees. On the comparatively heavy soils at Samaru, Nigeria, the share was used for ridging, splitting ridges, cross-tying, weeding, and breaking capped soils in the fur-



*Kabanyolo ox tool frame*



*Prototype multipurpose ox-drawn tool*

rows. The tool frame was designed with an offset beam to avoid blockage when lifting groundnuts. Though only a prototype, the design shows a considerable amount of ingenuity.

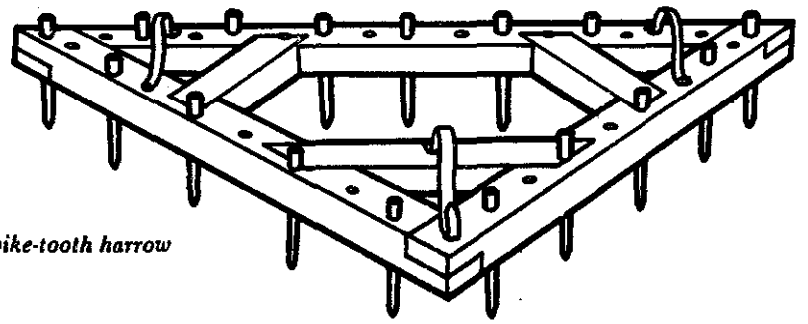
London WC2E 8HN, England

*Harrows*

**I.T. Triangular Spike-Tooth Harrow Plans**

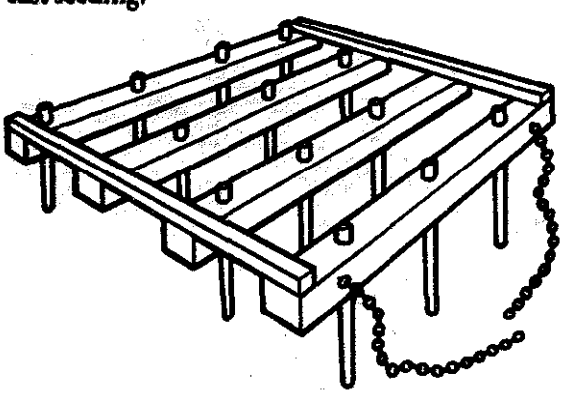
Originally designed in India, the teeth of this harrow can be made of hardwood or mild steel. Tooth spacing can be varied to suit soil conditions by removing teeth for wider spacing or by drilling holes and inserting teeth for closer spacing. The harrow can be used for preparing a seedbed, after plowing, and for covering seed after broadcasting. The harrow can be loaded with logs or stones to give greater penetration. For transport to and from the field, the harrow is turned on its back and run on the skids.



*Triangular spike-tooth harrow*

**I.T. High-Clearance Peg-Tooth Harrow Plans**

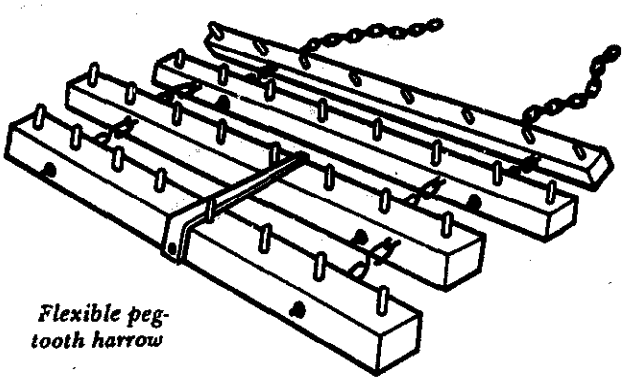
This harrow, constructed entirely of timber, was developed by the Ministry of Agriculture in Tanzania. Its high ground clearance and wide tooth spacing make it suitable for working in minimal tillage systems where it is advantageous to leave a trash cover on the soil surface. It can be used to break down soil clods before crop planting and for covering of seed after broadcast seeding.



*High-clearance peg-tooth harrow*

**I.T. Flexible Peg-Tooth Harrow Plans**

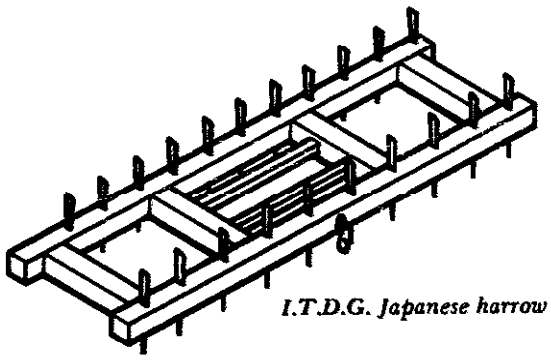
A locally built design from Iran, this low-cost peg-tooth harrow is designed for animal or tractor power. The flexible linkage between the bars helps make the harrow self-cleaning, and the linkage arrangement is designed to keep the teeth upright while in use. The bars are offset to give an average tooth spacing of 2 inches.



*Flexible peg-tooth harrow*

**Japanese Harrow Plans**

A simple, rigid, two-row harrow, this implement has a cutting action with the narrow edge of the teeth parallel to the line of draft. The flat, steel teeth are spaced 6 inches apart in each row.



*I.T.D.G. Japanese harrow*

**Allied Disc Harrow**

This is a versatile implement for crust breaking and seedbed preparation. Six-disc and eight-disc models are available. The angles of the discs are adjusted by a hand lever and a seat is provided for the operator. The implement can also be used as a threshing roller. Working width: .80 meter. Working depth: 50 to 110 millimeters. Draft: 40 to 50 kilograms.

Allied Trading Co.
Railway Rd., Ambala City 134 002
Haryana, India

**Cossul Disc Harrow**

This is a versatile implement suitable for breaking clods to prepare a seedbed and also for puddling rice fields. It can also be used as a threshing roller. The discs are provided with scrapers. Weight: 6-disc model, 38 kilograms; 8-disc model, 92 kilograms.

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**Disc Harrow**

Heavy-type, all-steel with six discs of 38-centimeters diameter. Adjustable. Fitted with seat.

**Disc Harrow Type PSP**

This disc harrow is all metal and can be supplied with six to 12 discs with working widths of 2.5 to 7 feet (0.85 to 2.00 meters). In each case the angle of the discs can be adjusted, and the disc gangs are interchangeable so that discs can throw either inwards or outwards. The six- and eight-disc models can be increased to 8 and 20 discs respectively. Transport wheels and a central tine to work between the gangs can be supplied. A seat is supplied and scrapers are fitted to all discs. Weight varies from 327 to 463 pounds (147 to 208 kilograms).

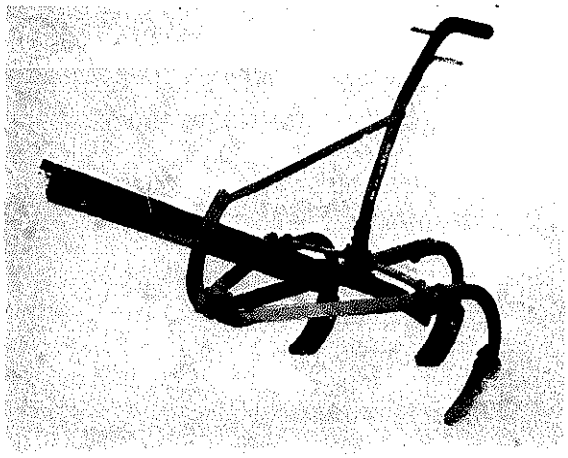
**CeCoCo Animal-Drawn Cultivator**

The working width of this cultivator can be easily adjusted and the blades remain parallel at all width settings. Weight: 21 kilograms.

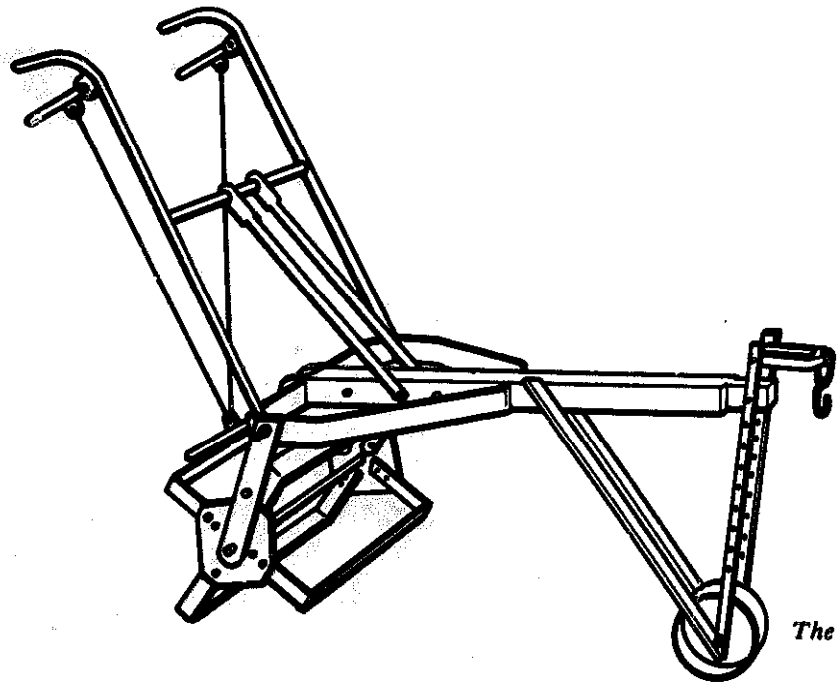
CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Cossul R.N. Cultivator**

This is a three-tine cultivator, made of steel with long wooden beam and single handle. The shovels are made of high carbon steel and are reversible. The width can be adjusted very easily through holes provided in the frame. Depth can be adjusted by changing the height of the beam through holes provided for the purpose. Moldboard plow, ridger plow, and seeder/fertilizer attachment can be supplied as extras. Weight: 16.0 kilograms.



*Cossul Bullock-Driven R.N. Cultivator*
Cossul & Co.



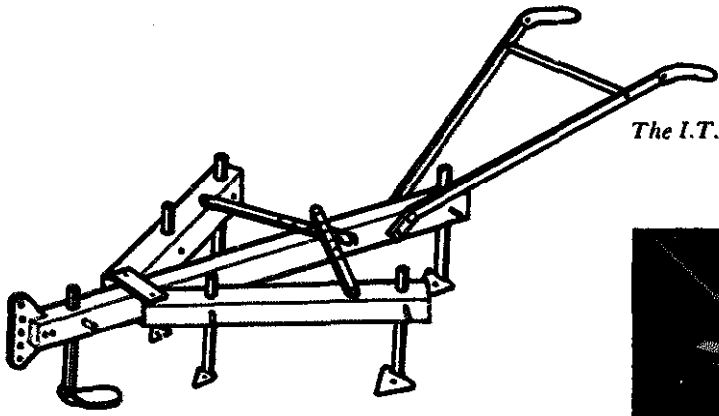
*The I.I.S.R. Weeder-Mulcher*

**Cossul Lever Expansion Five-Tine Cultivator**

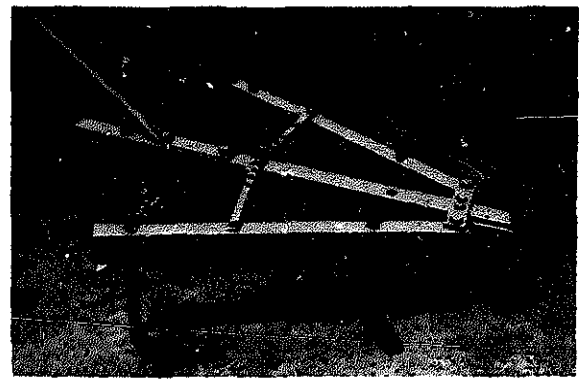
This cultivator is designed for preparing seedbeds and for inter-row cultivation. The points are reversible. The width can be adjusted from 300 to 625 millimeters (12 to 25 inches) by means of a lever. Right- and left-hand moldboards and rear double-face shovel are available as extras for throwing soil against the roots of growing plants and for making shallow channels for irrigation. Weight: 35 kilograms. Both above units manufactured by:
Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**The I.I.S.R. Weeder/Mulcher Plans (Indian Institute of Sugarcane Research)**

This animal-drawn, self-cleaning weeder is designed to destroy weeds, leave a mulch on the soil surface, and cover a lot of area per day. It can be used on most row crops with a spacing of 30 inches (75 centimeters) or more. The blade works at a depth of 2 inches (5 centimeters) below the surface. The weed roots are cut or



*The I.T.D.G. Expandable Cultivator*



*The first prototype model of the I.T.D.G. Expandable Cultivator*

pulled out and the soil layer is lifted slightly. The weeds drop off the blade and soon dry out.

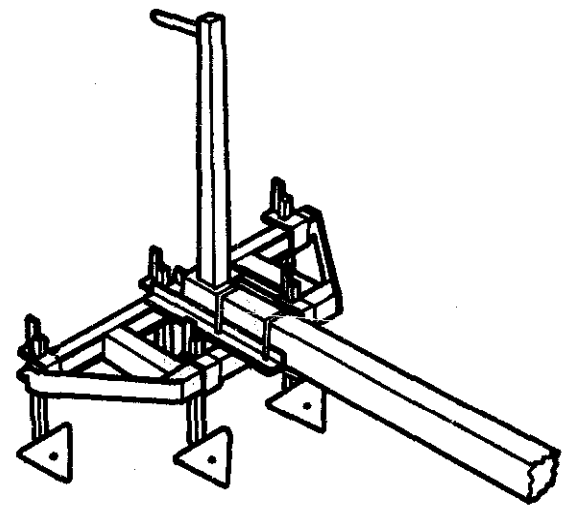
**The Intermediate Technology Expandable Cultivator Plans**

This lightweight cultivator is designed for weeding crops planted in 70 to 90-centimeter-spaced rows in sandy soils and can be pulled by one or two oxen or donkeys. The tines are individually adjustable for depth which makes the implement suitable for flat or ridge cultivation. The cultivator is suitable for manufacture by village blacksmiths.

**The Indian Five-Tine Sweep Cultivator Plans**

Dry farming areas where soil moisture conservation and soil erosion control are essential will benefit from this implement. The tool standards are staggered to allow crop residue and cut weed growth to remain on the soil surface. This cultivator can be used for primary tillage, seedbed preparation, weed control, and inter-row cultivation. The rigid steel frame can be built with additional toolbars to permit greater trash clearance.

Above three plans available from:
Intermediate Technology Publications, Ltd.
9 King St.
London WC2E 8HN, England



*The Indian Five-Tine Sweep Cultivator*

**Manga Hoe**

An adjustable-width cultivator available with 5 tines for donkey-draft or 7 tines for ox-draft. Extension bars are available to increase the width of the implement, in which form it can be used for row marking prior to planting.

S.A. Gard Pere et Fils
30500 Potelieres Par St. Amoroix (Gard)
France

**Horse-Drawn Cultivator**

Designed for spring cultivation following winter plowing, for cultivation of stubble, uprooting of quackgrass. Cultivating depth is controlled by a hand lever. Weight: 107 kilograms.

Agromet-Unia
Foreign Trade Enterprise
00-950 Przemyslowa 26
Warsaw, Poland

**Multi-Purpose Potato Cultivator**

Specially designed for potato cultivation, this combination three-purpose tool is supplied separately or combined with ridging, hoeing, and digging tools. The potato digger has a set of two guide wheels, the ridger, and an adjustable depth skid.

W. Hertecant
9200 Kwatrecht
Wetteren, Belgium

***Miscellaneous Animal-Drawn Tools***

**Roller**

This implement consists of two cylinders of 0.60 meters diameter. Available in two widths. Weight: 1.60-meter-wide model, 223 kilograms; 2.00-meter-wide model, 250 kilograms.

ETS. Techine
82400 Valance D'Agen
France

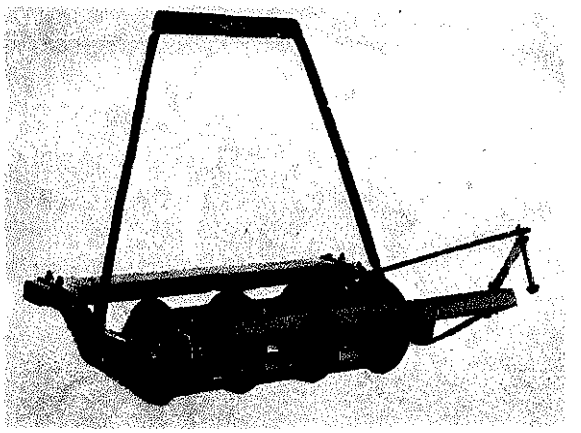
**Wetland Puddler**

It is designed for quick and efficient preparation of fields for paddy after first plowing. The three angular cast-iron hubs with four blades on each hub churn up the soil and leave the fine particles of it on the top surface. Weight: 39.5 kilograms.

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**Cossul Bullock-Driven Green Manure Trampler**

Growing a green manure crop and burying it is a way of adding to the organic matter content of the soil. This implement is useful for trampling green leaves and stalks. It consists of four 250-millimeter (10 inches) diameter steel discs with cast-iron hubs mounted on a horizontal shaft. Blades mounted on the shaft help to cut the green material. Weight: 39 kilograms.

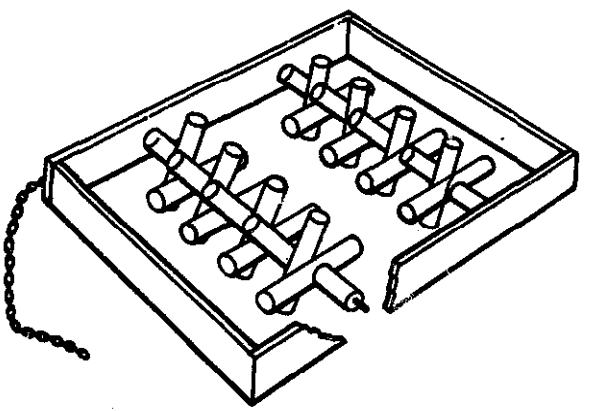


*Cossul Green Manure Trampler*
Cossul & Co.

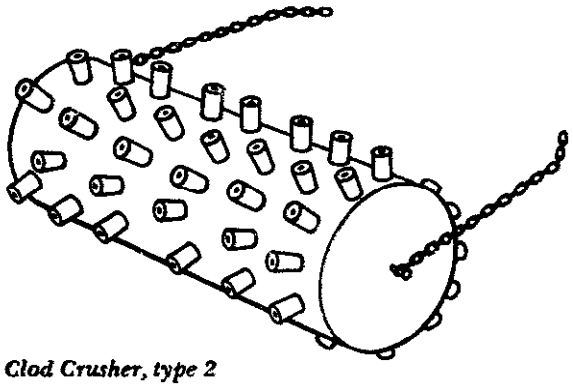
Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**I.T.D.G. Clod Crushers Plans**

These are two simple and cheaply constructed implements which are used for reducing the size of clods in cultivated land prior to ridging up the soil. They are made principally of gum (eucalyptus) poles. Type 1 has roller gangs which are built from short pieces of pole



*Clod Crusher, type 1*



*Clod Crusher, type 2*

and rest at an angle of approximately 60 degrees to each other. The poles are mounted to provide a self-cleaning effect. Type 2 consists of short pole pegs attached in a staggered formation around the circumference of a single heavy log roller. Sharpened steel bolts are driven into the center of each end of the roller to which the draft chains are attached. A singletree is fitted to the roller chains.

**I.T.D.G. Granule Applicator Plans**

The granule applicator was developed as part of the Intermediate Technology Farm Equipment Development Project work program attached to the Institute of Agricultural Research of Ahmadu Bello University. A Planet Junior-based, hand-pushed seeder was fitted to an ariana toolbar and a simple direct-drive from a spiked wheel was used to replace the original bevel gears and shaft drive to the metering mechanism. Standard ariana soil-moving components were added to enable a ridge to be built and granules to be applied, either on the surface or incorporated into the soil, simultaneously.

# -4- Tractors

## TWO-WHEEL TRACTORS

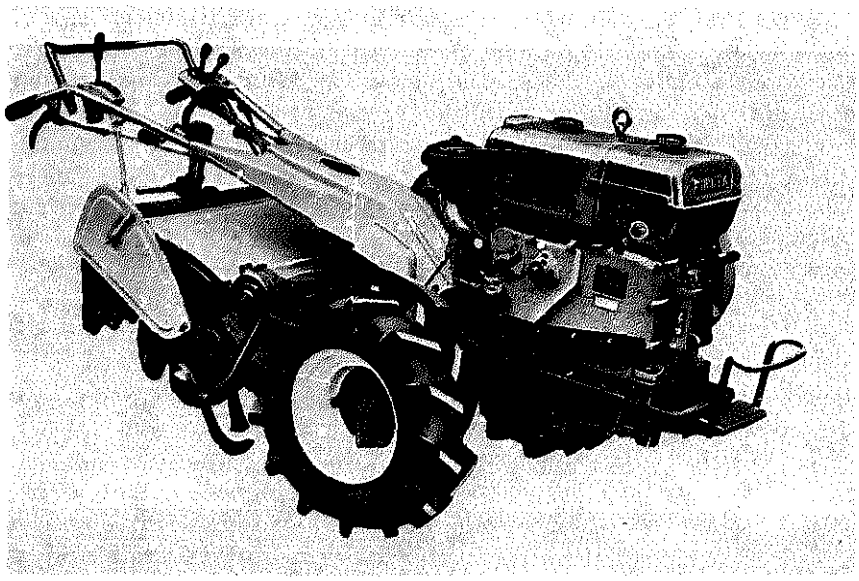
"Different levels of farm mechanization exist side by side in China," observes Ian Barwell in his report on the Chinese Two-Wheeled Tractor.* Barwell serves as a transport project officer with the Intermediate Technology Development Group based in London. He explains the different mechanization levels in terms of varying commune size (from 500 to 50,000 people), development, and farm machinery requirements. "At one and the same time, there is an increasing demand for conventional four-wheeled tractors, for two-wheeled tractors, and for draft animals such as horses and oxen for use in agricultural work."

Thousands of miles away, Gene Logsdon, an editor for *Organic Gardening* and *New Farm* in the United States, shows that a need for diversified, well-developed equipment is equally significant—even on a single, small farm such as his.

"When I figure my needs, I do not automatically figure that I have 20 acres to cultivate or even six, which is all the land I actually have in animal crops. Instead I look closely at that six-acre figure and ask myself: Of that total, how big an area will I ever have to plow (or disk, or weed, or plant, or harvest) in one day? The answer is usually one-quarter acre or less. That being the case, a quarter-acre is the size my tools need to be geared to."

"Actually, I'm overpowered with my ancient WD Allis-Chalmers tractor which has a horsepower rating of around 35. That's enough for quite a sizable little farm. My biggest plowing job takes me less than two hours. I only use my tractor's capability fully when I mow hay and pasturelands. My tractor would be just about right on an 80-acre farm if the 80 acres were devoted to the wide variety of food and fiber production typical of the self-sustaining homestead. Even on an 80, you should rarely *have* to work more than five acres a day. If, however, the entire 80 were given over to commercial fruit

* Material excerpted with permission from Ian J. Barwell. "The Chinese Two-Wheeled Tractor." *World Crops and Livestock,* July-August 1977.

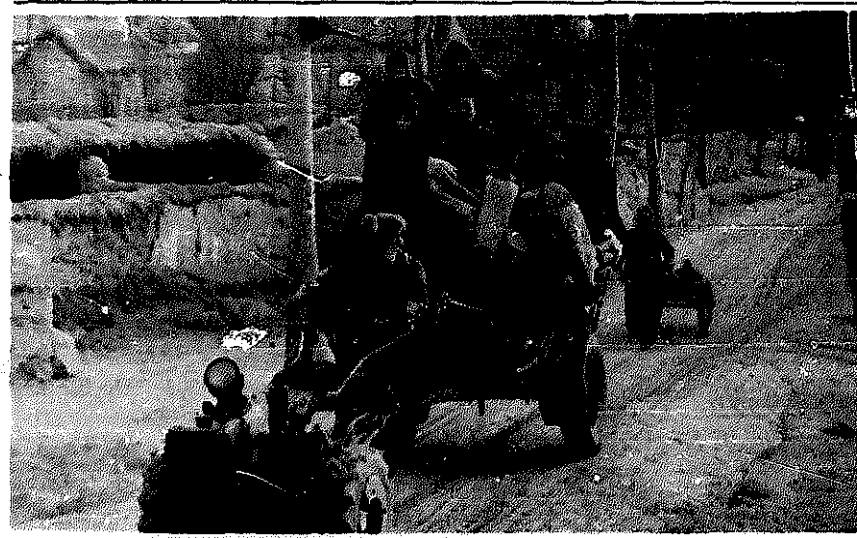


*The Kubota, a Japanese two-wheeled tractor.*
Kubota, Ltd.

and vegetable production or any single specialty crop, you would usually need quite larger machinery to handle it."

Just as Gene Logsdon in North America is firmly convinced that many growers should look at single-axle tractors and tillers, so, too, are the Chinese. The two-wheeled or single-axle tractor has played a vital role in the mechanization of Chinese agriculture, reports Ian Barwell. Since much of the cultivated land is divided into very small plots for irrigation, the two-wheeled tractor works well in such small land segments. Besides, the two-wheeled tractor is a much cheaper unit to buy and run than a conventional four-wheeled tractor, and it also lends itself to production by a number of small- and medium-scale factories throughout the country.

Writes Barwell, "Ease of maintenance and durability are major considerations in the design of the tractor which can be used for plowing or rotary cultivation, and as a power source to drive other items of machinery. Attached to a trailer, it forms a simple means of transport and is extensively used in this role, both in rural situations and to carry goods and people from the countryside to the town and back again. Current annual production of the tractor runs into hundreds of thousands of units, and they are now being exported to certain other developing countries; both India and the Philippines are now producing similar machines. However, the tractor is not suitable for use in the very dry conditions prevalent in parts of Africa, because it does not have the tractive power required for cultivation in such circumstances."



*A single-axle tractor hitched to a two-wheeled trailer for transport.*
Ian Barwell

The tractor engine, he reports, has a power output of ten horsepower. The heart of the two-wheeled tractor is its rugged and durable single-cylinder, four-stroke diesel engine. Barwell continues:

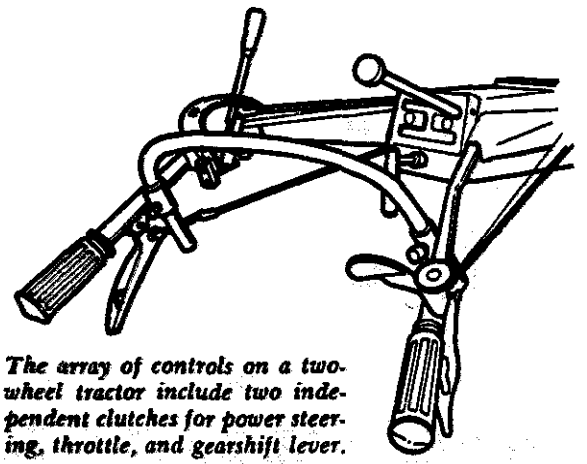
"The engine, whose main block and crankcase are a single iron casting, has two other interesting features which simplify maintenance. It is water-cooled by means of an evaporative tank system mounted above the block. It is this feature which is responsible for the characteristic wisp of steam rising from the tractor when it is in use. Direct visual indication of the water level is achieved by means of a red button mounted on the end of a rod protruding from the tank and attached inside to a float. As the water evaporates, the rod falls until the danger level is reached, and the button drops out of sight of the tractor operator. A forced-circulation, oil lubrication system is used, and the oil is passed through a sight glass visible to the operator so that he has a continuous check on the flow of lubricant."

The Chinese have many uses for the two-wheeled tractor. It can be fitted with either a single- or a two-furrow plow which attaches to a bracket at the rear of the gearbox. The setting of the plow can be adjusted for height, for angle relative to the direction of travel, and for orien-

tation of the blades themselves. The tractor can plow to a depth of 180 to 200 millimeters.

Using the power take-off at the rear of the gearbox, a rotary cultivator fitted with up to 16 blades can be attached. The rotor is shrouded by a canopy which helps to break up the lumps of earth, and the depth of cultivation is controlled by either a skid or a small-diameter wheel mounted behind the cultivator.

When plowing or cultivating, the operator may either walk along behind the tractor or sit on a seat mounted at the very rear of the machine. Steering is effected by control of the clutches engaging the drive to each of the wheels. The tractor is reportedly capable of working 0.1 to 0.15 hectares per hour.



*The array of controls on a two-wheel tractor include two independent clutches for power steering, throttle, and gearshift lever.*

The tractor can be driven to and from the fields if a small castor wheel is fitted at the rear. However, when it is used for cargo or passenger transport the tractor is hitched to a two-wheeled trailer, and the driver normally sits on a seat at the front of the trailer. He can then steer the vehicle by means of the handlebar, and this obviates the need for the castor wheel. Maximum payload in the transport mode averages 1,200 kilograms.

Mounted on the end of the crankshaft alongside the grooved pulley described earlier is a large flywheel which doubles as a flat-topped pulley. Using this feature, the tractor may be used as a source of power to drive a range of items of agricultural and crop-processing equipment, through a flat-belt drive system. It could, for example, be used to power a water pump, an electricity generator, a flour mill, or a rice thresher.

## SINGLE-AXLE TILLERS AND TRACTORS

A great variety of single-axle, sometimes called two-wheel, walking, or pedestrian tractors is available. The smaller models generally have a single-driven shaft which can be fitted either with rotary cultivator blades or with wheels for pulling trailers and trailed implements. Larger models often have a pair of driving wheels and an independently controlled drive for rotary cultivating. Engines usually run on gasoline in the smaller sizes and use diesel fuel in larger sizes. Transmission systems range from V-belt drive (with speed changing by means of stepped pulleys, and belt tensioning providing a clutch) to multispeed gear transmission with friction plate clutches.

Most manufacturers can supply a range of attachments for cultivation and transport work, and water pumps can usually be fitted, although it should be remembered that pumping is generally an arduous duty for a small engine. One maker supplies a threshing attachment with a rasp, bar-type drum, and concave.

Single-axle tractors have sometimes proved to be very successful in intensive agriculture on relatively soft soils which need thorough rotary cultivation—for example, in irrigated rice paddies in Asia or on market-gardening plots in Europe. They have been much less successful for relatively extensive agriculture on hard soils such as those in some savannah regions of Africa, where large areas have to be covered and tined cultivation is often more appropriate than rotary cultivation.

Like all small-engine-powered equipment, single-axle tractors require a good network of spare-part supplies, a high level of operator training, and regular maintenance, particularly in hot and/or dusty working conditions.

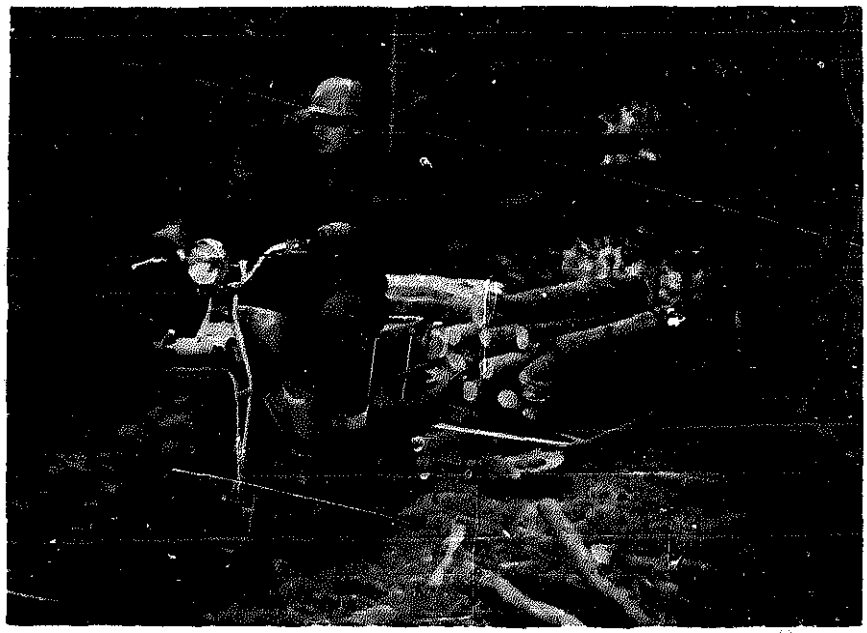
## NORTH AMERICAN SOURCES OF WALKING TRACTORS

### The Rokon Automatic Mototractor

At first glance, one can hardly take this stocky trail bike seriously as a useful farm implement. But after serious study, it is obvious that

the Mototractor is a two-wheeled, two-wheel drive, dual-purpose power unit designed to handle all the usual farm chores with the same hearty determination of any tractor—while providing an expedient, rugged means of transportation as well.

A conversation with a Technical Assistance Official for Africa revealed that "the Mototractor could well be the sole piece of technology developed in the United States with significant implications for emerging nations. It is extremely strong and has few moving parts. In order to be useful, a farm tool must be able to till more land than the space it needs to turn around in, a problem with Western-oriented equipment.

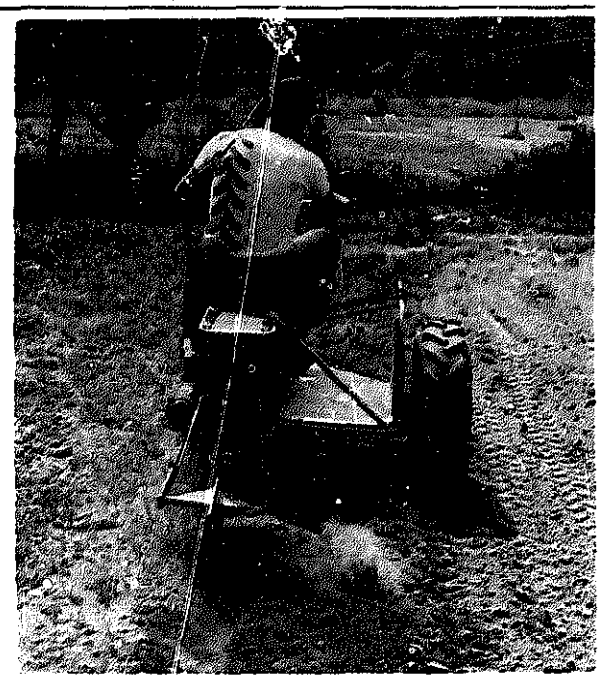


*The Rokon tractor crosses rugged terrain towing a heavy load.*
Rokon, Inc.

"Unlike Far Eastern countries, labor is at a premium in Africa, not land. Without the help of a labor force, the farmer must rely on mechanization to get enough land prepared to feed his family and provide him with a cash crop. At the same time, he needs a means of local transportation and a way to get his produce to market—especially during the rainy season."

Rokon has designed the Mototractor to satisfy both needs. It has all the attachments of a small-farm, utility tractor—plow, cultivators, trailer, and spraying and irrigating equipment—is able to transverse two-foot streams, has wide tires for superior traction in mud, has a ten-horsepower gasoline engine and power take-off shaft, can climb 45-degree inclines, and has a maximum operating speed of 40 miles per hour.

In the United States, the Mototractor is widely used by engineers, foresters, and fire-



*A third wheel provides added balance for plowing at slow speeds.* Rokon, Inc.

fighters for rapid travel over rough terrain. The power take-off shaft will operate a pump for fire-fighting as well as many farm tools. Gearing ratios provide pulling power which has proved valuable in rescue operations. One ski resort in Vermont uses their Mototractor to climb mountains carrying workers, tools, and materials all year-round, as well as for rescue.

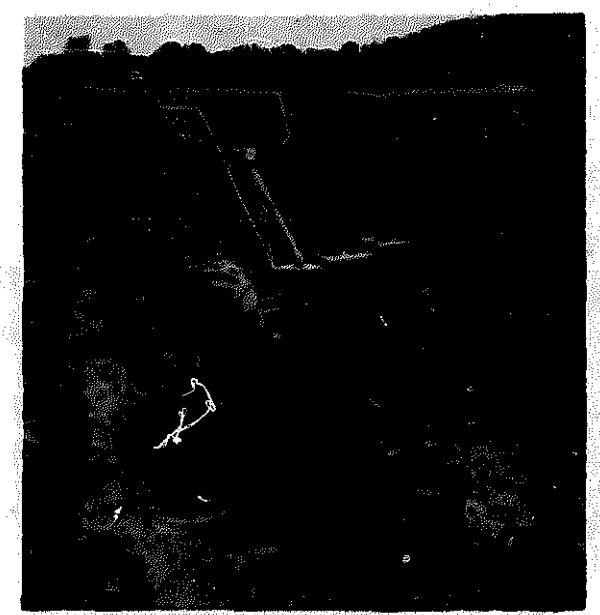
# THE FORD DNT PEDESTRIAN TRACTOR, NOW THE INTEC

In 1964, Ford decided to develop a program designed to help solve the world food crisis while enhancing the reputation of the company and its farm products in developing nations. After a series of conferences with university and foundation experts and with representatives of governmental agencies, "Ford elected to design a tractor which would provide simple mechanization for small farmers at a price roughly comparable to a pair of oxen," reports Richard Dewey, Public Relations Manager for Ford Tractor Operations.

After five years of research and engineering Ford was ready to test marketability of their new model DNT—*D*eveloping *N*ations *T*ractor. Confidence in its powerful, reliable transaxle system, wheels designed for added strength and improved traction, the simplicity of the rope starter and push-pull metal clutch rod, and its basic rugged, durable design encouraged them to continue. As their news release announced, "The two-wheeled tractor is the first ever designed specifically to bring the benefits of modern farming technology to people on small farms in developing countries at a price they can afford to pay."



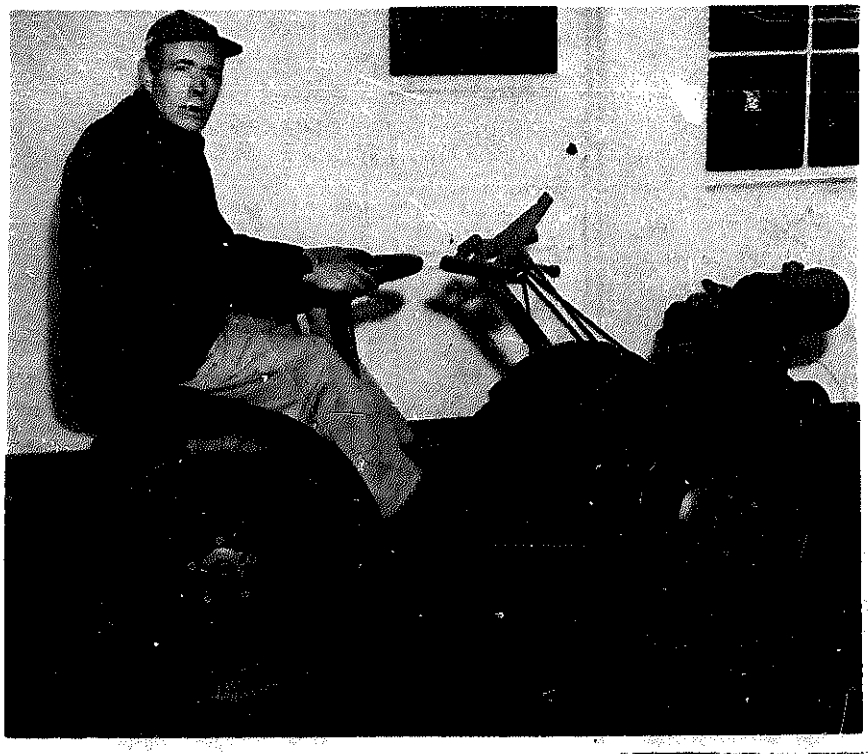
*The INTEC's high ground clearance is an important feature in continuing mechanical cultivation late into the season.*
Dowding Tool Products, Inc.

But "insurmountable logistical and social problems" terminated the effort. Dewey continued, "Getting spare parts to dealers posed no difficulty but getting the dealer to the broken-down machinery did. It just wouldn't pay any serviceman to spend three or four days trekking through the jungle in search of his customer. With attitudes as stubborn as they are, it's hard to convince village farmers that anything new, even appropriately scaled and designed machinery, will do the job right. They are skeptical of a tractor which runs on hard-to-get fuel and eventually breaks down into a pile of rusty nuts and bolts. Fuel for animals grows on trees and a worn-out ox can be eaten. There's real 'horse sense' in using animal-drawn equipment in developing countries."

# BUILD—'EM—YOURSELF TWO- AND FOUR-WHEELED TRACTORS

Paul Davenport started building tractors over twenty years ago from parts he scrounged mostly from old Model A Fords. Now he says he is too old for that kind of work, but he still sells the plans for a two-wheel model with a two-and-one-half- or six-horsepower motor, and a four-wheeled, four-wheel-drive, six-horsepower model.

The feature Paul boasts of most is the ruggedness of his tractors. "These parts were originally designed to take the power of a 24-horsepower engine. With these small engines, they will last almost indefinitely." Some parts include a standard Model A transmission with three forward speeds and reverse, brakes for turning and handling, and regular wheels and tires (or implement tires).



*You can build this four-wheeled, four-wheel-drive tractor from a Davenport kit.*
Paul Davenport

*The Davenport two-wheel tractor has a drawbar with a single pin for changing implements quickly.*
Paul Davenport

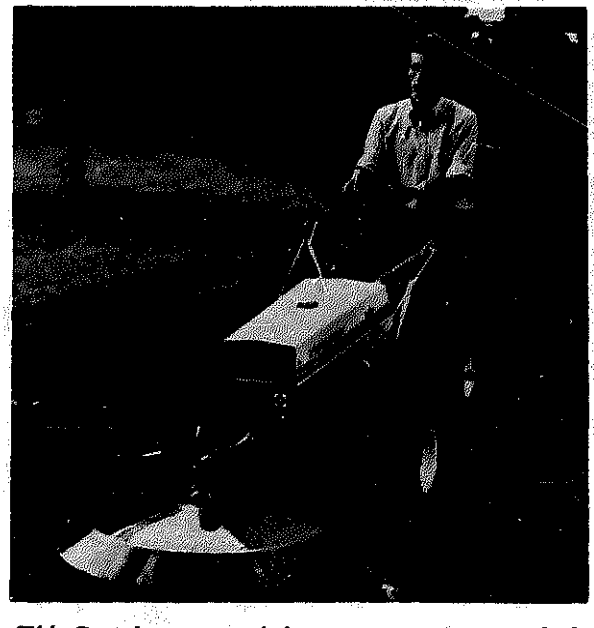
The actual building cost is hard to estimate. It all depends upon how good a scrounger you are and how much of the work you can do for yourself. There is a certain amount of cutting, drilling, and welding you will need to do, or perhaps your local welder will have to help you out.

The plans illustrate a simple but practical drawbar which pulls from ahead of the axles for better handling. A single pin allows a quick change of implements. With the two-and-one-half-horsepower engine on his two-wheeled tractor, Paul can pull a nine-inch plow, eight inches deep in low gear. The four-wheeled unit can pull a 12-inch plow ten inches deep in light to medium soil. Flexibility in the center, keeping all four wheels on the ground, regardless of terrain, coupled with four-wheel drive gives this machine "sensational pulling power."

Paul's Tractor Co.
8520 Cherry St.
Fontana, CA 92335

### Gravely Convertible Tractors

Gravely Convertible two-wheel tractors have an all-gear transmission separately powering both the wheels and the power take-off shaft for attachments. Models with 8, 10, and 12 h.p. engines provide power to match the job requirements and operate with forward, neutral, and reverse speeds. Attachments include sickle bar; rotary and flail mowers; a plow, sweeper, and blower for snow; a dumping trailer; and, for the garden, a furrower, cultivator, shovel, and rotary tiller.



*This Gravely power unit has a rotary mower attached to the front, dual wheels for better traction, and a riding sulky with steering column.*

One Gravely Lane
Clemmons, NC 27012

### Ferrari

Ferrari carries three models of walking tractors with air-cooled diesel engines ranging from 7 to 21 h.p. The fuel injection system means there are no plugs, points, magneto, or carburetor. Direct gear-drive replaces the need for chains or belts. The middle range, 14 h.p. model has four forward and two reverse speeds, and power take-offs, each with two speeds. The tilling width is about 30 inches and the unit readily accommodates a sickle bar, snow blower, trailer, sprayer, plows, and even a table saw.

**Pasquali Walking Tractors**

Pasquali Italian-made walking tractors come in many sizes, ranging from 7 to 18 h.p. All are equipped with a four-stroke, air-cooled diesel engine. The lower-powered models, from 7 to 14 h.p., have four speeds forward and two reverse; the higher-powered units have a sliding-type key gear with synchronizer operating twelve speeds—nine forward, three reverse—at a rate of 0.6 to 16 kph. All models have two power take-off shafts, the top one synchronized with all gearbox speeds and the bottom one with two independent speeds. The rotary tiller disconnects automatically when reverse gear is engaged, and the handles are completely adjustable.

Pasquali has the unusual attraction of offering over 70 attachments for its walking tractors. So extensive is their list of attachments that it takes a 200-page book to describe them all. All are available upon request through a dealer in the United States with the allowance of a twelve-week lead time.

**EDKO Walking Tractor**

The EDKO tractor is constructed with a ¼-inch by 3-inch frame and 11-gauge handle with three-position adjustment. It is powered by a 5 h.p. gasoline engine with six-to-one gear reduction and recoil starter. It features two speeds forward with "dead man" reverse (1.25 mph). Low speed ranges from 1 to 1.75 mph, high speed from 2 to 2.75. It has a rugged chain-drive system with dual-split steel pulleys, and 11-inch ground clearance axle with rachet wheel. Wheel widths are adjustable from 17 to 23 inches on

*The EDKO Chain-Drive Walking Tractor with toolbar and cultivators.*
EDKO Mfg., Inc.

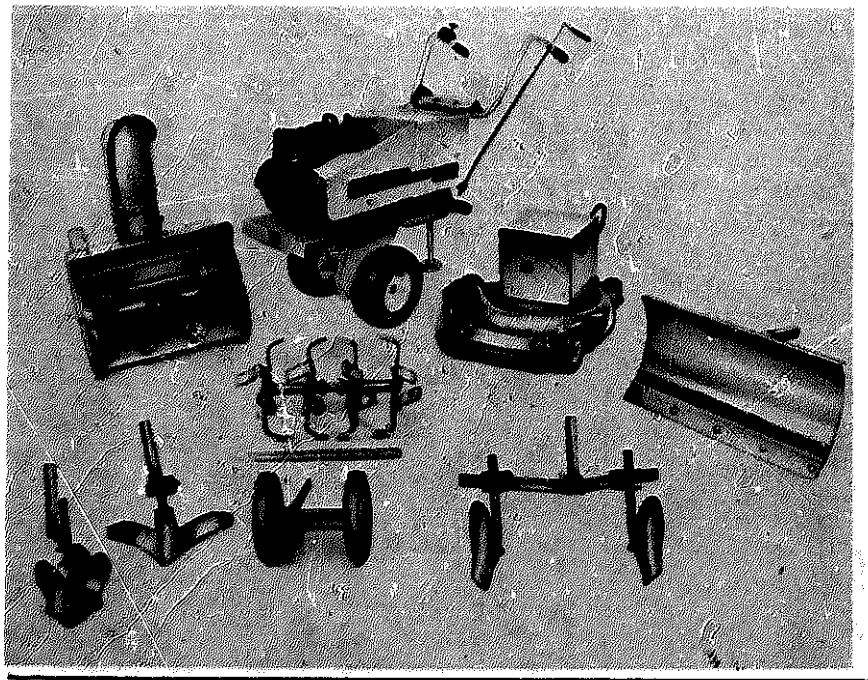
1-inch increments for each wheel. No tools are required to change the following attachments: 7-inch moldboard plow with coulter, disc, six-prong cultivator, furrow opener, 40-inch blade, wheel weights, and chains.

EDKO Mfg., Inc.
2725 Second Ave.
Des Moines, IA 50313

**Haban Power-Trac V**

The chain-drive transmission with one speed forward and reverse is provided only in the 5 h.p. size. The 3 h.p. model has no reverse. An attachment clutch acts independently of traction controls. Controls are mounted on handlebars of tubular steel. It has semipneumatic tires with 11-inch by 4:00 wheels. Both models feature 14-inch tines for tilling a patch 26 inches wide and 8 inches or more deep. Attachments for the 5 h.p. model include a variety of cultivator tools, a 22-inch-cut rotary mower, a 24-inch snow-thrower, and a 30-inch dozer blade for grading gravel and clearing snow.

Haban Mfg. Co.
2100 Northwestern Ave.
Racine, WI 53404



*The Haban Power-Trac V with attachments: snow-blower, rotary mower, scraper blade, bolo tiller tines and depth bar, furrower, sweep, rubber tires, and hiller.*
Haban Mfg. Co.

## INTERNATIONAL SOURCES OF WALKING TRACTORS

**Bucher M600**

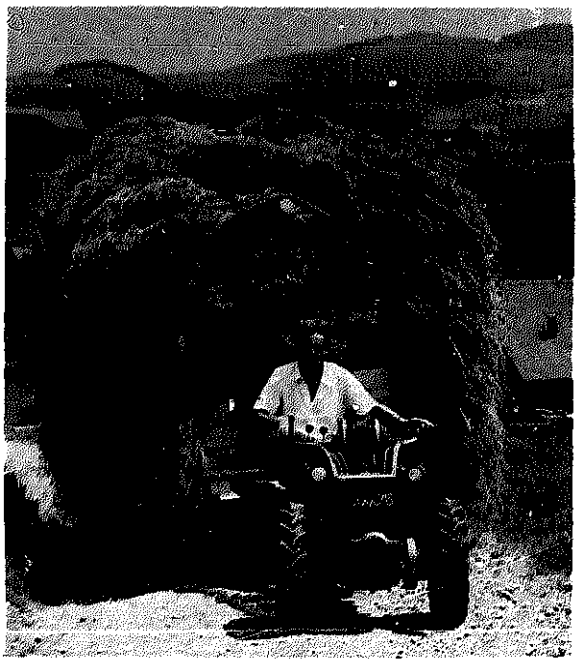
The Bucher M600 cutter bar mowers are specifically designed walking tractors for mowing and windrowing crops grown on the steep slopes of Switzerland. Three different mechanisms are available for windrowing; a trailer and sulky are also available. Special wheel extensions keep the mower upright when traversing a slope. The M600 is run by a 10 h.p., air-cooled gasoline engine, has three forward, one reverse speed, and weighs 320 kilograms. Other models are available ranging from 7 to 11 horsepower. At this writing, Bucher-Guyer is seeking a North American distributor.

Bucher-Guyer, Ltd. Engineering Works
CH-8166 Niederweningen
Zurich, Switzerland

**AEBI AM Walking Tractors**

AEBI tractors come in three models: the AM 8; the AM 15, with 15 h.p.; and the AM 75, with 10 h.p. All have four-stroke gasoline engines and mowing attachments. The AM 75 has a transmission with four forward and one reverse speed,

*Bucher Cutter Bar Mower M200*
Bucher-Guyer, Ltd. Engineering Works



*The AEBI AM75 pulling quite a load uphill.*
AEBI & Co.

a high-/low-speed option for the cutter bar and three forward and one reverse speed for the rear power take-off. Power can be linked to a trailer capable of a 900-kilogram payload; hence the unit becomes a four-wheel-drive machine. Other attachments include a sulky, hay turner, and rotary tiller. Operating in reverse, the AEBI AM 75 pulls a potato harvester which digs the potatoes, sifts the soil away from the tubers, and deposits them in a row on the surface of the soil.

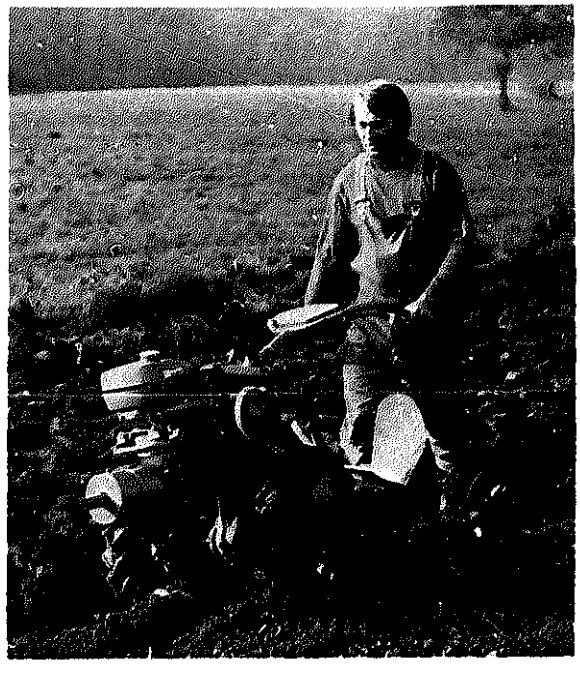
**AG Maschinenfabrik**
**CH-3400 Burgdorf, Switzerland**



*Agria 6000 with weighted wheels for extra traction to pull a reversible moldboard plow.*
Agria-Werke

### Agria Model 2400 Walking Tractor

Agria Model 2400 walking tractors are available with either an 8 h.p., two-stroke or a 9 h.p., four-stroke gasoline engine. They have a six-speed gearbox, three forward and three reverse, and an independent power take-off shaft. The steel-tube handlebars are adjustable 180 degrees, and track width can be adjusted from 10.6 to 22.2 inches, depending upon accessories and row width. A wide range of attachments makes this unit Agria's versatile one. Attachments include a two-section, adjustable harrow, a two-piston spray pump, a water pump, a 31.5-inch spindle reel mower with seat, snow blower and plow, sweeper, rotary tillers with widths between 12.6 and 26 inches with or without duckfoot hoe, quarter-turn plow, reversible plow, ridger, cultivator, mulcher, sickle bar mowers of different working widths and fineness cuts, and a trailer with seat.

### Agria Model 2700

Designed for power rather than versatility, the robust Agria 2700 walking tractor has a 13-h.p., four-stroke diesel engine with electric start. The nine-speed gearbox, six forward and three reverse, operates at rates between 0.7 and 12 mph. The upper power take-off shaft operates at two speeds; the bottom also at two but with the option of operating independently of the gearbox. The lower shaft stops automatically when reverse gear is engaged. The 270-kilogram unit is balanced for easy maneuverability when hoeing, tilling, plowing, and transporting. One unusual attachment is the sprinkler, complete with water tank. Agria is not represented in North America at this time and is seeking distributors.

*Robust Agria 2700 with rotary tiller*
Agria-Werke

Agria-Werke GmbH
D-7108 Moeckmuehl
West Germany

### Moty Mule Universal

The Mule is a versatile mowing, tilling, hay-harvesting implement built for safe operation on steep slopes. It is available with either a two- or four-cycle gasoline engine or a four-cycle diesel engine. A floating axle adapts to rough ground conditions without transmitting jolts to the operator. The V-belt power transmission absorbs the shock when obstacles jam the cutting blade on the reciprocating mower. Front and rear power take-off shafts are provided to power a great variety of implement attachments which may be installed in seconds, thanks to a quick-disconnect arrangement. The rear power take-off can also be utilized to propel the shaft for a wheel-drive trailer. The unit weighs 150 kilograms, 100 kilograms without the mowing attachment, and operates in first gear at 4 kph, second gear at 10 kph and reverse at 3 kph. More than 25 attachments are available. Some of the more unusual ones include a grain-reaping attachment, push-on grinding attachment, hay-pushing rake, dibbling seeder with two-row arrangement, hay rake and tedder, hay rake with reversible rotation arrangement, and vineyard plow.

Moty-Werk, Landmachinenbau
8523 Frauental A./L62
Austria/Stmk

### Kubota Versatiller

A heavy unit weighing 485 kilograms, the Kubota Versatiller has a continuous output of 9 h.p. and a maximum of 12. It operates at six

forward and two reverse speeds and the tilling unit operates at four speeds. With a maximum traveling speed of 15 kph, the unit is powered by a rotary, diesel-powered, water-cooled engine with radiator. It tills a width of 60 centimeters, a depth of 19 centimeters with 20 blades, tilling at a rate of 1 hectare every ten hours. The Kubota puddles wet fields, tills, plows, harrows, and weeds. The power take-off provides a stationary 12-h.p. engine to drive belt-driven machines such as threshers, hullers, and generators.

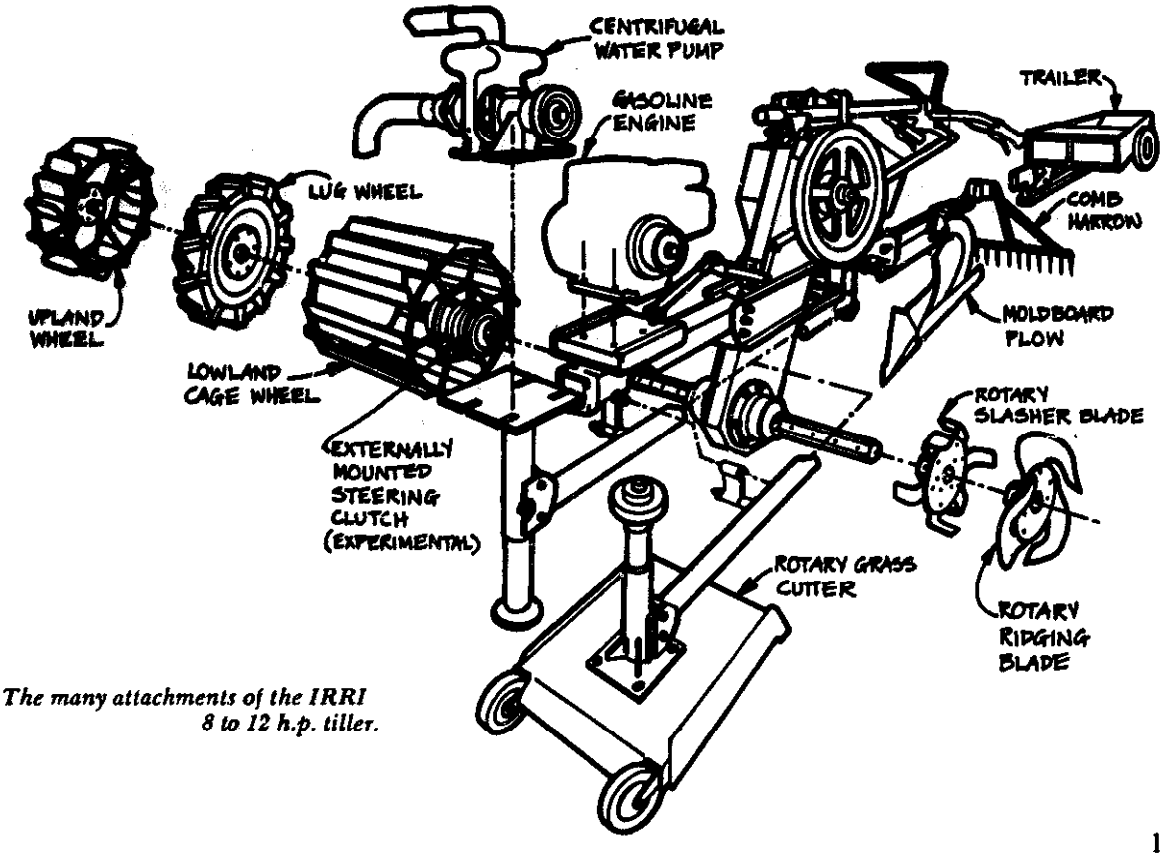
Kerala Agro-Machinery Corp., Ltd.
Athani P.O. Ernakulam District
Kerala, India

Kubota, Ltd.
22 Funade-cho
2-chome Naniwa-ku
Osaka, Japan

Note: The Kerala Corporation is interested in marketing their products in North America but has no distributor at this time.

**IRRI Power Tiller**

The International Rice Research Institute has designed this 8 to 12 h.p. tiller with features especially for developing countries. The heavy-duty power tiller offers almost all of the features of the latest power tillers produced in the industrialized countries, yet it can be easily fabricated in developing nations at a fraction of the cost. The machine is well balanced and is equipped with steering clutches for easy maneuverability. The four forward and two reverse speeds can be shifted by using a simple main clutch control and gear shifting lever. Belts do not have to be shifted to change speeds. Used for cultivation on both upland and lowland conditions, the tiller can prepare 1.2 to 1.5 hectares of land per eight-hour day and can transport 600 kilograms on country roads. This rigid, heavy-duty machine is equipped with a water-cooled, horizontal-stroke diesel engine which transfers power through V-belts. Maintenance cost is kept low as most parts can be easily repaired in small machine shops, and many machine elements are readily available to developing nations.



*The many attachments of the IRRI 8 to 12 h.p. tiller.*

*The IRRI Power Tiller is seen here puddling a rice paddy while pulling the operator on a puddling sled. Notice the weight extending to the front to compensate for the weight of the sled and operator.*
International Rice Research Institute

*Not yet widely adopted, the IRRI puddling sled can be modified for construction with local materials for less than $20.*
International Rice Research Institute

Simple to manufacture, the power tiller has five major assemblies: engine, transfer case, multispeed gear transmission, handlebars, and rotary tiller. All components, except the engine, can be easily fabricated in developing nations without special production dies and tooling. Consequently, production can be economical even with low market demand.

Manufacturers' addresses and construction plans are available from:
Agricultural Engineering Department
International Rice Research Institute
P.O. Box 933
Manila, Philippines

**Hakorette Standard**

The Hakorette comes with a 6 h.p. two-stroke engine, elastic three-stage V-belt drive transmission with three speeds up to 10 mph. High-traction capacity powers attachments which include rotovator, snowplow, trailer with 500-kilogram or ½-ton capacity, 8-inch plow, and a reel mower with seat.

Hako-Werke
2060 Bad Oldesloe
Postfach 1444, West Germany

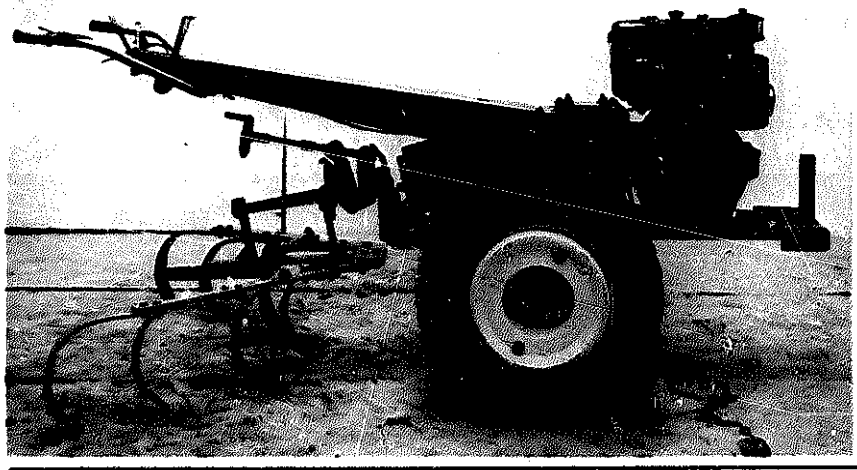
**Solo**

The Solo combi-system is a single 4 h.p., two-stroke engine complete with centrifugal clutch which can be fitted quickly to any of the following implements: mower, rotary cultivator, generator, earth auger, water pump, or outboard motor.

Solo Kleinmotoren GmbH
7032 Sindelfingen 6
Postfach 20, West Germany

**Bouyer Two-Wheel Tropical Tractors**

Though they are made in France, these tractors are marketed solely (at present) in developing nations. They were designed in collaboration with CEEMAT (Center for Studies and Tests of Tropical Material), specifically to satisfy the demands of tropical cotton culture following a request of the CFDT (French Company of Textile). A spokesman for Bouyer explained, "It appeared to this company that a normal tractor was not able to work in cotton fields. In fact, it requires a simple machine to make eventual repairs very easy in areas far from economic centers, and a specific machine for cotton with a high clearance and an adjustable working width." They are able to work both in wet and dry cultures under hot climates.



*Bouyer Walking Tractor with cultivator attachment. Notice depth adjustment and handlebar controls. Wheel weights are mounted to improve traction, and the extending frame in the front is a provision for adding even more weight.*
Bouyer

**Type 203**

This is the smallest tractor made by Bouyer. It has a 5 h.p., four-stroke, air-cooled gasoline engine. The gearbox houses two speed ranges with two forward speeds each and two reverse speeds. There are two speeds for the power take-off shaft.

**Type 334**

Powered by a 6 or 7 h.p., four-stroke gasoline or diesel air-cooled engine, it has two ranges of three forward speeds and one range of three reverse speeds. There is one speed for the power take-off shaft.

**Type TR**

The heftiest of the Bouyer products has a four-stroke, air-cooled diesel engine available in either 9, 11 or 14 h.p. Special features for operation in a hot climate include an oil regenerator and oil bath air filter. There are two speed ranges for three forward speeds and one range of three reverse speeds. Three power take-off shafts operate at different speeds including one independent, one independent with clutch, and one driving the rotovator.

Bouyer supplies a wide range of attachments for use with all three tractors, though sizes differ. These include many variations of plows such as a reversible plow, universal hitch, rotovator, cultivators, toolbar frame for carrying hoes, potato lifter, four-row seeding drill, two-row drill seeder and fertilizer combination, spraying equipment and trailer reservoir, irrigation pump, sickle bar and rear rotary mowers-disc harrows, and many wheels for better traction in both wet and dry cultures. At the time of this writing, Bouyer is interested in establishing a distributor in North America.

Bouyer
B.P. 23
Tomblaine 54510, France

**Sagisag Model A by Mametora**

Any engine of a farmer's choice can be mounted on the basic engine frame. An overdrive clutch mechanism provides transmission efficiency when changing the all-gear transmission with 12 forward and six reverse speeds. Electric start and headlight are provided. The 16-blade rotary tiller tills 13 centimeters deep and 60 centimeters wide. The manufacturer claims a capacity of 2 hectares per hour with tiller; the plow attachment takes 75 minutes to cover the same area.

Tramat Mercantile, Inc.
747-749 Gandara St.
Sta. Cruz, Manila

**Mametora Power Tillers MC**

Three models are available from this company, no horsepower ratings are given. All have four-cycle, vertical, monocylinder engines with air cooling, two power take-off shafts, V-belt and gear-driven transmission with two forward and one reverse speed.

**Mametora Power Tiller HMD**

A 7 h.p. unit has all-gear transmission, eight speeds forward, four reverse and a four-cycle, 252-cubic centimeter engine. Attachments include a rotary plow, side and middle furrower, puddling wheel and rakes, power transmission pulley, and trailer.

Other models are available.

**Mametora Return-Culti**

The Return-Culti is the largest of the many walking tillers Mametora produces. It is available with either a 4.5 or a 6.5 h.p., four-cycle, air-cooled, gasoline motor, both units operating with two forward speeds and one reverse speed; however, the larger model has three forward speeds for the rotary tiller. The front-mounted rotary tiller has the unusual feature of operating both in forward and reverse, hence the name Return-Culti. Handles are adjustable 180 degrees in all directions, and the unit's low center of gravity makes it safe for working on slopes. It is most suitable for operations in mulberry fields, orchards, tea plantations, and vegetable gardens, and in addition to cultivation and weeding, can conduct various operations such as fertilizing, cutting stalks, and dislodging roots with a winch mechanism mounted on a frame. The Mametora power tiller Model HMD-25 is a 7 h.p. unit designed for plowing, rotary cultivation, side and middle furrowing, and paddy operations. Some of the more unusual attachments include a two-wheel carrier set for carrying compost and fertilizer, a special blade and cover for making trenches and a mulch dispenser for rolls of plastic. Weight: 97 kilograms without engine.

Above units manufactured by:
Mametora Agricultural Machinery Co., Ltd.
9-37 Nishi, 2-chome
Okegawa, Saitama, Japan

**ISEKI Power Tillers**

The Iseki Model KS500 is more than a tiller. Its four-cycle, air-cooled, 5 h.p. gasoline engine has six forward and two reverse speeds transmitting power through a gear-/chain-drive system. A few of its many attachments include puddling rotor and puddling rake, turn-wrest plow, ridger, power take-off pulley, auger-digger, as well as a rotary tiller. Another model, with the option of a two- or four-cycle, air-cooled gasoline engine weighs 180 pounds and operates a number of attachments also, including snow-handling and cultivating equipment. It has four forward and two reverse speeds; the main engine shaft is V-belt driven and the traveling section is driven by a gear-chain combination. The power take-off has two speeds.

Iseki Agricultural Machinery Mfg. Co., Ltd.
1-3 Nihonbashi, 2-chome, Chuo-ku
Tokyo, 103, Japan

**Land Master Lion**

The Lion is available with either a 7 h.p., four-stroke engine or a 6 h.p., two-stroke engine. Two forward and one reverse speed. Attachments include moldboard reversible or non-reversible plow, ridger, rotary cultivator, hoe, puddler, seeder, potato lifter, water pump (27,000 liters per hour, 7.6 meter head), and a thresher for rice and barley with a capacity of 140 kph.

Land Master, Ltd.
Sterte Rd.
Poole, Dorset BH15 2AF, U.K.

**WB Power Tiller Model WB1-A**

Powered by a four-cycle, single-cylinder, 8 h.p., air-cooled gasoline engine, Model WB1-A is made of heavy steel pipe framing and steel parts adaptable to local (Philippine) conditions with economical maintenance costs. Another unit is available fitted with a 10 h.p. engine. Accessories include moldboard plow, spiral plow, adjustable peg-toothed harrow, paddling steel cage wheel for wet plowing, paddling steel wheel for dry plowing with or without hub adaptor, wheel weight, pneumatic rubber tires, and rotary hoe with 12 blades. The company does export.

Warner Barnes Engineering

2900 Faraday Street cor, South Expressway
Makati, Rizal, Philippines

**Staub PPX**

Staub offers a wide product line of different-sized tillers and walking tractors. The PPX is one of their most versatile walking tractors. It is powered by a 322-cubic centimeters, four-cycle, 7 h.p. diesel engine. The gearbox houses three forward and two reverse speeds which are controlled by means of a single lever which changes gears and locks the wheels in drive position. Two connections for power take-off are mounted in the rear. Handle assembly is adjustable to all positions and reversible for use with the cutter bar and certain other tools. Attachments include rotary cultivator, plow, toothed cultivator, harrow, trailer, cutter bar, rotary mower, advanced hoe, sower, scraper blade, brush clearer, pump, and saw.

Societe des Tracteurs et Motoculteurs Staub
25, Bd de Verdun
92402 Courbevoie Cedex, France

**Honda Two-Wheeled Tractors**

A range of models from 2 to 8 h.p. is available with attachments including plows, ridgers, rotary cultivators, and various types of puddling equipment.

Honda Motor Co., Ltd.
Tokyo, Japan

**U 1200 Two-Wheeled Tractor**

This tractor can be fitted with gas or diesel engines of 8 to 10 h.p. It has a gearbox with three forward and three reverse speeds, and a choice of six PTO speeds. Attachments include mower, rotary cultivator, plow, ridger, harrow, hoe, potato lifter, trailer, sprayer, and belt drive for stationary machines.

Iruswerke Dusslingen
7401 Dusslingen
Postfach 128, West Germany

**Two-Wheeled Tractors**

Six h.p. gas-engined and 12 h.p. diesel-engined tractors are manufactured, together with a range of attachments including plows, rotary cultivators, tined cultivators, mowers, trailers, and others.

Gebruder Holder Maschinenabri[illegible]
7418 Metzingen/Wurtt
Postfach 66, West Germany

**Krishi NV 700 Power Tiller**

This machine has a 7 h.p. diesel engine and a four forward, two reverse speed gearbox.

# "DEAR DETROIT, THANKS, BUT NO THANKS"

by Gene Logsdon

If American business is really interested in satisfying *my* needs, I haven't seen a whole lot of proof. I never needed or wanted these gas-hogging, chrome-laden, corner-lurching monsters Detroit built for me for so many years. For their error, our car makers had to watch Volkswagen take all that money away from them with an ugly little car Detroit thought Americans were too dumb to buy.

The tractor makers haven't learned their lesson yet, it seems. I don't doubt that those new 20 to 30 horsepower tractors that appear to be tailored to the homestead are worth $6,000, or at least have $6,000 worth of parts and labor in them. But many of the refinements on those tractors aren't necessary or affordable for the homesteader whose aim is not to generate cash profit from his food production. The tractor I need does not have to be a powerhouse that can do everything except brush my teeth. For instance, it doesn't need rubber tires. Iron wheels would be just fine and would never go flat. I'm not going anywhere with this tractor except back and forth across my little 20 acres, slowly. I don't need a dozen forward speeds. Two will be adequate—and one reverse. My tractor needs no expensive shock system. Any bumps on my place I intend to engage at one or the other of my two forward speeds—slow and slower. I do not need a bucket seat, cigarette lighter, twin-beam headlights, dashlight, radio, cab, high-capacity hydraulics, double-plate clutching, syncromesh gears, hydrostatic transmission, or power steering. All I want is something that will pull as much as three horses and just as quietly.

Can't American technology come up with a long-lasting, easy-running, air-cooled engine so we can dispense with radiators once and for all? A motor that chugs easily along like the old two-cylinder John Deeres would be wonderful. And speaking of old John Deeres, why can't my ideal tractor have an easily turned flywheel crank so I can dispense with high-priced batteries that always seem to be dead when you need them most?

Lastly, is it too much to ask for a tractor which even a mechanical simpleton like myself can take apart easily? I don't mind buying new parts for a piece of machinery if only I could replace them myself. It seems to me that a simple tractor that takes the place of three horses should come apart with any good set of wrenches so that you can get to any broken piece in less than an hour.

The real reason I haven't seen the tractor of my dreams might be that it wouldn't make enough profit for the manufacturers and dealers. Several years ago, I was involved in an article about how farm equipment companies were coming to the aid of underdeveloped (how I despise that word) countries. I don't know if anything came of their praiseworthy plans, but in the course of talking to one executive, he described to me what his company had in mind. They intended, he said, to build a low-cost tractor with a four to six horsepower engine that would still pull the tools similar to, but improved over, those which draft animals traditionally pulled (which our 15 horsepower lawn tractors won't pull). The tractor would be so simple and durable it would rarely need repair work, but when it did, even a mechanical ignoramus could fix it most of the time.

I gasped, genuinely impressed. "That's the kind of tractor *I'm* looking for," I exclaimed. "Why don't you sell it in the United States?" He laughed. No, Americans wouldn't buy that kind of tractor. Market analyses showed Americans buy for status and would reject a truly economical tractor, he said. Then, seeing disbelief written all over my face, he weakened in a moment of candor. "Actually," he said with a grin, "we're afraid to market that kind of tractor here. It might capture too much of the market where our more profitable models are doing nicely now."

Another aspect of the company's plans for a simple tractor was even more significant. The plans called for a very small tractor not only because of cost and simplicity of operation, but also so that it would not give one small farmer any competitive advantage over another. The idea was just to *replace* the farmers' present power unit—draft animals—not to make it possible to farm more land. The tractor was intended not as a machine for aggrandizement which would eventually put the land in the hands of fewer people and destroy the present social structure, but which would only relieve some

of the toil of primitive farming, redirect more food from draft animals to humans, and improve production because the tractor implements work the soil better.

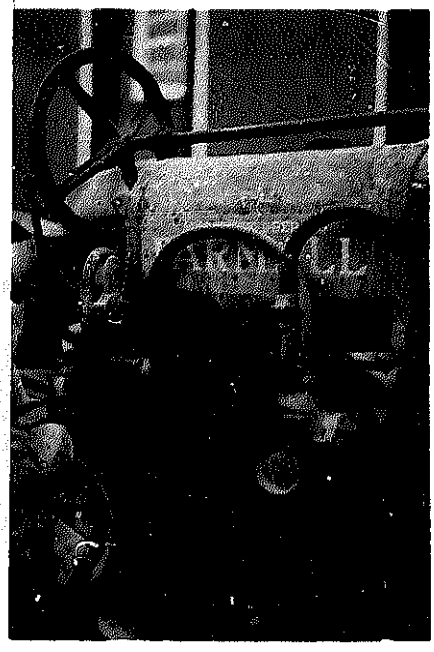
I don't know whether replacing hand and animal power with machine power is right for underdeveloped countries in the long run, but the thinking of the equipment company is revealing indeed, and certainly a step in the right direction. Someone evidently realized that what we have done in the United States might not be the best way to develop a country. The tractor never replaced the horse in this country; it replaced the farmer. The more powerful the tractor, the more farmers it replaced. At no time were the promises of the Machine God fulfilled except temporarily to the survivors in the get-big-or-get-out race. Each improvement in machinery meant more farmers out of business, so that today less than 5 percent of the United States' population produces the food and owns the land. What a shame.

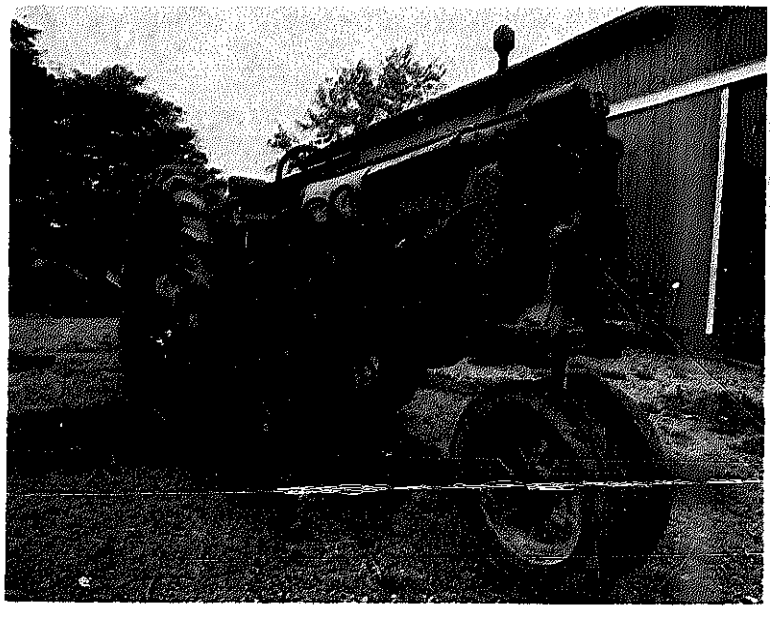
The only practical solution I found was to look for an old run-down tractor and repair it. You know the old saying, "They laughed when I sat down at the piano." Well, my friends absolutely roared when I sat down under an old junk tractor and said I was going to make it run again. I can't blame them. As my wife would put it, I have just enough native mechanical ability to unlock a door—if someone turns the key for me.

But to tend my 20 acres, I had to have a small, farm tractor. Something that would pull a seven-foot sickle mower, or an eight-foot disc, or a two-bottom plow. Twenty-five horsepower would do just fine. And naturally I wanted a tractor that wouldn't cost much.

That meant finding a junk tractor and burying myself in grease and gasket glue for a month or two of weekends, a prospect I did not find inviting. But wasn't I the one who was always pointing out that the homesteader who could not be his own handyman and mechanic was headed for failure? It was time to practice what I preached.

*Hydraulic improvisation*





***With a bit of ingenuity, tractors can be modernized like this old Farmall F-12. The owner installed a hydraulic lift system, covered the steel wheels, and now prefers this tractor over his many others for all his farming chores.***

The used tractor market is a never-never land of intrigue and mystery, I soon discovered. In no sector of our economy does free-enterprise capitalism flourish so vigorously. Demand is the whole game. A tractor that ten minutes ago was worthless (which means priced under $300) suddenly rises in value to $950 because a couple of what the tractor salesmen refer to as hobby farmers showed interest in it.

In the horsepower range I was looking for, old Fords, Fergusons, Ford-Fergusons, and John Deeres with three-point hitches are in biggest demand right now. Such tractors in good running order will sell for over $1,000 (1975 price). Comparable tractors without three-point hitches go for around $700. If in poor shape, both kinds of tractors could be as much as $400 lower. So, for one of the less desirable models in poor shape, you might pay around $300 and put it in running order for as little as $200 more, not counting your labor. But even if you had to shell out another $200 for repairs, you'd still have a good bargain.

I didn't really need the convenience of three-point hitch equipment, so I decided on one of the less desirable old tractors. I selected a WD Allis-Chalmers made about 1950. For one thing, I could get it cheap, and second, the owner was an especially nice fellow who let me use his tools and helped me with the overhauling. Third, the WD is a fairly simple tractor to take apart and put together. Fourth, it has a reputation of running even for hammer-head mechanics like me. Fifth, the WD has a power lift system almost as convenient as the three-point hitch. And finally, the tractor has both a hand and a foot clutch, which gives you the equivalent convenience of live power take-off found on modern tractors.

My son and I have the tractor running well enough to work our wheat field and mow the fall pastures, and it only cost me $500. There's more work to be done, but I have all next winter for that and I figure I'm still ahead with my old junk. Before long it will be as good as new.

*Old steel wheels are kept from the junkyard by bolting rubber treads over them.*

But I'm not the only one who prefers the older models. "I farmed my 132 acres in my spare time for about 25 years with tractors in the 20 to 30 horsepower range," says Harrell Noble from Xenia, Ohio. "Mine were old tractors when I bought them, and I still use them. I don't think it makes much sense for a part-time farmer to invest $5,000 to $7,000 in a new tractor. On my kind of farm, plowing 1½ acres per hour with my older tractors seems more sensible than plowing four to six acres per hour at five to ten times the investment."

*This old Farmall is like just another member of the family.*

Noble's first tractor back in 1952 was an Allis-Chalmers WC, which with an old disc, plow, manure spreader, and row planter (the tools you almost must have at the start) cost him around $700. Next he bought an F-20 International (1939 model) so that both he and his son could work in the field at the same time. His third tractor, a rebuilt 1942 Farmall H, he still refers to as his modern tractor. He's had two more over the year—another F-20 made in 1935 and a Farmall M which would pull a three-bottom plow.

"One advantage of buying older tractors is that you can afford more of them," says Noble. "Having several tractors can be very handy. At haying time, for instance, you don't have to keep hitching and unhitching tractors. We could leave the mounted cultivators on the H, rather than having to take them on and off for other pulling jobs. We'd use the Allis-Chalmers to pull the mower, one F-20 to rake, and the other F-20 pulling the baler. With the hay all mowed, the Allis-Chalmers was free to pull the wagons back and forth from the barn to the baler in the field."

But having an extra tractor can repay its cost in more than just convenience. "One year, one of the tractors broke down when we had a lot of hay ready to bale. The repairman couldn't get it fixed until the following week," recalls Noble. "I quickly hooked another tractor to the baler, with still a third one free to haul the loads of bales to the barn. Just as we finished, a rainstorm struck and the weather remained wet for a week. Having that extra tractor saved 50 tons of hay, in those days worth $1,000. We literally paid for two of those tractors in one day."

Jerry and Jean Harper in Indiana also have two tractors, which they refer to as "His" and "Hers." "His" is a Farmall H, 1952 vintage; "Hers," a Massey-Harris of about the same age. The Farmall needed a complete overhaul when they bought it. Harper tore it down, took the head to a

machine shop for valve grinding. He put in new pistons, rings, sleeves, rod bearings, and crankshaft bearings at a cost of about $100 plus labor.

When I was overhauling my WD Allis-Chalmers, after I got my tractor torn down, I found just about everything was worn out, so while new parts are still available from the company, I went whole hog and had a mechanic rebuild almost everything. Now I have a fairly new 25-year-old tractor at a fourth of the cost of a similar-sized new tractor. An additional benefit you sometimes gain from keeping up a vintage tractor is that it begins to accrue antique value after awhile. Restoring old tractors has become almost as hot a hobby as restoring old cars.

Another thing—get the service manual for your tractor if at all possible. On most makes, they are still available if the company is still in business. Extra-proper care is necessary for old tractors, and you just can't know everything you should do without the manual.

"By all means, get the service manual," seconds Bill Bennett in Wisconsin, who owns an older Ford 8N, the most popular homestead tractor of all. Manuals for most major models of tractors (Allis-Chalmers, David Brown, Case, Deere, Ford, International Harvester, Massey-Ferguson, Minneapolis-Moline and Oliver), both new and old, are available from I & T Shop Service, Technical Publications, P.O. Box 12901, Overland Park, KS 66212. Bennett began homesteading in 1972 on 40 acres. "About 37 acres were under rental contract to another operator the first year, so we could handle three acres with our big tiller," he says. "But when the 37 acres came out from under the rental, we knew we had reached beyond the tiller stage.

"Some folks opt for the big suburban garden tractors, mistakenly, I think. They are fine for a couple of acres, but not for a small farm—and they cost as much per pound as a Cadillac."

First, Bennett checked out the moderate-sized new tractors on dealer lots. "They are exciting machines with many improvements over older tractors, but cost at least $5,000—hard to justify on a not-so-commercial farm." So he started out on a quest for the simplest, cheapest, used rig in the real tractor category.

"We narrowed our search to the Ford models 8N, 9N, and 2N (depending on year of manufacture, 1939 to 1952); Massey-Ferguson models 20 and 30; the John Deere B; the Allis-Chalmers WD; the Farmall A, C, and H models; and the Case C and D. Fords seemed less rare than the others, so we tried to find one. Finally opportunity knocked. A machine repair shop in the township offered a shining 8N, overhauled, restored, repainted and guaranteed for $1,600. With it was a useful, hydraulically operated front-loader, said to be worth another $400. The tractor also had a two-range transmission, which means you can gear down and creep in difficult pulling situations. That provided eight forward speeds, as contrasted with the usual four on a model 8N—an accessory said to cost $200. So we figured the tractor was a good buy and have never regretted our purchase."

The earlier model, 9N (1939 to 1947) offers three forward speeds, while the 8N (1948 to 1952) has four. "You can't pull much of anything in fourth gear," explains Bennett, "but it allows you to speed up to twelve miles per hour over the road, handy for tooling over to the local garage for a tune-up."

Both these popular old Fords are rated at 23 horsepower. They are heavy and rugged and will handle a one- or two-bottom mounted plow, or an eight-foot disc, mounted or trailing.

New parts for old tractors are obtainable through the dealers who sell that make of tractor. New parts, even for older tractors, are not cheap. You can sometimes save appreciably by shopping the huge used tractor and junk tractor centers located all over the Midwest. Ask farmers or mechanics in your area for the supply centers closest to you. Some of them are: Worthington, MN 56187; Wenger's Farm Machinery, Inc., South Race St., Myerstown, PA 17067; Al Galloway, St. Johns, MI 48879; Willard Equipment Inc., St. Rt. 99N, Willard, OH 44890; and Central Tractor 1515 East Euclid, Des Moines, IA 50313. I've gotten parts at Willard. There are thousands of junked tractors there. It's a tractor restorer's paradise—or maybe nightmare. Dealers seem to have a pretty good idea of what they have in all that mess, so it pays to call ahead. But it pays to go looking in person, too.

"One place that sells the gamut of vintage tractor parts on a mail-order basis is the Tractor Supply Co., 7910 L Street, Omaha, NB 68127," says Bennett. "The company issues a big catalog annually and also has stores in farm towns in 27 Midwest states." Surplus Tractor Parts Corporation, P.O. Box 2125, Fargo, ND 58102, ships worldwide, and has a catalog available for $1.

An English-based company, the Vapormatic Company Ltd., P.O. Box 1, Budleigh Salterton, Devon, EX9 6JB, England, also specializes in tractor replacement parts for all major models. It has associate companies in several countries around the world, including Australia, Ireland, France, Holland, South Africa, Northern Ireland, and the United States.

Finally, where do you find the tractors? This is one time when the classified ads can be most helpful, especially in rural newspapers. Or even more especially, rural trading papers that are nothing but classified ads.

The second best place is at farm sales. Look at the sale announcements in your papers. Farm sales are usually on Saturday, and the notices always list the machinery to be sold several days to a week early. The third best place is at dealer lots. Even when dealers don't have the old equipment you need, they sometimes know where some is available.

I'm forever griping that the farm machinery manufacturers don't make tools to fit the two- to 20-acre homestead. But every time I wonder out loud "why don't they make such and such," sure enough I soon find out someone *is* making such and such.

Those of us familiar with the old Allis-Chalmers model G tractor remember its passing with tears in our eyes and terrible envy for those still lucky enough to have preserved one. The G is the ugliest tractor ever built; it looks like an arthritic spider trying to do push-ups. But there is no handier cultivating machine ever made for the large truck garden. It will turn sharp enough to turn itself inside out, and can be maneuvered (from the seat hovering over the plants) so easily that you could tickle the potatoes in their hills without harming them. No machine is designed to take attachments easier or can be repaired with less trouble. The G doesn't wear out—and the only way to get one is to inherit it.

*The original Allis-Chalmers G: "The only way to get one is to inherit it."*

But G lovers don't have to eat their hearts out any longer. There's a new small tractor on the market that looks and acts a lot like the old G. It's called Tuff-bilt, made by Tri-Tractor Manufacturing Co. (Rt. 1, Hwy. 19 North, Cumming, GA 30130). When I first heard about the tractor, the rumor going around said that the company was so small you could order your tractor in any color you wanted. "Well, that's not quite true," says Jerry Gravitt at Tri-Tractor headquarters in

Cumming. "That story got started because all the other machinery companies who wanted to sell the Tuff-bilt wanted it painted in their own colors. So we painted 'em orange, blue, or green depending on whom the order was for."

The tractor runs on a 16 horsepower, air-cooled, Lawson Tecumseh engine with all-gear drive and individual left- and right-hand brakes. It uses only about a gallon of gas an hour and has plenty of high clearance so you can cultivate over corn and other crops with ease. Cole and Brinly-Hardy tools fit the tractor, and there are all kinds of other attachments too—mower, 12-inch plow, 26-inch disc plow, cultivators—the works. The price is just under $2,800, which isn't bad considering that this is about all the tractor you really should need for handling 20 acres or so. "With a complete set of tools, you're talking about $4,200," says Gravitt, "which is quite a bit less than just the basic price on a regular small tractor."

Another company to bring back a version of the Chalmers G is John Blue with their Model G-1000. It's a bit larger and heavier than Tuff-bilt but the design is right there. With the engine mounted on the back, there is better traction and the front is left with clear visibility. Implements attached to the front let the operator watch with greater ease and drive with greater accuracy.

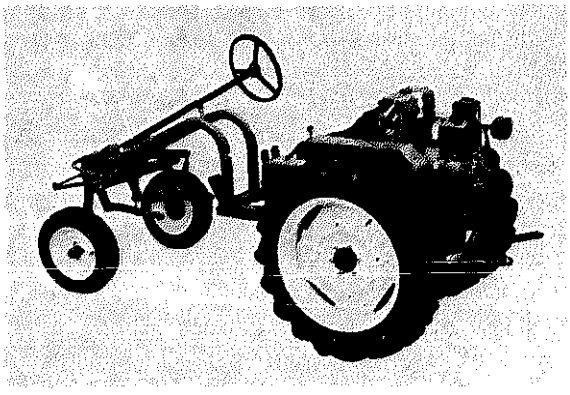
The Blue G-1000 had a slow start when it came out four years ago. "It was a novelty and folks were skeptical," reports Cecil Walker of their Bowling Green, Ohio, plant. But now it is really catching on with weekend farmers and garden folks—the garden implements are going with it. Surprisingly enough, sales have really taken off in Chicago.

Hefty has two models of the old-style G, a 27 horsepower, rear-mounted unit and the Hefty Hi-G. The Hi-G was particularly designed for nursery and agricultural applications where 36 inches of clearance and unrestricted visibility are required.

## NORTH AMERICAN SOURCES OF MODEL G TRACTORS

### Tuff-bilt

The smallest of the new G models available, the Tuff-bilt has a 16 h.p. engine for powering the liquid-cooled, hydrostatic transmission and two category O three-point hitches with 400-pound lifting capacities, front and rear. Implements available for use on the Tuff-bilt include front and rear cultivators, front attachment for the Cole No. 12 planter (page 204), disc harrow, three-point drawbar, 12-inch-bottom moldboard plow, 54-inch grader blade, a 26-inch disc plow and rotary mower.



*The Tuff-bilt tractor—a lot like the Allis-Chalmers G.* Tri-Tractor Mfg. Co.

Tri-Tractor Mfg. Co.
Rt. 1, Hwy. 19 North
Cumming, GA 30130

### Blue G-1000

The Blue G-1000 has a 16.8 h.p., water-cooled, four-cylinder gasoline engine. It has a Warner gear transmission with three forward speeds, and high and low reverse speeds. Hydraulic lift is standard but the live PTO is optional. The G-1000 can be operated with a single-row cultivator, 12-inch moldboard plow, 60-inch three-spindle mower, 6-foot single-section disc harrow, or a 5-foot spring-tooth or spike-tooth harrow.

John Blue Co.
P.O. Box 1607
Huntsville, AL 35807

### Hefty Hi-G

A high ground clearance of 36 inches provides the Hi-G with its outstanding feature and its name. As is characteristic of all type G trac-

*The Hefty Hi-G*

*The Hefty-G*
Diana Branch

tors, its 27 h.p., water-cooled, gasoline or diesel engine is mounted in the rear, and the driver enjoys unrestricted visibility. A front-mounted, three-point hydraulic implement lift system or rear-mounted hydraulic furrowing bars support the ground-working tools. Its high ground clearance design is particularly suited for nursery and agricultural applications, but the high center of gravity makes it unsuitable for working on steep slopes. The selective sliding gear transmission has six forward and one reverse speed, providing a maximum forward speed of 13 kph. The 2- by 4-inch, welded rectangular steel tube frame is 82 inches high to the top of the steering wheel, has a 76-inch wheelbase, and weighs 2,440 pounds. A 12-volt electrical system operates a starter, generator, and four sealed-beam headlights. Available as optional equipment are a 540 rpm power take-off, live engine speed, front center power take-off, two-cycle, water-cooled diesel engine, variable tread widths as low as 4½ inches or up to 120 inches, single-row or multiple gang independent cultivator assemblies, rear hydraulic furrow and bar assembly, and rear drawbar kit.

**Hefty Gw**

Incorporating the same engine, transmission, and frame construction as the Hefty Hi-G, the Hefty Gw has a lower center of gravity with its

lower, 19-inch ground clearance. The wide wheelbase straddles up to four rows or more of vegetables, reducing planting, cultivating and thinning time. It also has two specialized power take-off shaft outlets: one live at engine speed, one synchronized with ground speed. Optional implements include a 60-inch mid-mount rotary mower, single- and two-row cultivators, Danish fiber tine, spring-trip and spring-tine, double toolbar cultivator, midmount blade, and hydraulically controlled rear-mount furrowing bar with shanks. If you want the lower center of gravity of a Hefty but don't need the wider wheel base, a model called the Hefty G is available with a narrower wheelbase.

Juneau, WI 53039

# YE OLDE CHALMERS B AS HOMESTEAD TRACTOR

by John F. Sutton

If you're looking for a economical homestead tractor, you might consider one of the earliest of the utility-type tractors, the Allis-Chalmers Model B. This machine could be the workhorse tractor of today's homestead.

Rated at 20 horsepower, the B is considered a single-plow tractor, but depending upon soil types and conditions, it is capable of pulling a double plow.

While the B is a farm tractor in size, its power, workability, and durability make it superior to any of today's largest garden tractors, and its price, $150 and up, is a far cry from any other farm tractor or new 20-horse garden tractor.

A wide variety of attachments were produced for this versatile little tractor—mowers, cultivators, single-bottom mounted plows, and a rather unique two-way plow designed to allow plowing while traveling back and forth on the same furrow.

Don't limit yourself to mounted accessories. The B can easily pull a variety of manure spreaders, trailers, discs, drags, and planters. The power take-off will handle balers, blowers, rakes, and, best of all, the belt pulley will power feed grinders, saws, and small threshing machines, which are so handy in homestead and small farming operations.

Some of these tractors are equipped with a small hydraulic system capable of handling mounted plows, cultivators, and other assorted lightweight implements. For the most part, snow blades and manure buckets are homemade and thus of a wide variety.

*Sutton on his old Chalmers B.*

The B was introduced in 1937 as a lightweight general-purpose tractor; it is precisely this age factor which makes the B a very attractive tractor for the homesteader. Because of its age, the B often sells for less than $300 at farm auctions and between $300 and $500 through tractor dealers.

Even here in Wisconsin, where these tractors are highly prized by tobacco farmers, the prices remain low. Also, because of their age, they are simple machines and are economical to operate.

I prefer the hand start model, because of the simplicity of the mechanical workings of the tractor. The only concern with a hand start is the potential kickback of the cranking handle. Any indication of a backfire or kickback is a sign that it is time for maintenance.

At any rate, if you hold the crank properly (that is, with your thumb on the same side of the handle as your fingers), at most the flying handle may kick back and sting your hand, but there will be no broken bones.

Can you really homestead with the old Chalmers B? Absolutely! I have heard of people farming up to 80 acres with one B and a few attachments. My father-in-law farmed 280 acres, including up to 21 acres of tobacco, with a couple of Bs, an old Chalmers WC, and a good team—and with one of the Bs running the milking machines for 40 to 45 Jersey cows.

My wife, son, and I recently raised two organic acres of tobacco with our oldest B (hand start) doing all of the disking (no plowing) and all other soil preparations, planting, cultivating, and harvesting. And the old B could have handled more acres had we the time and fortitude.

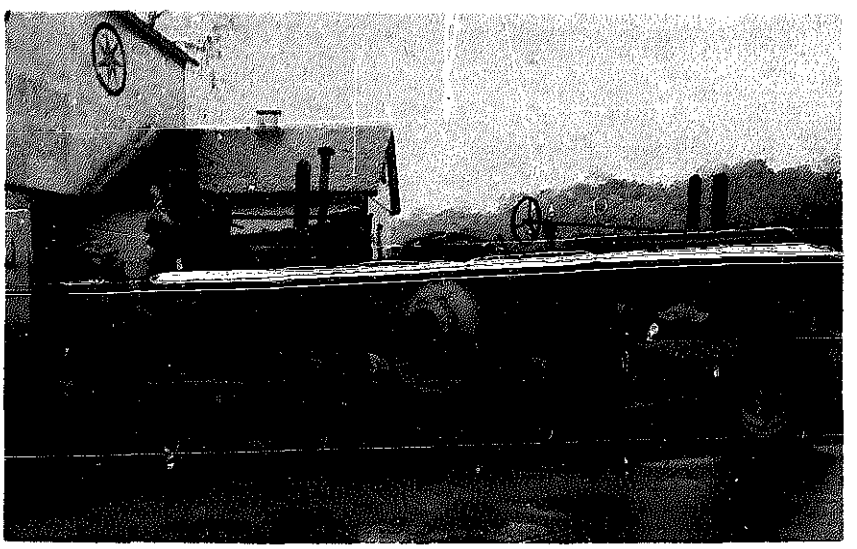
Parts for all models are still readily available and inexpensive if purchased wisely.

# THE CARE AND FEEDING OF TWO-CYLINDER JOHN DEERE TRACTORS

**by Arnold Voehringer**

The big, green, two-cylinder John Deeres of the pre-World War II years stand almost in a class by themselves as models of appropriate technology. They were built with one goal in mind—to perform the jobs for which they were intended as simply and economically as possible.

The two-cylinder John Deere is a fine example of form strictly following function. With its low compression ratio, it seems to run on just about anything. That little tank behind the main tank is for gasoline to start the tractor and warm it up. Then you switch to the main tank, which can contain kerosene, heating oil, or diesel fuel, as well as regular gas.



*"No better tractor," says Arnold Voehringer of his vintage John Deeres. The 1936 and 1939 (styled) Bs seen here are adapted to a wide range of jobs on farms of all sizes.*

The rugged elegance and almost primitive simplicity of design that are the trademarks of those machines that came out of John Deere's Moline, Illinois, shops are typified by features such as their flywheel starting system. While other manufacturers introduced fancy self-starters with batteries that went dead, and crank starters with their penchant for kicking back and breaking thumbs, John Deere opted for the big exposed flywheel, which almost always turned over on the first or second turn. The operator simply opens the petcock for each cylinder and pulls the flywheel (my wife can start our B with one hand) to top dead center, at which point the magneto fires and the tractor snorts to life.

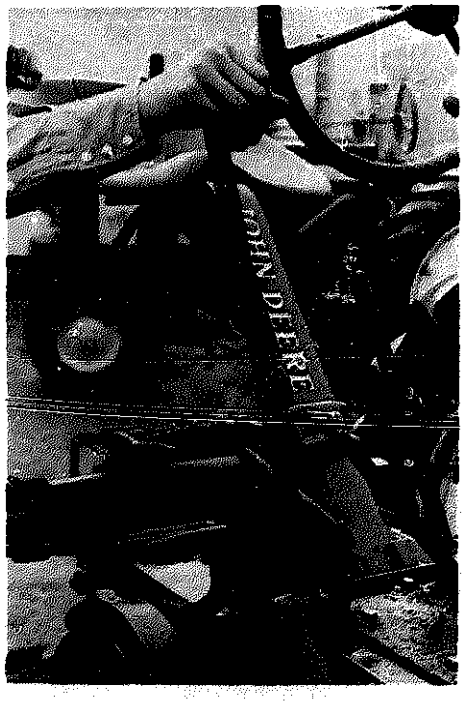
The thermo-syphon cooling system bypasses the need for a water pump by capitalizing on that elementary law of physics that says hot water rises and displaces cold water in a closed system.

Another advantage of the old Deeres is the safety aspect of the hand clutch. When a foot slips off the pedal of a conventional clutch and the tractor lurches forward, the result is potentially catastrophic. Should the A or B with hand clutch jerk forward, it effectively pulls the clutch rearward and the tractor stops.

With their low center of gravity created by the horizontal engine, J.D.s are less prone to rolling over on hilly terrain. Also, with the engine closer to the rear axle, traction is improved. While this means the front end is correspondingly lighter, it can be correctd simply by the use of front-end weights.

But even beyond the hand clutch, the flywheel starter, and the interchangeability of parts, the old Deeres had something else going for them. They sounded right. It's a sound no one who is familiar with the unmistakable, sunup to sundown putt-putt of a two-cylinder J.D. going about its business on some hillside halfway across the county, or who has experienced the magnificent, unmuffled din of that engine set at full throttle for filling silo, is ever likely to forget.

With just two cylinders, there are fewer parts to replace and repairs are easy, even for the operator with very limited mechanical aptitude. With a peak rpm of 975, the John Deere A is a relatively low-revving engine, and is much less sensitive to exact tolerances than modern tractors. Just about everything that can go wrong can be fixed by anyone with a maintenance manual and some basic tools. Adjusting the clutch, for instance, almost invariably means an expensive trip to the



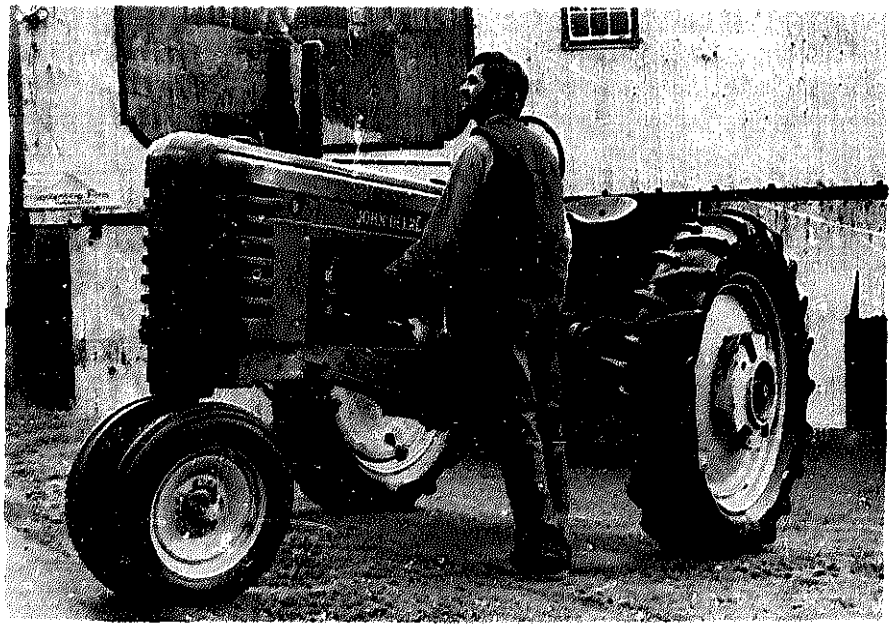
*The hand clutch is a real safety plus, especially with young operators.*

dealer with any modern tractor. All that's required to do the same job on an A or B are pliers and a ¾-inch wrench. Likewise for the carburetor adjustment. You just turn in the screw till you hear the pop, then turn it out until the black smoke appears. With the bearings, both the main and the connecting rod bearings are simple to adjust—a far cry from some of today's sealed roller bearings. The same simplicity applies to work on the steering, ignition, brakes, and any number of jobs that are major headaches with more sophisticated technology. Even the transmission, with its big, rugged gears and one-piece housing, is much less intimidating than its bewildering modern counterparts. Since the crankshaft turns parallel to the rear axle, not perpendicular as is the case with most later transmissions, the power is transmitted directly through the spur gears instead of around corners.

Unlike some other tractors of similar vintage, parts are still widely available for elderly J.D.s. The regional farm magazines regularly run ads from parts dealers. Many John Deere dealers still have parts on hand or can order them. The dealer is also the place to order a repair manual and parts book, both of which are worth their weight in gold if you do your own repair work.

This discussion is confined to the A and B models, since many more of them were made and, consequently, are still available. The two models were designed for two specific categories of farmer.

On my own hillside farm near Kempton, Pennsylvania, I use my 1936 B for mowing in the summer and sawing firewood in the winter, my 1939 B for cultivating, a 1947 A for disking, drilling,



*"Just turn in the screw until you hear the pop, then back it off until the black smoke appears."*

and spreading manure, a 720 diesel for plowing, baling, combining and picking corn, and a 1939 G for hayridges, secondary tillage, pulling wagons, and running a hammermill.

For the small farmer with five or ten acres and no more four-legged animals than, say, a horse and a goat or cow, the B is ideal. Unless it's a late model, big-piston B, or you have exceptionally loose soil, don't count on pulling more than a two-bottom, 12-inch plow. The A is a different story. You can run a 60-inch flail chopper, a baler, a combine, or a four-row front-mounted cultivator with an A. It may not get over the ground quite as fast as some of today's behemoths, but it's just right for most jobs on the small farm.

The big difference between John Deere's letter series (A and B) and their corresponding number series (60 and 50) is that the latter offers live hydraulics and live power take-off, a real asset when it comes to baling, combing, and corn picking. If you have live PTO and your baler starts to jam,

you can pull out the clutch to stop the tractor without stopping the baler. Without the live PTO, the baler stops too, and once you stop a jammed baler, you'll never get it started again without unplugging it by hand. Three-point hitch attachments can be purchased for the A or B, enabling the operator to use the full range of newer implements.

The B started out in 1935 with a drawbar horsepower rating of nine and ended up in 1952 with a rating of 20. The A started out as a 16 horsepower drawbar tractor in 1934 and finished in 1952 with 26. Until the big tractors (40 horsepower and up) started to arrive on the scene around wartime, these tractors were generally regarded as *the* best source of power. Today, by virtue of their size and weight, they are often better-adapted to operations on the small farm than their streamlined modern counterparts.

Fortunately, many two-cylinder John Deeres in good condition are still available at sales. In the eastern U.S.A. (in 1977), Bs are bringing from $00 to $700, As about $1,000. The 50s and 60s are a little higher.

When sizing up old J.D.s at a farm sale, how do you tell a good one from a clunker? Here are a few easy checks:

1. Check the side play in the hand clutch. There is no grease fitting at the bushing, so unless a new bushing and pin have been installed (which you can usually tell), this play is a good indication of how hard the tractor has been used. Anything over three-inches play should be viewed with caution.
2. Check the play in the radiator fan. Again, three inches should be about tops, although I've seen four and five inches of play in tractors still being used daily.
3. Check the steering wheel play and the brake pedal side play. The left pedal may be a little looser, especially if the tractor has been used mainly for plowing with a conventional plow.

*Flywheel starting beats cranking any day, the author reports.*

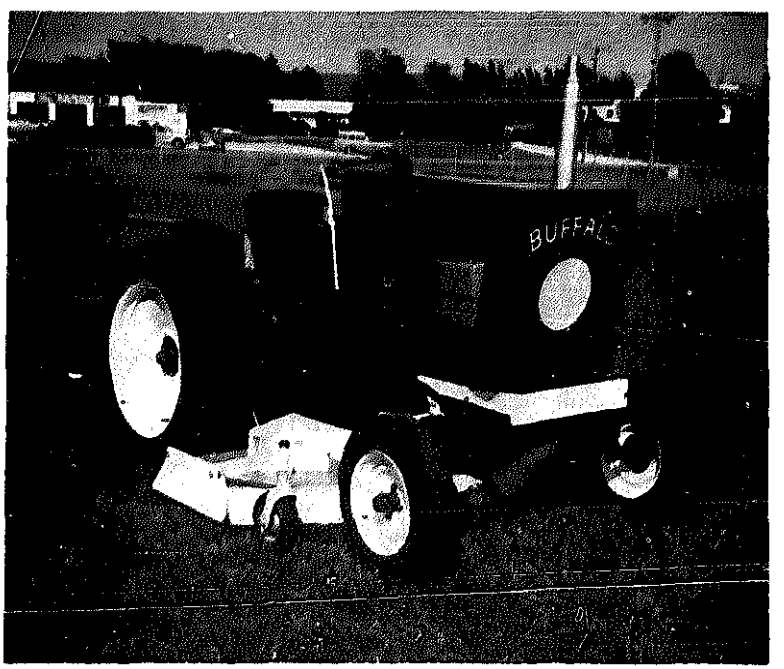
4. Grab the flywheel and try to shake it. If it moves more than the slightest bit (.010 inches), steer clear.
5. Check for large leaks from oil, water, transmission, gear oil, and hydraulics. There should be no signs of oil in the radiator or water in the crank case.
6. Check the block and manifold for cracks. With two cylinder J.D.s, if you can't see the cracks there probably are none.
7. Check the rear-end housing. The best of the three types John Deere used is the Power-Trol, which allows the use of either a single- or double-acting hydraulic cylinder.

With so much to recommend them, what are the chances that John Deere might be prevailed upon to reintroduce a two-cylinder tractor in the 20 to 40 horsepower range? After all, the stock of parts around the country won't hold out forever. Not very likely, say J.D. marketing people, who argue that the largest of their current line of garden tractors and the smallest of the "Long Green Line" of utility farm tractors (the 36 horsepower 830) effectively overlap to serve this market. Maybe so, but speaking as one who has his doubts, I can see a legitimate case to be made for the two-cylinder as the tractor of the future.

# THE BUFFALO

The Buffalo is an outgrowth of a little tractor Vern Schield invented in 1963 called the Self-Helper. It was developed to aid emerging nations in their transition from muscle to machine power. Self-Help, Inc., manufacturer of these tractors, is a nonprofit organization that only sells outside the United States.

The Waverly Tractor Company in Iowa modified the Self-Helper design to meet United States safety standards and now produces their model, the Buffalo, for sale here. They use recycled automotive parts to allow the Buffalo to compete in price with imported models. Vern Schield, inventor of the Self-Helper, makes these points about the Buffalo, "We have found that the Chevrolet differential used in 1955 to 1964 cars invariably outlasted its original application. When gears run together for 50,000 miles and still mesh within specifications, you know the differential was well



*The Buffalo*

designed. General Motors made millions of them and we only pick the best. In our application, it can last for years. Sure it helps America not to waste its waste, but most of all it helps us build a tractor you can afford. We have no reservations about guaranteeing everything we use."

The transmission is from a ¾-ton Ford or Chevy pickup. V-belts acting as a clutch make a two-to-one reduction from the 25 horsepower, air-cooled engine to the transmission. Except for a few later models, all American-manufactured combines and forage harvesters have such a V-belt drive from the engine.

Waverly Tractor Company's original intentions were to purchase a steering section from one of the manufacturers that make this type of equipment for small tractors. However, they found a Saginaw steering section which was standard on most General Motors cars, as well as Ford and Chrysler. It was easier to install and much heavier than the steering sections manufactured for this purpose. So, naturally, this was their choice.

Waverly Tractor doesn't fit any mold. The factory is in an old buffalo pasture, next to the shed where the first prototype now lives. The field testing is done by teenagers—nobody can break things faster than two kids competing. Everyone who works for the company wants to be there. Some employees have quit better-paying jobs to do so. Others have started cottage industries, working in their homes and usually furnishing their own equipment. Several partially handicapped people are turning out quality parts for the Buffalo. Schield feels that this, too, is a resource that should not be wasted.

Turning discarded materials into marketable products is not only a rewarding experience, but it is also good business. Seeking this combination has led Waverly Tractor into many interesting developments.

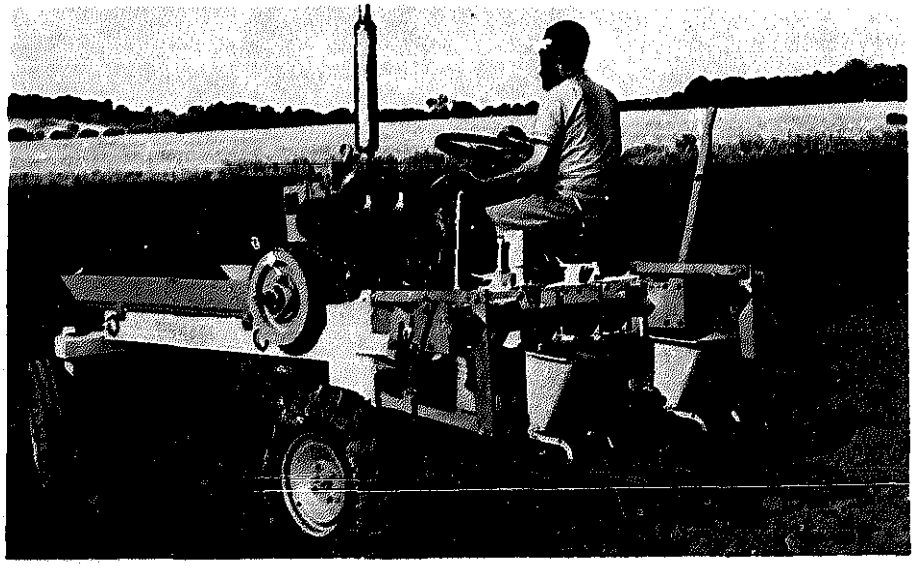
Sleeping Giant–Hwy. 3 East
Waverly, IA 50677

# AFRICA'S OWN, THE TINKABI

Africa is proud to announce the arrival of its own tractor, the Tinkabi. With a name derived from the Siswati word for oxen, the Tinkabi was designed under the aegis of the Swaziland government and the National Industrial Development Corporation (NIDC) of Swaziland to give small

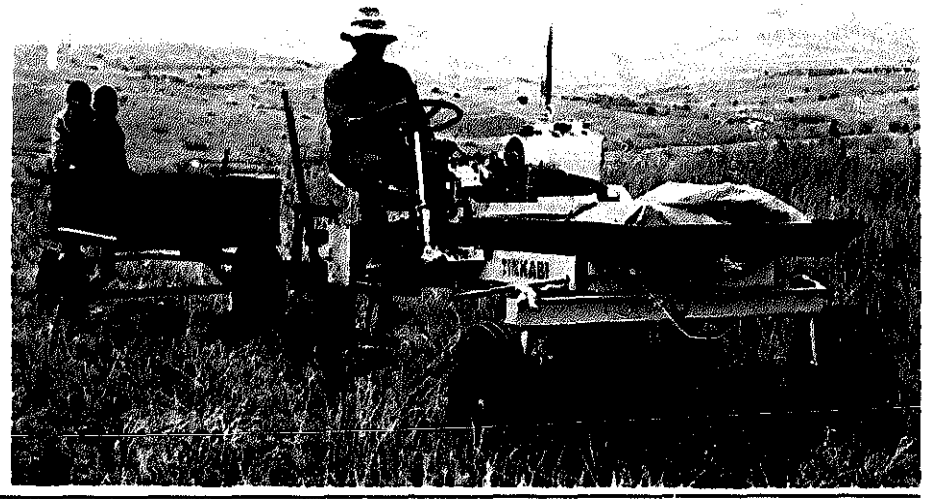


*The Tinkabi with seeding attachment*
National Industrial Development Corp.

farmers the opportunity to mechanize. As the NIDC theory goes, ". . . if [the] agricultural Third World is to develop, it is essential that a simple, low-cost tractor is made available to the farmer to increase his productivity and income."

The Tinkabi has many features not normally found on other tractors. Its front loading platform is capable of carrying 500 kilograms. The addition of a trailer brings the transport capacity to 2,000 kilograms. The heart of the tractor is an air-cooled, hand-started, twin cylinder, 16 horsepower engine which, under normal farm use, consumes less than 1½ liters of diesel fuel per hour.

A wide range of implements can be clamped to the toolbar assembly. Basic equipment like the plow, planter, cultivator, ridger, and harrow accomplish the usual agricultural tasks while additional features such as a sprayer, circular saw, hammermill, water pump, overhead sprinkler system for up to four hectares, sawbench, and electrical generator make a useful contribution to the general chores that are needed to be done around the farm on a daily basis. As of May 1977, Tinkabi will do all this for about $2,000.

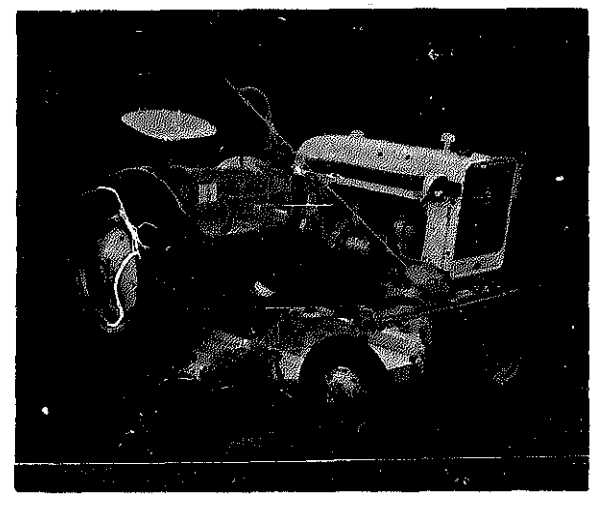


*With a front loading platform and trailer, the Tinkabi can transport 2,000 kilograms.* National Industrial Development Corp.

## NORTH AMERICAN SOURCES OF FOUR-WHEEL TRACTORS

### The International Cub Tractor

International Harvester has been making the Cub for over 25 years. It started out as an all-purpose farm tractor but has since gained popularity as a versatile implement for commercial situations: warehouses, loading docks, nurseries, and small airports. It has a 15 h.p., four-cylinder engine and hydraulic power for front-, rear-, and center-mounted implements. The offset front motor mounting improves visibility for front- and center-mounted work. The one-point fast hitch acts as a swinging drawbar to hitch or switch implements in a minute or less. The power take-off can be operated at three speeds to run a number of different implements



*The International Harvester Cub* International Harvester Co.

with different power and speed requirements. Attachments available with the Cub include moldboard plow, cultivators, discs, earth and snowplows, rotary and sickle bar mowers. The Cub is also available as a compact model with an 18.5 h.p. engine. With lower clearance than the standard Cub, this unit is better suited for lawn and estate work.

**International Farmall 140 Tractor**

Capable of mounting attachments at the front, center, and rear, the Farmall is used most with front and center cultivation to take full advantage of the Culti-Vision feature, also available on the Cub. With no blind spot in front, you can see the ground rigs on both sides of a single row and control them precisely both horizontally and vertically. This tractor is widely used for cultivating tobacco, vegetables, and nursery stock. One size larger than the Cub, the Farmall employs a 25 h.p., four-cycle, water-cooled engine with four forward and one reverse gear.

International Harvester Co.
401 N. Michigan Ave.
Chicago, IL 60611

**Power King Tractors**

Power King, formerly known as Economy tractors, offers several models. Differing only in features—tire sizes and type of hitch—Power King tractors put a 14 h.p., four-cycle, air-cooled, gasoline engine to operate equipment for all sorts of tasks. A belt-driven power take-off on the front of the tractor operates the mower, tiller, and snowblower while the three-groove pulley behind the engine drives the sprayer and hydraulic systems. Other attachments include a full line of cultivating equipment: spring-tooth cultivator, heavy-duty cultivator, toolbar hiller-furrower, and rotary tiller, as well as a 5-foot sickle bar, trailer, sprayer, and seed-fertilizer spreader.

*A Power King tractor with rotary tiller attachment.*
Engineering Products Co.

Engineering Products Co.
P.O. Box 284
1515 E. Ellis St.
Waukesha, WI 53186

**Ford 1600**

Ford's smallest tractor outside of the lawn and garden category is their Model 1600 with a 23 h.p. diesel engine. With nine speeds forward and three reverse and many modern features, this unit transcends simplicity but is special because diesel tractors are not commonly found in the United States. This unit has attachments for many farm jobs: there are subsoilers, cultivators, harrows, mowers, rakes, scoops, cranes, post-hole diggers, loaders, seeders, and fertilizer attachments.

Ford Motor Co., Tractor & Implement Operation
2500 E. Maple Rd.
Troy, MI 48084

*Ford Model 1600*

**Wheel Horse Series D**

The 16 and 19.9 h.p. Wheel Horse tractors would fall into the lawn and garden category except for the fact that they offer a wide variety of attachments, making them more of a utility tool than an implement for lawn care. Some of the attachments include a 3-gallons-per-minute sprayer, log splitter, landscaping rake, rear-mounted garden blade, shredder-grinder, 4-foot side-mounted sickle bar, lug wheels, mowers, cab, and all Brinly-Hardy cultivating attachments.

Wheel Horse
515 W. Ireland Rd.
South Bend, IN 46614

**Magnatrac**

To date, Magnatrac is the only small-scale full-track crawler we have seen. The enclosed and protected tracking system with side panels and center idler wheels features No. A550 chain welded to 10-gauge interlocking steel shoes with over 10,000 pounds of ultimate track strength, and dual track tension springs for approximately 3,000 pounds of tension maintained on each track. The all-gear transmission with four forward and one reverse speed shifts like an automobile. It is powered by a 16 h.p., valve-in-head, cool-running, cast-iron (or 12 h.p. standard) engine. It can utilize over 30 attachments including the whole Brinly-Hardy line of farm and garden implements, both high- and low-lift loaders with either hydraulic or electric lift systems, a 42-inch snow and soil blade, a 42-inch snowblower, self-dumping bucket, 36-inch-wide manure fork, backhoe, and electric light kit.

Struck Corp.
Struck Lane
Cedarburg, WI 53012

**Hefty-F and LNT**

The Hefty-F is an all-chore power tractor with a 27 h.p., water-cooled, four-stroke, four-cylinder, gasoline engine with diesel option. A selective sliding gear transmission operates six speeds forward and one reverse for a maximum traveling speed of 8.5 mph forward. It has a live power take-off shaft at the rear of the tractor, a ground clearance of 19½ inches, weighs 2,200 pounds and has a 12-volt starter and generator and four sealed-beam headlights. Sharing the same specifications, the Hefty LNT incorporates the same components into a compact design for narrow nursery work. Its 38-inch overall tractor width is adjustable to 56 inches. An optional creeper gear unit is available to reduce ground speed to as low as 2/10 mph for transplanting and for extra slow ground speed work. Optional implements include a 60-inch, midmount rotary

*The Hefty-LNT*
Diana Branch

mower, front-end loader, front-mounted snowblower, and all attachments accommodated by category I, three-point hitches. Examples include chisel plows, one- and two-bottom plows, disc harrows, six-inch blades, one-row cultivators, field cultivators, 60-inch rotary tillers and a 60-inch rotary broom.

Hefty Tractor Co.
P.O. Box 188
Juneau, WI 53039

**CPI Model AY**

Custom Products makes a 14 h.p. tractor with a four-cycle, air-cooled, manual start engine. It comes with four forward and one reverse speed and has a steel channel frame with 60-inch wheelbase and 14½ inches of ground clearance. As optional equipment, the Model AY is available with head and tail lights, a hydraulic power take-off system with three-point hitch which operates the lift and all other tools requiring power. Accessories include a 50-inch rotary mower, snowblower, 54-inch rear leveling blade, a 44-inch, 16-bladed, double-disc harrow, six-sweep cultivator, rotary tiller, 12-inch single-row ridger, single-row planter, fertilizer hopper, transplanter, and tilt-top cargo trailer. Weight: 905 pounds.

Custom Products, Inc.
4232 Roosevelt Rd.
Stevensville, MI 49127

**Belarus Model 250**

Another air-cooled, four-stroke diesel tractor similar in size to the Ford 1600 is the Belarus 250. It has a standard three-point hitch with drawbar, rear PTO and side-mounted power shaft, eight forward and six reverse speeds. A full line of attachments and larger units is available.

## INTERNATIONAL SOURCES OF FOUR-WHEEL TRACTORS

Finally realizing a market for the small utility farm tractor, many North American companies are distributing European and Far Eastern tractors, although they have not themselves undertaken to manufacture them. Those models readily available in North America but not manufactured there will be listed first.

Many of the larger agricultural machinery manufacturers in the United States, like John Deere and Massey Ferguson, are in the process of establishing arrangements with foreign manufacturers to build small tractors to their own specifications. As of fall 1977, arrangements were still being formalized.

### The Holder Model A-18 Tractor

The Model A-18 was designed by the Gebruder Holder Company in Germany for use on hilly vineyard terrain, tree plantations, nurseries, berry farms—any situation requiring the combined features of maneuverability, stability, and power in a compact unit to operate in high-density plantings. Its 18 h.p., four-stroke, air-cooled, diesel engine claims to have the power of a 25 or 30 h.p. gasoline engine while consuming 1/8 the amount of fuel or less. Model A-18 comes with a standard three-point hitch and has the unusual feature of articulated, bends-in-the-middle, steering. Attachments available include a 31- or 39-inch rotary cultivator, an implement linkage for steep vertical lift, a universal implement carrier frame for plow and cultivating blades, a sickle bar, trailed spindle gang mowers, rollers, a trailer, seed and fertilizer spreaders, all varieties of rakes, and miscellaneous lawn equipment. Larger units are available.

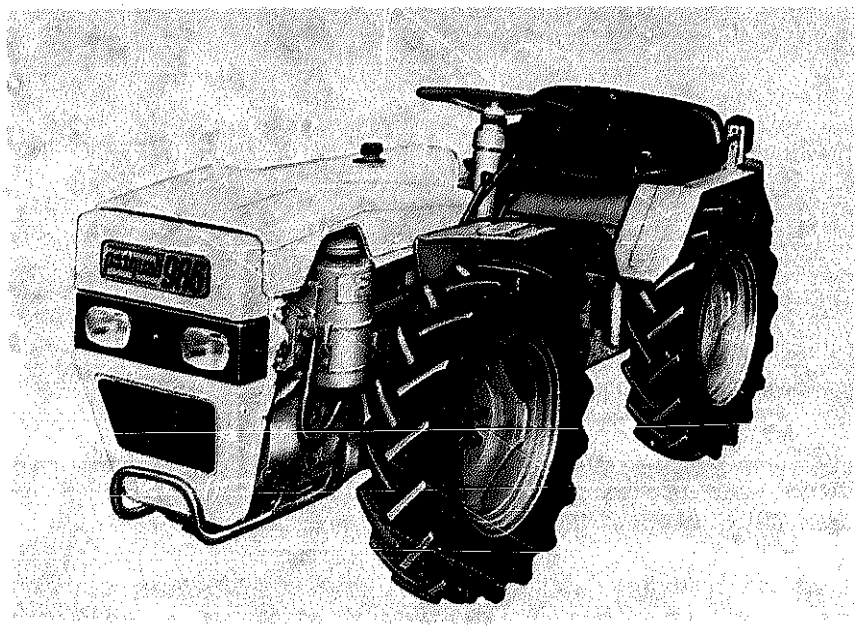
### Pasquali U.S.A.

The Italian-built Pasquali is a 19.9 h.p. one-cylinder, four-wheel-drive, four-stroke, diesel tractor with articulated steering. Models with 24, 29 and 34 h.p. are also available. The transmission employs a sliding-type key gear with synchronizer supplying nine forward and three reverse speeds. The PTO has two speeds but it



*Pasquali Four-Wheel-Drive Tractor*
Pasquali U.S.A., Inc.

can also be synchronized with all tractor speeds. Supplied with both a two- and three-point linkage, the hitches can be raised with an independent hydraulic lift system. Implements available for use with the GBT Pasquali include a rotary tiller, front-mount mower, single- and double-bottom plows, cultivator, and side cycle mower. Pasquali offers a number of other PTO attachments—enough to fill a 200-page blooklet. These are discussed in the section on two-wheel tractors.

Via Nuovo, 30
Calenzano (Firenze), Italy

Pasquali USA
Verona, WI 53593

**Satoh Beaver**

The 15 h.p. Beaver is made in Japan. It has a two-cylinder, water-cooled, four-cycle, diesel engine and is available with either two- or four-wheel drive. A sliding selective gear transmission system offers six forward and two reverse speeds with a maximum speed of 7 mph. A power take-off shaft, live hydraulics, category 0 three-point hitch, sealed brakes, various warning lights, full lighting, and choice of tire tread are all standard. Optional equipment includes front chassis, front and rear wheel weights, rotary tiller with special two-point hitch, front power take-off, power take-off adaptor with guard, and hydraulic external adaptor plate. All standard category 0 implements can be fitted to this unit.

**Kubota Models B6000, L175, L225, L285**

Kubota offers four basic models, and variations, of two-, three-, and four-cylinder, liquid-cooled, diesel tractors with power output ranging from 12½ to 30 h.p. The three-point hitch fits all category one implements, and the PTO is located front, center, and rear with a ten-speed multirange transmission. Units are available with four-wheel drive and lug tire options. Kubota is made in Japan but dealerships are being widely established.

**Yanmar**

Another compact diesel tractor available with either two- or four-wheel drive, is the Japanese-built Yanmar. The engine has two cylinders, is water-cooled, and is a four-cycle unit available in either 13, 15 or 20 h.p. models. The constant-mesh/selective mesh gear combination provides six forward and two reverse speeds. A two-speed PTO accompanies the three-point category 0 hitch with hydraulic lift. The Yanmar can be operated with a rotary mower capable of covering 1½ acres per hour, a front-end loader and backhoe for the 20 h.p. model, a 30- or 42-inch rear-mount tiller (depending on the size of the tractor), and a full line of cultivation attachments—tandem disc harrow, moldboard plow, and one-row cultivators with either rigid or six Danish vibrating S shanks. Attachments are available through the Yanmar dealers but are not exclusive to Yanmar.

**Agrale Model 4100**

A four-stroke, diesel, 16 h.p., air-cooled engine powers a seven forward and three reverse speed transmission, differential lock dry plate, spring-loaded clutch, and a power take-off with three engine speeds. The unit has a working weight of 1,100 kilograms, a ground clearance of 12 inches, and a 48-inch wheelbase. It has a hydraulic lifting system coupled directly with the front power take-off of the engine, governed by a controlling three-stage lever. Implements include a two-row seed and fertilizer drill, leveling blade, cargo transporter, coffee cultivator, cultivating harrow, and three-bottom moldboard plow.

Agrale S.A.
Rua Sinimbu, 1260
Caixa Postal, 1311
95.100 Caxias Do Sul, RS, Brazil

**Iseki TX1300**

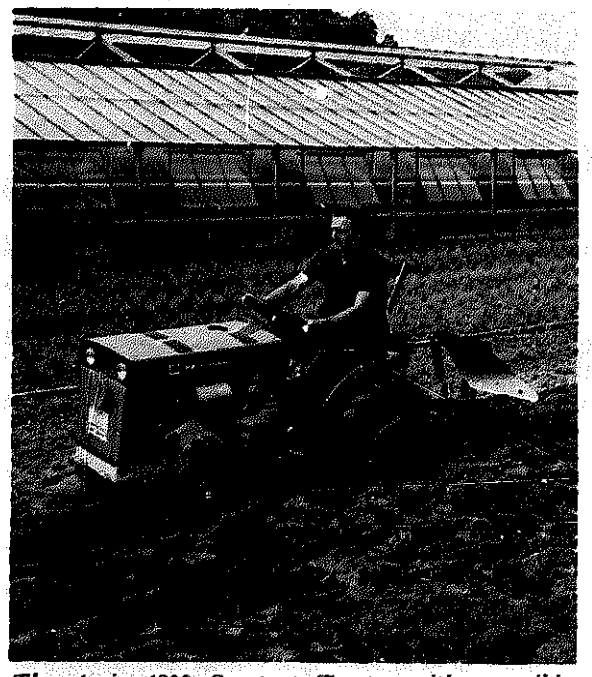
Similar in design to the Kubota is the water-cooled, diesel Iseki. It has nine forward and three reverse speeds, three speeds on the PTO,

and a hydraulic lift. Units with four-wheel drive are available, an important feature in small tractors. Often, a small tractor falls short in tractive ability before it runs out of power. Four-wheel drive increases traction by 50 percent, according to Iseki. A wide range of attachments is available for fertilizing, planting, ridging, puddling (rice culture in wetlands), mowing, tedding, mulching, and plowing.

Iseki Agricultural Machinery Mfg. Co., Ltd.
Overseas Dept.
1-3 Nihonbashi, 2-chome
Chou-ku, Tokyo, Japan

**Agria 4800 Compact Tractor**

Though universally applicable, the 4800 is designed to fill the gap between the range of operation of the two-wheel tractor and the commensurable four-wheel tractor in agriculture, nurseries, orchards, and vineyards. It is powered by a 19 h.p., air-cooled, four-stroke, single-cylinder engine with six forward and six reverse speeds, differential, and differential lock. Top speed is 10 mph. The rear power take-off is independent of gear speed. Track width is adjustable between 24.2 and 32.3 inches; its ground clearance is approximately 10 inches. Equipped with hydraulic lift and a 12-volt electrical system for starter, head and tail lights, and direction indicators. Weight: approximately 1,323 pounds. Implements and accessories include rotary tiller, wheel weights, spraying unit with its own 8 h.p., two-stroke gasoline engine with a 19.8 gallon capacity and high-pressure sprayer pumping 55 liters per minute, spring-tine cultivator adjustable from 80 to 125 centimeters, a six-disc harrow with working width of 43.4 inches, reversible plow, side reciprocating mower, four sizes of earth-boring augers, a two-part harrow with 70.8-inch working width, all-weather hood with front window, fertilizer-broadcaster in three sizes either ground-driven or driven by a power take-off connection, and 1,100-kilogram-capacity trailer. At the time of this writing Agria is seeking a distributor in North America.



*The Agria 4800 Compact Tractor with reversible plow*
Agria-Werke

Agria-Werke GmbH
7108 Moeckmuehl,
West Germany

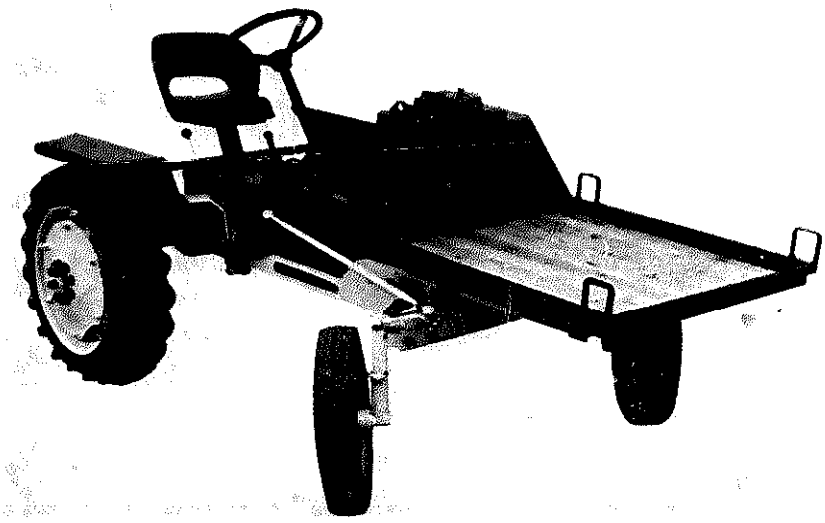
**Basak-12 Garden-Type Tractor**

Weighted wheels are provided with this compact, single-cylinder, 11.2 h.p. tractor. It has three forward and one reverse speed and a mechanical command lifting system with three-point linkage. Attachments include a moldboard plow with a working width of 26 centimeters and working depth of 19 centimeters, a seven-tine or three-row cultivator, ridger, duck-foot cultivator, subsoiler, and sprayer.

Turkish Agricultural Supply Organization
P.O.B. 509
Ankara, Turkey

**Bouyer Tractor Type TE**

Made in France, the Bouyer Type TE is a tractor built for function and simplicity. An air-cooled, diesel, four-stroke engine with either one or two cylinders, it comes in sizes varying from 14 to 20 horsepower. Wheel tread can vary from 1.410 to 1.800 meters. The V-belt transmission provides two speed ranges, high and low, for three forward speeds and one range of three reverse speeds. A wooden front platform pro-

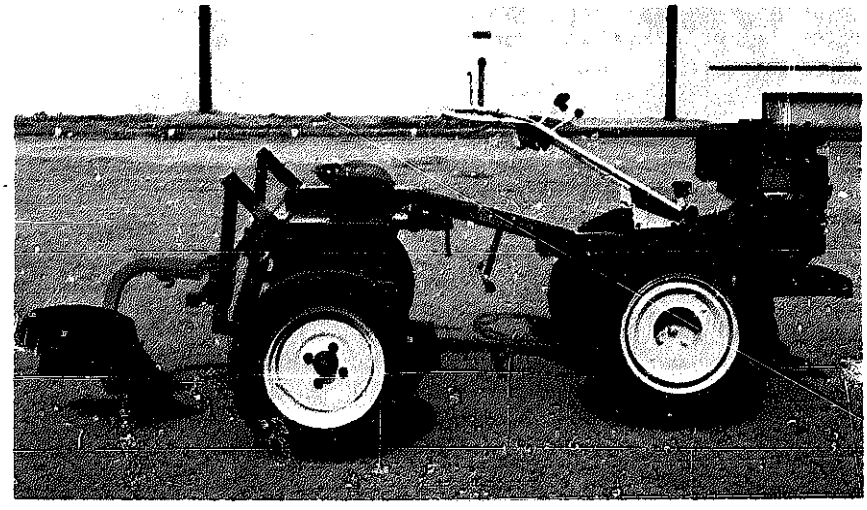


*Bouyer Tractor Type TE*
Bouyer

vides space for carrying a small load (500 kilograms maximum) without a trailer and provides a place for carrying extra weight in case more traction is required. The three-point hitch with hydraulic lift can be attached to a number of cultivation implements on a drawbar. A four-row seeder-fertilizer distributor is available along with a range of implements for tropical agriculture.

**Bouyer Mototracteur MT-80**

The MT-80 is a front-, two-wheel drive unit with articulated steering. The rear axle with seat mounting, the tropicultor, is separable from the main power unit. The front unit is powered with either an 8 or 10 h.p., air-cooled engine with special equipment for operating in tropical climates. The two-belt transmission operates a high and low range for two forward and one reverse speed. It is not clear whether or not the power section is designed for use without the tropicultor. However, it does appear that the tropicultor was designed to allow the power unit of a walking tractor to function with attachments for cultivation, plowing, and seeding larger than those of most walking tractors. It is equipped with a mechanical lifting device but no power take-off. Attachments include a subsoiler, a ten-inch moldboard plow, a spring-tooth harrow, a nine-tine chisel plow, and a three-row seeder.



*Bouyer MT-80 with main power unit, tropicultor, and moldboard plow on a mechanical lift.*

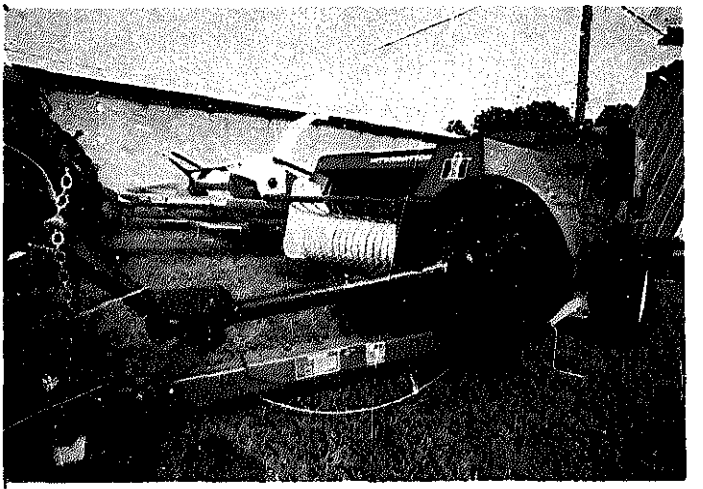
# TRACTOR ACCESSORIES

## The PTO

Power supplied to farm equipment can come from the unit's own motor, a pulley drive from an independent motor, or by the power take-off shaft of a tractor. The power take-off (PTO) arrangement was introduced in the 1920s and has become the most widely utilized power source for farm work. Universal joint linkages between the tractor and implement have minimized the limitations the presence of a tractor imposes on the flexibility and maneuverability of this setup. The amount of use any one farm implement gets in a year does not usually justify the investment in a separate motor; so the PTO offers considerable savings in capital output here.



*The flexible network of universal joints linking a PTO shaft to a hay baler.*

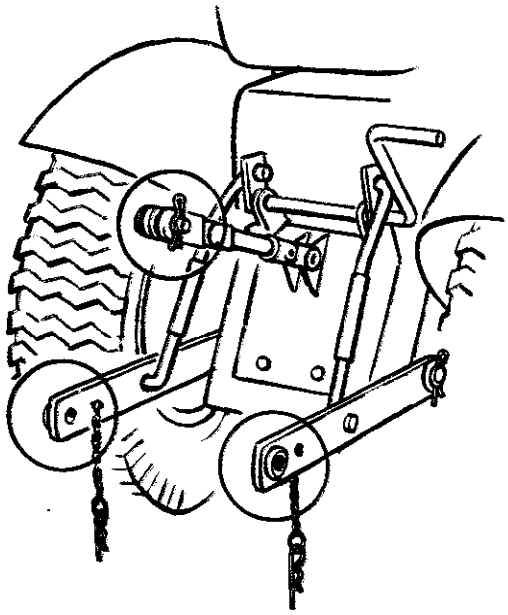
*The finger points to a power-take-off shaft on an old model tractor with a pull-type hitch.*

## Hitches

Machinery is called either pull-type (trailing) or mounted. Pull-type tools simply hitch to the tractor drawbar and are pulled thus by the tractor. Mounted tools attach to tractors in such a way that they can be lifted entirely off the ground for easy turning or transport to and from fields. Almost all mounted tools today use the three-point hitch arrangement pioneered by Henry Ferguson on the Ford and Ferguson tractors. (The Allis-Chalmers WD and WD-45 have their own hydraulic hitch arrangement which is somewhat different from the three-point hitch and will accommodate only Allis-Chalmers machinery built for it.) The three-point hitch (by which a tool hitches to two points on the drawbar and one above) makes hitching, transport of machinery, lifting, lowering, and depth adjustments relatively easy compared to older methods. Today, three-point hitches can be purchased and fitted to almost any tractor.

Pull-type tools are not to be ignored, however. If you are willing to give up some convenience and especially if machinery does not have to be transported over the road, older implements can be used which offer a considerable saving. Three-point hitches and tools to fit them are in a higher price range than the same equipment in pull-type models.

Particularly when buying an older tractor,



*Circled are the three points of attachment for a hydraulically powered lifting hitch.*

a general rule to consider is to be sure that you know what equipment will or will not fit your tractor. The ideal is to buy your basic machinery—plow, disc, planter, mower, cultivator, and others—together with the tractor on which they have been mounted.

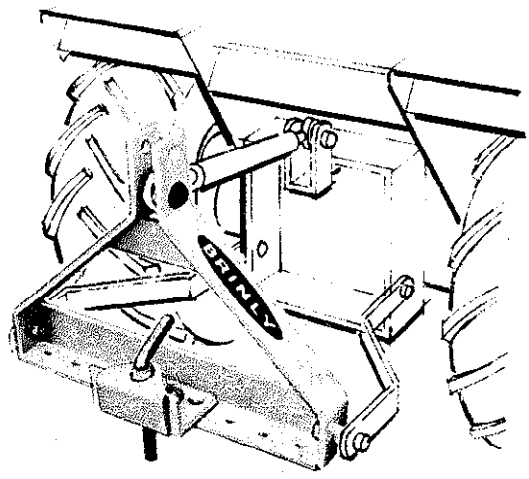
Many small tractors come equipped with three-point hydraulic lifting hitches which do not fit the many pull-type tools made for small farm and garden tractors. Brinly-Hardy makes the following adapters to convert three-point hitches into pull-type on 14 to 18 h.p., category 0 tractors.

### A Frame Adapter With Sleeve Hitch

This unit was designed for adapting sleeve-type hitch implements for use on tractors equipped with category 0 three-point hitches. It is required for using Model KK-305 Planter-Fertilizer, TT-100 Toolbar and BB-363 Fork Lift Kit. Weight: 28 pounds.

### Drawbar Attachment (For use with category 0 three-point hitch)

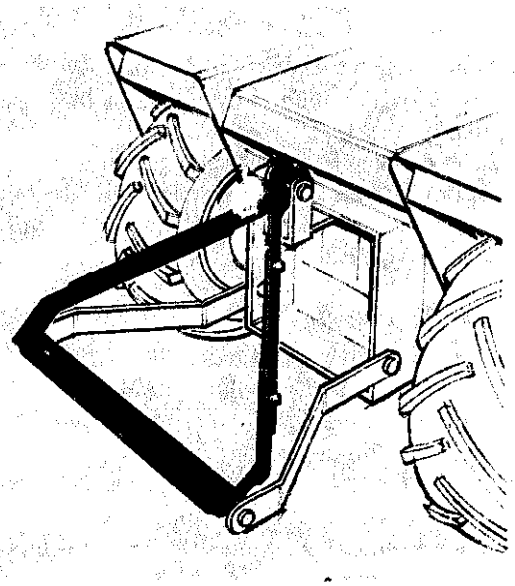
This unit includes cross-type drawbar and two adjustable support links for drawbar weight control. Use it for general-purpose trail-behind attachments. Weight: 18 pounds.



*Model HH-1000 three-point A Frame Adapter with Sleeve Hitch.*
Brinly-Hardy

### The Toolbar

Rather than attaching each implement directly to a tractor, the toolbar allows the option of pulling many attachments at any desired spacing. When planting, both planters and fertilizer distributors can be utilized at the same time. Plantings can be made in irregularly spaced rows to make way for the tractor's tire



*Model BB-370 Drawbar attachment.*
Brinly-Hardy

tracks or for intercropping techniques. When cultivating, any number of chisels or sweeps can be mounted on a tool bar in any complementary combination. The tool bar also offers a savings in investment in that only a simple bar clamp is needed for the link between tool and tractor rather than separate hitching hardware, which can be especially complicated and expensive with three-point hitches.

The above three attachments are made by:

Louisville, KY 40201

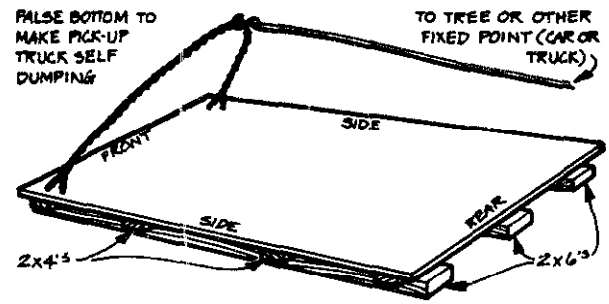
## FARM TRANSPORT—CARTS AND WAGONS

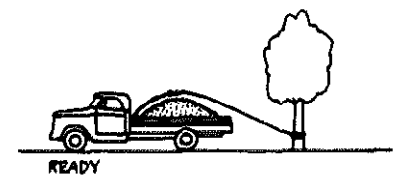
Everyone is aware of the need for a utility transport vehicle on the farm, and their availability is certainly widespread. Rather than try to list a full range of sources for this kind of tractor attachment, we have chosen simply to cite examples of what is made and offer a few build-it-yourself plans. When selecting a trailer design, here are a few points to consider.

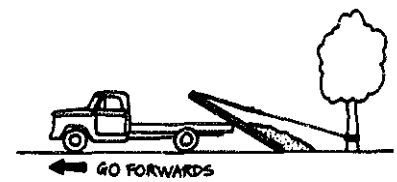
1. Capacity—both size and volume, can side extensions be added on, bought or built?
2. For hilly terrain, a long bed, low to the ground, with a wide tread is best.
3. The longer the distance between the hitch and the axle, the easier it is to back into places.
4. Do you need a trailer that can dump?
5. Match a trailer to your needs and to complement the power source pulling it with a maximum load.

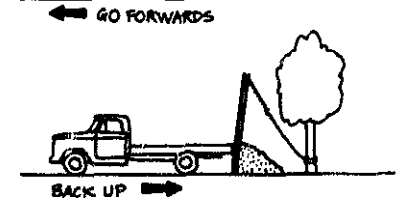
### Build-It-Yourself Dumper for a Pickup Truck

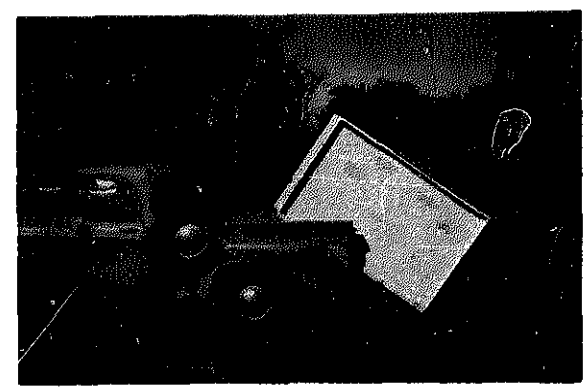
Tim Sanford of Alexander, Maine, was kind enough to send us these plans for adaptation to a pickup truck he has found useful. It simply involves building a platform to fit in the bed of a truck, but not fitted around the wheel wells. It must be free to slide out of the truck. A sturdy chain arrangement is attached to the front of the platform as illustrated, to which a fixed line will be attached. As the driver slowly goes forward, the platform and load will be neatly left behind but not in a dumping position. The driver then slowly backs up and pushes the load into a vertical position so the material slides off the platform.











*You can build this dumper from the Pickup Truck Dumper Plans described in the text.*
Howard S. Berg

### Pickup Truck Dumper Plans

Plans for a roll-out dump box are available for $3.75 (as of fall, 1977).

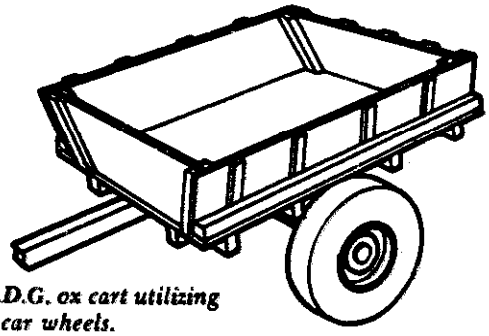
Concord, CA 94519

### ITDG Ox Cart Plans Utilizing Old Car Wheels

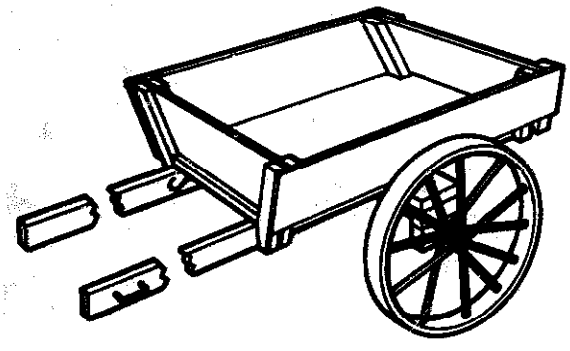
This cart uses the front wheels from an old car or lorry. Wheel mountings are cut off and welded to a box-section axle fabricated from angle iron. The cart chassis and body are constructed of wood, and all parts are bolted together.



*I.T.D.G. ox cart utilizing old car wheels.*

### ITDG Plans for Wananchi Ox Cart

Designed to carry a load of 1,400 pounds, this cart is pulled by two oxen. The wood-block axle bearings, each made of two pieces of wood, are oil-impregnated by soaking in hot oil, and the axle bearing hold is drilled centrally through the blocks. This bearing design facilitates ease of maintenance and renewal of the bearings by carpenters in rural areas.



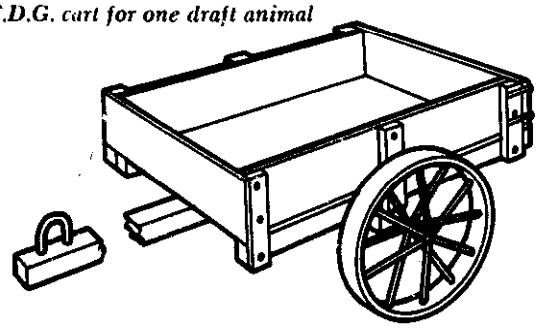
*I.T.D.G. Wananchi ox cart*

### ITDG Cart For One Draft Animal Plans

Designed to carry a load of 1,400 pounds, cart is pulled by one donkey or an ox. The wood-block axle bearings are oil-impregnated by soaking in hot oil before drilling and assembly. Both the front and back boards of the cart body are removable. The cart shafts can be made of tubular metal pipe instead of timber for extra strength.

All the above plans are available from:
Intermediate Technology Publications, Ltd.*
9 King St.
London WC2E 8HN, England

*I.T.D.G. cart for one draft animal*



### Tractor Carryall Plans

Plans for a nonwheeled carryall bed to be attached by a three-point hitch to a hydraulic lift system of a tractor are available for a slight charge.

VITA (Volunteers in Technical Assistance)
3206 Rhode Island Ave.
Mt. Rainer, MD 20822

### Heald's Hauler

Available as a kit, this quarter-ton utility truck features large flotation tires, sturdy tubular frame, and dump bed. The large, padded seat and bed tip open for easy access to the engine. The truck is powered by either an 8 h.p. Tecumseh or a 10 h.p. Synchro-balanced Briggs & Stratton four-cycle engine. A large Comet torque converter, forward and reverse transmission, number 40 chain, and differential axle complete the drive train. Hand-operated throttle and hydraulic disc brakes are standard. Lights,

* Intermediate Technology publications can be ordered from International Scholarly Book Service, Inc., Box 555, Forest Grove, Oregon 97116

*The Heald Hauler*
Heald, Inc.

speedometer, knob tires, and spark arrest muffler are options. The Hauler comes in easy-to-build semikit form with all parts furnished. The engine and transmission come assembled and are mounted on the welded and painted frame. The tires are mounted on the rims, so all that is required is to bolt the various parts together using an easy-to-follow step-by-step procedure. Construction time averages 6 to 8 hours.

Heald, Inc.
Dept. DTB, P.O. Box 1148
Benton Harbor, MI 49022

**Bike Barrow**

The bike barrow was designed by Jay Welsh at the Foundation of Self-Sufficiency Research Center, 35 Maple Avenue, Catonsville, MD 21228 as a simple pushcart to be built from recycled materials. The three-wheeled cart, built from two discarded bicycles, two-by-fours, and plywood can be maneuvered by one or two people. Plans presented in the May 1977 issue of *Rain* magazine are available by purchasing that issue.

*Rain* Magazine
2270 Northwest Irving
Portland, OR 97210

**Fayette Trailer Carts**

Fayette offers models of wide-bottomed trailer carts 4 feet wide by 6 to 8 feet long that carry up to 1,200 pounds. Rugged wheels are designed for transport across the country or around the corner.

Fayette Mfg.
Fayette, OH 43521

**Garden Way Handcart**

Three sizes with a wooden body are available as kits or finished carts.

*The Garden Way hand cart*
Garden Way Research

Garden Way Research
Department DTB
Charlotte, VT 05445

**Economy Handcart**

Plans are available for a cart with large wheels which converts easily to a garden tractor dumping cart. Tips on acquiring construction parts are also provided.

Economy Designs
Box 871, Dept. DTB
East Douglas, MA 01516

**Vermont Ware**

Two carts are available with 300-pound capacity and metal beds.

Vermont-Ware
Dept. 702-DTB
Hinesburg, VT 05461

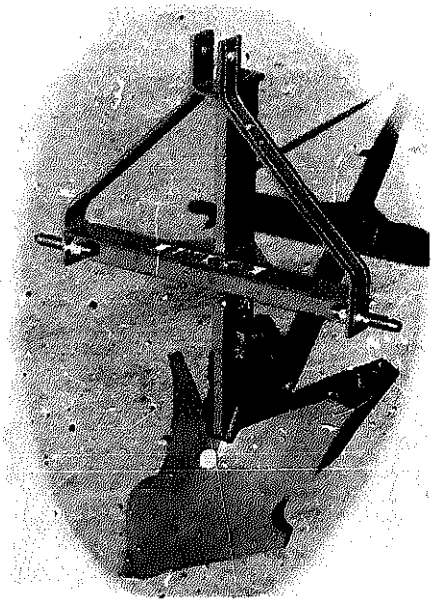
**Utility Trailer**

A utility trailer capable of on-the-road travel is available in three sizes, all with a 1,200-pound capacity. The utility model weighs 389 pounds, has 24-inch removable side racks and a bed sized 102 x 55 inches. The bed tilts for easy loading of equipment.

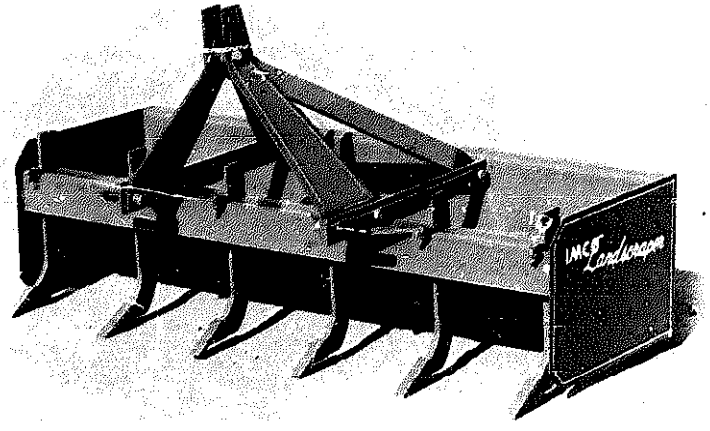
Vann Industries
Clinton, NC 28328

## ASSORTED TRACTOR ATTACHMENTS

A number of tools and implements for the small farm tractor are available for miscellaneous farm tasks which do not fall comfortably under one heading. We thought it would suffice to illustrate these implements with only one representative photograph and descriptive caption since differences between manufacturer's models are slight and because often the function is quite familiar.

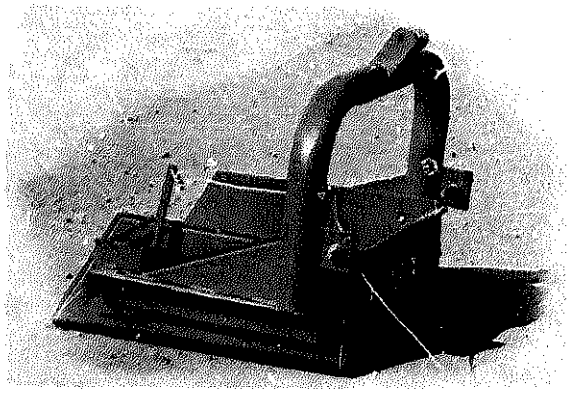


*A middlebuster, designed for the large garden or small farm, gives a full 12- or 15-inch cut. Two-row models are available, and both use a standard category 1 hitch.*
Independent Mfg. Co.

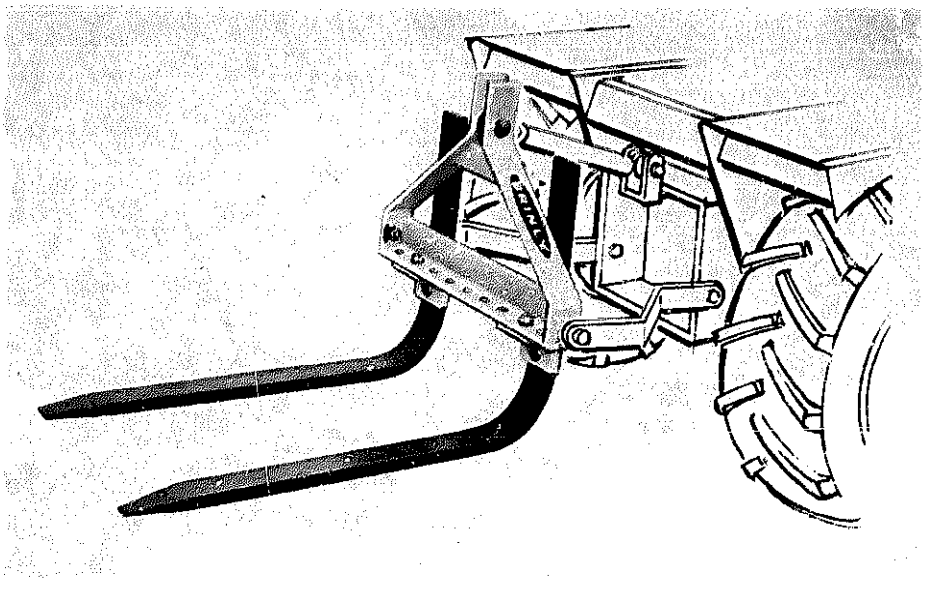


*Especially of interest to nurserymen and builders, a boxscraper or land scraper with its scarifier shanks assists in leveling and grading land.*
Independent Mfg. Co.

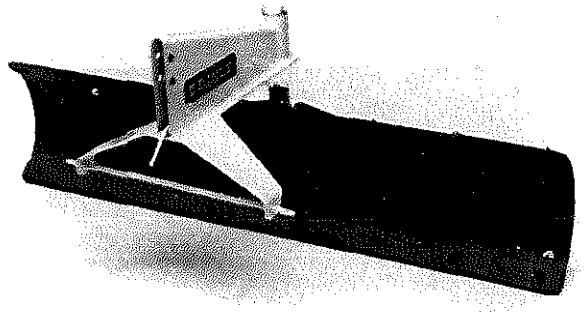
*Tractor-operated post hole diggers, or augers, make quick work of digging holes in most types of soil.*
Independent Mfg. Co.



*Scoops, attached to a tractor with a three-point hitch, can be used for pond and ditch digging, feedlot cleaning, and moving and dumping materials on the farm.*
Independent Mfg. Co.

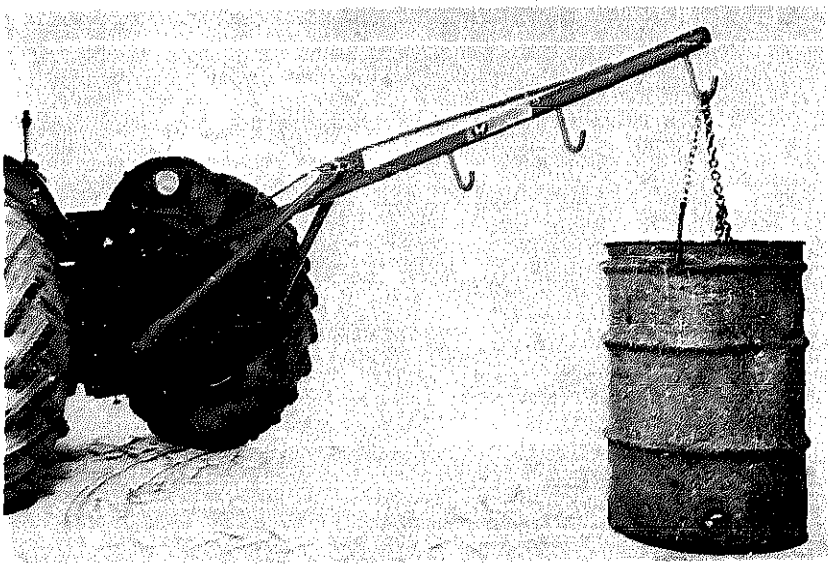


*Forklifts, for lifting, hay handling, and short-haul transporting, can be valuable work savers.*
Brinly-Hardy Co.



*Rear blades, especially when they can be angled or reversed, can be utilized for a variety of tasks including landscaping, leveling, grading, and snow removal.* **Brinly-Hardy Co.**

*The Agria walking tractor with a hauling wagon, fully equipped for road travel.* **Agria-Werke**



***A boom crane is useful not only for lifting, but also for pulling fence posts, changing wagon tires, and even for some portions of a farm slaughtering operation.*** **Wikomi Manufacturing Company**

# SHOULD YOU INVEST IN FOREIGN MACHINERY?

At the international level, attachments for two- and four-wheel tractors are not difficult to locate. Each manufacturer generally offers a full line of implements to fit his machinery, including even the unfamiliar power take-off tools for windrowing, harvesting, and pumping as explained in each chapter of this book. In North America, the latter are not always so easy to come by, but three companies do carry the basic tools required for plowing, cultivating, and seeding with small tractors. These include the Brinly-Hardy Co., Inc., P.O. Box 1116, Louisville, KY 40201; the Independent Mfg. Co. (IMCO), P.O. Box 300, Neodesha, KS 66757; and the Special Products Co. (SpeeCo), 15000 West 44th Ave., Golden, CO 80401. Many big-name manufacturers, who build tractors, carry a line of attachments from these smaller companies.

Europeans have all the tools they need for the small farm and they all attach to one power unit For many implements, we have found no North American counterpart, but if available at all, chances are such counterparts will have their own motors. Certainly there are advantages to having one machine running while tending another, but consolidation provides the resources to afford a huskier power unit or other attachments.

Foreign manufacturers have shown considerable interest in marketing in North America, and from our vantage point, the prognosis for getting these tools into the hands of America's small farmers looks very good.

"Well sure," you say, "those tools are great for European farmers who have the manufacturer next door and can get parts and service with no problem. What about small farmers in the United States who can't wait to send for a part overseas?" Taking seriously the small-scale farming market and the skepticism against investing in foreign equipment, some companies (like Kubota and Pasquali, for instance) are setting out to solve that problem. For example, the Pasquali Company in Barcelona, Italy is establishing an arm of its company in Verona, Wisconsin called Pasquali U.S.A. Instead of passing through the hands of an importer, a distributor, and a dealer, all of whom handle a variety of products, Pasquali will serve as both importer and distributor and will handle only Pasquali products. They will stock every part that would be found at the manufacturing plant in Italy, so that a dealer need only send to them for a part and be assured of the same service as if they were dealing with a Detroit manufacturer. As for service, Pasquali U.S.A. is planning a training program for its dealers right at the manufacturing plant in Barcelona.

All this is great news to the small-scale farmer. Not only does it lend credibility to foreign products as worthwhile investments in the future in North America, but it stimulates the competitive spirit in our own free-enterprise system. We have had many requests for this book from United States manufacturers who are interested in new product lines. If the market reveals itself, many will jump at the chance to satisfy it. As we mentioned earlier, John Deere, Allis-Chalmers, and Massey Ferguson are contracting to sell Japanese-made intermediate tractors under their own names.

The ball is already rolling. There's no reason for this marketing approach to stop with tractors. Meanwhile, study the foreign alternatives as prospects of things to come.

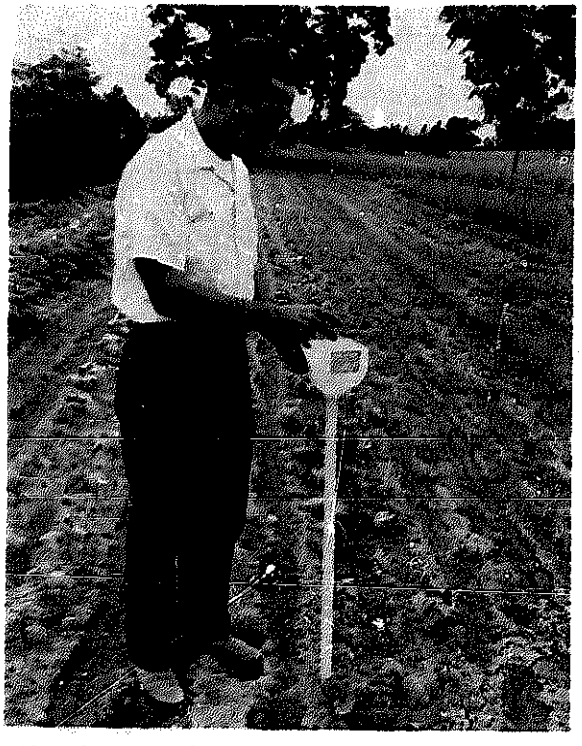
# -5- Equipment for Seeding and Planting

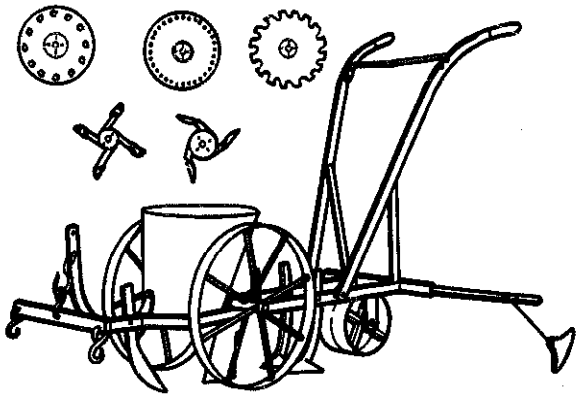
The simplest hand-operated planters are the walking stick type, most suitable for planting seeds at wide spacings or for interplanting. They can be used in quite rough seedbeds so long as the ground is soft enough for the stick to be inserted.

A hand-pushed, wheeled seeder normally requires a well-prepared seedbed for easy penetration and uniform placement of seed as well as ease of operation. Two or more of these seeder units may sometimes be mounted on an animal-drawn tool bar.



*After hours of back-bending labor, Don Green, a Michigan gardener, decided there was an easier way to put his seeds in place—to make an extension of his hand. Using the top part of a ½-gallon plastic container and a plastic tube used in a golf bag to protect the club shafts, he created a seed funnel. Total cost was 18 cents, and his device can be used to place rock fertilizers or shrubs or garden plants too.*

The simplest animal-drawn seeders consist of a cultivator-type tine carrying a tube through which seeds are dropped by hand. These implements ensure that the seeds are sown in lines at approximately constant depth, but the spacing along and between the rows depends entirely on the operator's skill. Single-row and multirow versions are available. Most units are fitted with a reversible, adjustable marker.



*Animal-drawn planter with mechanical seed-metering plates.*

Animal-drawn seeders with mechanical seed metering are of two types.

1. Those planting several rows at close spacing are commonly used for grain crops in humid or irrigated areas.
2. Single-row machines are generally used to space seeds at wide intervals in drier areas.

Various mechanical seed-metering systems are used. A rotating brush or agitator controlling the flow of seed through an adjustable opening will handle most types of seeds with minimal damage, as will contrarotating soft rollers, but these mechanisms do not closely control seed spacing in the row. Fluted roller feed mechanisms give more accurate control of the overall seed rate per hectare but, again, do not control

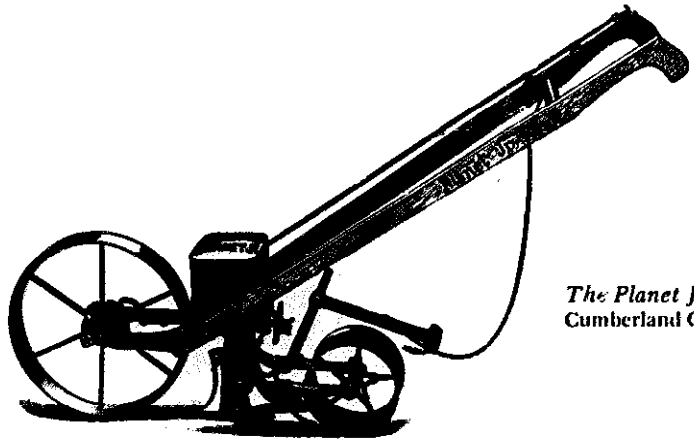
spacing in the row. Cell-wheel and perforated belt-metering systems can give very precise spacing of seeds, particularly those which are approximately spherical in shape. The metal cell wheel is more likely to cause damage to delicate seeds than the flexible perforated belt. Some seeders can be adjusted to plant bunches of seeds at wide spacings.

Many animal-drawn seed drills can also place fertilizers close to the seeds, where they may be more effective. Specialized fertilizer-spreading equipment is available.*

# SEEDING

**by Rob Johnston**

To plant large seeds in large amounts, we generally use our two-row corn planter. However, most of our crops are small seeded, or planted in pieces too small to make setting up a corn planter practical. The implement which really comes in handy is our Planet Junior Number 300-A seeder. Planet Junior has been making hand garden implements for over 100 years, and the models have hardly changed. The 300-A has been made since the 1920s, and the current unit is nearly identical to the first ones made.



*The Planet Jr. 300-A Seeder.*
Cumberland General Store

We seed lettuce, beans, and everything in between. We could do just as good a job seeding by hand, but this is where the weather sets the rules. Here in Maine, considering the crops we're growing, we have to take full advantage of days with good planting weather. We might sow four crops with the hand seeder where we would have time to sow only one by hand. The unit is made of cast iron and steel and has enough weight (over 40 pounds) to roll with good momentum. Anyone who has tried to push a plastic seeder on less-than-perfect soil can appreciate this feature.

The seeding mechanism of the 300-A is simple. A small, fluted, feed wheel inside the hopper pushes the seed through a hole in the stationary seed plate; the seed falls into the furrow made with the depth-adjustable opening plow, is covered with a down-pressure-adjustable coverer, and firmed with a concave, rear packing wheel which leaves a slight ridge over the seed for easy sprout penetration. When changing from one seed to another or varying the spacing at which the seed is dropped, the seed plate hole size is changed (there are 39 different holes from which to choose).

Of course, we do a lot of seeding by hand, especially for our trials, where we may have 200 10- or 15-foot rows in a single trial. The time it takes to empty and refill the hopper on the Planet Junior seeder is impractical on these short rows of many different varieties. However, we often use the seeder to make rows for hand planting.

* Reprinted with permission from *Tools for Agriculture: A Buyer's Guide to Low Cost Agricultural Implements*, by John Boyd (London: Intermediate Technology Publications, Ltd.).

For the first row, we stretch a line between stakes and run the seeder along this line. The seeder has an adjustable row marker which marks the next row, so if we get the first row straight (easy when using a tight line), all the other rows in the planting will be straight too.

To make the furrows prior to hand sowing we use our Planet Junior garden plow, one of the high-wheel types that you find almost everywhere, which are made by numerous companies. I'm not sure about the other brands, but ours comes with three different-sized furrows. For large seed such as peas and potatoes, we use the moldboard plow attachment. After sowing the seed, the plow is run first down one side of the furrow, then back in the opposite direction down the other side, closing the furrow and covering the seed neatly and very quickly. It is certainly a whole lot faster than using a hand hoe. For small seeds such as carrots, we use the small cultivator tooth on the high-wheel plow and then cover the seed by hand during sowing.

## HAND-OPERATED JAB PLANTERS

*A hand-operated jab planter.*

For at least a century, most of the corn in this country was planted with jab planters. Two variations on the same idea were built, but both of them are basically glorified dibble sticks. The lower steel blade of the planter was jabbed into the ground, and then, by moving the handles, three or four kernels of corn were dropped from the planting box through a planting tube into the ground opened up by the blades. When the point of the planter was pulled out of the ground, the dirt fell around the seed.

Even after these planters were more or less obsolete, farmers used them to replant hills of

*Gene Logsdon demonstrating the use of the jab planter.*

corn skipped by the horse-drawn planter.

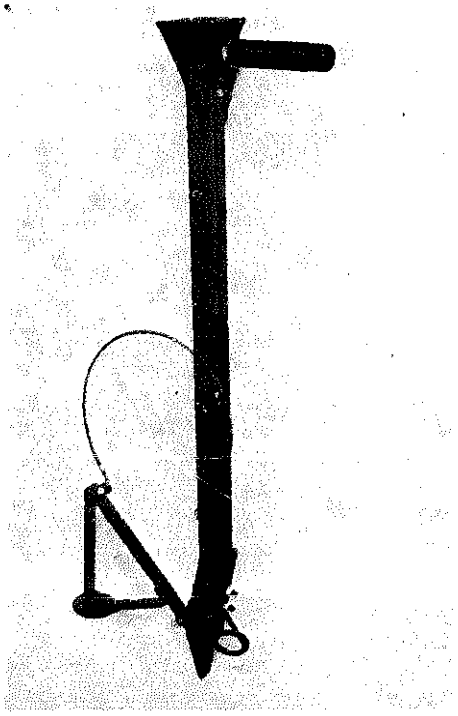
Today, a jab planter can come in handy for interplanting. For example, if you have a row of corn up and growing and want to plant pole beans beside the cornstalks, the hand planter is just what you need. You can walk along the row, plant the seeds where you will, and not disturb the soil around the already growing corn.

Fancy new models of the jab planter are still available and are used in research plot planting. They are available from manufacturers and suppliers of seed industry equipment. Old, used jab planters are often available at farm sales. You might pay $5 for one, or you might pay $35—you can never tell at an auction.

## NORTH AMERICAN SOURCES OF HAND PLANTERS

### Jab-Type Hand Planter

The Allan Machine Company has three models of jab planters which are hand fed, spring operated, have a metal barrel, and will adjust to different planting depths.



*ALMACO Slim-Style Jab Planter model SHP-NBA*
Allan Machine Co.

*Model SHP-NBA*

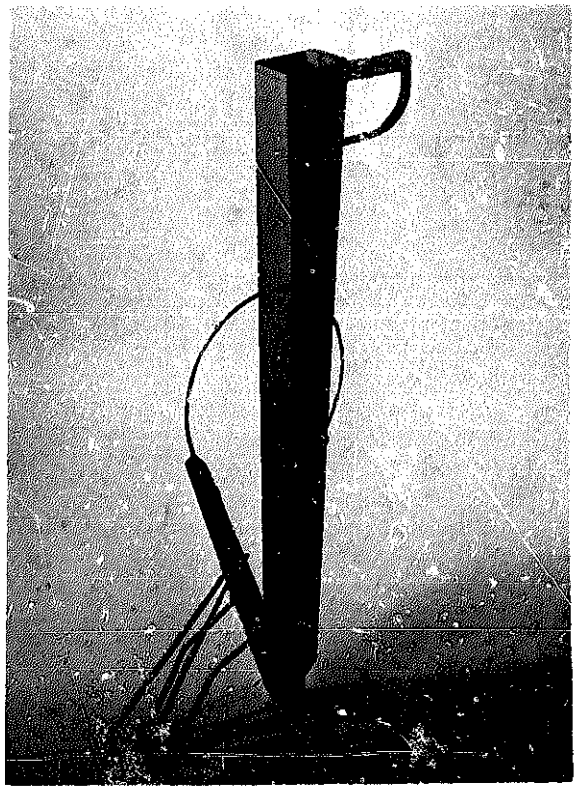
This is a slim-style unit and has a narrow, single barrel weighing 4½ pounds with a 1⅜-inch by ⅞-inch barrel opening.

*Model HP-SBA*

This is a single-barrel model which weighs 4 pounds and has a wooden back and a barrel opening of 2½ inches by 3 inches at the top.

*Model HP-DBA*

The third model has a double- or divided-barrel style and comes with a wood back.



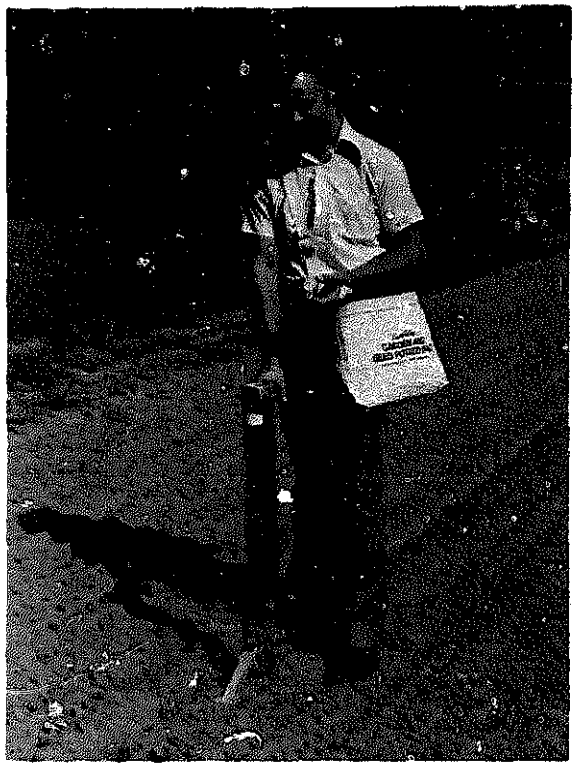
*ALMACO Single-Barrel Jab Planter model HP-SBA*
Allan Machine Co.

Allan Machine Co.
P.O. Box 112
Ames, IA 50010

### Potato Planter

Made of lightweight, corrosion-resistant ma-

terials, this unit plants potatoes at adjustable depths. It has a one-year guarantee.



*Hand jab potato planter.*
Esmay Products, Inc.

Esmay Products, Inc.
P.O. Box 547, Maple St.
Bristol, IN 46507

### Jab-Type Hand Planter

Burrows offers two models, both made of sheet metal and hardwoods. A spring-operated, planting depth adjustment is provided. The 4-pound units are approximately 33 inches high and have an opening 2½ inches by 3 inches at the top of the barrel.

Burrows Equipment Co.
1316 Sherman Ave.
Evanston, IL 60204

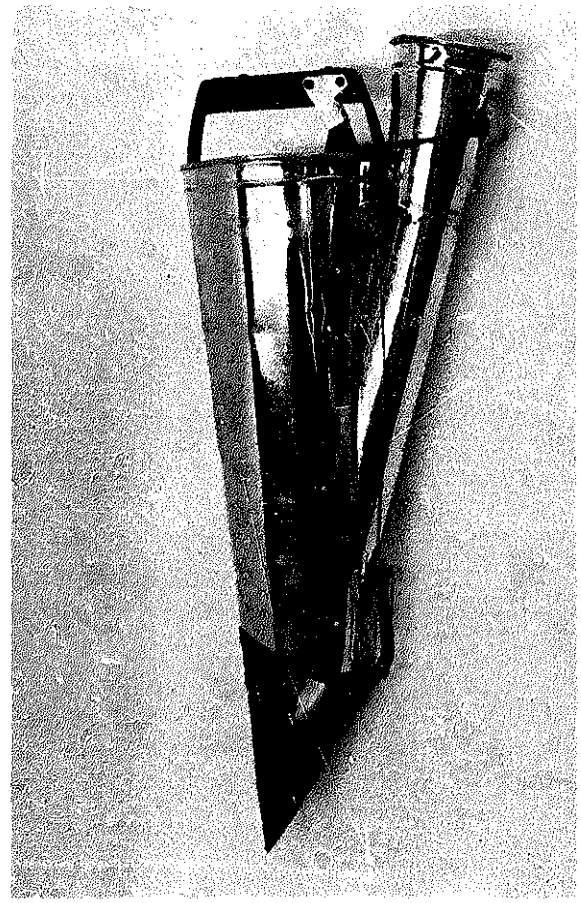
Maquinas Agricolas
Avenida Brazil No. 232
Marilia, Brazil

### The Plantmaster

To operate the plantmaster, you select one of a range of seed-metering discs according to the seed size, adjust the foot, place the unit on the soil, and depress the handle. A seed is automatically inserted into the soil. Up to 2,500 seeds can be planted per hour at a depth between 6 and 66 millimeters.

Vandermolen Corp.
119 Dorsa Ave.
Livingston, NJ 07039

Richmond Gibson, Ltd.
Salisbury Rd., Downtown Salisbury
Wiltshire, U.K.



*The Cumberland Plant Setter*
Cumberland General Store

### Cumberland Plant Setter

The Cumberland Plant Setter is a heavy

tin tank with a chute grooved and soldered to assure sturdy construction. High-carbon steel shovels with large, curved flanges rake the earth over the roots. It sets, waters, and covers tomato, tobacco, pepper, cabbage, sweet potato, strawberry, and other slip plants in one operation. Shipping weight is 12 pounds, height is 30 inches, and the diameter of the funnel chute is 4½ inches.

Cumberland General Store
Rt. 3, Box 479
Crossville, TN 38555

## INTERNATIONAL SOURCES OF JAB PLANTERS

**Hand Maize Planter**

A single seed is placed in the soil automatically when the stick is inserted. It can be used with one hand and is suitable for small cultivation or experimental work. It weighs 0.5 pounds (0.2 kilograms).

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**Models PD, PCM, PC, PA**

There are five variations of a basic two-handled, hand-powered, spring-operated jab planter.

Avenida Brazil, 232
Caixa Postal No. 196
Marila CEP 17.5000
*Estado de Sao Paulo, Brazil*

**Hand-Operated Seed-Dressing Drum Plans**

The object behind this drum was to build a seed-dressing device for village use, the design to be of fairly simple construction so that it could be made by local craftsmen.

The test drum used was an ordinary water tin of approximately 13 inches (330 millimeters) in diameter and 15 inches (382 millimeters) in height.

It was found that this drum had a capacity of 30 pounds (13.6 kilograms) of Chalimbana groundnuts, 35 pounds (15.9 kilograms) of soybeans or maize, and 38 pounds (17.2 kilograms) of fertilizer when filled correctly. In a durability test, a total of 1½ tons of fertilizer was mixed without signs of damage. The drum was also used for seed dressing of groundnuts and maize with satisfactory coverage performance and no apparent adverse effect on germination.

Intermediate Technology Publications, Ltd.*

London WC2E 8HN, England

# THE HORN SEED SOWER

The simplest kind of broadcasting seeder, the Horn Seed Sower, consists of a reservoir which funnels seed into a long tube. The operator holds the tube, or horn, at the end closest to the reservoir, and with a skilled flex of the wrist, seed is flung out of the tube. It can be used to broadcast any seed to be grown in a solid stand and, in experienced hands, will result in a more even distribution of seed than would be achieved by hand alone.

## SOURCES OF HORN SEED SOWERS

**Horn Sower**

This device sows primarily smooth grass or grain by swinging its horn back and forth. This sower spreads seed evenly from 30 to 40 feet at a rate determined by the adjustable feed gate in the base or tube joint and by rate of step. It comes with an 11-inch duck bag and an extension funnel attached to a tin distributing tube 22 inches long, 1¼ inches at the base and ¾ inch at the mouth. This sower has a capacity of ¼ bushel and a shipping weight of 1 pound, 8 ounces.

Cumberland General Store
Rt. 3, Box 479
Crossville, TN 38555

The Cyclone Seeder Co., Inc.
Box 68
Urbana, IN 46990

* Intermediate Technology publications can be ordered from International Scholarly Book Service, Inc., Box 555, Forest Grove, Oregon 97116.

*Horn Sower with canvas bag.*
Cumberland General Store

### Horn Sower

This horn seed sower has a metal horn in three sections. It has an adjustable rate gauge and wire scatterer. The shoulder strap is also adjustable. It can be used for seeding grasses and small grains on any acreage. Its capacity is 1 peck.

Crossville, TN 38555

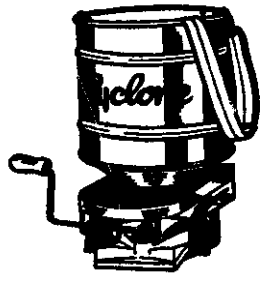
## THE HAND-CRANKED BROADCAST SEEDER

A further refinement of the horn, the broadcast seeder hangs by a strap over the shoulder. Seed in the canvas bag or metal hopper flows through an adjustable hole in the bottom onto a distributing fan which is powered by a hand crank. The fan spreads the seed evenly over the ground. Adjustments let you alter your seeding rate to suit the crop. But remember that the speed with which you walk and turn the crank will also vary the seeding rate considerably. You have to learn to walk and crank uniformly and then match the seeder's adjustments to your motions. Cyclone and Universal are two popular brand names available from most hardware stores and country catalogs. Models are light- or heavy-duty, the former for sowing seed only, the latter for spreading fertilizer and lime. Don't try to spread fertilizer with the lighter models, though. Much larger broadcasters pulled behind a tractor and powered by a power take-off shaft are capable of extensive broadcast-planting coverage.

### SOURCES OF HAND-CRANKED BROADCAST SEEDERS

#### Cyclone

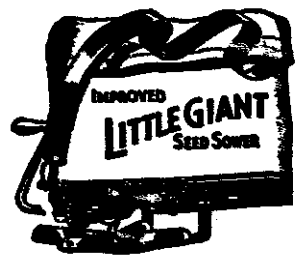
This is a triple-gear, adjustable sower with a self-feeding, oscillating feed plate. Equipped with a wide shoulder strap, an 18- by 6½-inch hardwood base, and spring stop, it is 10½ inches in diameter and weighs 5 pounds. It broadcasts all kinds of seed and is readily available through mail-order catalogs and hardware stores.



*Cyclone*
Cumberland General Store

**Little Giant**

This is a seeder with a double-feed flow to sow any kind of seed to be broadcast. It has an automatic feed flow which can be adjusted for any amount of seed per acre. Features include a wide shoulder strap, a 7- by 14½-inch hardwood base, a four-section distributing wheel 10½ inches in diameter, and a self-agitating feed plate. The seeder has a capacity of ½ bushel and is readily available through mail-order catalogs and hardware stores.



*Little Giant*
Cumberland General Store

For more information on either of the above seeders, write:
The Cyclone Seeder Co., Inc.
Box 68
Urbana, IN 46990

**Collapsible Hand Spreader**

A rotary agitator whirls material out to cover up to a 15-foot-wide swath depending on the density and particle size of the material being spread. It comes with an adjustable spreading rate gauge, spring load, trigger action on-off switch, die-cast metal gears, and measures 10½ inches high with a 9-inch diameter.

**Hand-Pushed Broadcast Seeder**

Cyclone also has a hand-pushed, broadcast seeder-spreader which is popularly used for spreading fertilizer. It is accurate in ounces or pounds per 1,000 square feet. A tapered-edge spreader eliminates skips and double overlaps. It comes equipped with micro dial settings for light, medium, or heavy applications, 8-inch wheels, T-bar handle, and a galvanized steel hopper. This seeder is easy to find in any hardware store or country catalog.

**Casoron Spreader**

The Geiger Casoron is a rigid, rust-resistant unit weighing 8 pounds. The Casoron spreader can spread or seed at a rate of from 50 to 500 pounds per acre. The flat base keeps the unit from tipping while filling. An adjustable control varies the swath width from 3 to 12 feet. The unit comes with a wide shoulder strap and a lubricated gearbox, sealed for protection.

E. C. Geiger
Rt. 63, Box 285
Harleysville, PA 19438

**Hand-Pushed Row Seeders**

Small row planters mount the seed box on one or more wheels which not only carry the seed box but activate a disc or plate, as it is called, in the bottom of the seed hopper. As the plate moves around, it allows the seeds to fall through the planting tube into the soil at regular, uniform spacings. In the simplest type of row seeder available, for example, the Plant-Rite and Dial-A-Seed seeders, the wheel *is* the planting disc. The smallest two-wheel seeder with changeable discs for different planting

intervals is the light Esmay seeder, which is regularly advertised and sold through catalogs and garden stores. A little larger and heavier, with a larger choice of planting depths and plates, are the Lambert, the Planet Junior, and one from Danville Manufacturing Co., Danville, IN 46122 (sold by Sears). There are probably others.

**Professional-Type Seeder-Fertilizer**

This seeder has a heavy-duty construction for large areas. It seeds and fertilizes in one operation. A choice of seven different-sized discs plus two sprockets offers over 20 spacing and depth combinations. The seeder opens the furrow, plants, covers, fertilizes on both sides of the seed, and marks the next row. It holds 1 quart of seed and 15 pounds of fertilizer, and has a shipping weight of 80 pounds.

Sears, Roebuck & Co.
Farm and Ranch Catalog

**Golden Harvest Garden Seeder**

This seeder opens the soil, plants and spaces seeds, covers and firms the soil, and marks the next row in one operation. It comes with six seed plates that will handle most seeds and has rear-wheel drive. The Seeder Attachment can be ordered to fit the high-wheel cultivator with a 24-inch wheel and a slot attachment foot, or as a separate implement. The seeder weighs 12 pounds, the attachment alone, 11 pounds.

**Garden Seeder**

This Garden Seeder opens the soil, spaces, plants, covers seeds, and marks the next row all in one pass. A drag chain covers the seeds ahead of the rear wheel which then packs the soil. There are six plates for versatility, and a kickstand holds the seeder upright for filling the hopper. It has a shipping weight of 11 pounds.

Sears, Roebuck & Co.
Farm and Ranch Catalog

**Planet Junior Number 4 Seeder**

This seeder is available with or without cultivating attachments. With the attachments, it combines six tools in one:

1. an accurate hill-dropping seeder,
2. a rapid, continuous row seeder,
3. a light-running, single-wheel hoe,
4. a sturdy, single-wheel cultivator,
5. a furrower, and
6. a hand plow.

Shipping weight: 50 pounds.

**Planet Junior Number 300A Seeder 7309X**

This seeder is equipped with three interchangeable plates with a total of 39 holes giving ample adjustment for any variety of seed. It includes a K712 opening plow. Shipping weight: 55 pounds each.

**Almaco V-Belt Planter and Applicator**

The V-belt planter is available as either a hand- or power-driven unit. It is manufactured for experimental agronomic work at universities and research stations. Features include a planter shoe depth adjustment, a 14-inch, wide-faced drive wheel, six interchangeable sprockets, roller chain drives, V-belt tension adjustment, V-type covering wheel, rubber-tired running gear, and adjustable handles. It is designed for use in planting test plots and in applying fertilizers, insecticides, and granular materials. Two models are available.

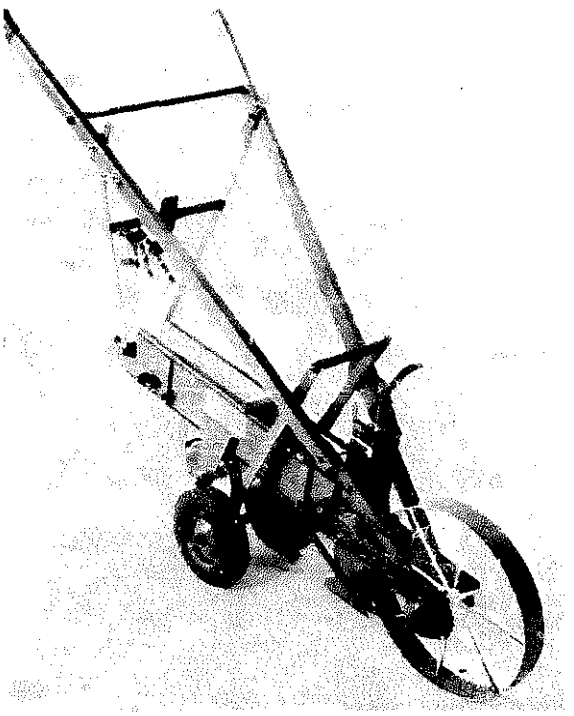
Ames, IA 50010



*ALMACO Endless V-Belt Planter-Applicator*
Allan Machine Co.

**English Seeders**

Two types of seeder are available from this company, and each may be pushed by hand or mounted on a Unibar animal-drawn tool bar. The reciprocating slide-action seeder was designed mainly as a precision seeder for use with hybrid maize, but can also handle groundnuts and beans using the standard maize slide. The seeder drops two or three seeds at 45-centimeter spacing with fertilizer alongside. Slides with smaller holes are available to enable sorghum, millet, and delinted cotton to be sown. A simple reciprocating action, combined with positive ejection of the seed (by slide-actuated springs), ensures trouble-free operation. The use of graded seed is preferable. Seeds and fertilizer are kept separate throughout, so that burning of the seed does not occur.

The roller-seeder can be supplied as a two-wheeled, single-row machine for hand propulsion or ridge planting with an animal-drawn tool bar. Multirow tool-bar-mounted versions can also be supplied. The seed rollers can be drilled to suit the customers' requirements, allowing any spacing along the row up to a maximum of 1.65 meters. Seed ejection from the rollers is positive.

**IRRI Multihopper Seeder**

This unit was designed by the International Rice Research Institute in the Philippines for sowing pregerminated rice. It can sow 50 kilograms of pregerminated seed per hectare in 5 to 7 hours. Pulled by one man, the single central ground wheel drives the metering tools. Row spacing is 25 centimeters. This seeder requires:

1. pregerminated seed,
2. good water control at planting time, and
3. good land preparation.

**Aspee APS-61 Seeder**

This hand-pushed seeder can sow all types of seeds in thin lines by metering them through holes in a plate. It is suitable for light soils and incorporates a furrow opener and seed coverer. Weight: 15 kilograms.

**Aspee APS-53 Hand Hill and Drill Seeder**

Suitable for hill and line drilling of seeds in soft or dry soils, this seeder plants practically all seeds, big or small, in hill spacings of 10, 15, 20, 30, or 60 centimeters. It opens the furrow, drops the seed to the proper depth, covers it evenly, firms the soil over the seed, and marks out the next row in one operation.

A lever instantly shuts off the flow of seeds when handles are raised for drawing back or turning at the end of a row. Weight: 12 kilograms.

**Aspee APS-54 Seed Drill and Wheel Hoe**

This dual-purpose implement cuts the soil, drills seeds, covers them with soil, and packs them into the soil. The line-sowing mechanism drops seeds at the required spacing. It is suitable for small seeds such as wheat, rice, jute, linseed, mustard, and others. Weight: 15 kilograms.

All three above seeders are available from:
American Spring & Pressing Works Pvt., Ltd.
P.O. Box 7602
Malad, Bombay 400 064, India

**Cottonseed Planter**

This implement was especially developed for planting nondelinted cottonseed. Spacing between plant stands can be 17, 20, or 31 centimeters and six or seven seeds are planted at each stand. Alternative seed plates allow the machine to be used for planting other crops such as groundnuts, millet, maize, and sorghum. Weight: 39 kilograms.

E.B.R.A.
28, rue du Maine, B.P. 84
49009 Angers, France

**Direct Seeder**

A two-row hand-drawn machine for upland rice culture, with different feed rollers, it can be used for planting other seeds such as wheat, barley, maize, sorghum, and millet. Capacity of each hopper is 2.2 liters. Spacing between rows is adjustable from 150 to 360 millimeters.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**The Bean Drill**

This single unit, thin-line drill is capable of handling all sizes of seeds, from the smallest up to peas and small beans. It sows at a predetermined depth with the row covered. The drill coulter is adjustable for depth, and the metal agitator ensures positive seed flow. Standard specifications include shut-off control, adjustable marker, and four seed plates giving 46 holes from 2.5 to 25 millimeters in diameter.

J. Gibbs, Ltd.
Stanwell Road, Bedfont, Feltham
Middlesex TW14 8ND, U.K.

**Exel Hand Seeder**

This push-type seeder unit is designed for drilling most types of vegetable seed on the flat. It is suitable for small market gardens where the seedbed has been well prepared. Twin rubber-tired wheels drive the mechanism, which consists of an aluminum cell wheel suited to the crop being sown. The hopper has a 2-pint (1-liter) capacity, and a simple seed coverer is provided.

Russel's (Kirbymoorside), Ltd.
The Works Kirbymoorside, Ltd.
York YO6 6DJ, U.K.

**Hand-Pushed Seed Drill**

This is a precision seeder in which seeds are metered through a perforated belt, resulting in minimal seed damage. Seeds which are approximately spherical (or pelleted into spherical pellets) can be drilled singly. Seeds such as lettuce or carrot can be distributed at an average of two seeds from each belt perforation. Group spacings can be arranged: two or three seeds 25 or 50 millimeters apart, followed by a gap before the next group of seeds. Double and treble line coulters are available to sow two lines of seeds 50 millimeters apart, three lines 25 millimeters apart, or th[illegible]38 millimeters apart. This device is suita[illegible] nearly every type of seed up to the size of beans, peas, or maize. Two or more seeder units can be mounted on an animal-drawn tool bar.

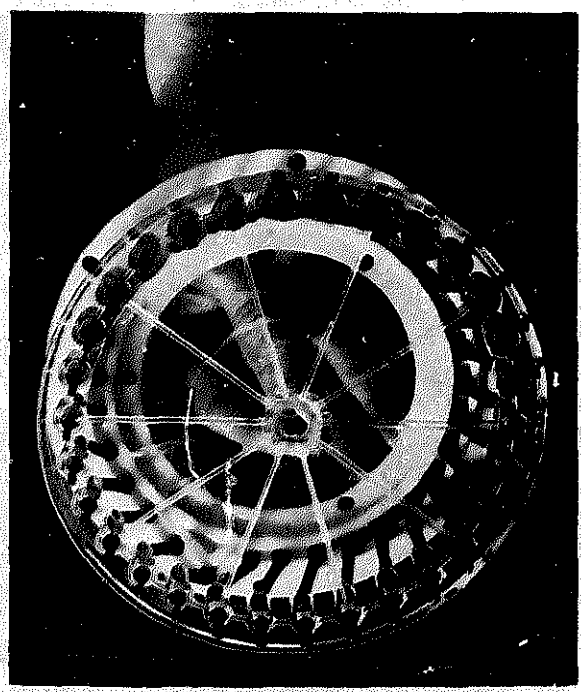
**Mini Nibex Planter**

The Mini Nibex hand planter is for growers with up to 10 acres and will sow up to 2 acres in a day. The Nibex cup system includes 25 types of cups for different seeds—both natural and pelleted. This wide range makes it possible to be able to choose the most suitable

*Mini Nibex Hand Planter*
Nibe-Verken AB

cup for the desired drilling method. The seeding rate can be varied from 4 to almost 2,000 seeds per running yard—either thin-line or hand-drilled in widths of 2, 2.5, or 4 inches (50, 65, or 105 millimeters). The cup system is largely unaffected by variations in seed size. To reduce the amount of seed required when sowing small and expensive seeds, a regulator-economizer insert is available for use in the seed-housing unit.

When a suitable drilling depth has been established and the seed distribution mechanism has been set for the desired number of seeds per yard, the Mini Nibex is ready for sowing. The coulter gives the furrow the correct depth, the cups distribute the seed in the desired way, the presswheel beds them down in the moist earth, and the coverers enclose them with loose soil.



*Thirty-one seed-distributing cups are housed in this chamber, which is interchangeable to accommodate different seed sizes.*
Nibe-Verken AB

Cups are easily switched for fast changes between seeds. The relationship between cup type, number of cup feeds per yard, and number of seeds sown per yard can be found in the detailed sowing instructions.

The seeder unit is mounted between two supporting wheels which are 4 by 16 inches, or 105 by 400 millimeters in diameter, and the bearing surfaces are perforated to prevent packing and crusting of the soil. Drive is from the front wheel via two chain transmissions. The changing sprockets offer 59 selections, from 3.5 to 86 cup feeds per yard. Drilling depth is progressively adjustable by means of two handwheels. Changeover is performed without tools.

Nibe-Verken AB
S–285 00 Markaryd
Sweden

# CONE SEEDERS

Cone seeders have been an important development in equipment for research or experimental agriculture. Seed poured into a small funnel at the top of the cone is distributed evenly at the base when the funnel is lifted. The cone is geared to rotate one full turn in the plot length with a scraper deflecting the seed to the furrow opener. The cone base is roughened to prevent the seed from rolling.

## SOURCES OF CONE SEEDERS

### Craftsman Cone Seeders

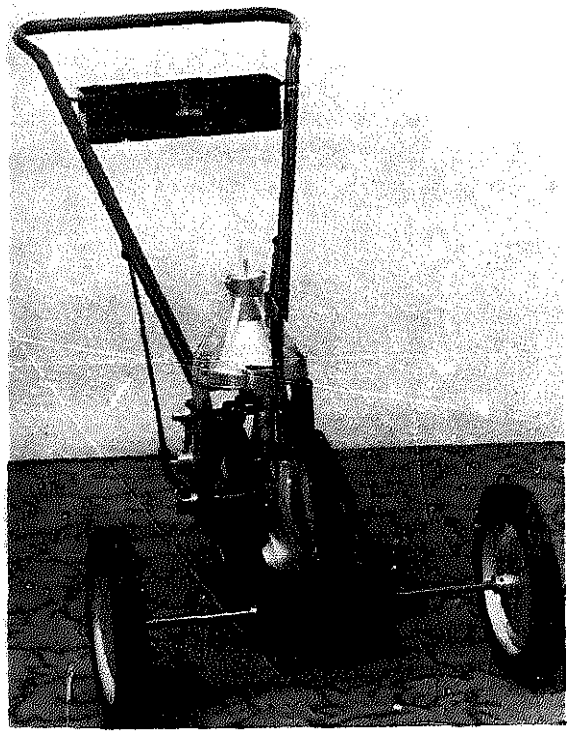
Cones are available as single units or mounted in groups for installation on custom-built drills. They can be supplied with a 7- or 14-inch base diameter and with either knurled or plain base plates.

Craftsman also manufacturers a hand-pushed, single-row seeder with single- or double-metering cones. It has a three-wheel chassis with 12-inch, double-disc openers. Sprockets are available to adjust for row length. The two-cone model is used for simultaneous fertilizer or insecticide treatments during seeding.

Craftsman Machine Co.
61 Heaton
Winnipeg 2, Manitoba, Canada

### Chain's Cone Planter

A planter manufactured by Chain Machine Company has four cone dispensers mounted on a 12 h.p. compact tractor. The cones are driven



*Craftsman cone seeder for research plot work.*
Craftsman Machine Co.

through a multiselection chain and sprocket drive from the rear wheel with selections for plot lengths from 4½ to 30 feet. The double-disc openers are hydraulically controlled and can be equipped with firming wheels and drag coverers. Two seats are provided for operators to load the cones.

> NOTE: This planter is referred to as a precision planter in the manufacturer's literature. This refers to the precision manufacture and not to precision planting, which requires a seed-cell planter and a short, controlled seed drop.

Chain Machine Co.
112 N. Kansas
Haven, KS 67543

**The Swanson Planter**

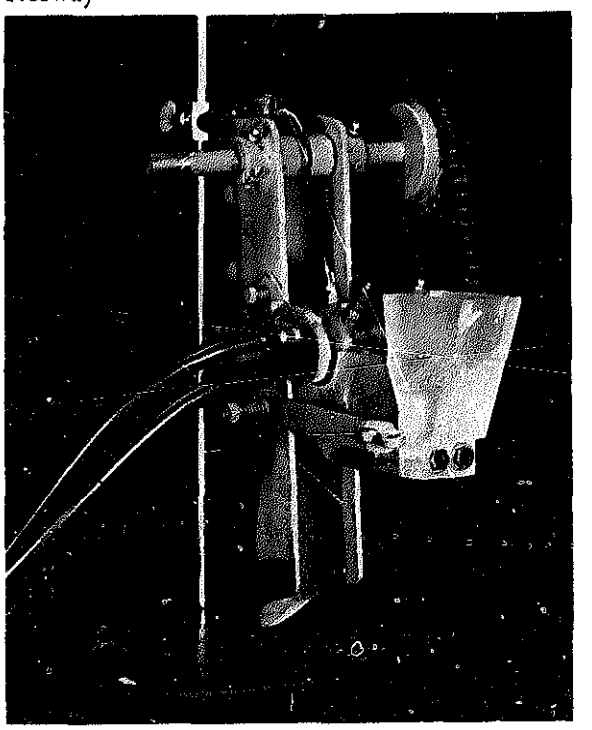
The Swanson plot planter, developed for small test plots for such seeds as soybean, sorghum and kenaf, uses a cone arrangement similar to the Craftsman cone. Sprockets are available for rows 3 to 32 feet long.

Swanson Machine Co.
20-26 E. Columbia Ave.
Champaign, IL 61820

**A Norwegian Cone Seeder**

The Oyjord plot drill has a single cone-type dispenser feeding a spinning divider which divides the sample into 2, 4, 6, 8, or 10 openings to correspond with the number of row openers used. The row length can be adjusted to any size between 13 and 49 feet. The drill is available with a three-point hitch or as a self-propelled model with a 4 h.p. engine. A planting rate of 60 to 100 plots per hour is claimed. Equipment for continuous drilling and press-wheels are optional extras. The cone dispenser differs from the Craftsman type in that the seed is guided around a fixed base by wipers and drops from a hole in the base.

Jens A Schou Mek Versksted
Drobak
Norway



*Suction-Spaced Seeder* Agriculture Canada

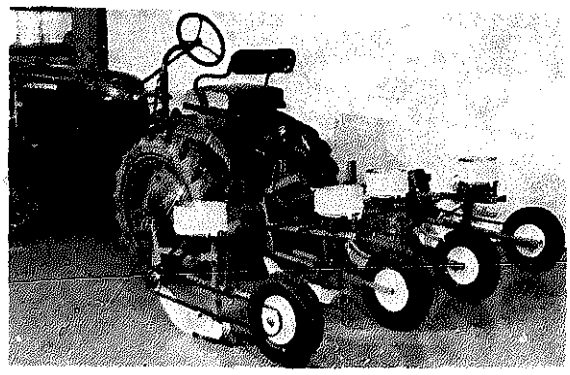
**Suction-Spaced Seeder**

This plant seeder has been the inspiration behind many new types of planters. It was originally developed by Mr. L.G.I. Copp of the Crop Research Division, Department of Scientific Research, in Christchurch, New Zealand. It is a one-row planting unit, and mounts on a two-wheel tractor. Seed is picked up by vacuum through hypodermic needles on a revolving drum with a small vacuum pump.

W.A. Habgood, Ltd.
Lincoln, New Zealand

**Soybean Planter**

Originally developed by the Engineering Research Service of Agriculture Canada, this soybean planter for population studies is now available commercially in an improved form, making it suitable for repetition planting of large numbers of samples at different spacings. The original models used seed hopper bottoms mounted on a lightweight frame for adjustable row widths. Spacing within the rows was by sprocket and seed plate selection. Seed accuracy has been improved by using brush cutoffs and a smooth drop tube. The planter mounts on a four-wheel tractor.



*Soybean Planter*
Agriculture Canada

Mear Supply
327 Townline
Carleton Place, Ontario, Canada

**Four-Row Plot Seeder**

Seed is fed to the openers of this self-propelled seeder by either a V-trough belt or a fluted dispenser and a four-way spinning divider. It is designed for the exacting requirements of research plot experiments. Fertilizer may also be applied through a belt attachment. The four-row seeder pictured here is now obsolete because it was made to attach to a Bolens Ridemaster tractor, which is no longer being produced. However, models by other manufacturers are available. Plans are available from the Engineering Research Service, Agriculture Canada, Ottawa, Ontario K1A 0C6 Canada, and similar seeders are commercially available.

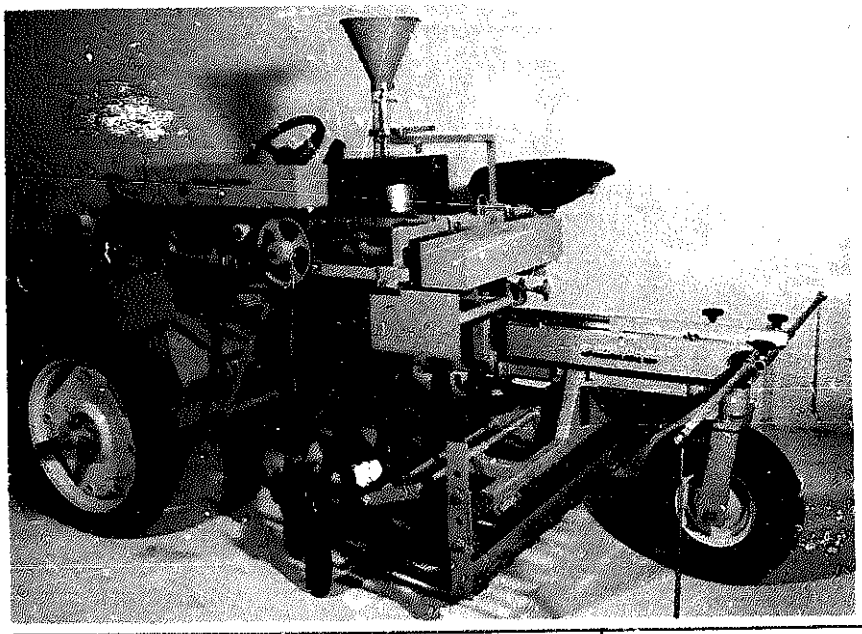
**Two Plot Drills**

The first of these is a three-row planter employing two operators, one pulling and the other pushing, and using a seed cup to dispense seed to three row openers. The delivery rate is adjusted by a plate at the bottom of the cup. The cup is hinged to permit dumping of leftover seed.

Bill's Welding
South Grand St.
Pullman, WA 99163



*Walter and Wintersteiger Plot Drill*
Walter and Wintersteiger

The Walter and Wintersteiger plot drill is a three-wheeled, self-propelled model available with either a full-width or individual hopper seed box. Metering is done by a fluted wheel. The seed boxes have a provision for dumping unused seed. The machine can be purchased with three to eight row openers and with a two- or three-speed gearbox. Cultivating and spraying attachments are available.

F. Walter & H. Wintersteiger
4910 Ried im Innkreis
Frasch augasse 19, Postfach 124
Dimmelstrasse, Austria

**Toothed-Wheel Seeders**

Some European seed drills are suited to planting larger plots in that they are mounted on a three-point hitch and have a catch pan to collect seed when regulating the dispensers or when emptying the seed box through an unloading valve at each run. Individual runs can be shut off as desired, or hopper inserts can be used for seed separation in the box. The most common dispenser is a toothed-wheel metering device driven by a gearbox with up to 81 selections.

**Plantox Drill**

The Plantox drill is a machine mounted on a three-point hitch suitable for horticultural and forestry plantings. The five-row distributor is driven from the tractor PTO. All types of seeds can be planted in rows or wide beds.

Zijlstra en Bohuis NU
Beneden Weerdiep 105
Veedam, Holland

**Finlay Plot Seeder**

The Finlay plot seeder is a sophisticated semiautomatic machine for planting large numbers of plots per day. It uses cartridge loading and a false-bottom seed dispenser, and is available with one to nine row openers.

B. Forrest, Metal Patterns, Ltd.
749 Port Rd.
Woodsville, S. Australia

**Svenska Plot Seeder**

A plot seeder for sugar beet experiments, this unit meters a premeasured quantity of seed to a plot row and is available as one-row units.

Svenska Sockerfabriks Aktiebolaget
Betmekaniseringsavdelningen
Kavlinge, Sweden

**Habgood Vacuum Planter**

A vacuum pickup planter suitable for precision planting of any type of seed is available for tool bar mounting. A source of vacuum is required to provide suction to hypodermic needles mounted on a revolving cylinder.

W.A. Habgood, Ltd.
Lincoln, New Zealand

**Mat-OSU Planter**

The Mat-OSU planter was developed at Oregon State University for fertilizer trials. Commercial planters were found unsuitable for the precise planting required, so a vacuum pickup wheel was developed. It has been found suitable for grass, legume, cereal, flower, and tree seeds without grading the seed. Row spacing is adjustable from 12 inches to 6 feet. Fertilizer metering is by Cole top delivery hoppers. Fertilizer can be placed accurately at varying positions in relation to the seed.

Mater Machine Works
520 S. 1st St., Box 410
Corvallis, OR 97330

**MacKey Plot Drills**

The MacKey plot drills use a dispenser consisting of a base plate with grooves corresponding to the number of openers, and a seed tray with a press plate which slides along the grooves to deliver seeds to the seed tubes. The tray is geared to traverse its length over the plot length.

The hand-pushed model has one to three openers spaced at 6-inch intervals and can be geared for rows 40 to 80 inches long. One hundred 5-foot rows can be planted per hour. The power model has five openers and can be geared for 10- to 20-foot plots. Its capacity is 100 10-foot plots per hour.

Maskinfirma Tuland
P.O. Box 107
Landskrona, Sweden

**A Seeder for Cereals**

The N.I.A.E. spaced plant seeder was developed to replace hand dibbling of cereal grains for lattice-planted plots. The planter is cam operated to plant seeds 2 inches apart on a 6-inch row spacing. Holes are made by a series of dibblers, each consisting of a tube into which a plunger is inserted just before the tube enters the soil. The plungers are then raised and the seed is released from a preloaded, plastic seed magazine. A sowing rate of 500 rows per hour can be attained with a five-man crew. Twenty-three seeds are spaced in a 4-foot row. The planter is powered by a small engine with a 45:1 reduction box.

*Seeding ridges with animal-drawn equipment.*

**Super-Eco Seeder**

This is an all-steel seeder unit with two large wheels driving the mechanism. Different plates or distributors are available for sowing groundnuts, millet, sorghum, maize, rice, and several types of vegetables. The unit is fitted with two handles, a furrow opener, coverers, a presswheel, and a row guide for marking subsequent rows. The weight is approximately 82 pounds (37 kilograms), and the unit can be drawn by a single donkey or bullock.

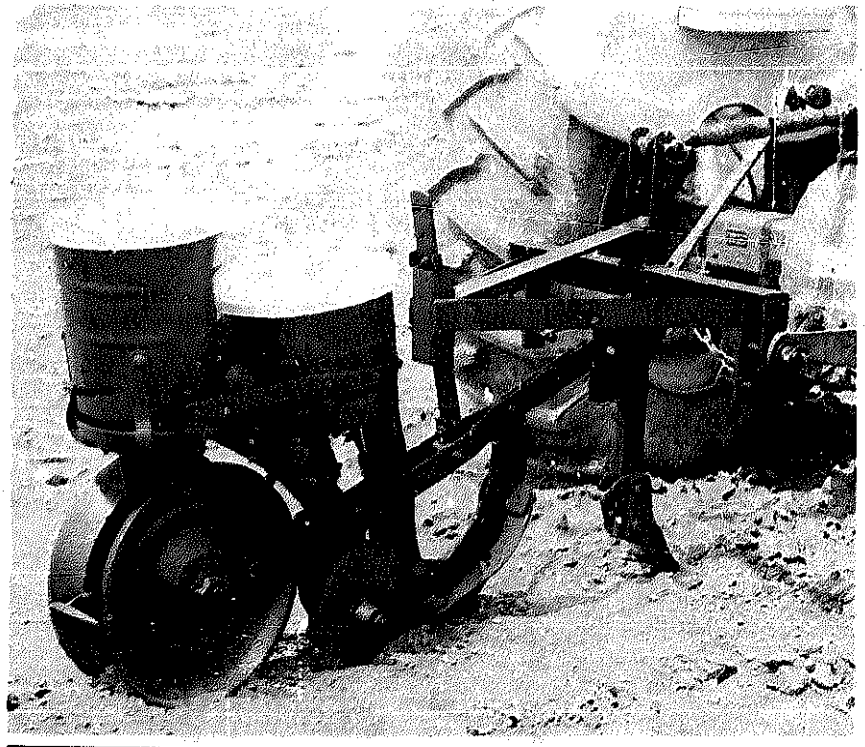
## TRACTOR-DRAWN UNIT PLANTERS

Many of the units described as hand-operated are also available with hitches for drawing by tractor. Larger, heavier planters, like the Brinly-Hardy (Louisville, KY 40200) and the Cole (Charlotte, NC 28200) are designed for tractor use only. The Brinly is for tractors with horsepower from 8 to 18, and the Cole for

tractors on up to perhaps 15 to 25 horsepower. These seeders attach to three-point hitch arrangements or other hydraulic lift systems.

Larger and heavier commercial farm planters of great precision can now be purchased in single-row versions. The new planters, like those now available from all the large farm equipment companies like John Deere and International Harvester, are called unit planters. Each planting unit is powered by its own drive wheel, so many units can be used together. You will have to make your own hitch arrangement to attach one of these units to your tractor as it is not made for mounting on a tool bar. But the small commercial grower may find adapting a unit seeder well worth the effort, since these planters generally do a better job of planting than the smaller garden planters.

It may be practical, with the unit planters mentioned above, to go to a two-unit planter if you are row cropping more than four or five acres. The smaller Cole is a sort of unit planter, that is, two units can be put together quite easily. Old, obsolete, two-row planters originally designed for horses or smaller farm tractors also make fine tools for homesteaders with just a few acres to plant, but they are becoming scarce. Old four-row planters are now easier to find, but they are a little large for the typical homestead. However, you can modify one to a two-row model, or if you are mechanically equipped, you can take a single unit from a four-row or two-row planter and convert it to a single-row seeder. It means, on four-row models especially, converting the presswheel that presses the dirt on top of the planted seed, into a drive wheel to turn the planting plates. Older four- and six-row planters do not have a drive wheel for each unit.



*Cole No. 12 Planter*
Cole Mfg. Co.

## SOURCES OF TRACTOR-DRAWN UNIT PLANTERS

### Cole Number 12 Planter

Designed for the small farmer, the No. 12 is a garden planter with opening foot and three-point hitch for use with category 0 and 1 tractors. The planter simultaneously plants seed and side-dresses fertilizer. It has a single, inclined-plate seed hopper with a set of four seed plates for planting corn, large and small squash, small limas, okra, tomatoes, peas, and snap beans in hill or drill fashion. Other seed plates are avail-

able. A set of four distance gears for changing spacing is included. Fertilizer is placed beside the seed to prevent any fertilizer damage in germination. The galvanized, fertilizer hopper has a 40-pound capacity and a rate of application adjustable from 34 to 650 pounds. It will apply any dry fertilizer. An opening shank is included (sweep is not included).

Cole also offers a variety of hitches to mount the No. 12 planter to almost any tractor. These include International Harvester Models Super A, 140, and Cub tractors, both with and without fast hitch. They also have hitches for tool bar applications and for mounting the planter to other cultivators. All units are available worldwide.

*The INTEC two-wheel tractor with a Cole No. 12 Planter attached. Often, equipment has applications even its manufacturer hasn't thought of.*
Dowding Tool Products, Inc.

**Cole's 210 Series**

A lift-type, 50-inch carrier with category 1 three-point hitch and front and rear tool bars allow the farmer to simultaneously plant and put out fertilizer. He has the option to use either one or two fertilizer hoppers, one of four planter chassis, and three seed hopper options. Fertilizer is placed by two disc-side placers and run by a ground-drive wheel. Seed spacing, seed depth, and seed plates may be changed without special tools. A wide variety of plates is available for all seed hoppers. Cole also offers many attachments to fit a farmer's needs, such as gauge wheels, spring shanks, furrow openers, bed levelers, cotton attachments, and depth gauge extensions. Granular chemical applicators are also offered for both herbicides and insecticides.

Charlotte, NC 28299

**Planet Junior Number 9192X Unit Seeder**

Inside its own individual mounting cradle, this seeder unit is spring-suspended. This permits each unit to follow the contour of the ground assuring uniform depth of planting. It is suspended so that down pressure or lifting action is accomplished by actuating the tractor lift device. Units may be mounted in multiple-row applications at minimum-row widths of 9 inches, and are ground driven. Shipping weight: 56 pounds.

**Model KK-305 Vegetable Planter**

A ground-drive unit for use in prepared soil, it is capable of planting seed as small as radish and turnip, as well as corn, beans, and peas. It opens the furrow and then drops and covers the seed at the desired spacing. It features a large-capacity seed hopper, a new float plate that allows the planter to follow ground contours, a new shovel-type opening foot, a new, larger, concave drive wheel which improves traction, reduces the possibility of skidding, and improves seed coverage. It is equipped with five quick-change seed plates, and 18 other seed plates are also available. Weight: 70 pounds.

**Model KK-310 Row Marker and Model KK-320 Fertilizer Hopper (for use with the KK-305 Planter)**

The KK-310 Row Marker helps maintain desired row spacing by marking next row as you plant. It is adjustable for different crop spacings. The KK-320 Fertilizer Accessory, when added to the KK-305 Planter, enables you to plant and fertilize in one operation. The rate of fertilizer flow can be regulated. Weight, Model KK-310: 10 pounds; Model KK-320: 20 pounds.

Brinly-Hardy Co., Inc.
P.O. Box 1116
Louisville, KY 40201

**Ventura Large Seed Planter**

This is a single-row planter which fits onto any tractor tool bar. The seed wheel revolves through the reservoir of seed, picks up one seed at a time, and deposits it into the planting opener. There are 12 different wheels for planting different-sized and -shaped seeds.

Ventura Mfg. & Implement Co.
1265 Commercial Ave., P.O. Box 1069
Oxnard, CA 93030

**Jumil J-2 Unit Planter**

Available with semiautomatic furrowers, this equipment furrows, sows, and fertilizes all in one operation at any required depth and spacing. The units themselves or the tool bar to attach them is furnished with three-point connections adjustable to any type or make of tractor. Discs are furnished to plant corn, cotton, rice, and peanuts. Special adapters are available for planting soybeans.

**Gandy Row Seeders**

Gandy makes a number of row seeder units with gear drives from a 12- or 6-volt electric motor or hydraulic motor drive. They have seeders for every major brand of farm equipment in all sizes.

Gandy Co.
528 Gandrud Rd.
Owatonna, MN 55060

**Models 202-202F, 404-404F**

The 202-404 planters for sowing cotton, corn, sunflower, melon, and sorghum seeds consist of separate T-63 sowing units which are attached to a rhomboid 2¼ by 2¼-inch tool bar. The units can be adjusted to a width of 16 inches to suit the required width between rows. The planter is made in three variations for two, four, or six rows. It is equipped with automatic markers fixed at a certain angle to ensure the creation of a prominent furrow that will mark the rows for the next pass. The marker works simultaneously with the elevation of the planter by the tractor operator. These markers can be set to suit different distances. The planter is equipped with front shovels mounted on a special front bar, to remove dry earth before sowing. Covering discs or shovels are optional. Other models are available, including those specially designed for planting sugar beets, vegetable seeds, onions, garlic, and peanuts, as well as multipurpose units.

Technohar Agricultural Machinery & Implements, Ltd.
New Industry Region, Petakh-Tikva
P.O.B. 225, Israel

**Heath Precision Vacuum Planter**

The seeds are picked up by means of a vacuum and held to the small holes in the plate, which is driven by the presswheel. An easily adjustable, graduated selector avoids doubling in case two seeds are picked up by the same hole. When each seed arrives near the lowest point, the vacuum stops abruptly; the seed is released and falls. The plate operates above the furrow opener and drops the seeds approximately 3 inches apart. The absence of mechanical handling means gentle treatment of the seeds, assuring maximum germination, which is especially important in beans. Planting depth can be easily controlled by a single handle which simultaneously adjusts the level of the two wheels. The fan is mounted on the tool bar and is connected to the tractor PTO which should be operated at 540 rpm. (A 1,000 rpm conversion kit is available.) The fan provides enough vacuum for up to 12 units. The vacuum's fine adjustment is controlled by the fan shutter, and a vacuum meter is connected to the fan. The planter is suitable for all row crops: sugar beets, cotton, corn, beans, sorghum, sunflowers, melons, watermelons, cucumbers, tomatoes, peppers, onions, cabbage, and broccoli, as well as coated seeds such as lettuce and carrots.

Features of the 925, as described by the manufacturer, include:

1. Precision planting with exact spacing.
2. Accuracy is maintained even at high speed; up to 50 seeds per second can be planted.
3. No grading is needed even with seeds of irregular shape and size.
4. No pelleting is needed for small seeds.
5. Changing the seeds or the seed plate and cleaning are very easy. The same seed plate is used for a variety of seed sizes.
6. A higher percentage of single seeds is dropped than with any other planter.
7. A zero pressure tire prevents mud from building up.

Seed spacings from 1.25 to 20 inches are easily obtained by changing a sprocket on the drive chain or the seed plate. The 925 is made up of unit planters. Up to 12 can be mounted on the heavy-duty tool bar with row spacings easily varied. The minimum spacing is 16 inches. The furrow openers are twin offset discs with a shoe to form the furrow. The discs cut away trash while the shoe firms and packs the sides and bottom of the furrow. Positive fin-type furrow closers are used. A furrow depth adjustment can be achieved without changing the level of the planter.

Heath Farm Equipment
125 S. Airpark Dr., P.O. Box 312
Fort Collins, CO 80522

**ALMACO V-Belt Planter-Applicator**

The V-belt planter-applicator can be supplied as a completely assembled unit, with mounting brackets in place of adjustable handles and rubber-tired running gear. The unit can be attached to power-driven equipment such as garden and riding tractors, or mounted on tool bars for single- or multiple-row planting or application of granular materials. Mounting brackets can be furnished which automatically adjust to the contour of the soil, thus assuring uniform depth of planting.

Certain parts of the planter-applicator such as the planter frame, V-belt pulleys and shafts, slanting, metal-covered hopper sides, metal apron, sprockets and drive chain, sliding gate, and smooth or ribbed-style V-belts can be special-ordered for different applications in mounting on power-driven equipment.

Via C. Battisti, Italy

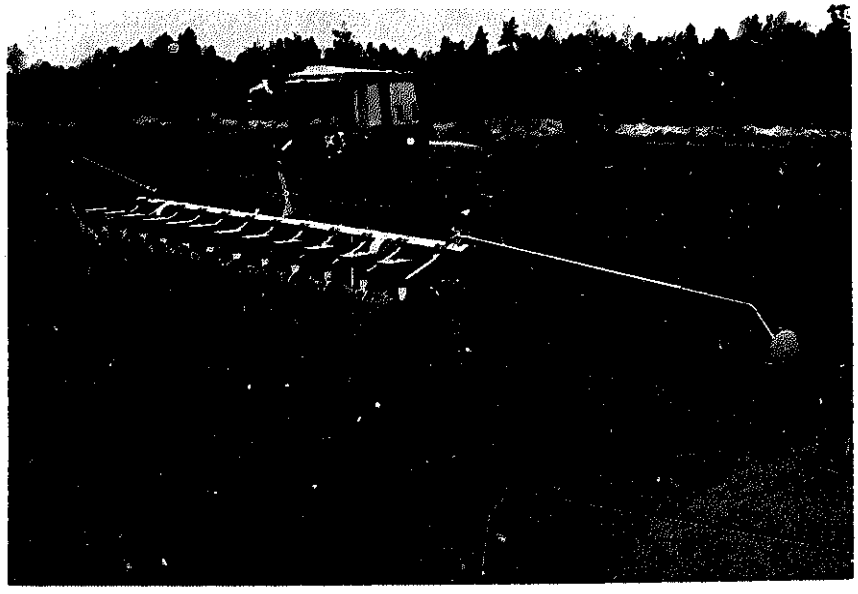
Tanzania Agricultural Machinery Testing Unit
P.O. Box 1389
Arusha, Tanzania

**Nibex Unit Seeder**

The flexible Nibex system incorporates an original cup-distribution technique which is ideal even for planting irregularly shaped vegetable seed, which formerly was difficult or impossible to sow individually. The system includes 25 types of cups for most seeds, both natural and pelleted. This wide range makes it possible to choose a suitable cup for each desired drilling method. The seeding rate can be varied from four to about 2,000 seeds per running yard—either thin-line or band-drilled over a width of 2.5 or 4 inches (65 or 105 millimeters). The cup system is largely unaffected by variations in seed size, and seed cup discs are quickly interchanged for different crops.

The furrow is formed so that the seeds are immediately covered by a thin layer of moist earth. The coulter sideplates prevent dry surface soil from filling the furrow before the presswheel presses the moist earth into direct contact with the seeds. The furrow is next covered with loose earth, and conditions are now ideal for growth. The adjustable skid and the weighted presswheel allow a constant drilling depth to be maintained, even on loose and uneven surfaces.

The stainless steel coulter gives maximum wear resistance and prevents earth from sticking to it, even in wet conditions. Wheel brackets, seeder units, and marker brackets can be positioned anywhere on the beam, making the row spacing progressively variable from 7.5 inches (20

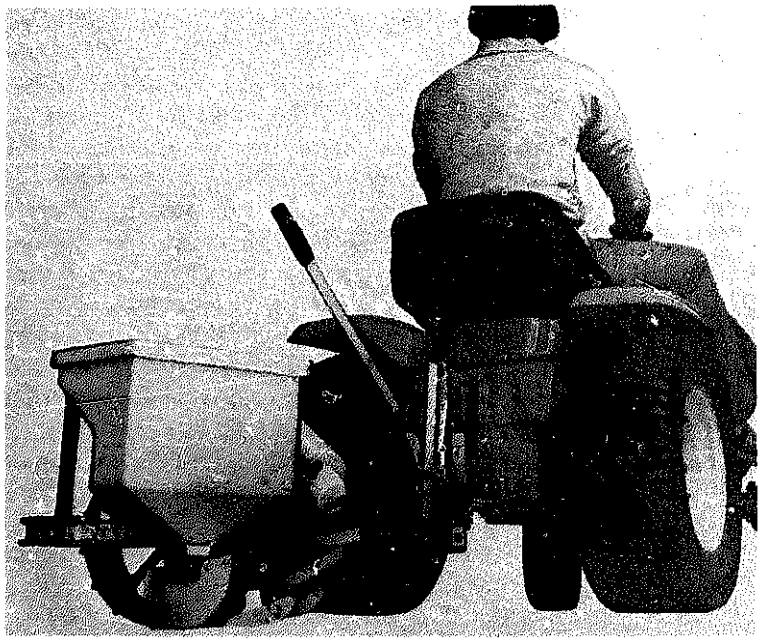


*Nibex Unit Seeder*
Nibe-Verken AB

centimeters) and upwards. (The rows can be brought closer together by attaching the unit sideways and driving back and forth in the same wheel tracks.)

Nibex unit seeders come in two- to twelve-row units; each unit has a 5-quart hopper capacity. Three-chain transmissions and a six-speed gearbox offer a choice of 18 settings. Normal operating speed is 2 mph; 3 is maximum. Depth is adjustable from 0 to 2 inches (0 to 5 centimeters). With 20-inch row spacing, a three-row machine will seed approximately 1.25 acres per hour.

Nibe-Verken AB
S–285 00 Markaryd
Sweden



*Esmay Unit Seeder*
Esmay Products, Inc.

**Seeder-Fertilizer Garden Tractor Mount**

This unit was specifically designed for the truck farmer and larger home gardener. One pass opens the soil to the desired depth, seeds, fertilizes, and covers the seedbed. It attaches to standard hitching devices, category 0, three-point, drawbar, or sleeve hitches. Of corrosion-proof construction, it comes with seven seed plates which plant more than 20 common vegetable seeds.

Esmay Products, Inc.
P.O. Box 547, Maple St.
Bristol, IN 46507

## GRAIN DRILLS*

* Reprinted in part from *Small-Scale Grain Raising* by Gene Logsdon. Rodale Press, 1977.

For planting seed in solid stands rather than in rows, a drill is used. For small acreages, however, you can often use small broadcasters much more efficiently, even counting the light disking or harrowing necessary to cover the seed. Generally speaking, the drill gives more precise planting depths than broadcasting and harrow covering and will result in better germination, especially if dry weather follows planting. The drill puts seed into the ground more or less continuously rather than depositing a precise number of seeds at precise spacings the way a row seeder does. It is used for cereal grains and grasses, and sometimes for soybeans if a solid stand is desired. Essentially, the drill is a long planting box with openings every six inches or so, from which planting tubes lead to the disc openers that run into the ground at planting depth. The discs open a shallow trench for the

*A team of horses could plant 20 continuous rows of grain with this 19th century drill.*
*Farm Implement News*, 1897

seed and close the trench on the seed after it falls. On old drills, a small length of chain drags behind each disc to aid in covering the seeds. The seeds are actually planted in rows, just inches apart, and when the grain gets to be about six inches high the plants grow together, giving the impression of a solid stand.

Normally, you can save quite a bit of money buying an old planter if it is still in working order. Be sure the planting plates come with it or can still be purchased. This is not usually a problem now because very cheap plastic plates are made to fit most planter boxes. In fact, the plates are given away by seed corn dealers when they sell a farmer his seed. The seed dealer wants a satisfied customer and the plastic plates he has are made specifically for the size kernels he sells—a different one for whatever plant population the farmer wants. But it is possible that on old and rare planters which you might find by chance, the plates wouldn't be a standard size. Before purchasing an old planter, it's always wise to make sure it has plates with it or find out where you can obtain new ones. Most of the common, older drills plant a swath of seven feet in one pass—about the right size for a homestead.

Seeding rates can be regulated by controls under the seed box. The seed box may be divided into two compartments, each side of which has its own control. Charts on the inside of the hinged box lids give instructions on setting the adjustments for different seeding rates. On old drills you will have to experiment by putting a measured amount of grain in the box, then planting a known, specified acre (or a portion thereof), and then see if the actual planting rate corresponds to what you have the drill set for. Compare and compensate accordingly. Those old cogs wear and may not work as precisely as they did when the drill was new.

Many drills, even old ones, have fertilizer

*A single-point, tractor-drawn seed drill with fertilizer drill—about the right size for the small farm.*

boxes just in front of the seed boxes. Unless they are well taken care of, the fertilizer boxes may be badly corroded or completely ruined. This will not necessarily stop you from using the drill, but you won't be able to fertilize as you plant. As another special feature, some drills have special smaller boxes for clover seed so that when planting spring cereal crops like oats, the farmer can sow clover right along with it.

## SOURCES OF TRACTOR-DRAWN DRILL SEEDERS

### Planet Junior 7135X Drill Seeder

A versatile planter with interchangeable seed plates for drilling vegetable seeds of all sizes. Special attachments are available for adapting the unit to field crops.

Planet Junior Division
Piper Industries

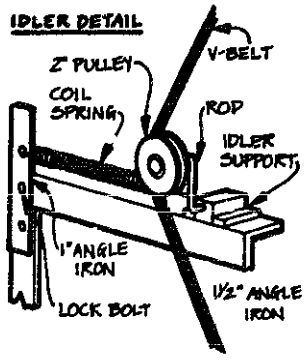
*This basic design for a homemade seeder with hopper, idler, wheel assembly and hitch was developed by the Texas Agricultural Extension Service of the Texas A & M University System in College Station, Texas.*



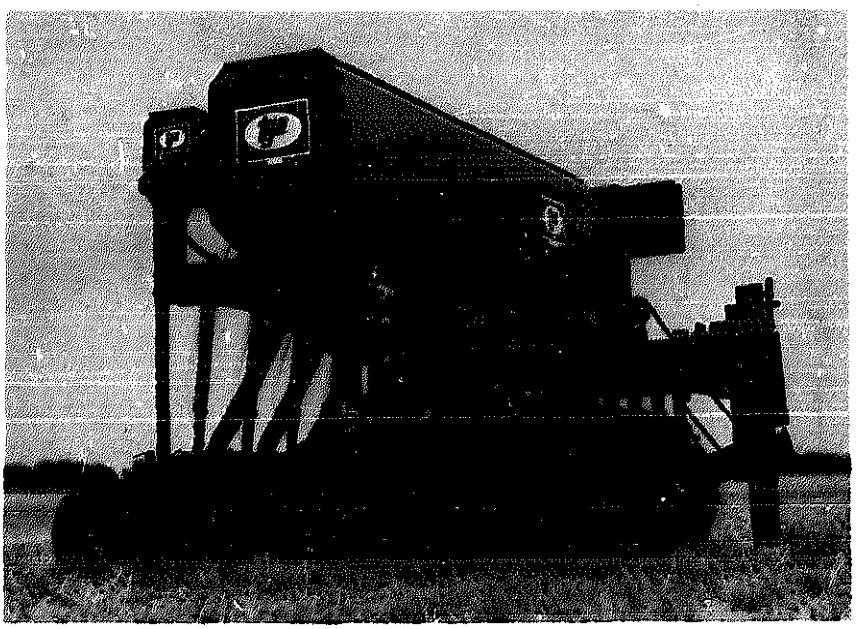
# NO-TILL PLANTERS

Sometimes called a pasture renovator, the no-till planter is a seed drill with a special function. It is supplied with a disc and a shoe which allow it to slice the turf and plant a seed without first plowing and preparing a seedbed. Animals can continue to graze while new plantings of clover or grass get started. One farmer reports, "I get a lot of nitrogen this way and I get it where it counts." According to Dick Margulis, who writes advice for novice farmers in *Countryside*, "Good natural nitrogen in the plant means good natural protein for the cow. A farmer ought not to buy his nitrogen or his protein. His total farm cycle ought to handle the greatest share of this problem." Also, planting in existing sod is a very good practice to control erosion.

**The Tye Pasture Pleaser**

The Tye Pasture Pleaser is a compact three-point-hitch-mounted, no-till planting unit covering 80 inches, with disc units spaced 10 inches apart. It is a conveniently sized tool for seeding legumes, grass, or small grains in sod, permanent, or improved pasture. Drive is by a single, spring-loaded, front-running coulter. Each double-disc unit is preceded by a spring-loaded coulter blade. Each blade, as well as each disc unit and press-wheel, is individually hinged and spring loaded for work on uneven ground. The larger hopper is fitted with internally fluted seeder units for small grains as well as soybeans. The small hopper or grass box is fitted with externally fluted seeder units for dispensing grasses and legumes. Brackets are provided for adding suitcase-type weights to assist penetration of the coulters in hard ground.

The Tye Co.
Box 218
Lockney, TX 79241

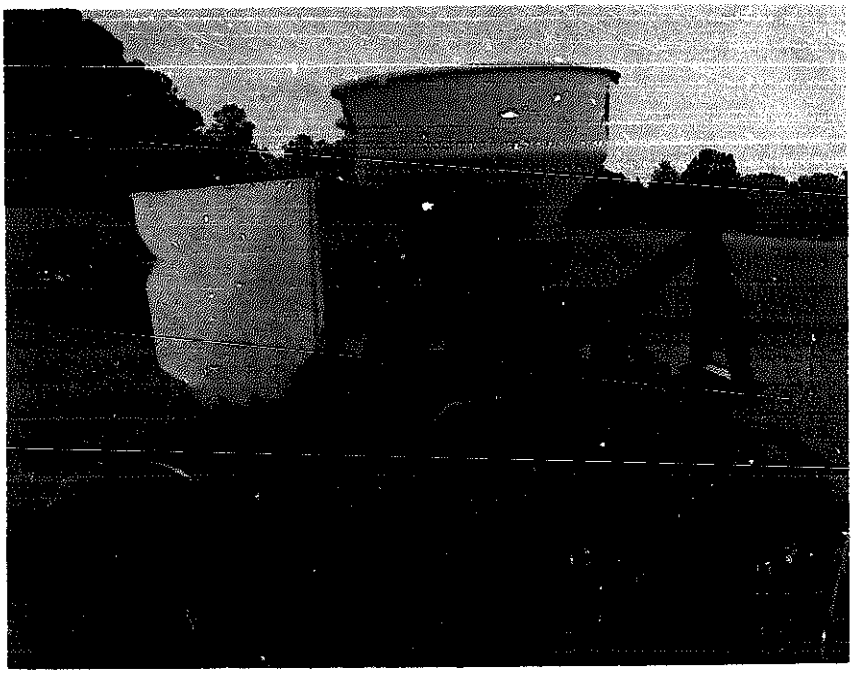


*Tye Pasture Pleaser*
Tye Co.

**Cole No-Till Planter**

The Cole No-Till Planter has a double-disc seed opener which cuts straw and debris in the field, preventing trash buildup in front of and under the seed opener. Included is a heavy-duty swivel coulter—a chisel plow which automatically resets after being tripped. You get a choice of three seed hoppers:

1. Edgedrop with 1-bushel capacity
2. Uniplex with 1-bushel capacity and single, inclined seed plate



*Cole No-Till Planter*
Cole Mfg. Co.

3. Duplex with dual, inclined seed plates and 2-bushel capacity.

Fertilizer attachments which place fertilizer 4 to 6 inches deep in the slit opened by the chisel plow come with the ground-drive wheel and 250-pound capacity fiberglass fertilizer hoppers. Granular chemical applicators which put out herbicides or insecticides or both are also available. The planter also comes in four- and six-row models.

Cole Mfg. Co.
1318 Central Ave
Charlotte, NC 28299

## TRACTOR-DRAWN BROADCAST SEEDERS

Power to turn the mechanical rotating distributor of a broadcast seeder can be supplied either by power take-off from the tractor or by a ground-drive wheel. (The distributing mechanism is basically the same as that of the hand-cranked broadcast seeder, which we discussed earlier in this chapter.) With no power source, animal-drawn distributors rely on a gear drive from the ground wheel to the rotating wheel to rotate the distributor. The newest units are battery-operated so that the distributor can be attached to any moving vehicle, whether it's a tractor, jeep, or automobile.

### SOURCES OF TRACTOR-DRAWN BROADCAST SEEDERS AND SPREADERS

**Ezee Flow Model 105 Spreader**

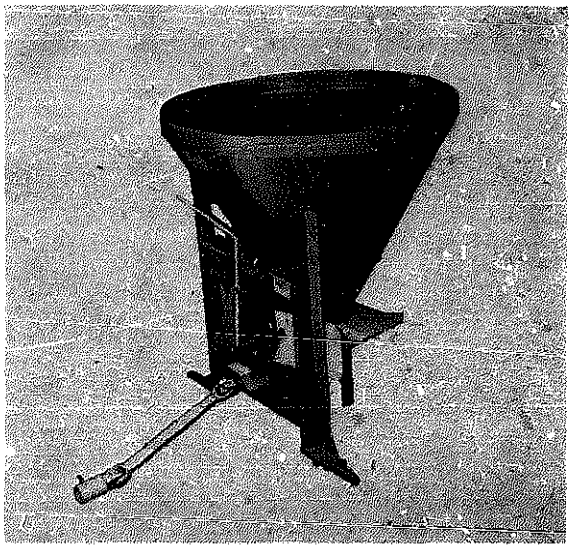
They call it a turf care model, but this 310-pound unit with a 7.7 cubic foot, 500-pound hopper capacity falls into the small farm category for us. With a 54-inch-wide coverage, this unit is ground driven and requires a minimum of 10 h.p. to pull it. The spreader is calibrated for seed as well as fertilizer distribution.

*Ezee Flow No. 105 Spreader*
Avco Corp.

**Ezee Flow Number 113 Broadcast Seeder**

With a 3-bushel (2-bushel extension available), galvanized steel hopper capacity, this 81-pound broadcast seeder spreads up to 36 feet. The spread is controlled from the tractor seat. The unit requires a minimum of 18 h.p., a three-point hitch, and a universal-joint PTO drive. Larger units are also available.

Ezee Flow, AVCO Corp.
First & Sycamore
Coldwater, OH 45828



*Ezee Flow No. 113 Spreader with three-point hitch mounting and universal PTO shaft drive.*
Avco Corp.

**Wikomi Electric Broadcast Seeder**

You can attach this electric seeder to your truck, jeep, or car—a tractor is not necessary, just a 6-volt battery. With a 1½-bushel capacity and an optional 1-bushel extension, you can plant 20 acres per hour. Larger units are available.

*Wikomi Electric Broadcast Seeder*
Wikomi Mfg. Co.

**Wikomi Poly-Hopper Seeder-Spreader**

A new product in their lawn and garden line, the 1-bushel seeder, 100-pound fertilizer spreader constructed of polyethylene fits most lawn and garden tractors and riding lawn mowers. It has a 12-volt electric drive, mounts on a rear drawbar, and weighs 28 pounds. Larger units are available.

Wikomi Mfg. Co.
P.O. Box 100
Litchfield, IL 62056

**Sears Spreaders**

The smallest unit Sears lists has a 1-bushel capacity. It bolts to a standard tractor drawbar and is powered with a direct drive PTO. It has an 18-gauge welded steel hopper and spreads a swath up to 50 feet wide. Weight: 37 pounds.

Sears, Roebuck & Co.
Farm and Ranch Catalog

**Apolo Broadcaster**

With a capacity of 400 to 450 kilograms, this fully adjustable unit operates from the power take-off shaft of a tractor. The recommended application speed is 7 to 12 kilometers per hour.

Industrias Metalurgicas Apolo S.A.
*Carrera 50-2 Sur–189 Autopista Sur*
Medellin, Antioqui, Colombia

**Lely**

Lely makes broadcasters for a tractor PTO with hopper capacities ranging from 8.5 to 156.4 bushels.

Lely
Box 1060
Wilson, NC 27893

**Gandy**

Starting with a 3-foot long, 1.6 cubic foot hopper, Gandy has tractor-drawn, wheel-driven spreaders for seeding or fertilizing.

Gandy Co.
528 Gandrud Rd.
Owatonna, MN 55060

**106 Single Spinner**

New Idea's smallest model spreader-seeder (No. 106) has a 12-gauge steel hopper capacity of 690 pounds and an effective spread width of 36 feet. Density of coverage ranges from 4 to 1,570 pounds per acre. It attaches to a tractor by a three-point hitch.

*New Idea Seeder No. 106*

AVCO Corp.; New Idea Farm Equipment Div.
First & Sycamore
Coldwater, OH 45828

**Diadem Precision Spinner Spreader and Seeder**

Attached with a three-point hitch, the Diadem comes with 7-, 9-, or 12-bushel capacities.

Vandermolen Corp.
119 Dorsa Ave.
Livingston, NJ 07039

**Gherardi Fertilizer Broadcaster**

Although this spreader is suitable for most types of fertilizer, it was designed chiefly for high-concentrate, granulated, pulled, or semi-pulled fertilizers requiring a high degree of accuracy. Traveling speed can range from 3 to 16 kilometers per hour. Two sizes are available: a 75-kilogram model with a 300-liter capacity, and a 130-kilogram unit with a 500-liter capacity.

Gherardi
Officine Macchine Agricole Industriali
Jesi (Ancona) Via Gallodoro 68, Italy

**Midjet**

The Midjet is a small, tractor-drawn, broadcast seeder-fertilizer designed as a lawn tool, which hitches to a small garden tractor.

# PLANTING BY SYSTEMS

## CHECK-ROW PLANTING

by Roger Blobaum

The check-row planter, an implement widely used on Corn Belt farms for more than 60 years, made possible the kind of mechanical weed control that many small farmers want.

The check-row planters, which disappeared along with work horses on most farms in the 1930s and 1940s, dropped seed corn in hills spaced about 30 inches apart each way. Their main limitation was that they could not be used on fields that were contoured or laid out in other ways that did not provide straight rows.

This checkerboard pattern made it possible to cultivate fields both ways, giving excellent results. This kind of cultivation threw dirt up around all sides of the corn hills and took out the weeds, both in and between the rows. It provided much better weed control than modern implements, which are unable to reach weeds between the plants in drilled rows.

The precise planting pattern was made possible by wire buttons spaced usually 40 or 42 inches apart on a check wire anchored with a stake at each end of the field. The stake had to be moved over by hand each time the planter came to the end of the row. The check wire passed through the planter as it moved across the field. The buttons tripped the plates in the seed corn boxes, dropping bunches of kernels in uniformly spaced hills.

Cultivators in that period had shanks that were guided by the farmer's feet. The shanks made it possible to guide the shovels around any hills that ended up slightly out of line in the checkerboard pattern. This arrangement was much more flexible than cultivators mounted on the tractors that were replacing horses on most farms.

The careful two-way cultivation made possible by check-row planting became less important when farmers began applying chemical weed killers. Fast-moving tractors and equipment that planted four or six rows at a time also helped bring about the switch to planters that drilled corn in rows and mounted cultivators that moved across these fields at much higher speeds.

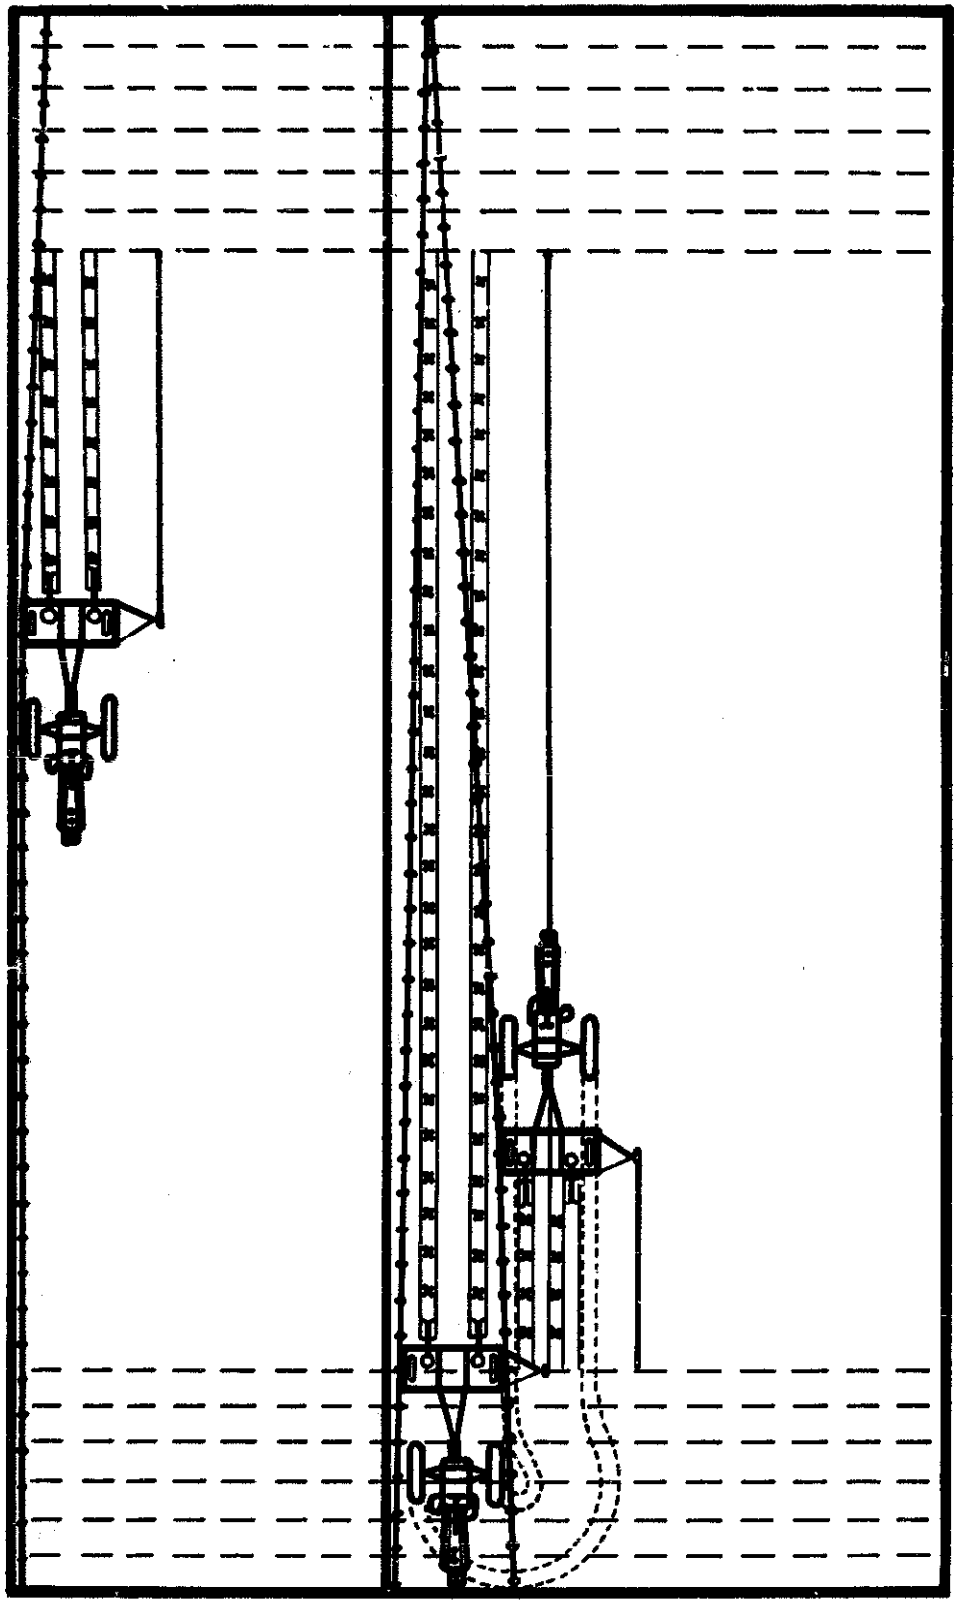
The introduction of four-row check planters caused some problems. Scientists at Iowa State College in the early 1930s solved one of them—the tendency of these planters to pull check wires

***The Check-Row Technique:***

*check wire with buttons*

*marked guide for next row*

*xxxxxxxxxxx plantings*

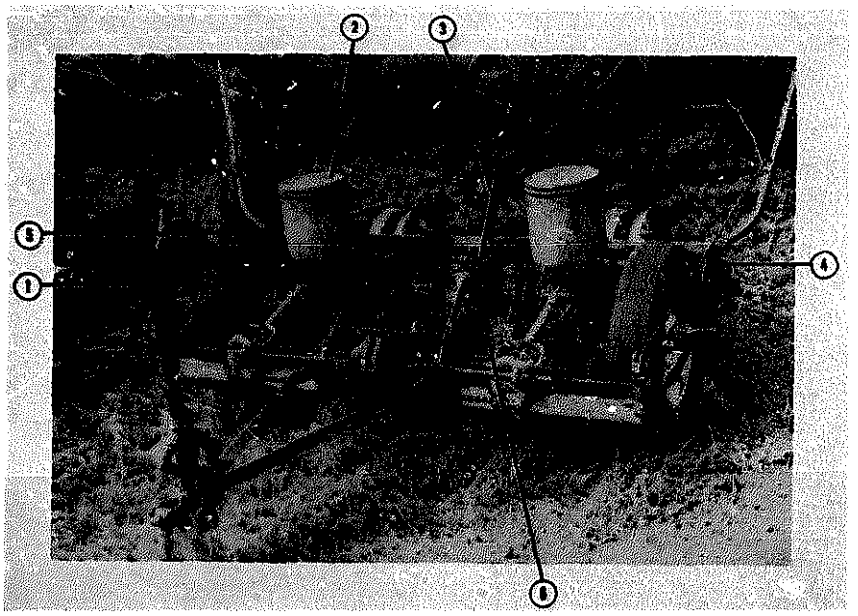


*Checking*

1. *After planting two or three rounds, stop and dig up about eight cross-rows to see if cross check is good.*
2. *If cross check is not accurate, adjust checkheads as necessary to correct cross check.*

*Turning at Ends of Field*

1. *Pull trip rope about nine buttons from the end. This will automatically release wire about seven buttons from the end.*
2. *Turn planter in position for planting the next two rows, stopping squarely over mark.*
3. *Move anchor stake behind runner on wire side. Set tension the same each time wire is moved.*
4. *Drive forward, keeping tractor straight over mark.*



*Parts of a check-row planter: 1) lever (arm); 2) seed hopper; 3) power lift control; 4) checkhead; 5) automatic release; 6) power lift clutch.* Ron Krupicka

out of line at the ends of the rows. A report presented in Chicago in 1933 described the development of the new pay out planter stake and concluded that it would eliminate this problem.

Although tractor-mounted planters were available, the Iowa State experiments utilized a pull-type planter so a tractor-mounted cultivator could be used at the same time. This made it possible to cultivate the seedbed just ahead of the check-row planter, giving the corn a better chance to get a jump on the weeds.

"We are so well pleased with the results of this combination that we feel justified in suggesting the desirability of designing planters so that this combination can be made by the user," the Iowa State report declared.

"It can be accomplished either by using a pull-type planter or by mounting the planter on the rear of the tractor in such a way that it will not interfere with the cultivator mounting."

Another report prepared by a Deere & Co. manager in 1944 described a high-speed check-row planter that was adapted to tractor power. The new design permitted the planter to push the corn kernels out of the seed box instead of using a mechanism that kicked or batted them out. It was seen as an important development in the transition from horses to tractors.

"This development, which has made it possible to speed up greatly the operation of planting corn, is an engineering achievement of much significance," the report said. "It is of inestimable value to the farmer in enabling him to plant his corn under more favorable weather and soil conditions."

The check-row method also was used to plant cotton, allowing cross-cultivation and eliminating the need for much of the labor-intensive hand hoeing and thinning that had been commonplace in the South for a century or more.

"Hill planting, cross harrowing, and checkered tillage practically eliminate the hoe as a weapon for killing grass and weeds and render hand thinning unnecessary, except in an occasional hill where the plants are too numerous," a 1929 report from the Arkansas Agricultural Experiment Station pointed out.

"The release of much hand labor from the acreage of cotton customarily cultivated will afford more time to till an increased area."

We haven't seen check-row equipment around for over 40 years, but this equipment is certainly something anyone farming with horses should investigate. For the organic farmer, check-row planting

is one way to completely devastate a population of weeds without the use of herbicides. Granted, fields cannot be as densely planted, but there is growing controversy over the importance of high-density planting, and with sparse plantings, there is more room for interplanting other crops like pumpkin and squash between the plants.

Back in the early 1930s, results reported in *Agricultural Engineering* * showed that production yields of cotton could be kept up by planting in the check-row fashion with more densely planted hills rather than distributing seed throughout the row with a drill, even with fewer plants per hill. Fueling the controversy is the escalating price of seed grains. Here are some sound arguments for check-row planting that were set forth in the article:

1. On bottom land, or on other lands of a high degree of fertility, cotton seems to produce as well when the plants are grouped in hills arranged for cross-cultivation as when the plants are distributed in rows.
2. Thickness of planting in hills appears to accomplish the same result in stimulating earliness as has been shown for close spacing in the drill.
3. No exact number of plants to the hills seems necessary. According to results, the number can range from two to six plants per hill or around 10,000 to 25,000 an acre. However, since the production was lowered less with 15 plants to the hill than with one plant to the hill, the stand maintained should be nearer the upper limits of the range of highest yields rather than toward the lower side of this range.
4. Hand thinning is unnecessary.

# CHECK-ROW PLANTING ALIVE AND WELL IN NEBRASKA

**by Ron Krupicka**

Editor's note: Ron is Codirector with Dennis Demmel for the Small Farm Energy Project at the Center for Rural Affairs in Hartington, Nebraska. This story is about his uncle.

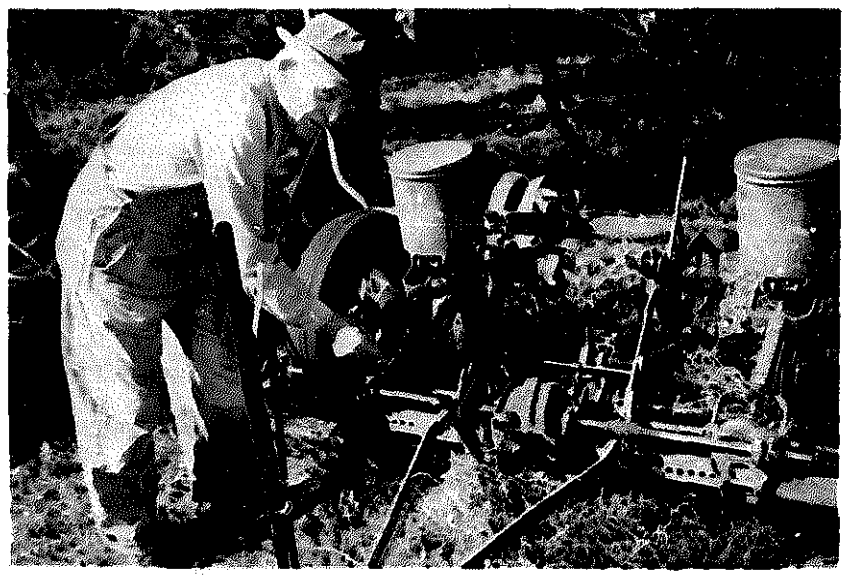
Louis Suchy, 72, has been farming his 320-acre, diversified farm near Niobrara, Nebraska all his life. He has always used a check-row planter for planting his corn. At first he used a horse-drawn check planter. Today, however, he uses a tractor-drawn, two-row, check-row planter he purchased at a local farm sale.

Louis' first step when planting with a check-row planter is to string a wire with buttons across the field from one end to the other. The wire is laid with just the right amount of slack so that it can be fitted in the guide located on the side of the planter. As the planter is pulled across the field, the wire passes through the checkhead and the buttons which are set every 40 inches on the wire trip a mechanism that turns the planter plate, allowing either two or three seeds to drop.

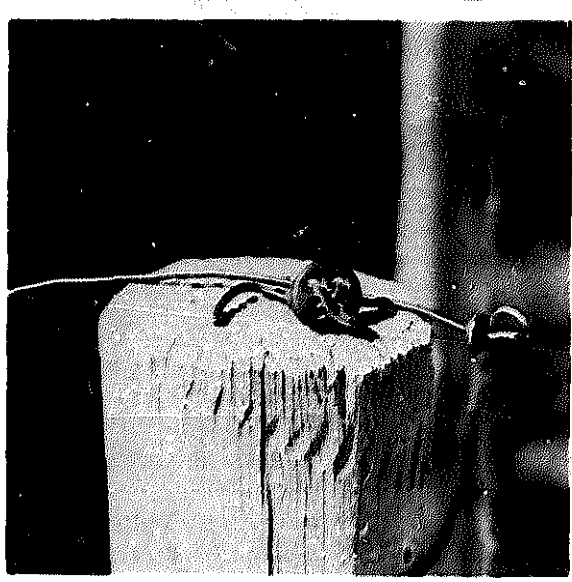
Louis has 16-hole plates in his planter which will drop three kernels to a button. But he feels that moisture is a limiting factor in his area and three kernels per hill would increase his plant population to the point where there wouldn't be enough water to supply all the plants. So Louis plants first two kernels, then three kernels in alternating hills. To do this, he has sealed up two holes on each plate by welding them shut.

To plant the corn, the planter is drawn down the row dropping two or three kernels in hills every 40 inches. After planting two or three rounds, the cross check is inspected by digging up about eight cross-rows to see if the check is good. If the check is off, the checkhead can be corrected by making the appropriate adjustments as explained in the instruction manual.

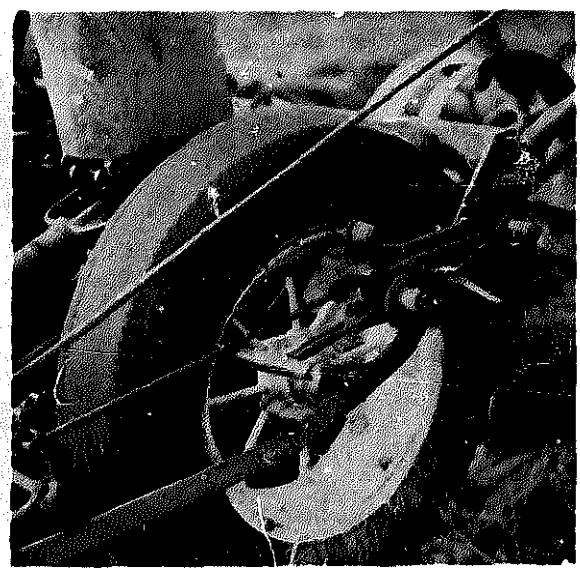
* Ware, J. O. The Hill Planting of Cotton and Checker Cultivation with Large Tillage Instruments. *Agricultural Engineering.* Vol. 11, no. 5, May 1930.



*Louis Suchy with his check-row planter. Here he points to the trip mechanism which is engaged when buttons on the guide wire pass through the checkhead.*
Ron Krupicka



*Check-row buttons got their name when metal buttons like the one on the left were used years ago. No longer resembling a button, the head on the wire to the right acts as the tripping mechanism for newer models.*
Ron Krupicka



*The checkhead on a check-row planter. The buttons trip this mechanism releasing seeds in one spot.*
Ron Krupicka

When the edge of the field is reached, the wire is disengaged and the machine is turned around in a figure eight, thus allowing planting as close as possible to the fence line. The wire is moved over two rows and the process is repeated back and forth across the field. The instruction manual states that six rows must be drilled for the end rows, but Louis' figure eight turn has reduced that to four. When he planted with horses, Louis said he could plant right up to the fence line and, as a result, there was no need to drill the end rows. Also, there was a seat on the horse-drawn planter so that the operator could manually trip the planter to drop the seeds.

Louis noticed that each year the extension service and equipment companies seemed to be promoting a different planting method. He felt that check planting started to decrease when the lister was

pushed. When asked why he still uses the check planter, Louis simply replied, "Dad taught me how to cultivate." It is for the same reason that Louis has never been in his fields with herbicides. He has observed that if you don't follow up spraying with weeding, you will still have weeds.

Louis keeps his fields clean by cultivating three times. The first time he follows the planter, the second time he crosses the planter rows at a 90-degree angle, and the third time he follows the planter again because "otherwise it would be mighty rough picking!" He still picks his corn in the ear with a one-row cornpicker and then stores it in his corncrib.

His average yield over the years has been 50 bushels per acre, sometimes 60—without using any commercial fertilizer on his corn.

# PLUG-MIX SEEDING AND EQUIPMENT*

Plug-mix is a method of seeding which incorporates crop seeds and water into a scientifically blended growing medium which is precision placed in the field with a type of jab planter called a hand plugger. Having ⅛- to ¼-cup of loose soil, the seed and compost-nutrient mixture cradles each hill to ensure a uniform, optimum environment for germination and for young seedlings to get off to a good start. It is particularly suited for extensive plantings of most small-seeded vegetable crops.

Advantages of plug-mix seeding over standard seeding methods:

1. A uniform, optimum environment in seed and young seedling zones is provided, along with an adequate, safe level of fertilizer readily available to the seedlings.
2. Plant stands are often better, and seed germination and plant growth are more rapid and uniform.
3. There is no compaction problem with the tilthy plug-mix soil.
4. Fertilizer salt damage during dry periods, and leaching of nutrients during top-water and rainfall are reduced.
5. Fertilizers and seeds are conserved by placement only where needed. This reduces the fertilization of competing weeds.
6. With the automatic plug-mix planter, an economical and successful method of seeding through mulch-covered beds is now available.

Perfecting the plug-mix method involved a joint research project between Cornell University and the University of Florida. Cornell worked on a soil blend while Florida worked on the design of application equipment. Cornell worked with chemicals, but you can arrive at a potent mixture of your own by blending compost, manure, and other organic nutrient sources.

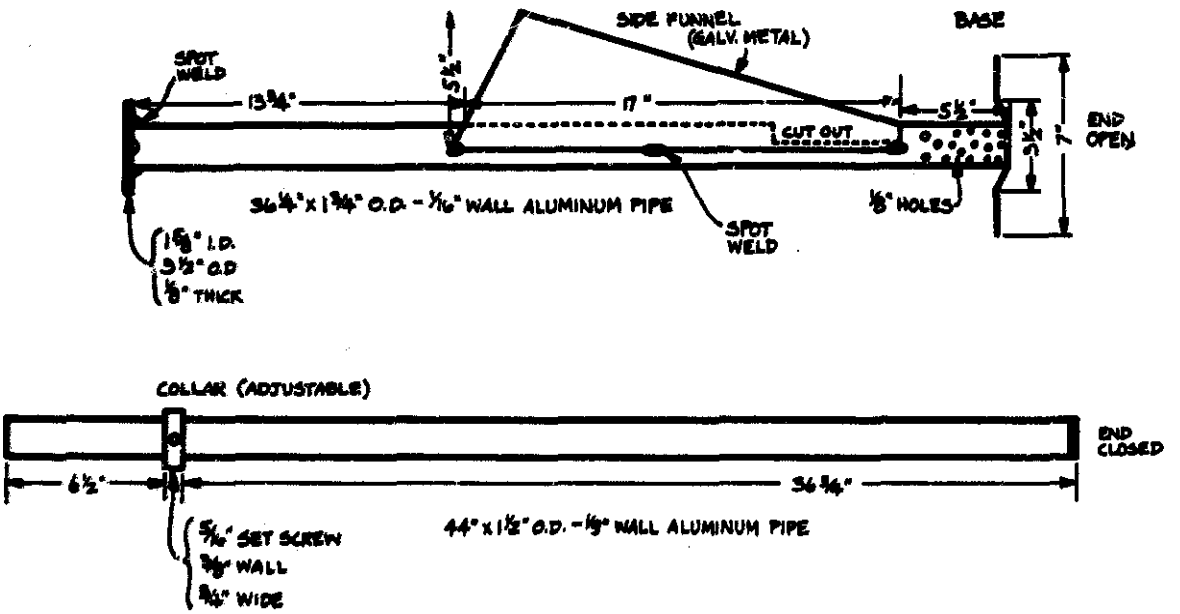
[1] James Edward Knott. *Handbook for Vegetable Growers*, rev. ed. New York: John Wiley and Sons, Inc., 1962.

A simple and inexpensive hand-operated applicator was constructed for use in early research trials:



The pluggers were used by some growers with positive results, but high labor costs encouraged the development of an automatic planter.

**Mechanical Plug-Mix Planters Number 900M and Number 900**

The tractor-mounted automatic planter meters up to ½ cup of loose mix into revolving cups which deliver the mix to the planter pockets. The pockets pierce the soil and deposit the mix at fixed intervals. Presswheels can be mounted behind planter pockets to firm the soil from each side on unmulched beds. The unit works well without presswheels on mulch-covered beds, the pockets punching holes through the mulch as they deposit the mix. The toolbar-mounted planter has operated efficiently at a forward speed of 1 mph and is designed to plant at down-row spacings of 10, 12, 20, 30, 51, or 60 inches.

# MECHANIZATION OF FARMING UNDER PLASTIC TUNNELS

Editor's note: This information is extracted from a letter written to the editor by Dr. Y. Alper, who is with the Institute of Agricultural Engineering in Bet Dagan, Israel.

The method of growing in low, plastic tunnels has become very popular in the Israeli agriculture over the last few years. Its main advantage is an early crop of fresh vegetables on the market. Our Institute started working on the mechanization of this method a few years ago.

The synchronized plastic mulching and planting machine was the first machine developed for this purpose. This unit, which seeds, mulches, and perforates the plastic above the seeds in one operation, is manufactured by a local company and is used commercially by farmers.

Low plastic tunnel cultivation is a popular technique for early crop ripening. Early ripening is achieved by this method not only by early planting, but also through the better microclimate conditions and the physical protection of the plants during their first stages of growth. The increasing use of this growing technique created a need for mechanical means to erect the tunnels.

The T-2100, which is fed by straight steel wires, forms the arches and places them into the ground in a continuous operation. The spacing between arches and their height are adjustable. The machine is pulled by a small-size tractor and ground-driven by its own wheels.

An automatic machine for farming and inserting wire arches into the ground was developed and field-tested during the 1976 season. Field-test results were very successful and some units were planned to be operated commercially in 1978.

A wire renewer which straightens used wires for reuse with an automatic inserting device was also built.

The development of these machines is a considerable contribution to the mechanization of growing in low, plastic tunnels in Israel; each of these machines can also be operated separately, according to local conditions.

**The Kennco Plastic Machine**

This plastic machine covers a formed bed with a 1.5-mil plastic. The machine simultaneously tucks and buries the plastic at the sides just under the outside corner of the bed to insure permanence throughout the crop. Plastic machines can be equipped with gas knives or nozzles to inject gas or liquid herbicides just prior to laying plastic on the bed.

Plastic-laying machines come complete with three-point hitch, seat, hiller blades, and aluminum end plugs. A larger, high-speed machine is also available.

# WINDFELL FARM: AN EXPERIMENT IN INTERMEDIATE AGRICULTURE

"We want to grow the highest-quality, best-looking organic produce possible and stay competitive with our chemically oriented neighbor," says Steve Talbott, of Banks, Oregon. To do this, he and his father are developing "a workable, efficient, small-scale family farm" that specializes in row crop vegetables. Affectionately named Windfell, the farm doubles as a home enterprise and an experiment in intermediate agriculture.

The key to the Talbott system is a transplanting machine called the Hydro-Synchron, invented and patented by the Talbotts, and a cropping system called Jetspeed. Jetspeed is the registered name for an integrated system of diversified row crop production, using high-quality facilities, machinery, and

tools and an intermediate technology applicable to a small- or medium-sized operation, from 5 to 100 acres.

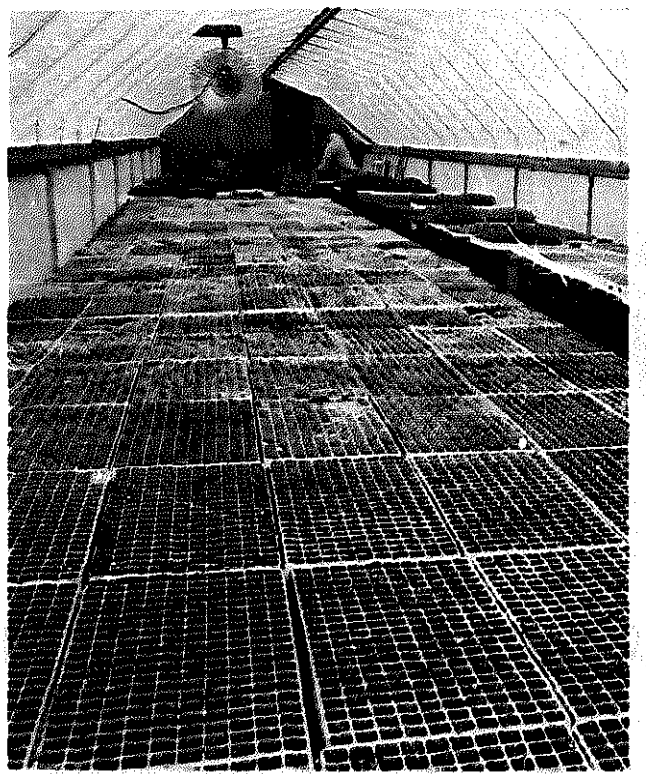
The system is neither capital-intensive nor labor-intensive, using both in an appropriate balance to maximize labor efficiency, provide a human scale in the process, and maintain as much as possible a diversity of tasks for workers. At the small end of the scale, the operation can be run by a family with seasonal help at harvest. At the other end, a sizeable outside payroll would be required. The Talbotts' system is ecologically sound, energy-efficient, uses the land intensively, adapts to highly diversified cropping, and they believe, is demonstrably profitable. Transplanting, as opposed to direct field seeding, is the key to Jetspeed.

During 1976 and 1977, research and development of all aspects of the Jetspeed transplant row crop system continued at Windfell Farm, some 70 acres located 24 miles west of Portland, Oregon. Windfell was advised that the soil, the slope, and the general conditions were not favorable for row crop production. The acreage had been in grain for years with mediocre results. But the Talbotts accepted the challenge and developed markets for their Biogold products in local communities and the city of Portland.

*Long, straight rows of evenly spaced seedlings that require no thinning and a minimum of cultivation are the end product of the Hydro-Synchron, the key to the Talbott's planting system.*

Some crops have been routinely transplanted by some growers for generations. The process is slow, often back-breaking and always inefficient, resulting in severe plant shock and mortality. Assuming an improved transplanter, the transplant system insures precise plant spacing and thus, maximum field population. Weeding and thinning problems are greatly reduced or even eliminated with good management, and maturity is more uniform so harvesting costs are reduced. The shorter period from transplanting to harvest means a more intensive and cost-effective use of the land. Talbott advises, "The figure on the bottom line is what counts."

To adopt a transplant system required either a reliable source of plants or a facility for producing them. Windfell developed the systems and the specialized equipment necessary to produce hardy plants that grow fast with stocky tops and strong, branching root systems. Their double-poly house is particularly well adapted to these techniques.

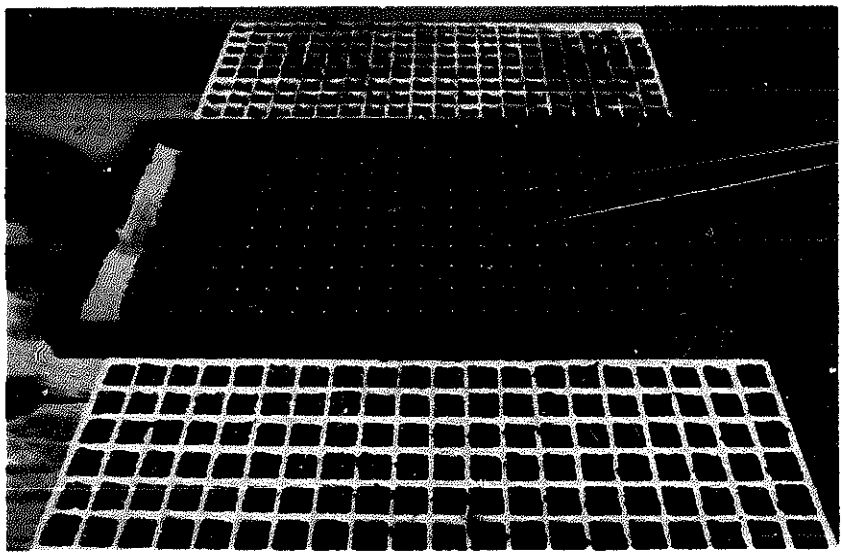


*Thousands of seedlings get a good start and grow into hardy plants inside the Talbott double-poly house.*

*TODD Planter Flats with pyramid-shaped cells.*

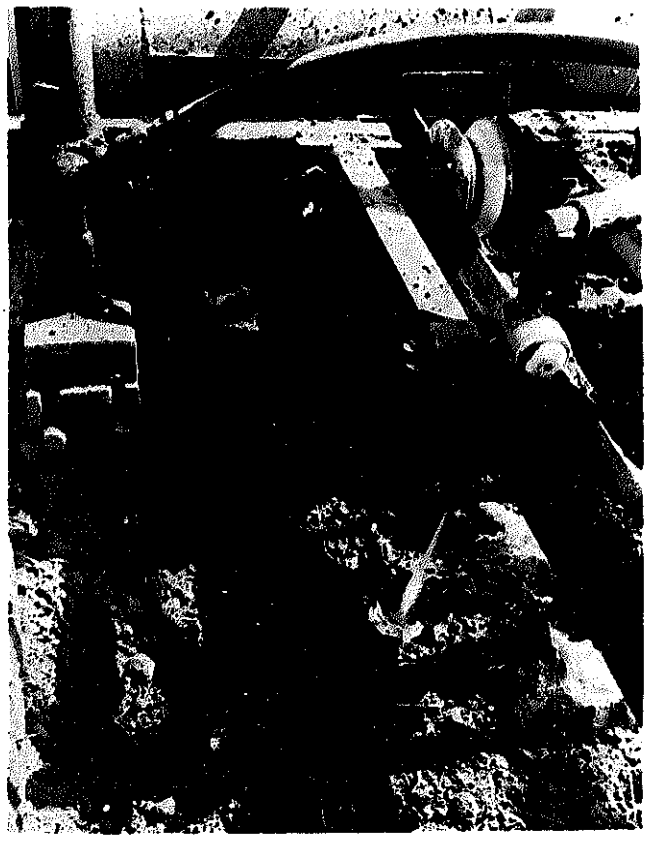
After investigating many different plant-growing systems, it was clear that the Speedling System was the one to adopt. In this system, the patented TODD Planter Flats with inverted, pyramid-shaped cells rest on aluminum T-rails. This promotes natural air pruning of the root system. The result is rapid branching and concentration of the root structure within the cell. Plants can be transplanted with virtually no shock and without interruption of growth.

The Jetspeed planting mix is composed of 50 percent peat, 50 percent vermiculite, bone meal, lime, dolomite, and several additives that have been found to produce the ideal transplants with strong, stocky tops, and quick-growing, widely branching root systems which can be easily pulled intact from the Speedling trays at an early date. The Talbotts found that for the small operator, mixing and tray filling can be done economically with hand labor and good organization. But they found that seeding without an efficient seeder was very time-consuming and costly. Hence the Digit-200 seeder.



*The Digit-200 Plate Seeder*
Gene Talbott

An ingenious invention, the Digit-200 seeder is simply a tray which sets on top of the 200-unit, cavity trays and has small holes placed exactly in line with where a seed should be deposited. A pile of seeds is scattered across the tray, one dropping in each hole. Excess seeds are gathered at one end. When the tray is lifted, one seed is left in each tray cavity and a thin layer of vermiculite is spread on top. With the Digit-200 seeder, six 200-unit trays can be planted per minute. Making such efficient



*A short, powerful blast of fertilized water is the key to the transplanter. The four synchronized nozzles force water into the soil at designated spots as the tractor-pulled transplanter traverses the field. Through a braking system that allows the spray to remain stationary as the tractor continues its slow pace, the driver of the machine need only keep it on course. No stopping or restarting is necessary. As the holes are created, a new seedling is inserted by one of the riders who sits just behind the jet sprays.*

use of hand labor, this simple tool exemplifies the kind of inventive work which is needed to develop an appropriate, intermediate, small-farm technology.

The indispensable key to success with the transplant system of row crop production is the transplanter. Experience illustrates that conventional transplanters were totally inadequate; so the Talbotts developed a completely new machine using the hydraulic jet principle. The result was the Hydro-Synchron, a fast, efficient, multirow implement that uses water jets to drill holes to receive the transplants. The drilled holes instantly fill with mud and water (together with a starter solution if desired), and the roots, hand-placed, are sealed deep in the muddy solution at any desired plant and row spacing. Three workers can transplant six rows of lettuce at the rate of about 8,000 plants per hour; wing units increase the planting capacity threefold.

*Boxes of seedlings are placed directly in front of the three seats the riders occupy. Seedlings go from box to soil at a suprisingly unhurried pace considering the tractor maintains a constant crawling speed through the field.*

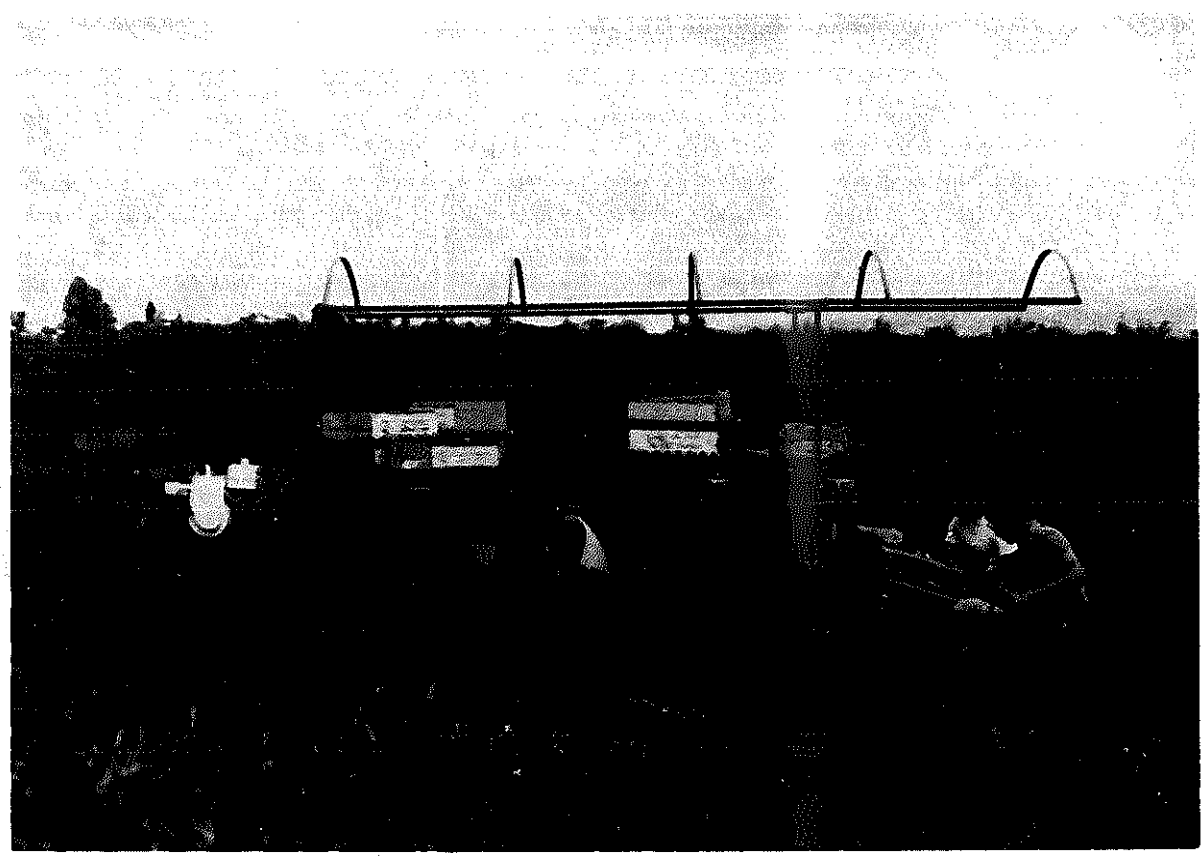
Beyond planting, the Talbotts have other devices and techniques to complete their system. At Windfell, the main implement used in soil preparation is a Rototiller with a corrugated roller pulled in tandem for minimum tillage. Tillage is limited to the upper four inches of the soil. If the organic content of this layer is maintained, the open structure and fertility of the sublayers will be built continuously by a healthy biological population in the soil. Drip irrigation appears to be their only solution to a limited water supply.

Integrated pest control is an area of continuous investigation at Windfell. The availability of compressed air has facilitated experimentation with air-atomizing nozzles attached to the Hydro-Synchron for ultra-low-volume spraying. Numerous test programs are being conducted using some of the recent biological control methods.

For optimum population, the beds are five feet wide, six feet six inches on center and 500 feet long. Population is 2,550 plants per bed, with six rows nine inches apart and plants staggered at 14 inches apart in the row. The spacing is precise and each plant has exactly the same space to grow. It is estimated that with direct-seeded lettuce or celery, uneven spacing cuts the optimum field population by at least 20 percent. Add to this the approximately three-week longer growing period with direct seeding, and the dramatic difference in the two systems is clear.

But experience reveals another important factor with the Jetspeed transplant system—weed control. The rapid establishment of the crop canopy tends to smother weed growth. The beds shown were neither machine cultivated nor hand hoed—and no herbicides were used.

The Walker Harvester, another Talbott development, is a fine implement for assisting in field picking and packing of summer squash, cucumbers, tomatoes, and peppers. The machine is self-



***Self-Propelled Walker Harvester***
**Gene Talbott**

propelled and has a hydrostatic drive which is instantly adjustable to any appropriate speed, forward or reverse. A guidance wand keeps the wheels tracking in the spaces between the permanent beds. The two rear wheel cages are adjustable to accommodate various bed widths.

At Windfell, in order to insure a uniform, standard pack, summer squashes are harvested every day, beginning in June and continuing into October. The Jetspeed transplant system brings the crop to market early. Covering the beds with black plastic mulch and transplanting through the plastic will cut another two weeks off the time to market. Other experimental forcing systems are expected to bring the start of harvest even earlier. The grower with the earliest crop can quickly establish his market and command the top preseason prices.

For the small- to medium-sized grower, depending on the local market, diversification can be very important. The Jetspeed transplant system is particularly adaptable to the production of diverse crops side by side. Gross returns from just one lettuce bed were $404 (202-dozen heads at an average price of $2.00 per dozen). One acre consisting of 13 beds grossed $5,252. Under climate conditions at Windfell, a minimum of four and possibly five cycles per season may be obtained. The potential gross per acre is substantial!!

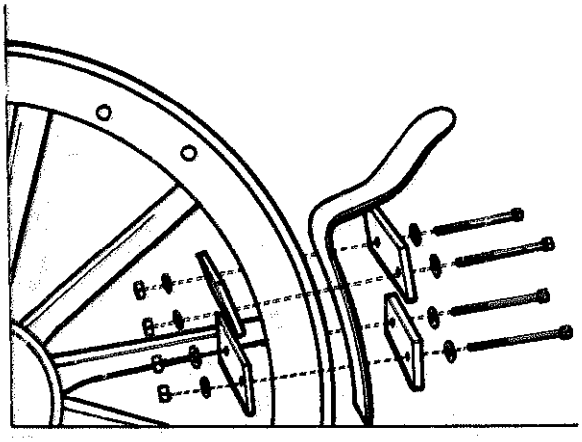
# TRANSPLANTERS

Many crops are traditionally planted as small plants rather than from seed, either to extend the growing season by starting plants indoors, to avoid thinning, or to get more crops planted in one year. The Japanese have developed perhaps the most energy-efficient transplanting mechanism, which they use largely for rice and tobacco. It is a two-wheel tractor with an automatic steering mechanism which guides the tractor while one man feeds plants into the transplanting mechanism.

We in North America are familiar only with tractor-drawn units. They can plant from one to 16 or more rows at a time, with one or two people feeding the transplanter per row. Often, a water tank is mounted on the hauling tractor, and plants are watered with either a continuous or intermittent flow as soon as they are set and firmed into the ground. One unit just described makes the planting hole with a water spray. Additional equipment might include cultivators or a fertilizer distributor.



*Here is a hint from* **Farm Labor Savers** *suggesting that an extended cleat attached to a wagon wheel be driven across the field to automatically dig evenly spaced planting holes. Used in either wet or dry weather, it will save time and energy when a considerable number of plants or trees are being planted.*

### A Semiautomatic Device For Planting Cassava Stem Cuttings on Ridges

From the Agricultural Engineering Department at Ife, Nigeria, G.A. Makanjuola reports the development of a mechanical device for planting cassava stem cuttings on freshly made ridges.

This device is a machine consisting of a disc ridge and semiautomatic planter which can be built as a multirow unit. It can be manufactured entirely locally (Nigeria) with the exception of the ridger discs and bearings.

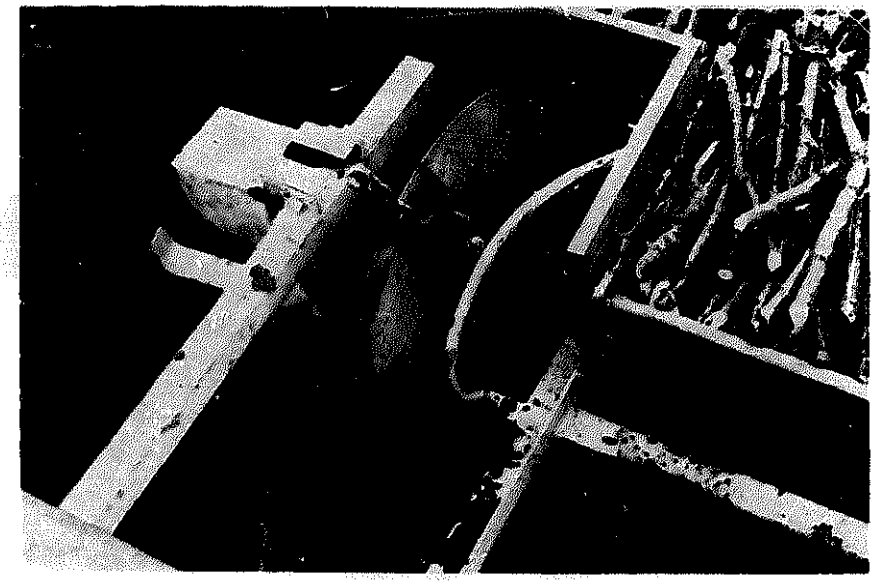
*A two-row ridger in operation, pulling a planter behind it with a pipe joint.*

Investigations revealed that cassava stem cuttings can be successfully planted on an unridged field with the New Holland transplanter, but it cannot be easily modified to plant on ridges.

The newly designed planting mechanism consists of a disc on which are mounted three rubber pieces cut from 75-millimeter, flat belting material. These rubber pieces serve as hands for holding the stem cuttings in position as the cuttings are pushed into the newly made ridge.

When cuttings reach the erect position they are released. The hands are kept closed by means of a roller which moves along the surface of a curved member. The cuttings are prevented from slipping during the planting process by a combination of the grip of the rubber hands and stops welded toward the center against which the top of the cuttings bear as they are pushed into the soil.

The planter is pulled behind the disc plow and planting discs are mounted on shafts which are driven by chains directly from the implement land wheels. The sprocket on each of the land wheels is mounted on a sleeve which is bolted to the wheel hub. The sprockets on the planting disc shafts are mounted on a hub provided with a pawl and ratchet device which allows power transmission in one direction only. This is to



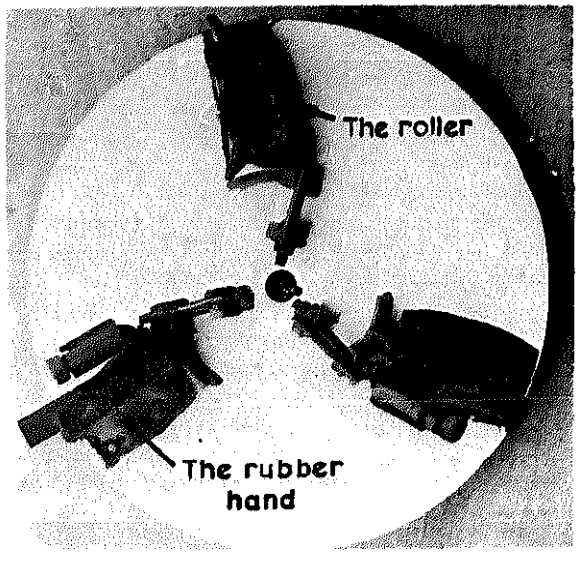
*The planting mechanism in operation.*

make reversing possible. By varying the number of teeth on both sprockets, it is possible to alter the spacing along the rows. By moving the planting discs along their shafts and adjusting the center distance of the land wheels, it is possible to obtain different spacings between two adjacent rows.

**Ellis Transplanters**

Deluxe models are available with positive gauge wheel drive. The operators place the plant at the right depth while the machine sets the plant in the furrow, waters the roots, and packs the soil around the roots and stem. Models are available with a one- to four-row capacity.

A continuous or intermittent water supply is available with all Ellis Automatic Transplanters. The system uses two valves mounted on the seat bar between the operators. One valve is used to adjust the amount of water applied per plant while the other shuts the water



*The planting disc.*

off at the end of a row and on at the beginning of the next.

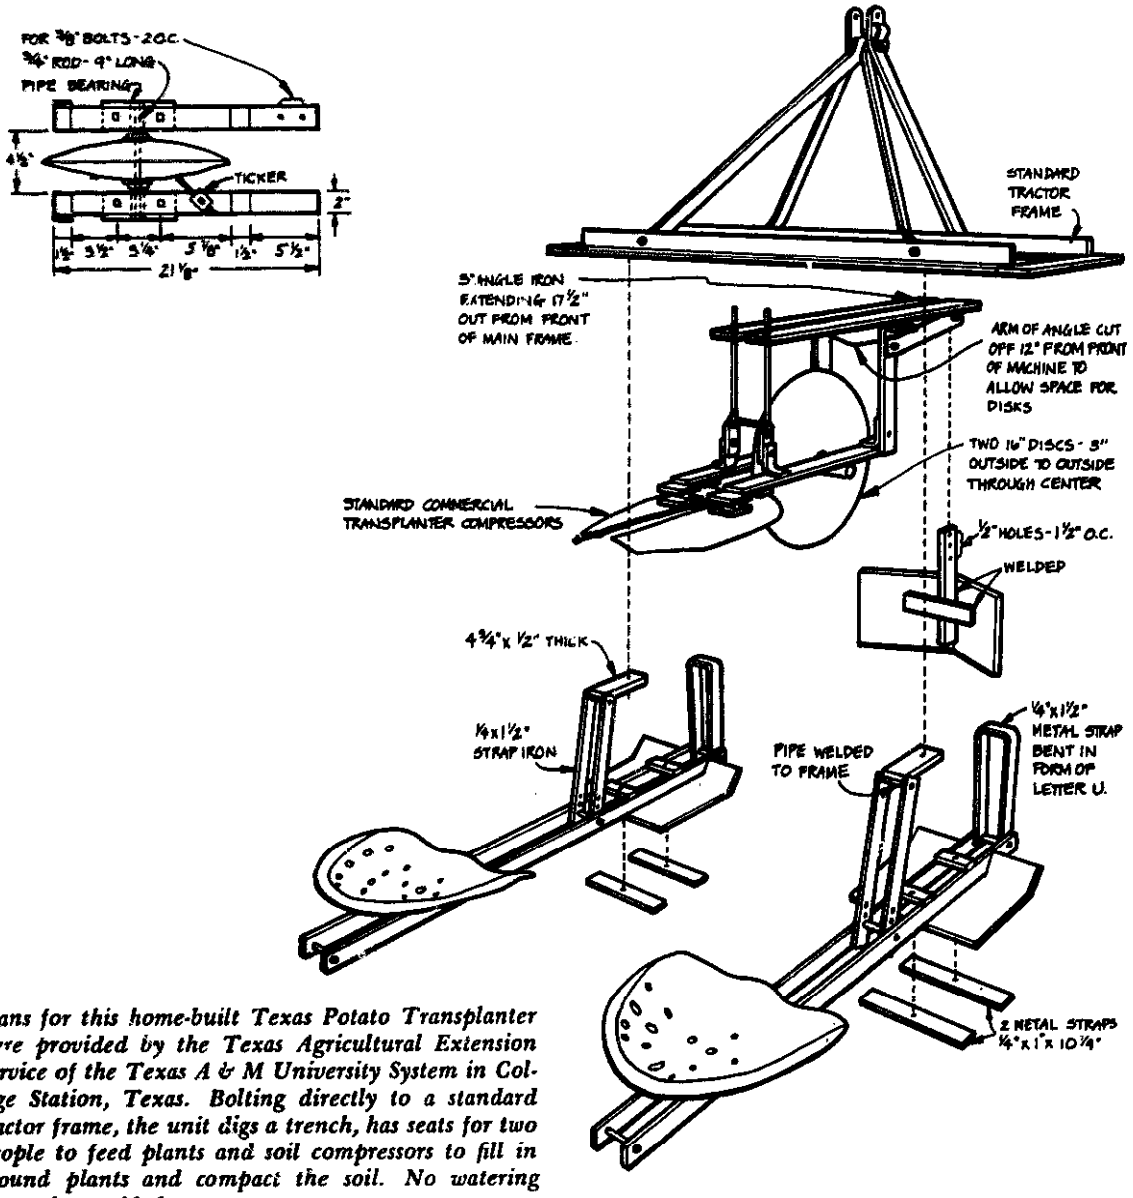
Verona, WI 53593

**Mechanical Transplanters**

The Mechanical Transplanter Company has a number of models ranging in size from a one-row to a four-row unit which can be attached to any tractor drawbar with a single pin. Everything is adjustable on these units, including seats, footrests, plant spacers, and water valves. The Flo Check watering system turns water on and off at the instant of setting. Water is not lost between plants and the amount of water given each plant can be set by a wing nut adjustment control.

Mechanical Transplanter Co.
S. Central at U.S. 31
Holland, MI 49423



*Plans for this home-built Texas Potato Transplanter were provided by the Texas Agricultural Extension Service of the Texas A & M University System in College Station, Texas. Bolting directly to a standard tractor frame, the unit digs a trench, has seats for two people to feed plants and soil compressors to fill in around plants and compact the soil. No watering system is provided.*

**Holland Transplanters**

All Holland Transplanters have adjustable packing wheels, a Start-rite water valve, blunt- or round-point digging shoes, plant stands and plant boxes, plant holders, and back-rested seats as standard equipment. Available units range in size from a special one-row, one-seater unit for garden tractors, to eight-seated, four-row planters. They are available as either tractor-mounted or tractor-drawn units with or without watering tanks, cultivators, and fertilizer distributors.

Holland Transplanter Co.
Holland, MI 49423

**Kennco Plant Setters**

Available in one-, two-, or three-row models, the Kennco plant setter passes over a completed bed (with or without plastic covering), punches a hole for a plant and a stake (if required), then waters the hole completely, and allows a riding attendant to place a hothouse seedling or seedbed-grown plant directly into the watered hole. Attendants ride at a comfortable position with all plants and controls directly available for rapid but thorough plant setting in each row. Experience has shown that using this method, replanting due to young plant attrition is extremely minimal. Watering controls consist of metering valves and on-off valves handled by the attendant.

Ruskin, FL 33570

## NORTH AMERICAN SOURCES OF TRANSPLANTERS

**Prentice Multirow Transplanter: Hydro-Synchron by Jetspeed**

Just described in the article on Windfell Farm, the Jetspeed also has the diversity to convert from transplanter to boom sprayer to cultivator. The machine can plant from one to 18 rows, and the rows can be spaced as desired from 2 to 60 inches apart (with wing units). An attachment is available for planting through black plastic mulch.

A smaller unit, the Jetmaster, is a hand-pushed transplanter designed for planting two 3-foot beds at a time, at any desired spacing, with the same water-jet planting mechanism. Speedling transplants are set by hand by workers following the unit. A whole line of intermediately scaled tools and machinery is designed for a permanent-bed row-crop system.

E.V. Prentice Machinery Co.
2303 N. Randolph Ave.
Portland, OR 97227

**Ellis Model 450**

This is a one-row transplanter with three-point hitch and a 55-gallon barrel which mounts directly over the hitch and makes it easy to lift. The unit can be attached to some tractors without a three-point hitch, by mounting the barrel on the tractor. These tractors include the John Deere M and MT, the International C, Super A, Cub, and 140, and the Allis-Chalmers CA, D10, D12, and WD. The one-row unit will plant up to 5,000 plants per hour.

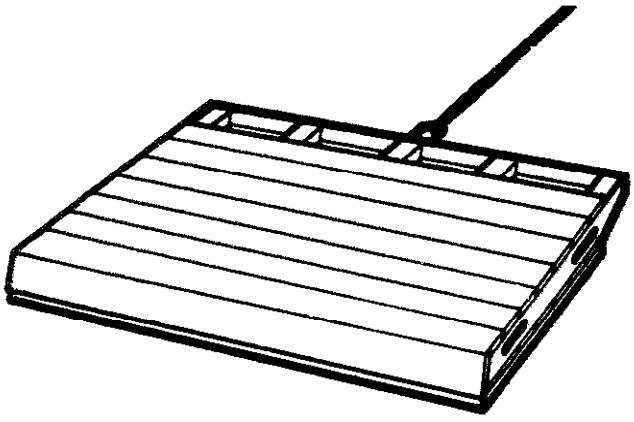
Box 246
Verona, WI 53593

## INTERNATIONAL SOURCES OF TRANSPLANTERS

**Animal-Drawn Rice Transplanter Platform Plans**

This transplanter consists of a wooden platform pulled by a buffalo or a pair of bullocks over the mud of the paddy field when it's ready for transplanting. Four workers are seated cross-legged on the platform, holding the seedlings in their laps. Special recesses are provided on the platform for extra seedlings. Under the platform are attached eight wooden markers, and each worker transplants two of the rows marked in the mud. The workers do not wade through mud and there is no back-breaking bending over. Transplanting is done in parallel rows, at least at twice the normal speed, as both hands are used simultaneously.

Intermediate Technology Publications, Ltd.
9 King St.
London WC2E 8HN, England



*Animal-drawn rice transplanter platform.*

**Rau-Kombi Semiautomatic Potato Planter**

This is available as a two- or four-row unit, one operator per row, tractor-drawn implement. It has spring-loaded adjustable covering discs, with a 50-kilogram capacity per hopper. Optional features include a track eliminator, sand plates for driving lugs, a coulter in front of the planting share, and an insecticide applicator. Weight: two-row, 242 kilograms; four-row, 463 kilograms.

**Rau-Kombi Planter**

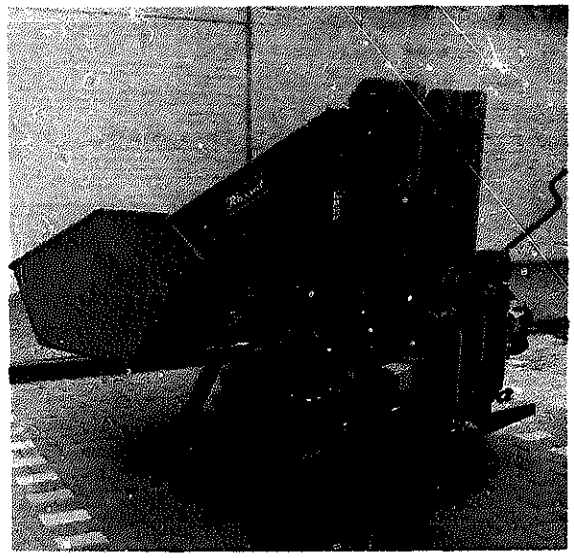
This unit is suitable for vegetables, beets, tobacco, onions, strawberries, forestry plantings, and others. The press rollers do not act above the neck but below, at the feeder roots, closing the soil as required. It will plant two, three, five, or seven rows; spacing of plants along the rows is adjustable.

Hassia-Rau-Vertriebsgesellschaft
D 7315 Weilheim/Tech
Johannes-Rau-Strasse, West Germany

**Hassia Automatic Potato Planter**

The Hassia potato planter Model GLO is available for planting two and three rows at one time, with row spacing adjustable from 62.5 to 75 centimeters.

A.J. Troster Landmaschinenfabrik
6308 Butzbach, Oberhess
Postfach 240, West Germany



*Hassia Automatic Potato Planter.*
**Hassia**

**Gruse Potato Planter**

This planter has independent, front-mounted furrow openers that are adjustable for depth and float independently to facilitate an even planting depth. Two-row models will plant row widths of between 28 and 36 inches at a maximum speed of 5 mph. It is totally automatic.

RH Group Root Harvesters, Ltd.
Rengate
Peterborough PE1 5BD, England

**Nardi Transplanter**

This model automatically opens the furrow, places the plant, and firms the soil around it. A synchronized valve on the frame is operated by the planting disc wheel which measures the required amount of water for each plant. On request, the transplanter can be supplied with a fertilizing unit for surface spreading or depositing at a depth of 4 to 6 centimeters below the surface. Transplanting depth is adjustable, and the distance between plants can be adjusted by changing the gears on the drive wheels, changing the diameter of the drive wheels, or by changing the number of pincers. The unit is attached by a three-point hitch and is available with a special attachment for planting in offset rows.

Nardi Macchine Agricole
06017 Selci Lama
Perugia, Italy

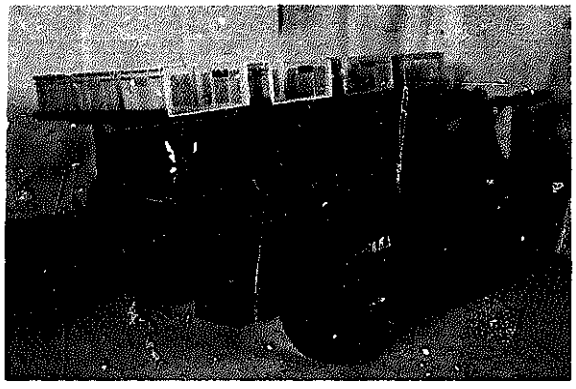
### Self-Propelled Tobacco Transplanter KC-6

Powered by a four-cycle, air-cooled, 2.3 h.p. engine, this two-wheeled walking transplanter plants all kinds of ridges and furrows—wide, narrow, high, or low—with tobacco plants at spacing intervals from 25 to 45 centimeters in circular or square holes. It can make sharp turns, so no additional turning space is needed. It requires a minimum labor input of one or two people for planting at a rate of 3 to 4 acres per day. The transplanter is self-propelled, with two speeds forward and one reverse. It has automatic steering; it will plant either before or after mulching with a nylon sheet.

*Circle Tekko Self-Propelled Tobacco Transplanter KC-6*
**Circle Tekko Co.**

### Beet Transplanter BTP-2

The BTP-2 is used with a 35 h.p. tractor with a three-point hitch to plant two furrows at one time at a rate of 1.5 to 2 hectares per day. Its operation utilizes four or five people. Row spacing is adjustable between 550 and 700 millimeters; the planting interval is set at 225 millimeters. Standard attachments include two seedling pot separators, one seedling collector set, 30 seedling boxes, and one set of tools. The BTP-2 uses a new feeding-planting mechanism which guarantees reliable planting and easy adjustment. It comes with a special attachment for planting high furrows. A four-row unit to be pulled behind a 60 h.p. tractor is also available.



*Circle Tekko Beet Transplanter BTP-2*
**Circle Tekko Co.**

Both of the above transplanters are available from:

Circle Tekko Co., Ltd.
194 Izumicho, Takikawa-City
Hokkaido, Japan

### Metamora Rice Planter MSP-2A

The MSP-2A plants rice seedlings that have developed from two to five true leaves. Seedlings may be raised in mats. A lever can be set for small (2 to 2.5 true leaves), medium (3 to 3.5) and large (4 to 5) seedlings, and also for the number of seedlings in each clump. The lever setting for planting intervals is adjustable in 1-centimeter steps between 12 and 21 centimeters. The seedling feeder is to the rear of the wheels, so that the operator has a good front view. Additional seedlings are set on two trays stacked on top. The trays can be reached from the operating position. Wheels are independently suspended so that the body is maintained in a horizontal position by operating the lever within easy reach. Two-wheel drive and a float for buoyancy assure easy travel across the paddy. Sharp turns can be made by operating side clutches which disengage one wheel as the other keeps moving. Seedlings are not injured by this planting. Planting depth can be varied by adjusting the float. The four-cycle, air-cooled, 3.5 h.p. engine operates the 83-kilogram unit at a capacity of ½ acre per hour as the operator walks along behind. Planting two rows at one time, 30 centimeters apart in clumps of three to five seedlings each, yields a density of from 50 to 90 clumps per 3.3 square meters.

**Metamora Tobacco Transplanter**

The operator walks behind the machine, feeding the planting mechanism with seedlings less than 22 centimeters high while steering. It will plant tobacco, cabbage, and Chinese cabbage. Adjustments you can make include the distance between seedlings from 25 to 41 centimeters (10 stages), the height of the ridge from 0 to 40 centimeters, the distance between wheels, and the inclination of the chassis. The air-cooled, four-cycle, 2.5 to 3.5 h.p. gasoline engine powers two forward and one reverse speed for planting at a rate of 1 acre every 3 or 4 hours.

Metamora Agricultural Machinery Co., Ltd.
9-37 Nishi 2-Chome
Okegawa, Saitama, Japan

**Mizuho Suzue Rice-Transplanting Machine**

The Mizuho plants two rows of either young or adult seedlings at a rate of approximately 2½ acres per hour without damage to the plant. Spacing is adjustable between plants, but row width is set at 300 millimeters. One person operates this gasoline-powered machine. A low center of gravity and the well-going straight faculty minimize the amount of attention the unit requires by the driver.

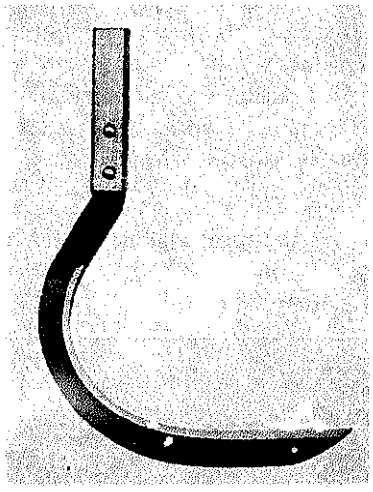
# -6- Harvesting Equipment

## SICKLE, SCYTHE AND GRAIN CRADLE

The sickle and the scythe are the earliest forms of hand tools developed for harvesting a crop. Although their development can be traced back to around 2,000 B.C., they are still used in many parts of the world today for small-scale farming.

The scythe was developed from the sickle by lengthening the blade and adapting the handle in such a way that both hands of the operator can be used. The larger blade of the scythe increases the rate of doing work, while the longer handle is less fatiguing for the operator as he can stand upright when working. The scythe can be used for harvesting both cereal and forage crops.



*A common sickle.* True Temper

## BRING ON THE SCYTHE

by Drew Langsner

On a year-long trip, we found scythes in common use throughout Europe—from Turkey to France to Scandinavia. In modern Switzerland, Alpine farmers regularly scythe hay on slopes that are too steep for any machinery. Grazing cattle would lead to erosion. And if the grass is allowed to grow, winter snow clings to the long, dry blades until great weights accumulate, causing avalanches and loss of precious soil.

The Alpine farmers are very practical workers, so I was particularly interested in their technique for mowing. Watching a man and his teenage sons scything a very steep field gave me the impression of a functional ballet. The effort exerted was great, yet light and rhythmic all at once. About every 15 minutes work halted. The blades were quickly honed with a whetstone kept in a water-filled scabbard hung from each man's belt. With razor-sharp blades, mowing resumed until a small field, perhaps an acre, was cut.

One day our Swiss host informed me that the grass around his cheese-making hut was of sufficient growth for mowing into a small amount of fodder. Of course, I was quite anxious to try scything.

First he demonstrated his sharpening procedure. The edge of the blade must be so thin that it deflects when pressed against one's thumbnail. Lightweight grass-cutting blades come this way new. But after repeated honings, the thin edge section wears away, leaving a cutting edge too thick for razor-edge sharpening. Rethinning is done by pounding the blade with a hammer over a small stake anvil driven into a log. When the blade passes the thumbnail test, it is ready for honing.

That job is accomplished with the long, thin whetstone. The stroke used is very similar to knife sharpening—the stone is worked toward the edge with long, smooth passes at a very slight angle. The stone is dipped in water every minute or so to wash away accumulating grit that would contaminate its pores and hinder further sharpening. The test of an adequately sharp blade is in its

*To begin a stroke, your trunk is twisted quite far to the right.*

use. One should feel almost zero friction between the blade and the grass being cut.

For the proper mowing technique, legs are set rather apart, knees are bent a little, and the body cants forward at a slight angle for balance.

To begin a stroke, your trunk is twisted quite far to the right. The scythe is held so that the tang, the shank connecting the blade and handle, is just above the ground, at cutting depth. The blade tip is angled slightly upwards, but not much. The position of the tang regulates the cut. The slightly lifted tip is to help avoid hitting obstructions during the stroke. Finally, the blade is aimed so that it will cut a very thin swath with each stroke. The scythe is not a hacking weed chopper, but a fine cutting tool. In use, the blade actually slices along whatever is being cut. Each pass mows only a few inches in depth, perhaps six to ten inches, depending on the blade length.

The actual stroke involves using your entire body in a smooth, pivoting movement. Beginning at the right, swing in a full arc until your shoulders are turned all the way left. (This long, thin stroke actually cuts more grass than a short, broad hacking movement.) Then take a short step forward as the scythe is returned to the beginning position.

To mow a patch of grass, grain, or weeds, begin at the left edge and gradually work your way from one end to another. You can work up or downhill, but always go in the same direction. After mowing one swath, return to the beginning edge and mow a second swath one arc space to

*The actual stroke involves the entire body in a smooth, pivoting movement.*

the right. Working in this fashion, your reapings will fall away to the cut side, not against standing growth in the following swath.

Several types of scythe blades and snaths (handles) are currently available in America. The standard blade, 30 inches long and made of fairly heavy steel, is suitable for cutting weeds and small grains. A shorter, even stouter blade is sold for clearing brush and briars.

The technique for using these scythes is the same as for mowing grass, but with extra vigor. These blades are generally not pounded thin or sharpened to such a high degree as grass blades. But they must be kept quite sharp to be effective. Standard blades are generally sharpened with a mill file or on a hand-turned grindstone. Work mainly on the bottom side of the edge. Many a frustrated mower has a blade sharpened on the upper edge. This creates a downward-slanting bevel that tends to run the scythe into the ground as it cuts. Always sharpen standard blades on the lower side first, then gently remove any wire edge that may form on the upper side. It is a good idea to finish up by honing with a hand stone.

Recently, thin, lightweight grass blades have been imported to this country. These blades are excellent for fine mowing work, but they are not suitable for cutting tough weeds. They are delicate; the fine edge is quickly dulled or nicked if run into the ground, a stone, or hidden debris.

Two styles of snaths, or handles, are on the market. The standard snath is made of bent ash

and is quite heavy. These are rugged and suitable for use with standard and brush blades. Also available is a bent aluminum snath, which works quite well with the superlight grass blade. But aluminum snaths are too light for the more rugged work of cutting grain, coarse weeds, or briars. For such tasks, the extra weight of the ash snath creates a momentum that helps in mowing. Wooden snaths should be cleaned and treated, once or twice a year, with a mixture of two parts linseed oil to one part turpentine.

Some older hardware stores still carry scythes, especially in country districts. You might have to ask, as the last one ever ordered may be in the back storeroom.

Often scythes appear at auctions or yard sales. It is not too hard to clean up a mildly rusted blade. Be sure that the snath is not cracked, and that it has one, or preferably two, handles. (Snath handles are tightened by twisting counterclockwise.)

## GRAIN CRADLE

The grain cradle is an improved scythe with a set of wooden tines above the blade that catch the wheat (or other grains) as the blade severs it on the forward swing. Mastering the art of the scythe and grain cradle takes coordination and practice. For a right-handed stroke, the left foot is placed one stride forward and the first stroke is taken with the blade nearly parallel to the ground. The trick is to keep the grain stalks laying all one way during the next four strokes. Before each consecutive stroke, the right foot comes forward one-quarter stride. After the fourth stride, the wheat on the tines is slid off into a neat pile at the farther reach of the cradle's forward swing, ready to be tied into a bundle.

A farmer is a proud person: proud of his tools and proud of the work he and his tools produce when working as one, together. And with good reason; it takes practice and skill to master a task. Like an old pair of shoes, the tool conforms to the technique its master employs—becomes molded to his style and uncomfortable in the hands of another. The skill and intimacy in the relationship between man and tool are reflected in the following article by Steve Taylor about mowing with a scythe and the rare people who have the skill to use it right.

*Harvesting grain by hand with the help of the scythe and grain cradle.* United States Department of Agriculture

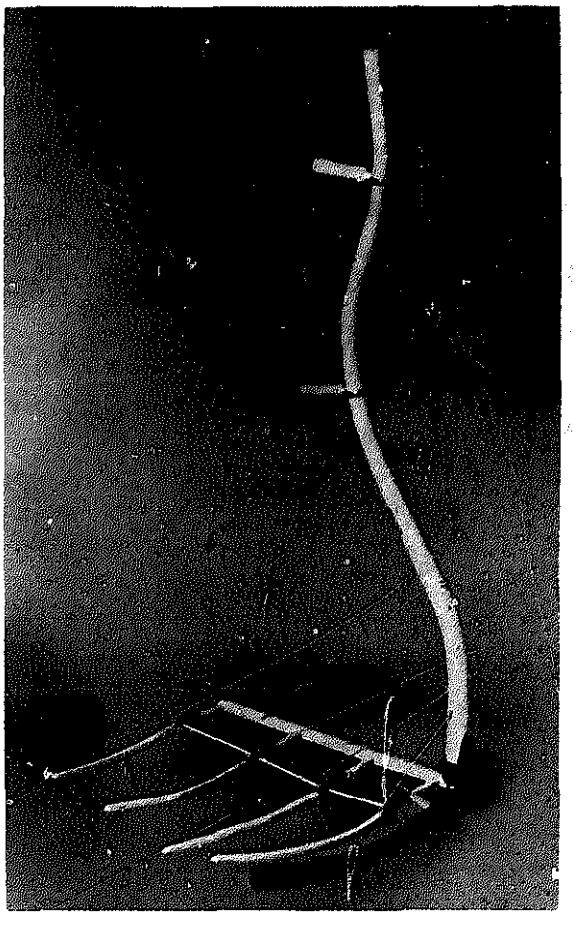
# BUILD-IT-YOURSELF GRAIN CRADLE

by Richard Weinsteiger

With new grain cradles impossible to find, and old cradles expensive and rare, here is an inexpensive way to convert a grass scythe into a functional cradle.

## CONSTRUCTION

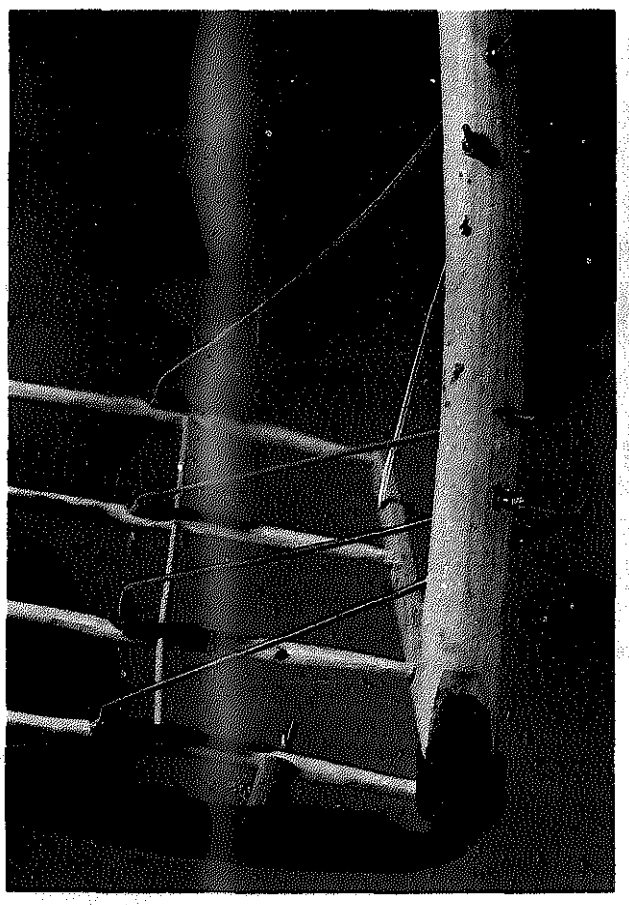
1. Start by obtaining a 30-inch-length by 3-inch-diameter piece of knot-free green hickory or ash. Remove the bark, using a drawknife and quarter the log. Shape the four pieces with the drawknife until they are approximately ¾ by ⅝ inches. Then, starting 10 inches from one end, taper the remainder to ⅜-inch diameter.
2. In order to bend these pieces to conform to the shape of the scythe blade, a jig has to be built using a 27-inch scrap piece of 2 x 4 and four pieces of 6-by-¾-inch dowel. Since all blades do not have the same arc, you will have to position the dowels accordingly. After the jig is built, place the four pieces in the jig and let dry for several days.
3. The upright or main support piece, also made from hardwood, is ⅝ by 1⅛ by 23½ inches. Drill four ⅜-inch holes 2, 8, 15 and 23 inches from the bottom. A shallow groove is filed across the grain ¾ inch from the bottom to accommodate the J-bolt. Drill a ¼-inch hole in the front face of the metal end cap of the scythe handle for the J-bolt. Make sure the hole is far enough from the center to avoid the blade clamp bolt.
4. Remove the pieces from the jig, apply resin to all outside bends and char with a torch to set

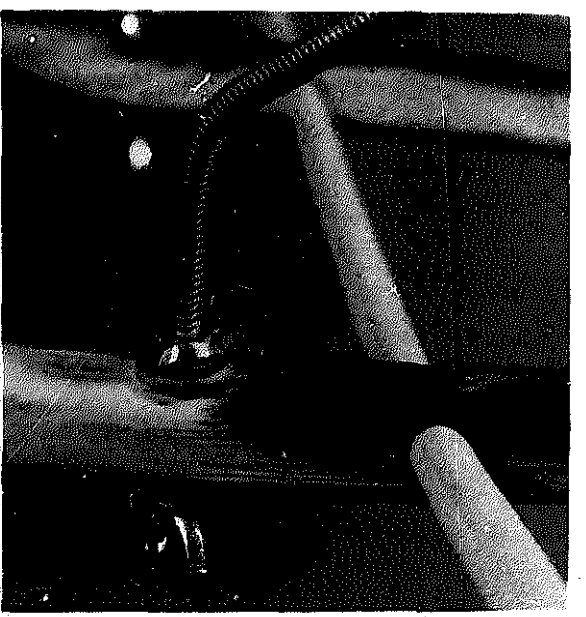


*A grain cradle can be built to fit any store-bought scythe*

the bends. Then whittle 5/8 inch of the ends that are to fit into the upright to a 3/8-inch diameter. Drill a 3/8-inch hole vertically 7½ inches from the support end for a supporting dowel to slide through, and in each piece a 3/16-inch diameter hole horizontally 9 inches from the end for the supporting all-thread.

5. Now assemble the unit by inserting the J-bolt with the upright attached to the faceplate and tightening the nut. Insert the four bent pieces into the holes in the upright. Place the 5/16-inch-diameter by 23¼-inch dowel through the vertical holes of the bent pieces. Next, drill a 3/16-inch hole midway between the top two bent arms. Cut a 26-inch piece of 3/16-inch all-thread, and make a right-angle bend 1½ inches from one end. Insert this piece with the right-angle bend into the 3/16-inch hole at the top of the upright, and fasten with a washer and wing nut. Judging the angle by holding the piece of all-thread to intersect the handle, drill a 3/16-inch hole 16 inches from the end cap. Cut four pieces of all-thread 28½, 22, 17 and 14½ inches in length, and using the same method, attach to the handle 17½, 10, 8 and 7 inches respectively. Put wing nuts on both the inside and outside of the pieces that are inserted in the bent arms.
6. Cut a 2-inch piece of ¾-inch dowel, and drill a 3/16-inch hole through the center lengthwise. The same diameter hole should be drilled in the bottom bent arm and the blade approximately 4½ inches from the handle. Cut a 4-inch length of 3/16-inch all-thread, and peen one end so that it will not slip through the hole in the blade. Insert through the blade, dowel and arm, and fasten with washer and a wing nut. Using ¾-inch brads, fasten the dowels to the arms and upright. Then adjust the wing nuts on the arms and handle to align the arms with the blade, making sure to keep the arms in back of the blade edge.





*The supporting all-thread strut is bolted in place with a wing nut.*

*The cradle's simple supportive network is adequately braced.*

# HAND MOWING: FEW HAVE THE SKILL TO SWING A SCYTHE—PROPERLY*

Story by Steve Taylor, Photos by Bob LaPree

Elwin Smith, herdsman on a large, East Washington dairy farm, gripped the handle of his scythe and at the starter's command went forth to mow the prescribed 50-foot course. Judges hovered around, measuring the swath he lay down in the lush green grass and clover.

When a half-dozen others had had their turn and the points and times were added up, Smith had won the Golden Scythe Award, symbolic of supremacy in the art of hand mowing in Sullivan County and other points east of the Mississippi.

The Sullivan County Dairy Herd Improvement Association (DHIA) has held its hand mowing championship every summer for the past 25 years or so. Anybody who thinks he or she is up to it can take a crack at winning a new scythe decorated with gold spray paint.

*Elwin Smith, winner of the Golden Scythe Award. Neatness of stubble nudged him ahead of the others.* Bob LaPree

* Reprinted with permission from *New Hampshire Times*, 27 July 1977.

Elwin Smith calls himself an old-timer, and it's usually old-timers who win the Sullivan County DHIA's Golden Scythe. In 1977, Smith nudged out three dairy farmers by one- to three-tenths of a point, and all were veterans in the scythe competition. They were Fred Hall of West Unit, defending champ Horace Bascom of Charlestown, and Smith's boss, Hans Eccardt of East Washington.

A broiling July sun beat down on Charlie Stone's beautiful Meriden dairy farm, and the temperature hovered at 99 degrees in the meadow across the road from the cow barn. The veteran scythemen warmed up by taking a few swings at grass around the edges of the field and then set to work putting fine edges on their scythes with pocket-size sharpening stones. Then one by one they mowed the course.

The competition is scored on a combination of factors. Time over course is worth 15 points, width of cut 30 points, neatness of stubble 45 points, and completing course 10 points. Penalty points up to 10 can be assessed by the judges for spitting tobacco juice on the course or giving judges or bystanders lip.

*Judges measure the width of his swath as Hans Eccardt finishes his course.*
**Bob LaPree**

Elwin Smith was slower on the course, achieving 11 out of a possible 15 points. He ran well behind speed merchant Horace Bascom, who laid down his swath in two minutes, five seconds. But Smith picked up a total of 43 out of 45 possible points for neatness of stubble and that gave him the victory.

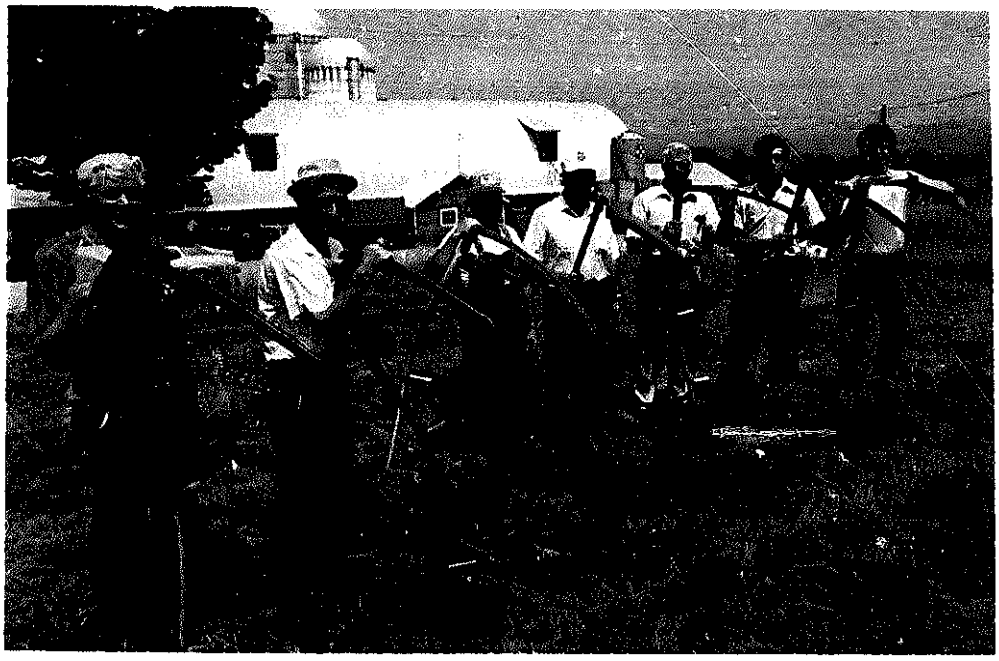
The swath where Smith had mowed looked like it had been cut with a lawnmower, so short was the remaining growth, and there weren't many places where the scythe had skipped and left little telltale manes of uncut grass.

Smith was repeating what he'd done at the DHIA field day back in 1959, winning the big prize, and darned if he didn't use the scythe he was given for the '59 championship to win in '77.

Later there was a competition for greenhorns, also known as dubbers or hackers. This was won by a Meriden area farmer-writer whose swath—like those of other contestants in his class—looked like it had been carved up with a hatchet.

After the competition, the veterans stood around and talked about their individual scythes. Eccardt had a European-style model with a straight handle. Stan Colby from Cornish praised his cherry snath. Elwin Smith savored a cold bottle of Miller beer Eccardt had sequestered in a clump of clover by the fence.

Then it was off to a picnic on the Stone farm lawn, with fiddle music by the Dave Levine



*The competitors pose for the camera (left to right): Stan Colby, Elwin Smith, Fred Hall, Hans Eccardt, Horace Bascom, Dean Bascom and Bennie Nelson.* **Bob LaPree**

orchestra. Another hand mowing competition had been written into history, its participants and spectators well entertained at the sight of the vestiges of an ancient art.

Virtually every boy and man in rural New Hampshire knew how to swing a scythe a century ago. The skill was essential to family and individual survival, for it was the means by which the basic feed of livestock—hay—was harvested on the land.

Hand mowing as a skill exists today, but only among old-timers and a few younger men who probably have learned it working on a highway crew responsible for trimming roadsides.

Hay was harvested in July and August a century ago, and came all in one crop. Today, the first cutting is in the barn before July 4, and second and third cuttings come along later in the summer. That's because of the introduction of legumes such as alfalfa and trefoil, which have displaced timothy and other grasses, the old standbys for hay production in New Hampshire.

During the Civil War, many New Hampshire farm hands enlisted in the Union Army and marched off to fight. A similar development in other northern states stimulated the development of farm machinery to speed up and ease the task of harvesting hay in this area.

The first significant invention was the horse-drawn mowing machine, which was developed in 1847 but not perfected until well after the Civil War. The mechanical hay loader and the dump rake were introduced in the 1870s, and the pace of haying was stepped up considerably.

The need for skilled scythemen diminished steadily in the late nineteenth century, although many poorer farmers continued to put up hay using the old methods. These farmers kept alive the traditional methods and procedures.

Haying with scythe, hand rake, and pitchfork traditionally began on the first Monday after the Fourth of July.

Work began at dawn when several men went out to do barn chores and milking. While chores were being completed, Grandpa and the young boys would go to work on sharpening scythes in preparation for the day's mowing. The kids would have to turn the crank on the grindstone while Grandpa would start water trickling on the stone.

After removing the snath, or handle, from the scythe, Grandpa would grasp the blade in both hands and bear down on the stone. The stone would turn rapidly without resistance, but as the

*Stan Colby sharpens his scythe with a whetstone.*
Bob LaPree

pressure increased, the stone would slow to a drag. Periodically the edge would be tested with a thumb, and after 10 or 15 minutes the job would probably be done. To a youngster that would seem like an eternity, especially if there were two or three more blades to go.

After sharpening the blades on the grindstone, a whetstone, sometimes called a rifle, would give them an even keener edge.

After breakfast, the crew would assemble in the field and work would begin. The hired men would start off first, followed by Dad or whoever was boss. The boss would try to crowd the mowers ahead of him, and if he passed one or more of them in the advancing echelon, they were disgraced and had to retreat and pick up a new swath at the rear.

Behind the mowers would come young boys with pitchforks, spreading out the newly mown hay to speed up drying. Since hand mowing is such hard physical work, especially if the men were being pushed by weather or the boss to produce, mowing was usually done in the cool of the morning. The afternoon was devoted to raking up, tumbling, and loading the hay onto wagons for transport to the barn.

In raking, the crew would set out in reverse order of the morning arrangement, with the young boys leading with small rakes, and the stronger men bringing up the progressively larger mounds of hay into windrows. While one man fetched the horses and wagon, the others would tumble the hay, that is, arrange it in piles which could be forked directly onto the load and which presumably would stay intact through several handlings from field to mow.

Next would come the time to pitch hay. Strong arms would fork the hay onto the wagon, then fork it off the wagon at the barn, shove it up into the storage area where it would be mowed away. The following winter the hay was supposed to come out of the mow by the tumble as it had gone in, but likely as not, it came out with much grunting and groaning and not by the tumble.

The tremendous physical exertion required that large quantities of fluids be available in the field. Cider was one important beverage; some old accounts tell of rum; switchel is said to have been a popular refreshment. Switchel was a concoction of cold water, sugar, ginger, and vinegar, and those still around who have consumed it say it was more or less thirst quenching.

As late as the 1880s, there were purists who refused to adopt the labor-saving machines such as the mower and dump rake, often claiming the iron wheels spoiled the land. So they kept swinging their scythes. But as time rolled on, there came to be fewer and fewer farms where the hay was harvested by pure human muscle power.

Hand mowing is the same sort of rural skill as sheep shearing. It requires determination as much as anything. It also requires reasonable muscular condition and a fair measure of coordination. But once the essential rhythms and movements are mastered, it can be done with grace and smoothness.

A man who can handle a scythe as gracefully and efficiently as anyone in New Hampshire is Stanley Colby of Cornish, a retired agricultural extension agent for Sullivan County and now a town selectman and amateur historian.

Colby grew up on a river farm in Plainfield. His father declined to do hand mowing when Stanley approached manhood, and so the boy had to learn. Colby's grandfather, Albon Wood, instructed him on mowing by hand with a scythe and coached him for a year or two. Wood could mow all day long and hardly work up a sweat, Colby recalls. Colby is willing to coach greenhorns today, much as his grandfather did him a half century ago.

"There's not much to it. You just have to know how to mow, how to sharpen a scythe, and how to set the nibs." The nibs are the handles affixed to the snath, which is the curved handle of the tool. The scythe is the metal blade which does the actual cutting.

"You should set the nibs so they're comfortable and then hold the tool in a normal position close to your body. The tip of the scythe should then be at your left foot.

"Then you do it. You keep your heel down, stand up tall. If you bend forward, you'll be a basket case in no time," Colby advises.

Good scythes are hard to find these days. The ones made for the market today are typically imported tools. "Those rigs may be okay for Austria or some such place, but they're not much good for anything over here except maybe cleaning around a fence post or something," Colby snorts.

Many scythes on the market now are ill shaped and don't have enough steel to take and hold a good edge, and the handles are generally inferior. Colby likes a snath made of cherry, but it's impossible to find cherry snaths today.

The best method of finding a good scythe is looking around in old barns. A lot of scythes got stuck away up on beams years ago, and not many people have gone seeking them out for use since.

Most of the winners in the Sullivan County hand mowing championship over the years have brought their own pet scythes with them. Horace Bascom, Sid Clarke, Jesse Stone, and Colby have captured the title most of the time, and all of them did it with their own special tools.

Finding a good grindstone on which to set a scythe is difficult, too, Colby says. Most of the good stones have been appropriated by homeowners and antique fanciers for decorations. Once left to weather, old grindstones are worthless for sharpening scythes.

## HARVESTING RICE

Rice is harvested in much the same way as other cereal crops. Care must be taken not to shatter the hull and risk losing some of the grain. Combines designed for wheat harvest (described later in this chapter), as well as sickles and knives, may be used for harvesting rice. However, tools designed by CeCoCo in Japan are specifically for rice harvest and are described as follows.

### CeCoCo Hand-Pushed Rice Planter-Cutter

This is an adjustable, hand-pushed rice cutter which promises to make the work of men, women, or children five times faster than when using a hand sickle. A 20-inch wide cradle collects the stalks as they are cut.

### CeCoCo Hand Rice Plant Cutter

This tool will reap slightly more than 1/10 acre per hour. The blade is easily detached for cleaning and sharpening. The operator uses both arms to power this tool and stands in an almost erect position. This technique is easy on workers and gives them the power to easily cut through stalks, even thick-cropped rice plants, leaving them grouped and ready for sheaves.

**CeCoCo Power Reaper**

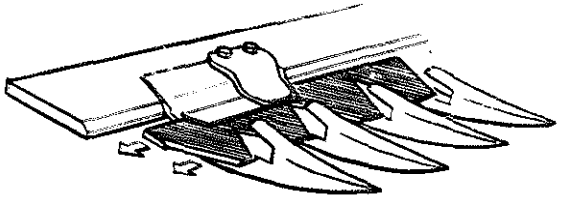
This is a lightweight tool designed to cut wheat or rice stalks at a rate of ¼ acre per hour. It is made of steel pipe and is powered by a 1½ h.p., air-cooled engine.

All three above cutters are made by:
CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Reciprocating Mower-Cutter**

The reciprocating mower is a high-speed machine which has largely superceded the scythe for cutting grass and forage crops, even for small acreages. Cutting close to the ground, it is especially valuable for harvesting badly laid cereal crops. Avoiding the chopping and shredding action of forage mowers, reciprocating mowers do not disturb the kernel or separate it from its husk. Left intact, threshing and cleaning procedures can be saved until a convenient time after the crop is safely delivered to the barn.

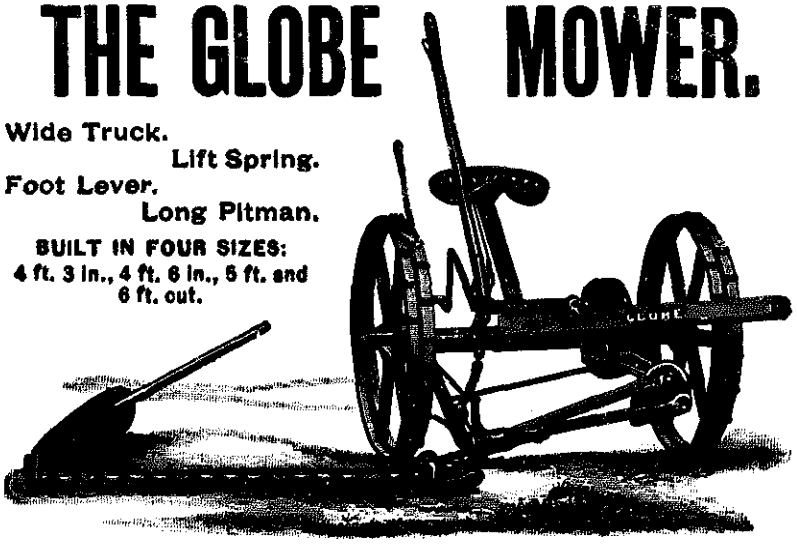
The cutting mechanism of a reciprocating mower consists of a set of triangular-shaped cutting knives operating with a back and forth motion inside a guide shaped like a comb. It



*The cutting mechanism of a reciprocating mower.*

can be either an animal-drawn or ground-driven machine, have its own power unit (motor mower), or be a front end or side attachment for a two- or four-wheel tractor.

When animal-drawn, the large land wheel rotating on the ground as the animal draws the machine forward provides the power to operate the mower knives through the gearbox and the pitman. For the tractor-drawn types, the power to operate the machine is obtained from the tractor engine. The tractor-drawn mower can be hitched to the tractor in a number of ways.



*An animal-drawn, ground-driven mower with mechanical lift. The Implement Age, 1894*

a. The mower can be a trailing unit behind the tractor and the power to the reciprocating knives is then provided by the tractor engine through the power take-off (PTO) shaft.
b. The mower can be mounted on the tractor
   1. at the rear of the three-point linkage, and is then driven by the PTO shaft;
   2. at the middle under the main body of the tractor, and is then driven through the tractor belt pulley;
   3. ahead of the front steering wheels, and is then driven through the pulley mounted in front of the tractor engine; or
   4. ahead of the power unit, and is then driven through a power take-off shaft.

***The Agria 1800 Tractor with a rear-mounted, side-operating reciprocating mower. The mower mounts on a three-point hitch with hydraulic lift and is powered by a rear PTO shaft.***
**Agria-Werke**

In some recent models, the power to operate the mower knives is provided by the tractor's hydraulic system through a flexible coupling instead of the rather difficult mechanical arrangement of the power take-off shaft and universal joints or V-belts. The location of the hydraulically operated mower in relation to the tractor can be either at the rear, middle, or front, the last two positions allowing the tractor driver to supervise its operation with ease.

The main disadvantages of a reciprocating mower are:

a. the working parts are liable to rapid wear,
b. they are not successful in heavy vegetation, and
c. the ground surface needs to be fairly level for satisfactory operation.

Reciprocating mowers are generally used for light grasses which are grown for hay. The cut grass is left in the field in a thin, orderly row which helps it dry quickly. Some mowers have gathering attachments which direct the stalks to fall into windrows, which simplifies handling afterwards. Turning the grass with a swath turner helps further the drying process. But when harvesting some grains, there is a threat of losing the seed, so the crop is gathered right away and threshed soon after.

It is difficult and perhaps even unnecessary to draw a clear distinction between single-axle tractors and motor mowers because mowing attachments are available for some tractors, and cultivating and trailing equipment is often available for motor mowers. Many of the mowers listed in this chapter can be used for fodder or grain crops such as wheat. Rice, however, is often prone to shattering and is not suited to this type of machine.

# A SEED HEAD HARVESTER FOR SMALL PLOTS*

by Rex L. Smith, Ph.D.

Editor's note: The lack of intermediate-scaled mechanization for harvesting small acreages of cereals encouraged us to adapt the following article from *Crop Science* into building instructions for a hand-carried, reciprocating harvester. Author Rex L. Smith originally published his article entitled "A Grass Seed Harvester For Small Plots" because "the seed harvester was helpful to my grass-breeding program and I wanted to share the information."

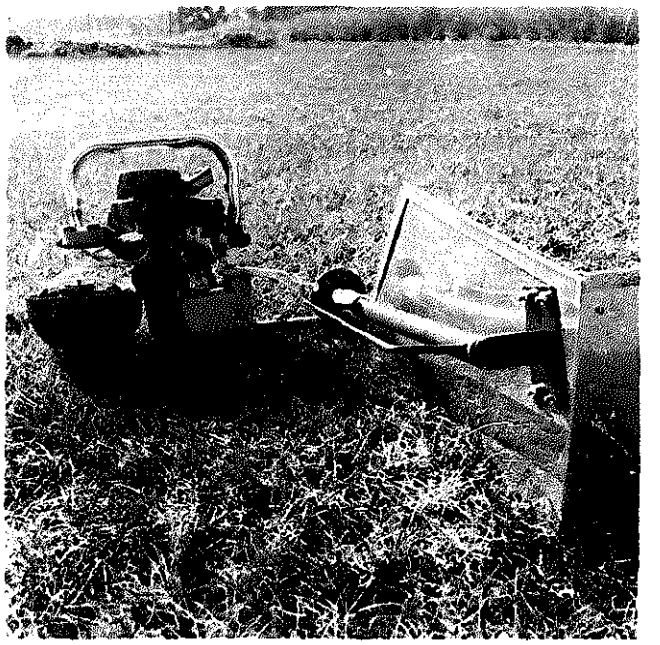
Seeds from small plots, especially those of species whose hulls shatter easily and whose seeds can be lost in the field, have been harvested mostly by hand because no suitable harvesters have been readily available. The increased cost of labor has made this practice expensive and, in our case, has restricted research because of insufficient seed quantities. The harvester described here was designed and built to reduce the cost and facilitate the seed harvesting of small plots of grass. It can reduce the time and labor requirements of hand cutting to one-fifth. The harvester is versatile and will effectively cut many species, including those producing small grains. In addition to harvesting seed, the cutter will also cut grass and legume forage samples.

The harvester consists of a Little Wonder gasoline-powered, 76-centimeter (30-inch) hedge trimmer (Little Wonder, Inc., 1028 Street Rd., Southampton, PA 18966), with a lightweight aluminum tray attached to catch the grass seed heads when cut. This hedge trimmer has two sharpened blades that reciprocate in opposite directions to give excellent cutting action; they can be easily resharpened with a file. As the gasoline motor is self-contained, there is no need for an expensive generator and no cord to manipulate. The harvester's overall weight is only 7.3 kilograms, so it can easily be held and operated by one man.

The aluminum tray was constructed of 0.5-millimeter aluminum sheet. Tray dimensions are 58

* Adapted with permission from *Crop Science*, vol. 13, 1973.

*A researcher harvesting seed heads with a gasoline-powered hedge harvester and collection bin attachment.*



*A close look at the catch bin adaptation.*

centimeters wide, 56 centimeters long, and 23 centimeters deep. The sides are sloped 45 degrees at the front to allow the cut material to fall back into the tray without interference. The front of the tray has a lip formed downward three millimeters over the front of the blade, and it is attached to the top of the blade by the four bolts. The rear of the tray is supported by the handle that is attached near the top of the tray side. This gives the tray a downward slope to the rear and facilitates collection of the cut material in the tray.

The handle is 50 centimeters long to permit the operator to balance the harvester by adjusting the position where it is held. It is constructed of thin-wall steel conduit with an attached six-millimeter-diameter rod which activates the hedge trimmer clutch when the handle is rotated. This retains the safety feature of the trimmer; both of the operator's hands have to be on the handles for the blades to function. The main section of the handle is constructed of 2.3-centimeter-diameter thin-wall steel conduit, with a short length of 1.8-centimeter-diameter conduit welded on the front end and inserted inside the original trimmer handle. Another short length of 1.8-centimeter diameter is welded on the rear bracket and inserted inside the rear of the main handle. Plastic wedges are used to give a good fit between the two conduit sizes. Our cost for the harvester was just over $100 when we built it in 1973.

The harvester is operated by sweeping it into the grass with the blade just below the grass seed heads. Cutting into a slight breeze is helpful in moving the harvested material into the tray, but not necessary. The tray empties completely when the harvester is tipped forward, and no cleaning is necessary when changing varieties. The harvested material is emptied directly into large cardboard boxes or onto sheets of canvas where it is dried before threshing.

### Tea Leaf Harvester

Utilizing the same theory as Smith's seed head harvester, the Japanese have devised a machine to pluck leaves from tea bushes. Reciprocating cutters and/or spindle reel mowers cut the leaves which are collected in a bag. Electric or gasoline-powered units are made for one or two people, and they are mounted on rollers wheels or carried by hand. Some blades are curved for aesthetic round-topped tea bushes or hedges.

*A two-person design harvests more at once and leaves an aesthetic round-topped bush.*
Kobayashi Cutlery

*The carefully guarded spindle reel mower snips tea leaves . . .*

## NORTH AMERICAN SOURCES OF FORAGE MOWERS AND HARVESTERS

### Haban Sickle Mo

Made for operation from the power take-off shafts of 20 h.p. tractors or less, the Sickle Mo makes a 4-foot cut with a full 3-inch stroke of the blade. Power is governed by a convenient clutch lever which actuates the drive belt. A full-floating action to the self-adjusting cutting bar keeps the blade level close to the ground. A swing back device permits the bar to move back instantly upon hitting a solid object.

Haban Mfg. Co.
2100 Northwestern Ave.
Racine, WI 53404

### Jari

Cutting bars on the Jari cut a range of 16 to 60 inches. It is a self-propelled unit available

**Haban Mfg. Co.**

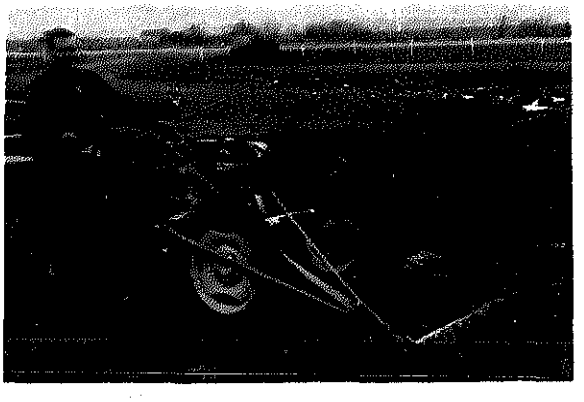
with a snowblower attachment. Separate controls engage the wheels and power unit.

Jari Division, Year-A-Round Cab Corp.
P.O. Box 2075
Mankato, MN 56001

**BCS Mainline Sickle Bar**

Manufactured in Italy, the BCS Mainline is a 13 h.p., gear-driven reciprocating mower with a 44-inch cutting bar. Sickle guards and swathboard ends are available, the latter designed to windrow the cut material. This unit has attachments for roto-cultivation, plowing, ridging, riding, and a trailer for transport. The manufacturer also offers a larger unit, which is discussed in the section on binders and reapers.

Central States Mainline Distributors
Box 348
London, OH 43140



*BCS Mainline Sicklebar*
**Central States Mainline Distributors**

**Ferrari**

The Ferrari walking tiller is manufactured in Italy. The handle pivots 180 degrees, allowing the tiller to be removed and a sickle bar attached. In this position, the unit runs backwards.

Ferrari
6104 Avenida Encinas
Carlsbad, CA 92008

**Kinco**

This is a 38-inch-wide sickle bar with wide tracking for stability on hills. Individual wheel clutches provide a source of power for easy turning. The knife disengages for transport.

Kinco Mfg.
168 N. Pascal
St. Paul, MN 55104

**The Seedburo Plot Cutter**

Designed for experimental work on research plots, the plot cutter is an 18-inch sickle bar mower with a collection bin for catching cereal crops as they fall back after being mowed. It has a variable ground speed control and complements the use of the Seedburo plot thresher.

Seedburo Equipment Co.

## INTERNATIONAL SOURCES OF MOWERS

**Bucher M600**

The Bucher M600 walking mower has a 10 h.p., gasoline engine and a three-speed and reverse gearbox. It can be supplied with a windrowing attachment, trailer, and extra-wide wheels for stability on slopes. Other models are also available.

Bucher-Geyer, Ltd. Engineering Works
CH–8166 Niederweningen
Zurich, Switzerland

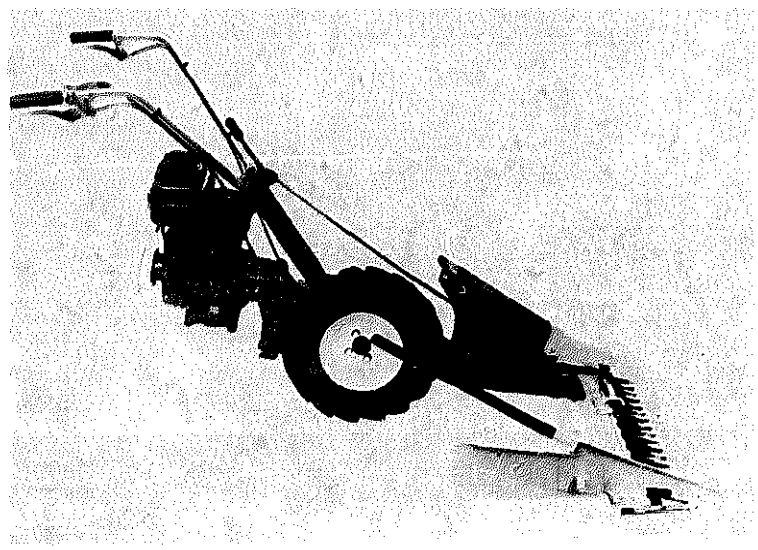
**Gebruder M 6**

The M 6 walking mower has been designed for mowing in all types of terrain. It has a 6 h.p. engine with a two forward, two reverse speed gearbox. It is fitted with a fingerless cutter bar.

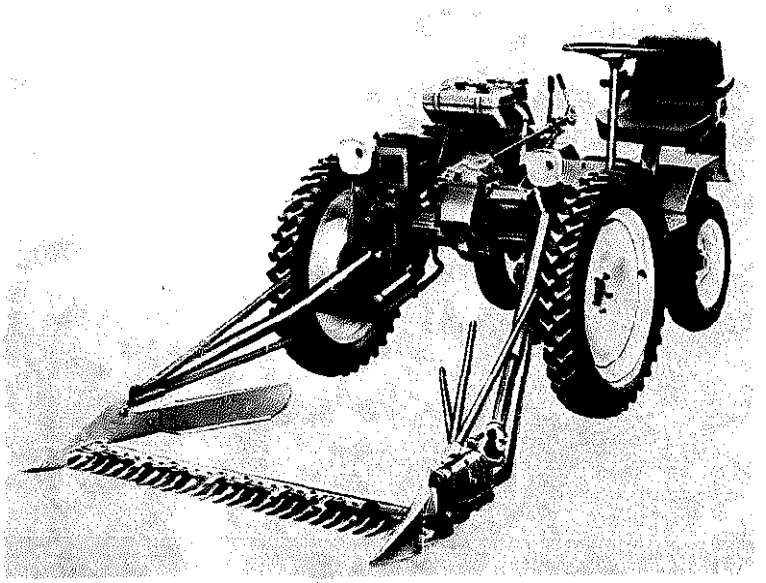
Gebruder Holder Maschinenfabrik
7418 Metzingen, Wurtt
Postfach 66, West Germany

**Bertolini Mowers**

Bertolini offers a 7 h.p. pedestrian and 14



*Bertolini mower with only one wheel.*
Bertolini Macchine Agricole



*Bertolini 14 h.p. Riding Mower*
Bertolini Macchine Agricole

h.p. riding mower. Both are suitable for cutting grass or grain crops.

Bertolini Macchine Agricole
42100 Reggio Emilia
Via Guicciardi 7, Italy

**Schanzlin Mini Mower**

This is a two-wheel pedestrian reciprocating mower.

Schanzlin Maschinenfabrik Gmbh
7831 Weisweil
Baden, West Germany

**Freres SF8**

This is a walking mower fitted with a 9 h.p. engine and a gearbox with four speeds forward and one reverse. Cutter bars of 1.10-, 1.27-, or 1.45-meter width are available. This mower may also be used to pull trailers and wheeled implements and to drive stationary machinery such as grinding mills.

Ets. Simon Freres
B.P. 47
50104 Cherbourg, France

**Irus Power Mower**

This mower has a 7 h.p. engine and can be supplied with cutter bars up to 1.40 meters wide, giving a work rate of 0.3 to 0.4 hectare per hour. A trailer, spraying, and pulling attachments are available for this two-wheeled power unit.

Iruswerke Dusslingen
7401 Dusslingen
Postfach 128, West Germany

**MF-130**

MF-130 motor mowers come with a 7 h.p. engine, two-speed and reverse gearbox. They are available with central or side-mounted cutter bar.

Macchine Agricole F.B.
36040 Sossano
Vicenza, Italy

**M.R. Mower-Tractor**

The steering handles on this mower can be set for driving in either direction. One direction is used for mowing and the other for rotary cultivating and trailer work. It is available with either an 8 h.p. gasoline or a 10 h.p. diesel engine. A special gearbox gives three forward and one reverse speed in both mowing and cultivating directions. Single-purpose mowers are also available.

S.E.P. Fabrica Macchine Agricole
Via Don Pasquino Borghi 6
42018 St. Martino In Rio
Reggio Emilia, Italy

**AEBI**

The Swiss AEBI two-wheel mower has a four-stroke, 10 h.p. gasoline engine with two forward and one reverse speed. It is specially designed for mountainous terrain, has 46-, 58-, and 66-inch cutting bars and a windrowing attachment which can be attached and removed without tools. (See walking tractor section for further details.) Various models are available.

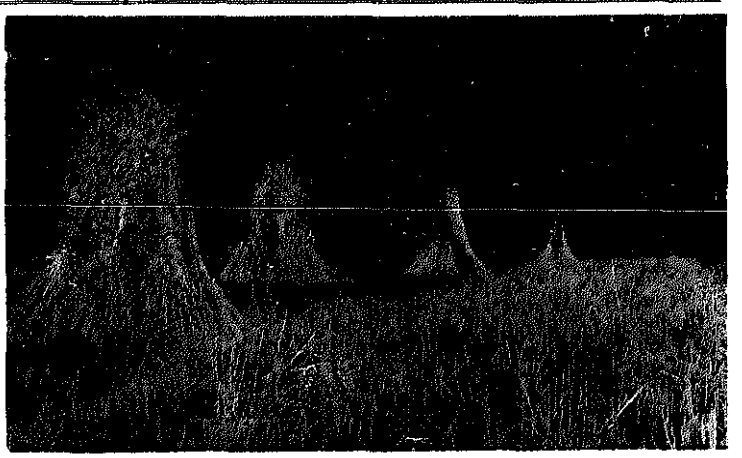
## WINDROWERS AND BINDERS

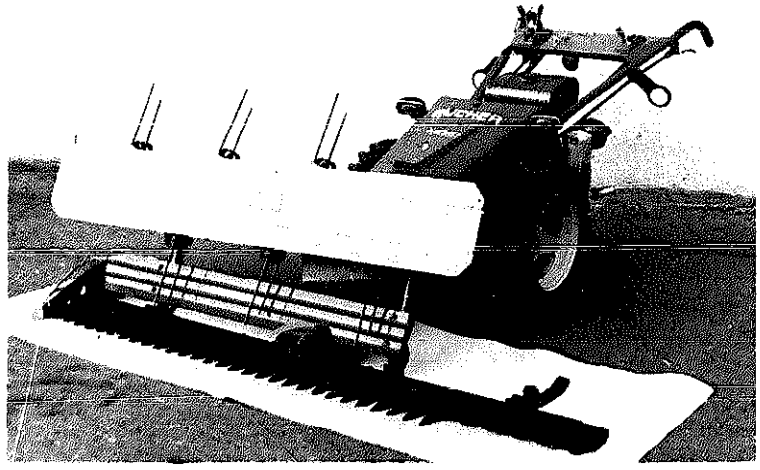
A windrow is a heaped row of cut vegetation. Grasses are raked into windrows to dry



*Hand-tied sheaves are stacked in shocks to dry in the field.*

before baling or storage. Delivering grain stalks neatly into a windrow as they are cut with a scythe and grain cradle facilitates bundling and eliminates the need for raking when harvesting by hand. Stalks are later tied into small bunches called sheaves which in turn are stacked and tied, butt end down, in larger bundles called shocks to allow grain heads to dry in the field.

In North America, hand harvesting has given way to a highly mechanized alternative, the combine harvester. This machine combines the cutting, gathering, threshing, and cleaning ac-



*The Bucher M600 reciprocating mower with a windrower attachment.*
Bucher-Geyer, Ltd.

tivities of grain processing into one large, expensive machine. It offers no practical alternative to hand harvesting for the small-holder in the size in which it is currently produced. However, in Europe, where homesteading has always been a way of life, a reciprocating mower with a windrowing mechanism is made to fit onto two-

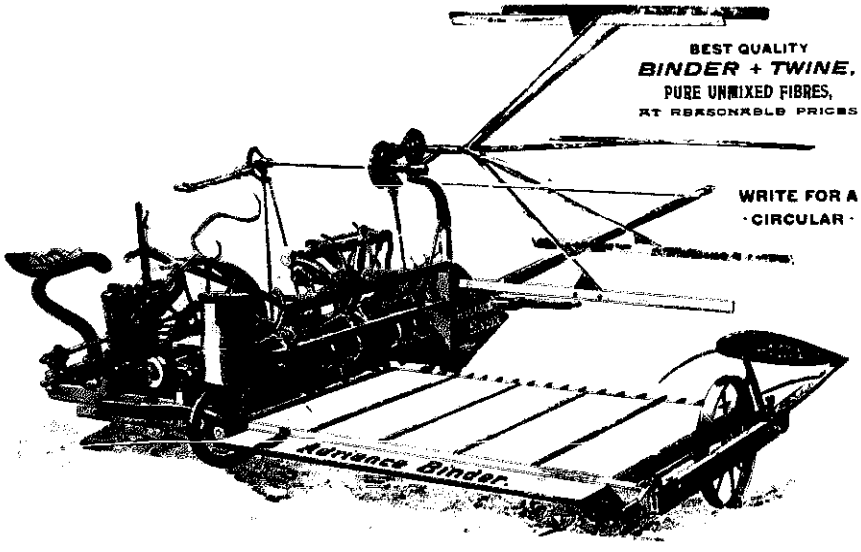
*The Bucher M600 with windrower at work.*
Bucher-Geyer, Ltd.

*The AEBI walking tractor with an attachment for turning or windrowing hay.*
AEBI and Co.

wheel walking tractors. Another attachment, the binder, has a rather complicated tying mechanism to carry out simultaneously the two operations of cutting a crop and tying it into neat and uniform sheaves. The binder basically consists of a reel to gather the crop for delivery to

the cutting mechanism, an elevating system of endless canvasses or a chainlike conveyor, and the binding mechanism which ties the cut material with a band of twine. Almost all of these parts are provided with adjustments so that a variety of crops can be harvested.

The binder has generally given way to the combine harvester for large-scale work. Until recently it was all but out of use in the United States except by conservative farmers of particular sects who have retained the old ways. But, recognizing a growing market for small-scale farming equipment, binders are making a comeback in North America.

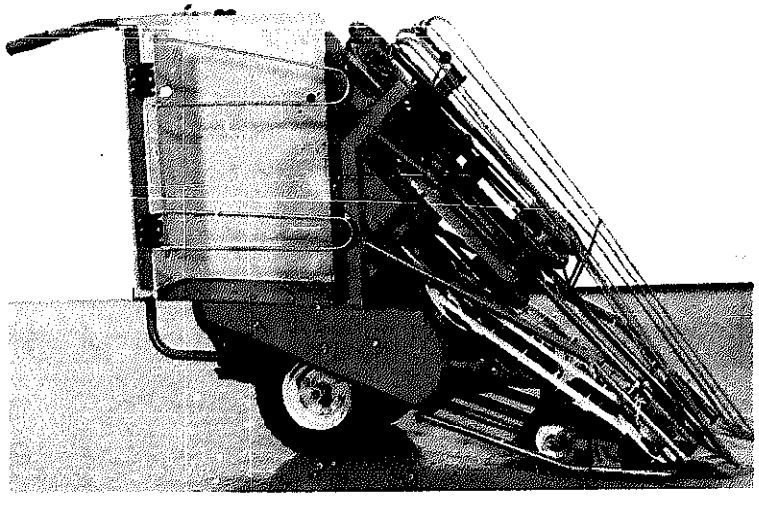


*A late 19th century reaper-binder.*
*The Implement Age*, 1894

## NORTH AMERICAN SOURCES OF BINDERS

### Ottawa Single-Row Harvester

Developed to harvest single rows of standing or lodged cereal plots for research purposes, this harvester is a compact, two-wheeled machine designed specifically for plot harvesting, with proper balance and convenient controls. Lodged crops are picked up by a pair of oblique-head finger bar assemblies mounted at 30 degrees at the front of the machine. As the straw is straightened by the dividers, it is gripped by elevating belts, cut 6 inches above the ground, and elevated to a hopper large enough to hold the yield of two 18-foot rows of cereal grain. The



*Ottawa Single-Row Harvester*
Agriculture Canada

harvester can be turned in a 5-foot pathway without declutching. Two 18-foot rows can be harvested by two men in one minute, including the time for unloading and cleaning.

Craftsman Machine Co.
61 Heaton
Winnipeg 2, Manitoba, Canada

**Winnipeg Plot Harvester**

The Winnipeg research plot harvester is mounted on a standard 7 h.p. Gravely garden tractor. Modifications were made to the cutting bar to limit the cutting width to two rows seeded a maximum of 12 inches apart. Small wheels were added under the front end to raise the cutting bar to the desired height. The reel, driven from the front wheels, is adjustable horizontally and vertically. As the plot is harvested, the material is gathered in a pan and can be collected and tied by the operator. A small opening was left at the rear of the pan to facilitate cleaning between varieties. A bar was placed across the front opening of the tray, a few inches from the bottom to ensure that the reel will force cut material back into the pan and away from the cutter bar. With this machine, it is possible to harvest 1,000 rod rows daily without the back-breaking labor inherent in the old sickle method. Three men are required to operate this machine efficiently.

Machine Service & Repair, Ltd.
47 Landsdown Ave.
Winnipeg 4, Manitoba, Canada

**BCS Binder**

The BCS binder is a mass-produced farm machine from Italy which is mounted on the front of a European-style walking tractor equipped with a riding sulky. The tractor has a 9 h.p. engine, disc clutch, and a three-speed gearbox. The binder has a 54-inch wide cut and ejects the tied bundles to the rear. The crop remains in an upright position throughout the cutting and tying process. There is a provision for adjusting the size of the bundle, but not for tying height. Because the wheel tread is inside of the cutting width and the bundles are deposited on the stubble remaining where it was cut, adjacent plots are not disturbed. Optional equipment available from the factory includes a differential axle rather than the standard solid axle with wheel release, high-clearance axle, and electric starting. A mower attachment is included with the unit.

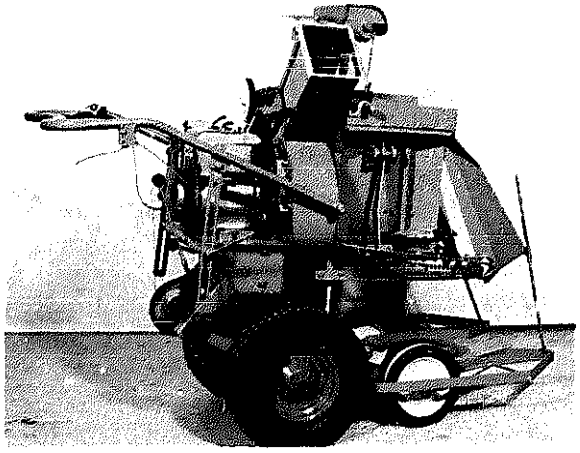
### Vacuum Blower Harvester

The vacuum blower harvester was developed by the Engineering Research Service, Agriculture Canada to quickly harvest two-row research cereal plots by cutting a minimum amount of material and transferring the cut material directly into a bag. Attachments at the front hold the cutter bar and act as a pivot for the gathering mechanism. It is supplied with a two-speed transmission and an air-cooled gasoline engine. All functions are adjustable.



*Vacuum Blower Harvester*
Agriculture Canada

Craftsman Machine Co.
61 Heaton
Winnipeg 2, Manitoba, Canada

**Poynter Stripper Harvester**

The Poynter pneumatic stripper harvester uses a comb to guide standing crops into a cylinder where heads are removed and threshed by the combination of impact from the cylinder and stripping through the comb. The chaff is removed by an air blast created by the cylinder. The straw is not cut. The unit is self-propelled and has a 24-inch swath extendable to 36 inches by additional crop fingers. The height of the comb is adjusted by a hand crank during operation.

The Poynter box stripper is similar to the pneumatic stripper except that all the stripped material is collected in an 8-cubic-foot box. This type of stripper is used in conjunction with a plot thresher to further thresh the collected material. The box stripper is normally hand-propelled, but it is also available as a power-propelled unit.

## COMBINE HARVESTERS

As the name implies, a combine harvester-thresher performs the multiple operations of harvesting and threshing a crop in a single pass over the field, the sequence of operations being cutting, conveying to the threshing mechanism, threshing, winnowing, cleaning, and finally, either bagging or delivering the grain in bulk to a bin, and from there to a trailer or truck alongside the machine. Because each of these separate operations are performed at the same time in a combine harvester, the resulting machine is necessarily complicated and expensive.

A combine can also be used either to pick up and thresh crops which have been previously cut and left in the swath, or as a stationary thresher for handling crops which have been cut and stacked. Separate headers, front end reaping mechanisms, are required for harvesting cereal and maize crops. Special attachments allow some combines to windrow or chop and scatter straw as well. Earlier models of combines were pulled by a tractor; the cutting and threshing mechanism was driven either by an auxiliary engine mounted on the combine or by the tractor engine through its power take-off shaft. Modern combines are self-propelled.

The losses from combine harvesting may be quite serious unless a constant watch is kept for signs of unsatisfactory threshing. Conditions may change from one hour to the next, and it may be necessary to vary the adjustments several times during a day for best results.

# THE FIELD FOR THE SMALL, COMBINED, HARVESTER-THRESHER*

By W. M. Hurst

Editor's note: A 1935 look at the harvesting needs of the small farmer reveals that little has changed in the past 40 years or more.

* Reprinted with permission from *Agricultural Engineering*, June 1935.

The development and widespread use of the combine was retarded for over 75 years because farmers, grain dealers, and farm machinery manufacturers thought it would work successfully only on the Pacific Coast. After the practicability of the combine had been demonstrated in the Great Plains states, it was predicted that its use would be restricted to areas where large-scale farming was practiced in dry areas. The demand for combines for harvesting soybeans in the corn belt, the introduction of the one-man combine, and the windrow harvester again made possible a wider use of this type of equipment.

Few, if any, agricultural machines are more efficient in performing the work for which they are intended than combines. However, the cutter bar is designed for heading ripe, dry grain and the cylinder, for threshing such material. In harvesting soybeans in the South, it is necessary to cut the plants within two or three inches of the ground and to handle a large volume of tangled vines and green weeds. In combining rice in the South, it is also necessary for the machine to handle not only green (unmatured) straw and weeds, but also much more straw than is customary in harvesting wheat.

The combine is also one of the few machines which may be purchased as well as operated at a lower cost than the equipment which it replaces. It is not, however, sufficiently low in first cost to permit its use on thousands of farms where general-purpose tractors are used. A small, inexpensive combine of somewhat different design than those now on the market would, it is believed, be used on many small farms in the east, north central, and some of the middle and south Atlantic states for small grain, in the south Atlantic and east south central states for soybeans, alfalfa, and clover, as well as a stationary thresher for cowpeas and other legumes.

For wider use in states east of the Mississippi River, the following features appear to be desirable and, in some cases, essential for a small combine:

1. Capacity to cut a 5- or 6-foot swath
2. A threshing cylinder designed for a large mass of straw and vines; possible width of the cylinder the same as the width of the cutter bar
3. A reel of such design as to gently pull the crop back on the elevator without shattering
4. An overall width of the machine to be not more than 12 feet, or of such design that not more than 15 or 20 minutes are required to get the machine in condition for transporting from one field to another
5. Weight from 2,500 to 3,000 pounds
6. A maximum cost to farmers of $500
7. Suitability for small grain, soybeans, and other legumes
8. Drive by power take-off from a tractor
9. Possession of a means for quickly adjusting concaves and reel—preferably from the driver's or operator's platform
10. A flexible mounting—pneumatic rubber tires or springs.

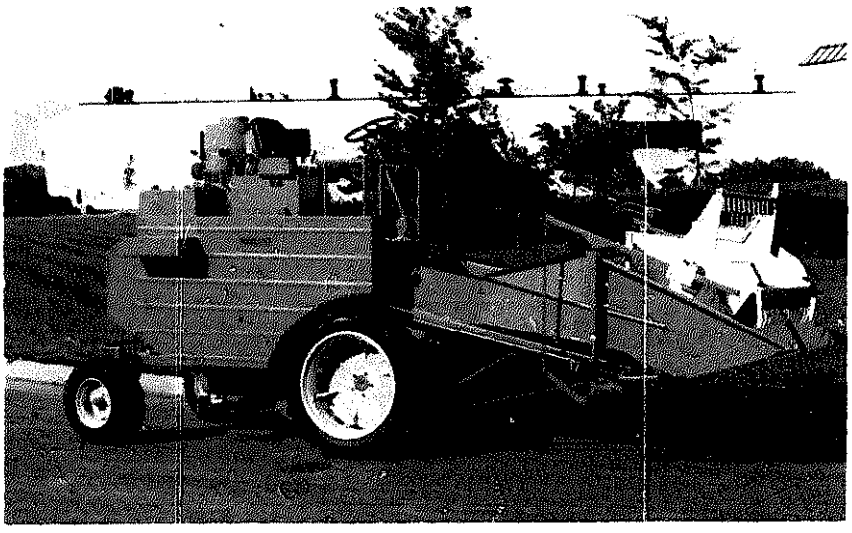
## NORTH AMERICAN SOURCES OF COMBINE HARVESTERS

### K.E.M. Research Plot Combine Model SP 50

Available for about half the price of the smallest popular farm combines in the United States, the K.E.M. Research Plot Combine has a large-capacity cylinder and a wide range of speeds making it possible to harvest a wide variety of crops. This self-propelled unit employs a 17.5 h.p. gasoline engine and a hydrostatic ground drive with infinite speeds forward or reverse from 0 to 6 mph. The threshing mechanism utilizes a 15-inch by 27-inch rasp bar cylinder and an air and shaker sieve after cutting a 54-inch swath. The header is comprised of a sickle bar cutter and guards, a power reel with delivery to the cylinder by a 27-inch wide conveyor belt, and hydraulic lift.

### K.E.M. SP 4000

Much larger than K.E.M.'s SP 50, this research plot combine has a 53 h.p., gasoline,



*K.E.M. Research Plot Combine SP 50*
K.E.M. Corp.

four-cylinder, Volkswagen engine. It has a 12-inch ground clearance, weighs 6,800 pounds (shipping weight), and has overall dimensions of 208 by 75 by 118 inches. The hydrostatic ground drive has two speeds for a traveling speed ranging between 0 and 12 mph. It comes with two adjustable sieves and a 27- by 80-inch straw rack. It can cut a width of 7 feet and has a 28-bushel-capacity grain tank. With grain and corn headers, it has multicrop versatility.

Haven, KS 67543

**ALMACO C-F Plot Combine**

This combine, designed for research test plots of small grains, corn, and soybeans, is self-propelled by a 37 h.p. gasoline engine. Its hydraulic system powers the forward and reverse drives, the variable speed thresher, the lift on the header assembly, and reel and drive on the variable-speed reel. It has an underslung, self-cleaning, adjustable, concave rasp bar. The 51½-inch sickle bar cutter is accompanied by headers for small grains and corn which have bean saver snouts for soybean harvesting. It weighs 5,000 pounds, is 17 feet 6 inches long and 7 feet wide.

## INTERNATIONAL SOURCES OF COMBINE HARVESTERS

### CeCoCo Midget Combine

To thresh grain in a traditional fashion, men and women swing sheaves over their shoulders and beat them down into a tub, or they have buffaloes and oxen tread on them. These methods result in significant grain losses due to shredding, incomplete threshing, and a high incidence of grain damage.

The people at CeCoCo explain that "the need for a simple and efficient rice combine is essential. The shortage of labor has made it difficult to reap sufficiently fast, creating a bottleneck at harvest time. Furthermore, the loss and damage incurred by the traditional methods of harvesting and threshing could not be afforded in view of the rapidly increasing population and its inherent food problem."

To solve this problem, they have developed the CeCoCo Midget Combine. Their 6 to 9 h.p. unit with six forward and two reverse speeds is claimed to reap and thresh approximately 1 acre of rice, wheat, or barley per 8-hour day, utilizing an air current design. This is one modern machine which helps to improve the soil organically, since straw is left in the field to rot into humus.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

### Iseki

Iseki manufactures two combine harvesters. Model HD660R has a 9 to 12 h.p., air-cooled, four-cycle gasoline engine and it is capable of covering 1.5 to 2.5 acres per 8-hour day. The harvesting mechanism employs a reciprocating mower for cutting and a Japanese type of thesher. It discharges the hay at intervals in fixed quantities to facilitate pickup. Their larger model, the Cosechadora HD 2000, has a 25 h.p., water-cooled engine which will harvest from 4 to 6 acres in an 8-hour day.

*The Wintersteiger Kultraplant with a corn header.*
Walter & Wintersteiger

**The Kultraplant Pam 150-S**

A self-propelled combine with a 63-inch cut, the Kultraplant is specially designed for small seed plots. The table, reel, and cylinder are comparable to a conventional combine, but seed is separated by air currents. The unit is powered by a Volkswagen engine and has three speeds forward and one reverse with a device to vary the speed in each gear. Cleanup time is claimed to be 1 minute. A 180-degree turn can be made in a pathway 20 feet wide, and the wheel tread is inside the width of the cut.

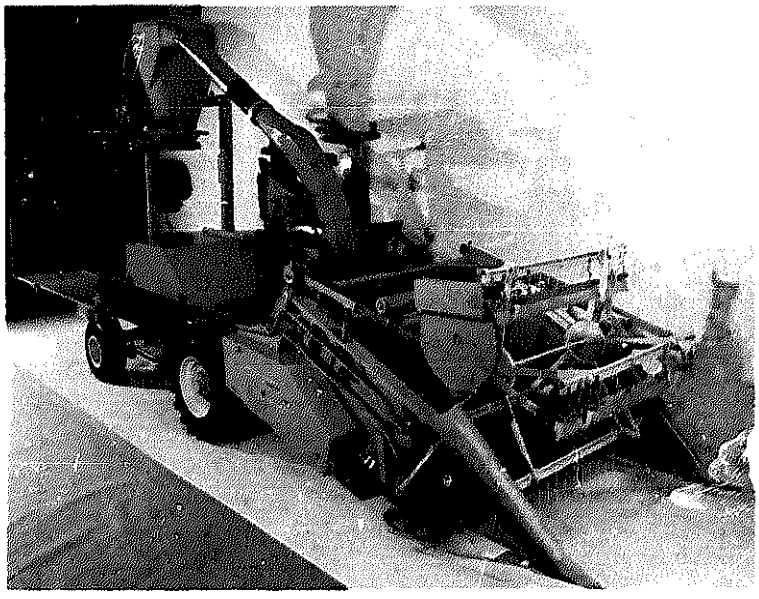
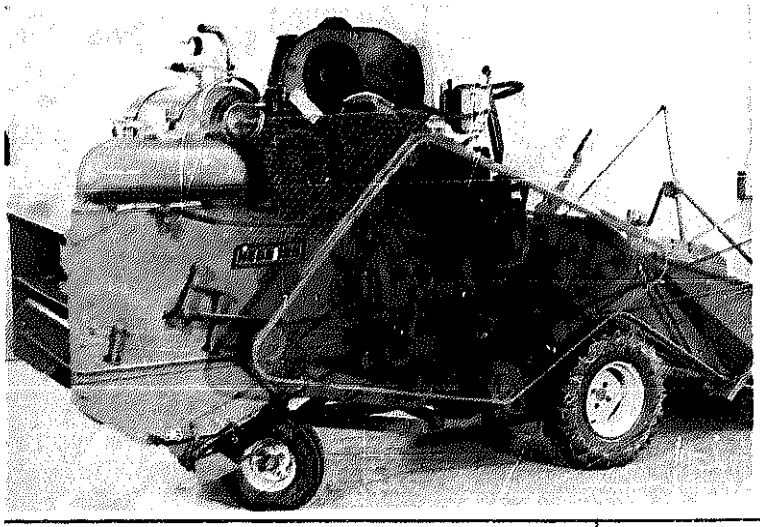
K.L., A–4910 Ried im Innkreis
Dimmelstrasse, Austria



*The Wintersteiger Kultraplant with a bean header.*
**Walter & Wintersteiger**



*Hege Combine*
**Agriculture Canada**

**Hege 125**

According to Agriculture Canada, the German Hege 125 differs from the Pam 150 in that it has straw walkers and a short cleaning sieve. A wide rubber belt is used to convey cut material to the cylinder; it does not have a reel. There are viewing doors to the screens and straw walkers. An overcapacity fan is used to blow the separating area clean at the end of each plot.

The cutting width is 49 inches, the total

length is 12.8 feet and total width, 51 inches. This combine is also powered by a Volkswagen engine with a combined four-speed transmission and variable-speed drive. It is possible to cut a plot 39.7 inches wide and 32.8 feet long in 1 minute, including the time to clean the machine. Models are being used at Oregon State and North Dakota State Universities in the United States.

Hans-Ulrich Hege
Saatzuchtmaschinen
7112 Domane Hohebuch
Waldenburg/Wiirtt, Germany

United States Parts outlet:

H & N Equipment, Inc.
Colwich, KS 67030

**Garvie Plot Combine**

The Garvie Plot Combine, developed by the National Institute of Agricultural Engineering in Great Britain, employs a canvas to convey the cut material to a rasp bar cylinder with a grate-type concave. Threshed grain falls through the concave to a conveyer belt which carries it to a grain pan. Straw is thrown into a collection bin and then removed by hand. The straw must be shaken when removing it to shake out any grain still in the straw. A special cleaner has been developed to further clean the sample.

The cylinder is direct-driven from a 7 h.p. engine. Wheel drive is by fixed displacement, double-volume, hydrostatic transmission to a single rear wheel, giving speeds of 1 or 3 mph in forward and reverse.

The total width of the machine is 4 feet 10 inches and the overall length, not including the reel, is 12 feet 3 inches. The driver sits at the side of the machine. Capacity is about 20 four-row, 10-foot plots per hour.

R.G. Garvie & Sons
2, Canal Rd.
Aberdeen, Scotland

**Stationary Combines**

Two makes of small European combines with 7-foot tables are available fitted with a large air compressor and nozzles located at strategic positions to make the combine self-cleaning. Also, extra rubber parts are fitted to the elevator flights.

Bolinder Mumktell
Eskilstuna, Sweden

W. Rosenlew & Co.
A.B. Engineering Works
Pori, Finland

**Suzue Combine**

Another combine to accommodate the average 3-acre Japanese farm is mounted on a walking tractor chassis and is available with wheels or tracks. The combine is unconventional in that air currents are used for the reel and for separation after threshing. Heads are cut off by contra-rotating rotary cutters at the front. Two threshing drums thresh the cut crop and deliver the material to the airstream in the cleaning section; the chaff and short straw is thrown out by a blower. The cleaned grain is then fed through an auger to a blower which blows it into a sack. The remaining stubble is cut into 5- to 6-inch pieces by circular cutters at the rear of the machine. A capacity of 1 acre per day is claimed. The combine is powered by a 9 h.p. kerosene engine and has a six-speed gearbox with a unique locking axle that gives good traction and maneuverability.

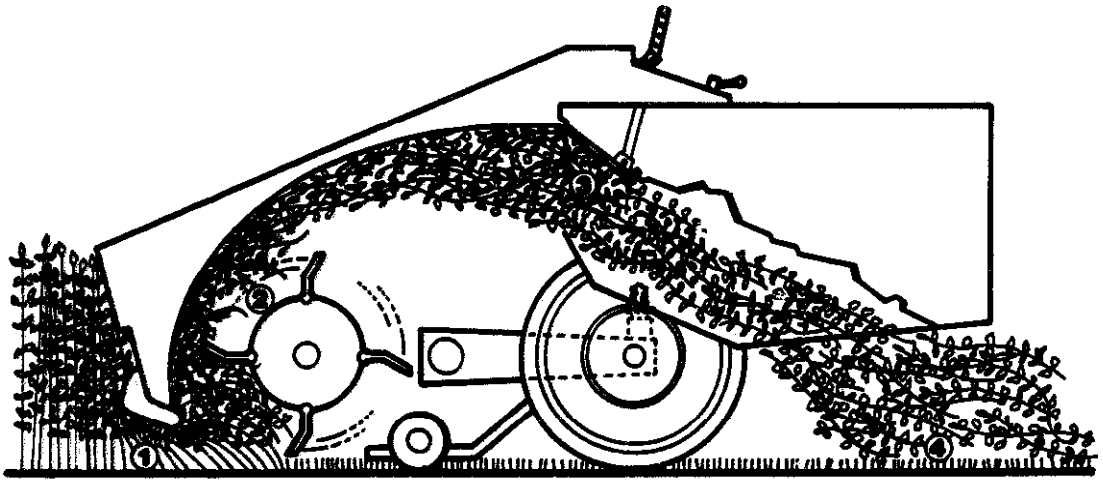
# FORAGE CROPS

## FORAGE HARVESTERS

The forage harvester has been developed fairly recently for collecting grasses or other forage crops from the field in their green stage

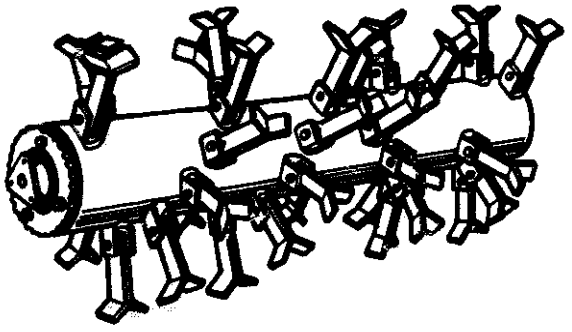
to be used later for making either silage or artificially dried feed. Earlier models of a field forage harvester consisted of a stationary chopper-blower mounted behind a reciprocating mower or behind a pickup reel for collecting previously mown grass. Power to the chopper-blower was provided either by an independently mounted engine or through the power take-off shaft of the driving tractor. However, these models have now been largely superceded by the modern flail-type forage harvester where the mower unit or the pickup reel and the chopper-blower are no longer used.

The principle of operation involves flails, or blades, which are hinged on a shaft or cylinder which rotates at a high speed as the machine is being driven forward. The flails cut the stationary vegetation by impact, in a manner similar to a hand-operated grass slasher or a conventional rotary lawn mower. Rotating at high speed, they also act as a fan and provide a draft of air and the necessary momentum for blowing the cut material up through an elevated exit spout. The shape of the spout directs the cut material into a trailer at the rear with the help of an adjustable end flap. The height of the cut is regulated by adjusting the wheels on which the machine is mounted. Some flail mowers simply cut high grasses and leave them in the field to be raked or baled.



1. *The full-width adjustable crop deflector bends standing plants over so knives can cut stems close to the ground. Once cut, the stems are conditioned by repeated light contact with knife edges, ensuring uniform, effective conditioning and soft, palatable hay.*
2. *At a maximum speed, plants move up and over the rotor without further contact with the knives so the upper leafy portions of the plants are undamaged.*
3. *A deflector at the rear slows down the speed of the plants and also fluffs and directs the hay down to the rear.*
4. *Cut and conditioned material falls gently on top of the stubble into a loose, fluffy swath or into a neat windrow of your selected width and density, depending on shield adjustment.*

Avco Corp.



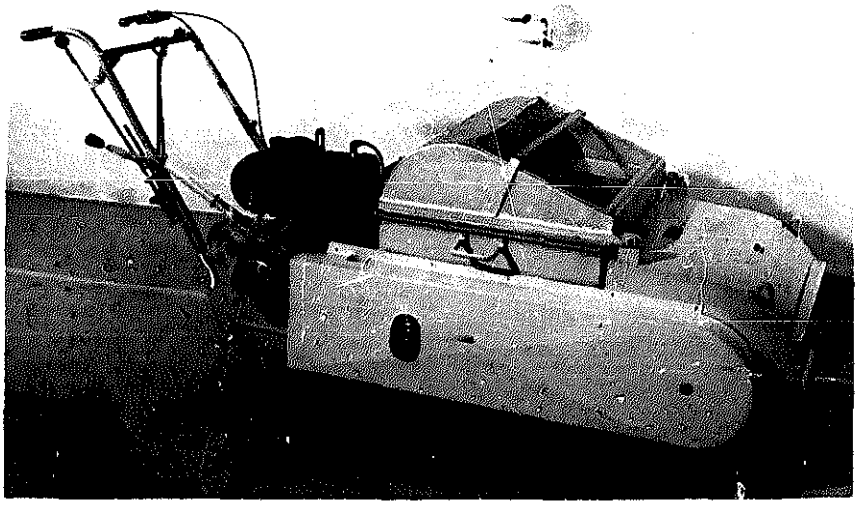
*The Flail mower consists of a solid shaft with loosely hung, pivot-mounted blades rotating at high speeds. This creates a tremendous chopping action, pulling material in from the front, shredding it, and distributing it evenly over the field. The blades simply fold back when they strike rocks or debris, returning to a cutting position when the obstruction is passed over.*

The modern forage harvester, built as a compact power take-off-driven unit, can perform the multiple operations of cutting, chopping, and loading green grass, dry hay, and other silage crops into a trailer in one pass over the field. It can also be used as an implement for the care of meadowland by cutting local concentrations of coarse grass and weeds, for distributing manure, and for removing molehills.

## NORTH AMERICAN SOURCES OF FORAGE MOWERS AND HARVESTERS

### Swift Current Harvester

The Swift Current forage plot harvester cuts forage material with a flail-type cutter and delivers it to a collection bin. The harvester is a two-wheel walking-type powered by a 7 h.p. engine. The width of cut is 24 inches, and grasses, legumes, or corn up to 3 feet high can be harvested. The sample box holds 6 cubic feet and is hinged so that it may be emptied by one person. An improved model is now available.



*Swift Current Forage Harvester*
Agriculture Canada

REM Mfg.
Swift Current
Saskatchewan, Canada

### KEM Plot Forage Harvester

The Kincaid Plot Forage Harvester was developed for cutting crops when there is a need for weight data in research experiments. It is also used on small plots when crops must be harvested in a stationary thresher. Maneuverability is good, and steering is accomplished by use of two hydrostatic pumps. This enables it to be used in very small areas. The pickup reel is effective in lodged crops, and the pickup angle on the bats is adjustable by a rotating cam plate on the end of the reel. The collection box is easily dumped. Pickup reel, hydraulic header lift, header gauge wheels, and electric start are all standard equipment. It measures 56 inches by 49 inches by 156 inches, weighs 1,520 pounds, utilizes a conventional sickle cutting bar in 3-inch sections and uses an 8 h.p. engine for cutting a 54-inch swath.

Kincaid Equipment Mfg. Corp.
P.O. Box 471
Haven, KS 67543

### Mott Model J-60

Model J-60 is a 60-inch, rear-mounted mower designed specifically for the Kubota L15 or other compact tractors (see chapter four). With a modified three-point hitch, it runs off a tractor power take-off with a 25 h.p. maximum. It can be used to mow lawns, and shred weeds for mulch, as well as cut up forage crops. A unit like this is particularly helpful to the organic farmer who wants to incorporate organic material into the soil with rototilling blades but who needs to have the crop residue finely chopped first to avoid clogging the tines. The mower will leave

stubble ¾ to 3 inches high and cut a 60-inch swath. A triple-mower gang arrangement is possible for a swath of 10 feet 4 inches. This arrangement utilizes two self-powered trailer-type mowers with 8 h.p. engines.

**Mott Model 18-60**

Designed specifically for the front power take-off of the Bolens 1886 tractor, this front-end, 60-inch model employs hammer knife safety flails as the cutting tools on this unit. The knifelike flails have an edgewise cutting action which provides a cleaner cut and uses less power than conventional flail mowers. It is called a safety flail mowing system because, being lightweight and free swinging, the flails fold back when hitting an obstruction to absorb the force of impact and minimize the danger of objects being thrown by the blade.

**Mott Model T38**

A unit to be towed, the T38 cuts a 38-inch swath and employs an 8 h.p. engine. It attaches quickly to any tractor drawbar with a cotter pin.

Other units are available specifically designed for most major farm and garden tractors, including the Allis-Chalmers 616 and 620 and the John Deere 300 and 400 tractors.

The above harvesters are manufactured by:
Mott Corp.
500 Shawmut Ave.
Le Grange, IL 60325

**Gehl FC72C Chopper**

Gehl offers a wide range of large forage harvesters, and their smallest unit, the FC72C flail chopper, requires a 40 h.p. tractor or larger.

Gehl Co.
West Bend, WI 53095

**Western Bear Cat Chopmaster**

The Chopmaster requires the power of a two- or three-plow tractor for cutting a 6-foot swath of corn or cotton stalks and for mowing jobs. It operates from a 540 rpm power take-off shaft and fits any drawbar. Models are available with or without a blower, a discharge elbow, a cutter head, or an auger.

Westernland Roller Co.
Hastings, NE 68901

**New Idea Cut/Ditioner**

New Idea offers a 7-foot windrowing mower requiring a minimum of 40 h.p. as their smallest unit.

AVCO Corp., New Idea Farm Equipment Div.
First & Sycamore
Coldwater, OH 45828

**Haban Flail Mo**

The Flail Mo is designed for front mounting on compact tractors of 7 h.p. or more. Two sizes are available, a 36-inch size with 80 knives and a

*Haban's 12 h.p. self-propelled flail mower, complete with riding sulky.*
Haban Mfg. Co.

48-inch size with 120 knives. It will cut tall grasses and brush to a minimum height of 1 inch without throwing stones. Depending upon conditions, it can be operated at speeds from 1 to 4 mph.

*Jumil JF-1* Jumil

*Hay harvesting in the late 1800s. The Implement Age,* 1894

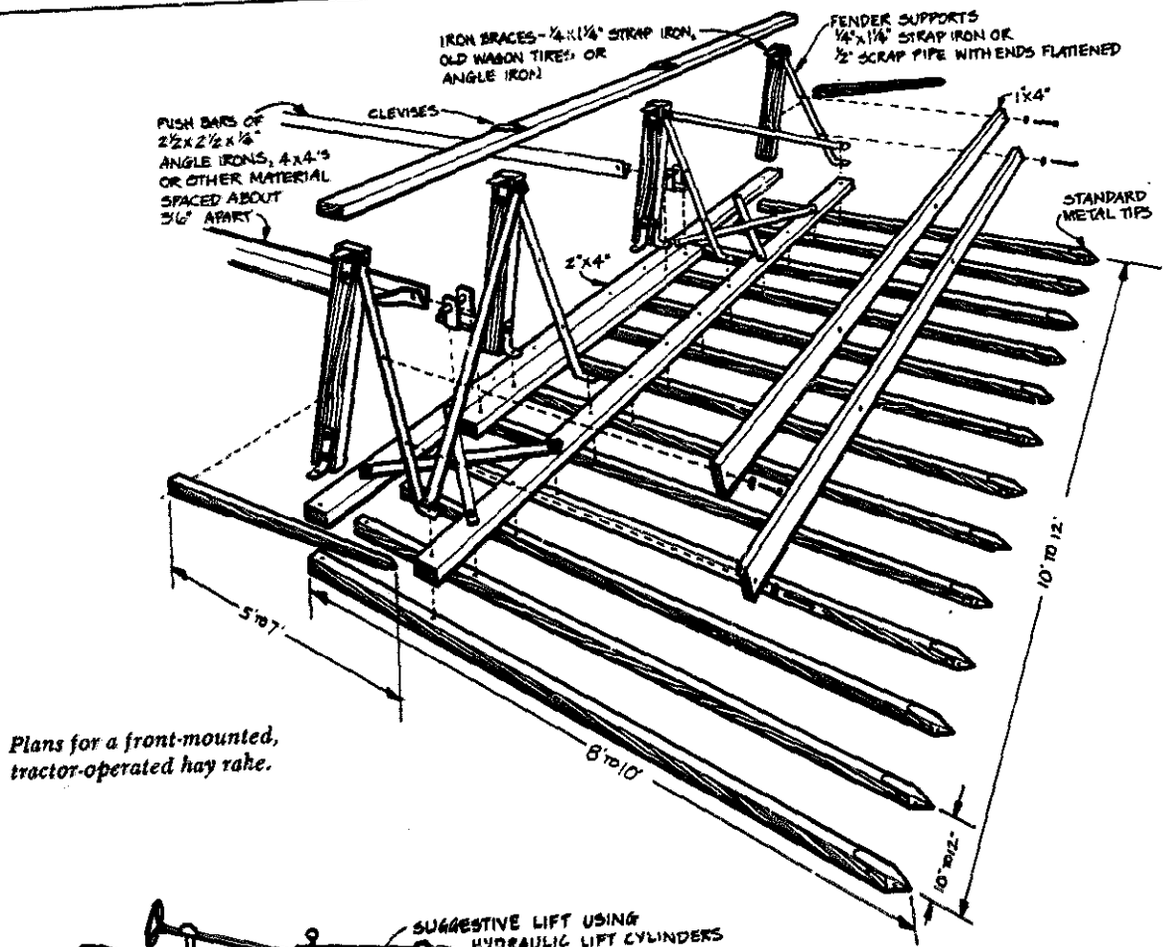
## RAKING HAY

Once forage crops are cut and allowed to dry, they have to be gathered. The Rake Factory in Suffolk, England is still making hay rakes by hand, along with their handmade wooden scythe snaths. Wide, lightweight wooden rakes with long pegs for teeth are used for raking by hand. An early method of hay collection was a ground-driven, animal-drawn contraption with raking arms which carried hay up a primitive (but clever) type of conveyor and dropped it onto a wagon.

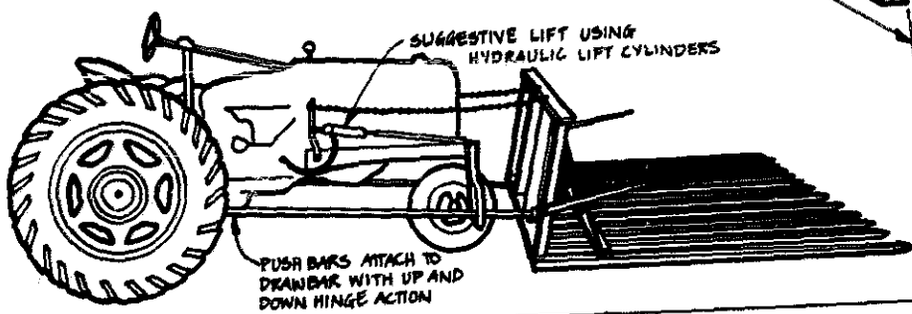
Today, baling is popular but most balers require the power input of a large tractor. However, one Italian manufacturer makes a baler attachment for a two-wheel tractor. They are Pasquali Macchine Agricole, Via Nuova 30, 50041 Calengano (Frenge) Italy. In North

America, you can write to Pasquali USA, P.O. Box 6235, Verona, WI 53716.

The Texas Agricultural Extension Service of the Texas A & M University System has developed detailed building plans for a raking attachment for the front end of a tractor. Made of wood, the rake becomes slick and slippery with use and glides easily across hay stubble. A hydraulic lift facilitates unloading hay onto a cart.



*Plans for a front-mounted, tractor-operated hay rake.*



# HARVESTING CORN

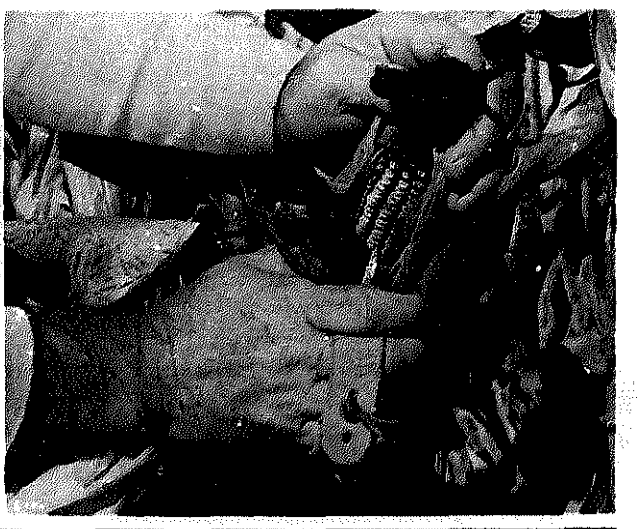
Corn is grown as a row crop, and because its stalks are rather thick and tough when mature, specialized equipment is necessary for harvesting the crop by mechanical means. For small acreages under the peasant farming system, harvesting is still carried out by hand.

## HAND HARVESTING

### *Corn Pegs*

The easiest way to harvest corn by hand is to allow it to hang on the stalk until the plant is dead and brown. Then, move down one row after another, husking the ears and tossing them onto a wagon, cart, or pickup truck. In the past, farmers used many kinds of husking pegs strapped to their fingers or the palm of one hand to rip the husk loose from the ear with one swift downward motion. The original husking peg was a simple piece of wood or bone about ¼-inch in thickness, sharpened to a point at one end, and held in the middle joint of the fingers of the right hand. A string or leather thong held it to the fingers. The husker would slash open the husk with the point of the peg, grab a section of husk between thumb and peg, and tear it off the ear. You can do the same with your fingers, but it takes longer and is harder on the fingers.

*Husking Peg.*



*Stripping the husk away.*

Over the years, improvements came to the husking peg, the ultimate being a sort of fingerless leather glove with a steel plate riveted to it. The plate had a steel hook on it which ripped open the husk when the husker ran the palm of his hand down the ear of corn. A good husker could perform this operation with amazing speed and skill and could husk a bushel of corn from the stalks in less than a minute.

### *Corn Knives*

A simple tool called a corn knife, shaped like a sword or machete, is used to cut stalks about 4 inches from the ground. Some have long handles and serrated edges.

*Corn Knife.*

*Chopping cornstalks with a corn knife.*

## MECHANICAL CORN HARVESTERS

### *Corn Binder*

Rarely used anymore, a corn binder could still be handy on a homestead if one could be found in running order. Just as with grain, the binder cuts the stalks of corn with a small reciprocating sickle bar, then bunches and binds the stalks into bundles with an automatic tier. Binders were made for use with both horses and tractors, and some were powered by the tractor's power take-off.

### *Corn Picker*

The commonly accepted colloquial name for the machine that replaced binders and the old method of harvesting corn is a corn picker. The picker strips the ear off the stalk as the machine moves down the row, husks the ear, and tosses it into a trailing wagon, leaving the stalk standing. One-row pickers are commonly available in the Corn Belt region of the United States and would suit many small homestead operations.

*An old one-row, pull-type corn picker with a conveyor and PTO connection.*

Mechanical single- or multiple-row pickers are equipped with snapping rolls to remove the cobs from the standing stalks. The power required to operate the machine is provided by the tractor's power take-off shaft, although self-propelled units or those mounted integrally on the tractor are also available. The machine is provided with a gatherer, or header, which guides the standing stalks in a row along a throat to the revolving, snapping rolls, where the cobs are pinched and snapped from the stalk. The cobs then drop onto an elevator system for conveyance to a trailer which is drawn beside or behind the machine. Most harvesters do not cut the stalks from the ground.

A simple, snapper type of corn harvester does not remove the husks from the cob, while a picker-husker is equipped with a husker attachment for removing the husks after snapping. A more recently developed machine is capable of shelling corn in the field after snapping and husking; another type can also shred the standing stalk after the cobs have been removed. Corn harvesters are generally classified according to the number of rows harvested and the way in which the machines are attached to the tractor.

## SOURCES OF CORN HARVESTERS

### New Idea One-Row Snapper and Superpicker

New Idea offers two corn pickers which can be operated with a minimum of a 35 or 40 h.p. tractor, with power to spare for pulling a loaded wagon behind. The picker removes husks but leaves kernels on the cob while the snapper leaves husks on as well. The picker weighs 2,400 pounds, the Snapper less than 2,000 pounds.

Coldwater, OH 45828

*New Idea Corn Harvester.*
Avco Corp.

### KMN Single-Row Corn Chopper Model MBJ

The model MBJ harvests corn as a forage crop at a rate of approximately 30 tons per hour when operating at a speed of 4.35 mph. Power is supplied by the power take-off shaft of a 30 h.p. or larger tractor. It is 8 feet long and weighs 860 pounds. A larger model, MB-37 is also available.

KMN Modern Farm Equipment, Inc.
12 Sullivan St.
Westwood, NJ 07675

### Corn Combines

A corn combine is the same machine as a grain combine, but it has a different header and different screens. It picks, husks, and shells the

corn in one operation. Just as many large American-manufactured combines are interchangeable for wheat and corn, so too are many of the smaller combines discussed earlier in this chapter.

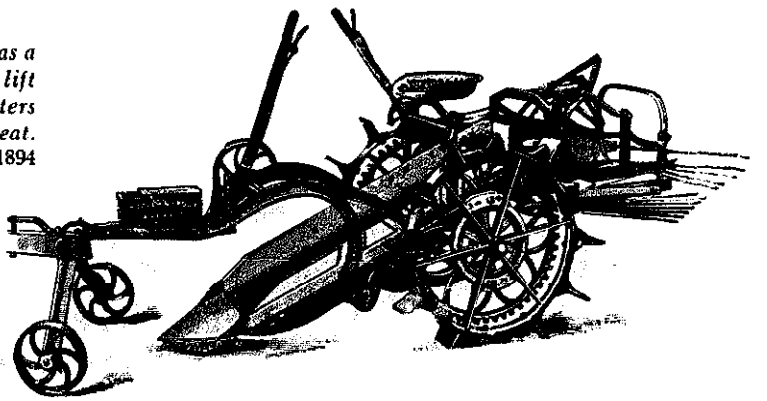
## ROOT CROPS

Root crops like potatoes, cassava, and sweet potatoes, which form their fruits under the soil, are usually grown in small acreages; so the high cost of specialized harvesting equipment is not justified by the amount of labor saved or the increase in output. However, a number of universal root-harvesting machines have been developed which can be used for a number of similar crops with only minor modifications to some of the parts. This way, the capital cost of the harvesting machine can be distributed over a number of crops, a particular advantage for the diversified organic farm.

The simplest and oldest implement for harvesting potatoes, still in use for small-scale work, is the potato-raising plow. A modified moldboard digger raises the potatoes from the ground onto prongs which sift the tubers from the soil.

The elevator-digger for potatoes carries a metal elevator chain composed of parallel links, which run on agitator sprockets behind the lifting share. The soil is shaken through the links of the chain web, and the potatoes are delivered partially clean at the rear of the machine in a narrow row ready to be gathered by hand. Taking the process one step further, some harvesters have another set of chains working either behind or at right angles to the first one to deliver the potatoes to an accompanying cart.

The most difficult operation in potato harvesting is the separation of stones and clods which are about the same size as the potatoes. It is necessary to follow harvesting with a step for separating the potatoes from the debris by hand. At this time, the potatoes are usually graded for size and quality.



*This horse-drawn digger has a ground-driven conveyor to lift potatoes onto the shaking sifters behind the operator's seat. The Implement Age,* 1894

## SOURCES OF HARVESTING PLOWS

**I.D.C.-Bornu Groundnut Lifter and I.T. Groundnut Lifter Plans**

The I.D.C.-Bornu Groundnut Lifter was originally developed in a joint USAID/Ministry of Agriculture project at Maiduguri for the savanna area of northern Nigeria. This tool was later introduced by the I.D.C.-Zaria for manufacture by local blacksmiths, and it was more recently adapted for local manufacture at the I.T.D.G. Project at Magoye, Zambia. The lifters have no sifting tines but were designed specifically for groundnut raising (peanuts and legumes).

## SOURCES OF HARVESTING PLOWS

### I.D.C.-Bornu Groundnut Lifter and I.T. Groundnut Lifter Plans

The I.D.C.-Bornu Groundnut Lifter was originally developed in a joint USAID/Ministry of Agriculture project at Maiduguri for the savanna area of northern Nigeria. This tool was later introduced by the I.D.C.-Zaria for manufacture by local blacksmiths, and it was more recently adapted for local manufacture at the I.T.D.G. Project at Magoye, Zambia. The lifters have no sifting tines but were designed specifically for groundnut raising (peanuts and legumes).

# MECHANICAL POTATO PICKERS*

**by A. A. Stone and Eric Patterson**

Editor's note: This article describes some of the old-time tools of potato harvesting. Looking back is a way of looking ahead for small farmers who recognize the value of old tools and can put them to work in a modernized way.

Before many years, the job of picking potatoes will be entirely a machine operation. Hand labor has been eliminated in nearly all of the other operations necessary to potato growing, and machines are even now on the market that eliminate the laborious job of hand picking.

Two types of mechanical potato pickers were used at the New York State Institute of Applied Agriculture at Farmingdale in 1929. These were picking machines only and had no sorting or grading attachment. Each of these machines employs a different principle.

In one, the potatoes are carried upward on the picker-elevator and emptied into bags at the rear of the elevator. While passing up the elevator, men on both side platforms must discard the vines, trash, and stones to prevent them from being bagged with the potatoes. The successful operation of this machine requires thorough separation at the digger, so that the load falling on the picker-elevator is reasonably clean. For best results, it should be used with a power-driven digger having a seven-foot main elevator, and either the usual vine turner and shaker or an extension elevator in the rear of the main elevator.

The other type was used for digging the entire crop on the Institute farm. The trash and vines are carried directly over the rear of the picker-elevator and dropped to the ground. The potatoes are picked off the long elevator by hand and placed in small conveyors at either side of the rear platform. Each side conveyor delivers through a two-way chute, permitting four bags to be carried.

The digger-elevator delivers its load directly to the main elevator of the picker. No vine turner or extension elevator is used on the digger. It was found that having a man on the digger to throw off the heaviest part of the vines and trash greatly lessened the work of the men on the picker.

No attempt was made to keep accurate figures showing the labor-saving or timesaving value of the machine, as the chief interest was in testing it from a mechanical standpoint. Various observers agreed, however, that it reduced the time usually required by 30 to 50 percent. The use of the picker made continuous digging possible, whereas with handpicking methods, the digging proceeds so much faster than the picking that the digger is kept idle much of the time waiting for the pickers to catch up. Digging proceeded at the rate of about two hours per acre.

There was an indication that some potatoes were bruised in passing over the picker. It was difficult to determine just where this bruising occurred, but it seemed to be on the main elevator of

* Reprinted with permission from *Agricultural Engineering*, September 1930.

*One of the first mechanical potato harvesters built, though obsolete for large farms, still satisfies the needs of today's small farmer.*

*The best way to find an old forgotten tool is to scour the countryside and rummage through the weeds.*

the picker, as potatoes passing up this elevator would occasionally be jostled, due to uneven ground, and would roll down the elevator, striking the bottom with sufficient force to cause the bruising. It was also noted that quite a number of small potatoes were left on the ground. These were believed to have sifted through the links of the digger-elevator. This was not considered a serious fault, as many growers prefer to leave such small potatoes in the field.

A tractor with a slow forward speed is necessary to use this picker. First or low speed was found to give the best results. It was necessary to idle down the tractor motor considerably in order to reduce the forward speed sufficiently. Where a traction type of digger is used, this reduction in forward speed would, in ordinary years, cause poor separation at the digger, but this year it made little difference. Probably an engine-driven or a power take-off-driven digger would be better than a traction digger for use with a potato picker.

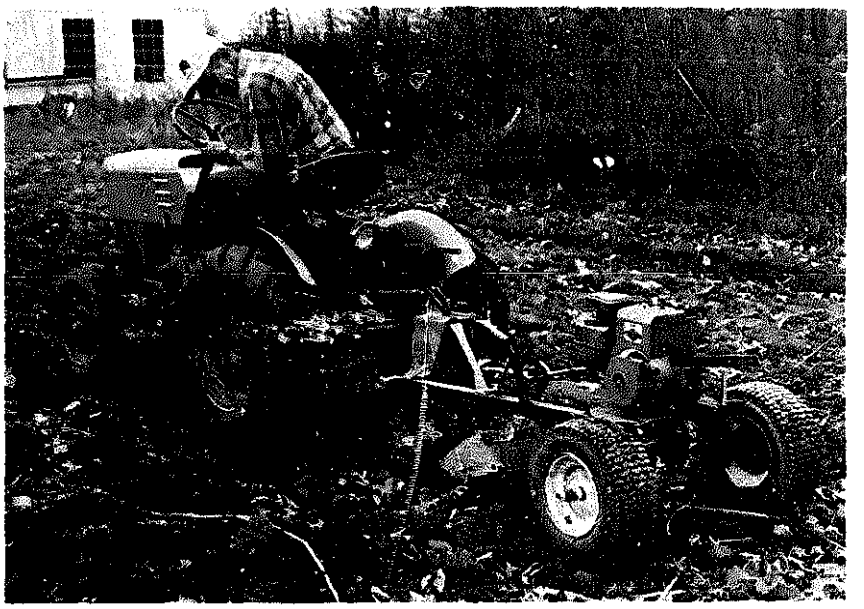
## THE TINKERING FARMER

Moving ahead by studying the past, Curtis Johns of Upper Sandusky, Ohio has built himself a small potato digger and he hopes to go into production soon. He fashioned it after a traditional design from spare and older parts to custom fit a category 0 or 1 three-point hitch on a tractor with 14 or more horsepower.

Johns' family and his daughter's family plant four or five acres of potatoes each year for their own personal use and a few more for sale. Such a large project called for something more than a potato hook with which to harvest, so he designed his own harvester. Johns is a tinkerer of the first degree, and the digger was by no means his first project. He has turned an old horse-drawn planter into a two-row corn planter and adapted a rotary hoe to the three-point hitch of his garden tractor.

The front blade of the digger is 15 inches wide to get the whole mound of potatoes and skims along under the ground. Potatoes slide up a drag chain onto shaking tines which sift the soil away. Then the potatoes roll back behind the digger onto the ground. The escalating chain and vibrating tines are powered by an independent 5 horsepower gasoline engine mounted on the rear end of the digger.

*Curtis Johns' homemade potato digger.*

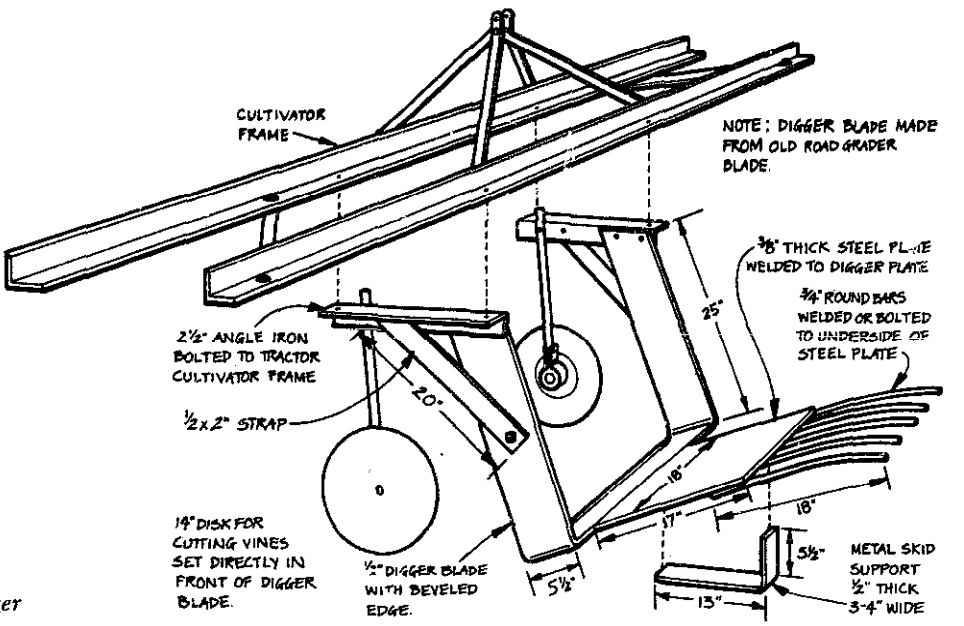


*Johns' digger at work.*

One prerequisite of the digger is that it be used with a slow-gear tractor, one with a creeper gear if possible. Johns uses an Economy tractor; he is a dealer. In its lowest gear, the digger will harvest 300 feet of potatoes in 15 minutes. He is thinking of attaching a catch pan to collect the potatoes but, says Johns, "I prefer to let them fall on the ground and dry a little. They'll keep a lot better in storage."

**Texas Potato Digger**

Angle iron, discarded coulters or discs, an old road grader blade, some round metal bars, a few scrap steel plates, and a few bolts are all the necessary parts for building this potato digger. It attaches to a three-point hydraulic lift. The design originated at the Texas Agricultural Extension Service of the Texas A & M University System.



*Texas Potato Digger*

## NORTH AMERICAN SOURCES OF POTATO HARVESTERS

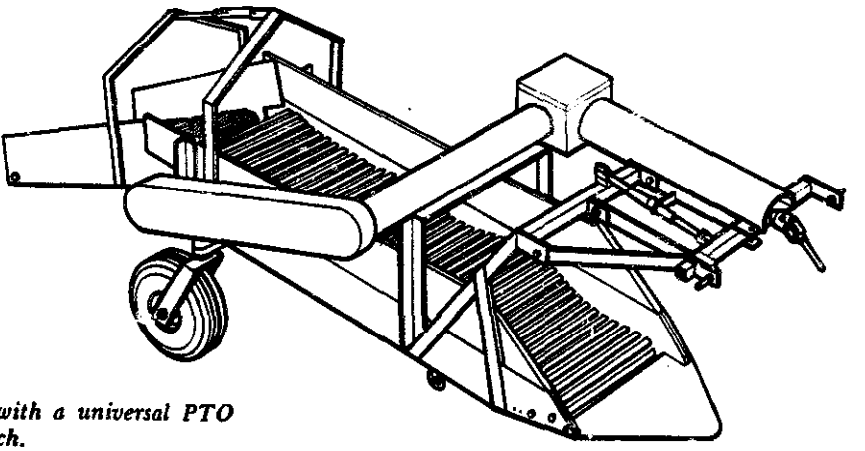
### P & S Digger

One-row, two-row, and wide-row, tractor-mounted, sweet potato diggers are available from this company. Mounted from a three-point hydraulic lift system, the depth is easily adjusted from the operator's seat. No additional supporting or gauge wheels are necessary. The one-row harvester can be pulled by a 25 h.p. tractor. A 26-inch wide digging shovel and shaker chain are used to insure lifting and cleaning of all potatoes in the row. Harvesters for grading by hand labor are also available.

H.S. Shoemaker & Son
Rayville, LA 71269

### Dahlman Small Root Crop Digger

Suggested for use with a 25 to 40 h.p. tractor, this small root crop digger is used for harvesting potatoes, onions, beets, rutabagas, turnips, parsnips, sweet potatoes, carrots, and other bulb roots.



*The Dahlman Potato Digger with a universal PTO connection and three-point hitch.*

Dahlman, Inc.
540 Broadway S, P.O. Box 504
Braham, MN 55006

## INTERNATIONAL SOURCES OF POTATO HARVESTERS

### Turnill Diggers

Both single- and double-row harvesters are available. The single-row harvester is fitted with a V-drawbar for operation with a lift bar between the tractor lower limbs and PTO drive, combined pneumatic depth wheels, disc coulters (scalloped) with screw adjustment for depth, and 16- by 4-inch heavy-duty wheels.

Root Harvesters Ltd.
Fengate
Peterborough PE1 5BD, U.K.

### Hellas Potato Extractor

The Hellas harvester extracts potatoes from the ground without any injury or blockage and sifts soil away from the tubers as they are carried up an elevator. It works in sandy, rocky, hard, or soft soil. It measures 1.4 by 3 meters, weighs 400 kilograms, and will harvest a 1,000-meter plot in 20 minutes. It requires a 30 h.p. tractor to pull it.

Altermon S.A.
15 Messogion Str.
Athens 609, Greece

### Elli Deidone M Sp D

This model is a towed potato harvester with double-floating sieve. It handles one row at a time, unloads from the side, and is mounted by a three-point hitch. Power take-off from a tractor is by means of a carden shaft. The digging depth is adjustable. The vibrating parts are mounted on sealed ball bearings.

Fratelli Deidone Macchine Agricole
C.C.I.A.N. 59212, Casella Postale 7
Villafranca Di Verona, Italy

**Agromet 2610**

This unit digs potatoes from two rows simultaneously, cleans them on the lath conveyors, and lays them down in a narrow strip running along its side. High-efficiency performance on level ground as well as on slopes recommends this machine for farmers who grow potatoes on medium and medium-heavy soils.. It is equipped with a hydraulic system which steers its wheels, while a suspension frame prevents skidding on slopes and insures precise steering control. The construction element is a transversal conveyor with rubber-coated laths, belt, and side screen. Its working width is 125 centimeters; potato ridge spacing is 63 centimeters, and the working depth is up to 25 centimeters. The digger has an output of 5 hectares per hour and a power requirement of 14 h.p. The KEP-2 model is for light or medium soils, digs two rows at one time, and requires 25 h.p. or more to operate.

Agromet Motorimport
Foreign Trade Enterprise
Warszawa, Przemystowa, Poland

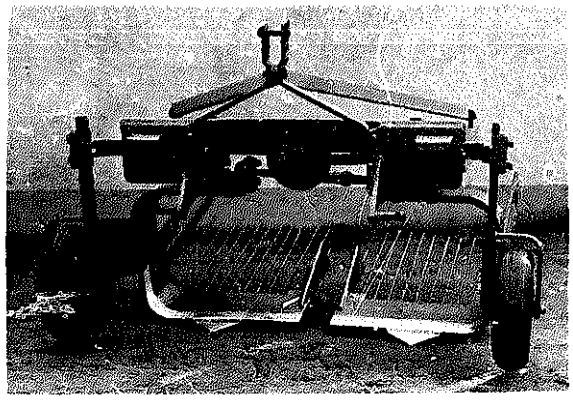
**CeCoCo Potato Digger**

This Potato Digger scoops up the buried potatoes with a digging blade. The mass of soil and potatoes is delivered to a traveling link elevator which is agitated up and down to sift soil through the links. A two-row type, powered by the PTO pulley of a 30 h.p. tractor, it has a capacity of 1.25 to 1.5 acres per hour and a working width of 1,240 millimeters.

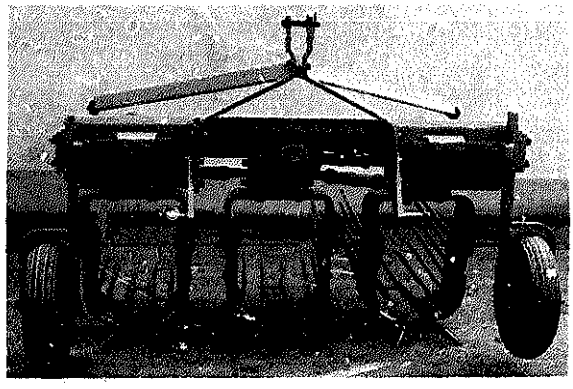
CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Hert Digger-Aligner Model PR-71**

Designed for potatoes and sugar beets, the digger-aligner fits all tractors with a three-point linkage and a minimum of 15 h.p. It consists of a sturdy frame carrying the sieves which are actuated from the power take-off through connecting rods and link mechanisms. The unit handles easily on slopes of up to 18 percent. It digs and aligns two rows of potatoes at distances from 60 to 80 centimeters. A different set of sieves is necessary for sugar beets. Three rows of beets set at different distances will be dug and dropped together in one row.



*Hert Digger-Aligner for Potatoes.*
Willem Hertecant



*Hert Digger-Aligner for Sugar Beets.*

## HARVESTING NUTS

Anyone who owns several nut trees or has planted a small crop of groundnuts has no doubt been confronted with problems at harvest time. The equipment necessary for small enterprises simply is not readily available. Harvesting a nut crop may require hours of back-breaking labor to collect the nuts by hand or a substantial financial investment to purchase the large machinery designed for commercial ventures. We found only two devices which gather fallen nuts from under trees and spare the operator repeated bending over.

### Stand-Up Pickup Pecan Gatherer

Designed to gather pecans and other nuts, this device has been in use since 1957. It is constructed of a spring-steel wire cage which can harvest nuts of many different sizes and permit the operator to remain in a standing position. Gathering occurs as the nuts are pressed between the wires of the cage, and when the wires return to their original position, the nuts are now contained within the cage. The nuts are released by catching the two punch-outs on the rim of a bucket and pushing forward. Should the wires wear out, replacements are available.

The Ray Griffith Co., Inc.
705 Sumrall Rd.
Columbia, MS 39429

### Pecan Picker-Up-Er

Originally designed for pecan harvesting, this simple implement can be used to pick up most kinds of fallen nuts from the ground. The device is composed of a wire spring formed into a semicircle, with a long handle. Nuts are collected by pressing the spring onto the nut—the wires separate, then return to their normal position with the nuts inside. To remove the nuts, the tool is simply held upside down over a container.

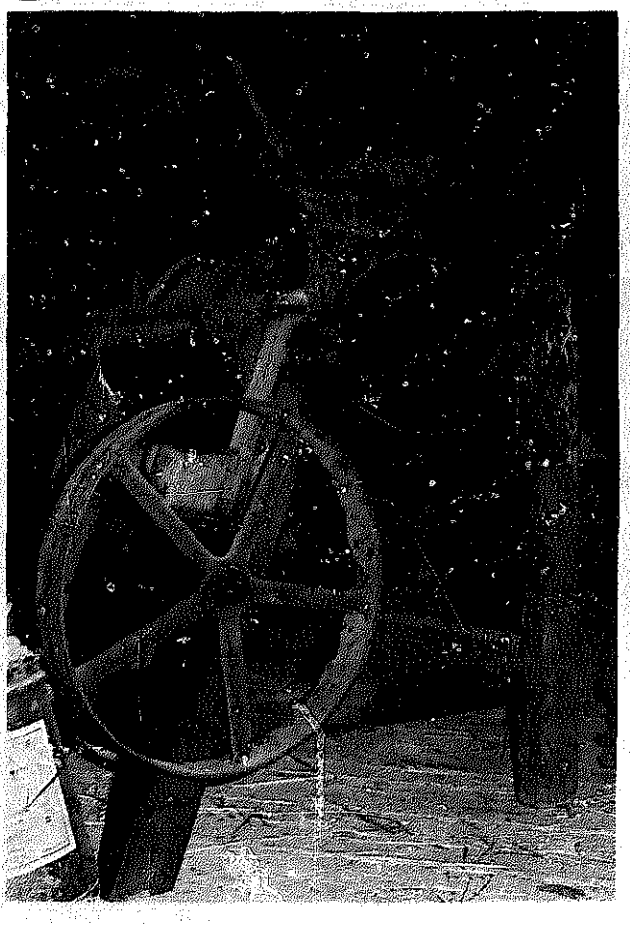
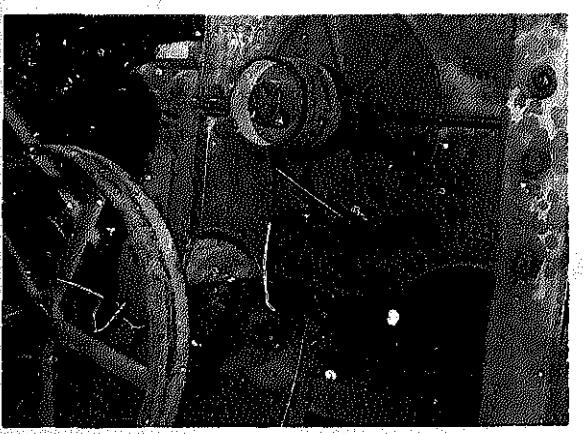
# -7- Cleaning Grains and Seeds

After harvest, a grain, bean, or seed crop may need to be broken away from its stalk, separated from the inedible protective chaff, and cleaned of dust, dirt, and pebbles before it is ready for human consumption. The operations for completing these tasks are called threshing, winnowing, and cleaning. Grain to be used as seed proceeds one step further, through a separator. This process provides a product of uniform size and removes any misshapen seed which might not germinate.

In most parts of the world except North America, small-scale machinery for threshing, winnowing, and cleaning is available in abundance, especially in the Far Eastern countries. Until recently, a North American farmer had only three choices—using a primitive flail and hand winnower, antiques, or expensive combine harvesters which combine the harvesting and processing operations into one. We have uncovered numerous sources of tools to fill this gap, but most of them are foreign to the North American market. We can offer three points of encouragement, however:

1) Most manufacturers are willing to export to North America.
2) Many North American manufacturers have





*The inscription "June 19, 1877. Try Me Once" should perhaps read "Try Me Once Again," as the value of old farm equipment is realized anew.*

*An old stationary thresher belt-driven from a pulley on the tractor power-take-off shaft.*

*An old stationary thresher in the field.*
Dr. B. N. Ghosh

shown an interest in starting production on new tools and implements, given a market for their products.

3) The techniques are simple, and enough build-it-yourself plans are available for you to satisfy your own needs.

## HAND THRESHING

The simplest method of hand threshing involves spreading a large, clean cloth (an old bedsheet is fine) on the floor of a barn or garage, laying a bundle of wheat on the sheet and beating it with an old rake, broom handle, or other appropriate club. The wheat heads do not have to be struck hard, for the grain will shatter out quite easily onto the sheet.

As another alternative, grain can be dislodged by allowing farm horses or bullocks to trample on unthreshed stalks. Threshing by trampling, however, is neither particularly efficient nor very hygienic, because of the possible contamination of grain from animal excreta.

In hand threshing, not every grain will fall out of the seed heads. But it need not go to waste. The bundles already flailed can be given to the chickens; they will pick out any grains missed, and the straw becomes their bedding. Each bundle of wheat will have a cup or two of grain in it. After several bundles are flailed, the corners of the sheet are pulled together, and the grain, chaff, and bits of straw are dumped into a bucket.

There are other alternatives to harvesting and threshing by hand, even for small-plot growers. Threshers and hullers are still very much used by the seed-processing trade, of course, but these machines are usually too expensive to be practical for homesteaders. But shredders will do a crude job of threshing grain in addition to performing their usual functions. Modifications, such as taking out every other blade or removing the screen completely, might improve the quality of the shredder's threshing work. The motor can be geared down so it will run the shredder more slowly. Wheat can even be threshed with a lawn mower, so long as a board is placed to one side to block the grain from being scattered too far by the blade.

## ANIMAL-DRAWN THRESHERS

A fairly recent development in threshing by animal power that is much faster than trampling, is the Olpad thresher. It consists of some 20 serrated or ribbed metal discs arranged in three

rows on a metal frame which is pulled by a pair of bullocks. A wooden beam or a suitable length of chain or rope can be used to hitch the animals to the frame. The output of the thresher is estimated to be four to five times that of a pair of bullocks threshing by trampling. Solid, cylindrical rollers and spiked wheel models are available, and ordinary animal-drawn disc harrows can also be used for this operation.

## SOURCES OF ANIMAL-DRAWN ROLLER THRESHERS

### Stone-Threshing Roller

This roller is tapered so that it can easily be pulled round in circles over the crop by the animals.

Dandekar Brothers
Engineers & Founders
Sangli, Maharashtra, India

### Olpad Thresher

This unit has serrated discs 450 millimeters (18 inches) in diameter, and an angle iron frame. Discs are mounted on a steel shaft and cast-iron spools keep them in position. A seat with a back, footrests, and back and front guards are provided for the operator's safety. An extra raking attachment can be fitted for stirring straw during the threshing operation. This thresher is available in 20-, 14-, 11-, and 8-inch disc sizes.

## TREADLE THRESHERS

Treadle-operated rice threshers are widely used in the Far East. Bunches of straw are held against a revolving drum and the grain is combed out by wire loop teeth. These machines are generally suitable for rice only and not for crops such as wheat, which require a more violent threshing action.

*Operating a treadle thresher by holding bunches of straw against a revolving drum.*

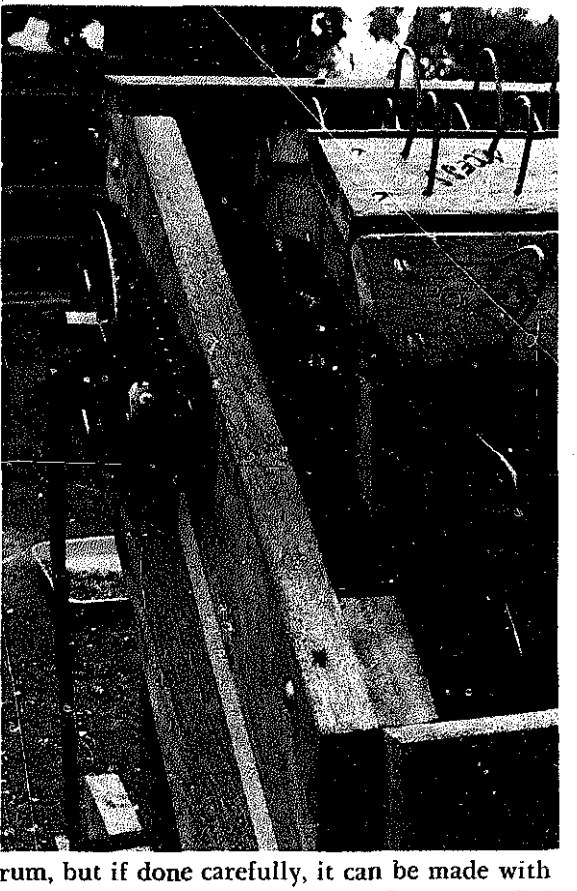
# A FOOT-POWERED THRESHER FOR RICE, SORGHUM, OATS, AND OTHER SMALL GRAINS

by B. David Williams, Jr.

This type of foot-powered thresher is not new. Until more advanced mechanization became widespread in Japan and Taiwan, similar machines were found extensively on small farms in those countries.

Substituting bicycle sprockets and chains for the gear system provides a simple answer to the problem of gears. Bearings from the bicycle pedal shaft are also easily obtained and are adequate for both the drum and the large sprocket shaft. The only sophisticated tools needed to build this thresher are an electric welder and a drill press. Most of the operations can be done with simple hand tools.

*Building plans are available for this treadle-powered thresher.*
S.P.A.T.F.



*Bicycle sprockets and chain replace a complicated gear system. Simple wire loops on the threshing drum knock grain from the stalks as the drum revolves.*
S.P.A.T.F.

The most difficult part of the construction is the drum, but if done carefully, it can be made with simple tools. Balance is important, but not overly critical, as the drum spins at only 250 to 300 revolutions per minute. The wire loops on the drum are the teeth which strike the grain from the stalks.

* Reprinted with permission from *Appropriate Technology*, vol. 2 no. 2.

*The thresher in operation—the cloth hood keeps threshed grain confined, and the drop cloth collects the kernels.* S.P.A.T.F.

This machine does not separate the chaff from the good grain. As in threshing by hand, the grain must still be winnowed. But the machine does speed up the threshing and is also effective on some tough grains such as sorghum, which often defies hand threshing.

Threshing is done by holding a bundle of unthreshed grain firmly in your hands, beating and twisting the bundle lightly against the drum (which revolves away from you), and throwing the bundle of threshed straw aside. The grains fall down onto a canvas or plastic sheet which is placed under the thresher.

The work of cleaning the grain will be a lot easier if you first put the threshed grain into a box with ½-inch wire mesh screen on top. This will remove many of the broken stems and longer trash.

Those who want a simple, engine-driven thresher can build a similar machine, but with a wider drum of 36 inches, a stronger shaft of ¾ inch, and a large pulley on one side. A three to five horsepower engine will be sufficient, and in this case, approximately 400 revolutions per minute would be best.

A 24-page fully illustrated booklet, "Do-it-Yourself Foot-Operated Thresher Plans," for construction, assembly, and maintenance is available from:

S.P.A.T.F., Office of Village Development
P.O. Box 6937
Boroko, Papua, New Guinea

## SOURCES OF TREADLE-POWERED THRESHERS

**Peanut Thresher Plans**

Five pages of fully dimensioned, illustrative plans with complete assembly instructions for a treadle-powered or bicycle-powered peanut thresher are available from:

Cumberland General Store
Rt. 3
Crossville, TN 38555

**CeCoCo Light Foot Thresher**

This machine separates the grain from paddy sheaths by eliminating the mud, sand, stone, pieces of metal, and other foreign substances contained in the paddy. It is portable and conveniently used in the paddy field at the spot where the crop is harvested. Rotary motion is caused by stepping on the pedal; revolution rate is increased by gears, turning the threshing drum at any required speed. Crops are threshed by placing them against the toothed revolving drum.

The number of pedal strokes ranges from 90 to 100 per minute; the approximate drum speed is 450 rpm. The thresher is capable of threshing paddy at 115 kilograms per hour. It measures 15 cubic feet. Net weight: 50 kilograms: packed weight: approximately 90 kilograms.

## POWER-OPERATED THRESHERS

In a power thresher, the separation of grain from its stalk is carried out by passing the crop between a revolving drum and a stationary concave. The impact of the drum striking the grain against the concave beats the grain from the ears. In the shape of a half-cylinder, the concave forms a cradle below the threshing drum. It is either solid or grated and is always made of very strong wrought iron or heavy steel.

The revolving drum or cylinder carries a number of steel spikes or fine rasp bars as threshing teeth. Spiked teeth are often found in combines and threshers designed for rice processing. Because most small threshers are designed in rice-producing countries, they generally come equipped with spike-tooth drums which are not as efficient for threshing wheat. Rasp bar drums with fine-tooth spacings on the threshing bar are generally preferred for separating finer seeds from chaff. The threshing body of most modern combines comes equipped with a rasp bar, but both types of cylinders are usually available interchangeably.

Balance is an important factor. A thresher should be set on level ground with the drum carefully balanced to avoid vibration. If it's not level, the movement of grain across the width of the drum is uneven and threshing efficiency is impaired. The gap between the threshing drum and the concave is adjustable, depending upon the grain to be threshed. If the gap is too wide, the grain passes out of the machine with the straw, while too close a setting will break or bruise the grains.

Some small machines operate on a principle similar to the treadle rice threshers, with the crop being held against the revolving drum. But generally the whole crop is passed through the thresher. Spike-tooth drums are found particularly in Asia, where they are favored because they produce thoroughly crushed straw, or bhusa, which is fed to animals.

Threshers without cleaning equipment are often favored by small farmers because they combine high rates of threshing with low power requirements. They can often be driven from the power take-off (PTO) shaft of a two-wheeled tractor or by a gasoline or electric engine. Winnowing is done at the farmstead during slack periods. At this point, threshing is complete.

# THRESHING SEED CROPS

by Rob Johnston

If the crop is small, we often use a homemade flail. For larger crops, we use a Universal Thresher made in Japan by CeCoCo (Central Commercial Company), P.O. Box 8, Ibaraki City, Osaka Pref. 567 Japan. While it is not built as ruggedly as a comparable domestically made machine, it gets the job done satisfactorily and costs a great deal less.

If you don't want to spend $1,000 for a thresher, which is what we paid for ours in 1974, the old models which still exist in this country are worthwhile, if they are in decent condition. In our area, the cost is between $200 and $500. These are usually large machines, powered by a gasoline motor or tractor power take-off with a flat belt. It is possible, however, to mount wheels on an old

*Seedsman Rob Johnston threshing soybeans with his CeCoCo Universal Thresher from Japan.*
Rob Johnston

thresher so the machine can be towed into the field for on-the-spot threshing. On the other hand, our CeCoCo thresher is small, weighing about 250 pounds, and can be carried short distances by two determined people. We went to a small bother of putting removable (bolted) wheels on one end, which aid in towing. This portable nature is a real plus for the Japanese machine.

The new American-made threshers are rather small units usually trailer-mounted and designed to thresh experimental plots in breeding and testing projects.

Catalogs which list such equipment include:

Burrows Equipment Co.

*14-inch Plot Thresher*
K.E.M. Corp.

### 14-inch Plot Thresher

The Seedburo plot thresher has a 14-inch wide peg-tooth cylinder and is completely self-cleaning. A straw puller is used to slow the material thrown from the cylinder and to meter it evenly into an air blast. Interchangeable screens are placed at the bottom of the air chute to further clean the sample. This thresher has a rasp bar cylinder with 52 teeth, and is mounted on wheels to be moved by hand. It measures 30 by 30 by 20 inches, weighs 200 pounds and is powered by a 3 h.p. gasoline motor (a ¾ h.p. electric motor is optional).

### 18-inch Bundle Thresher

This thresher is built with a coil spring axle for towing behind a vehicle. It is fully adjustable for small seeds and grains, including soybeans, and has 14-inch diameter cylinders, with eight rasp bars per cylinder. Two fans are used to assist in complete separation. It is powered by a 7.5 h.p. gasoline engine with a hand clutch, fully guarded for safe operation.

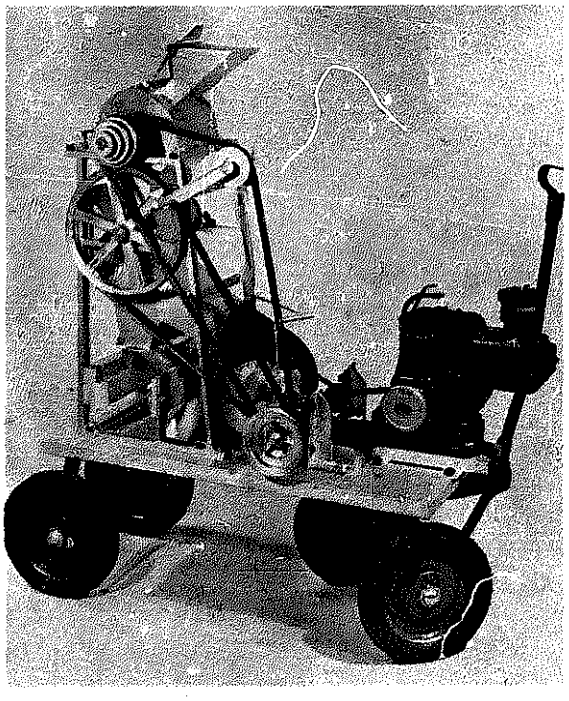
Chicago, IL 60606

**Small Bundle Plant and Head Thresher**

A medium-sized, self-cleaning thresher, this model is suitable for efficiently threshing and air-cleaning single plants, small bundles (heads only) of cereal or grain crops, some types of legumes, and other crops for both yield and purity research experiments. Two styles of cylinders and concaves are available: overshot spiked-type (round or square, depending on the grain to be harvested) or overshot rasping bar-type. The thresher also comes with both styles of cylinders and concaves that are interchangeable on the same machine. It has a self-cleaning metering wheel, removable seed catch pan with recleaning screens, and an air blower. Its heavy-gauge metal housing is mounted on a channel iron frame with rubber-tired wheels and hand truck handles for easy handling. The thresher is approximately 34 inches long, 25 inches wide and 40 inches high. Weight: 190 pounds. Supplied with electric motor or gasoline engine.



*Small Bundle Plant and Head Thresher with gasoline engine.*
Allan Machine Co.

*Small Bundle Plant and Head Thresher with electric motor.*
Allan Machine Co.

**Large Vogel Nursery Plot Thresher**

Vogel plot threshers are one of the most popular makes because they self-clean completely in 8 seconds. The 20-inch-wide cylinder is the overshot type with spiked teeth or optionally equipped with rubber rub bars. The cylinder is fed directly from the feeding pan. A straw puller slows the flow of material from the cylinder and meters it to the shaker pan. A fan removes the straw and chaff from the grain as the threshed material passes over a tail rake. The seed is caught in buckets at the side of the machine. Power is supplied by a 9 h.p. gasoline engine. Approximate overall dimensions: 8 feet

*Large Vogel Nursery Plot Thresher*
Allan Machine Co.

long, 7 feet high, 40 inches wide. Weight: 1,350 pounds. This thresher has an all-metal construction, except for wooden fan blades and operator's platform.

### Small Vogel Thresher

The Vogel head thresher is of the same basic design as the 20-inch Vogel thresher but without the shaker pan. The cylinder is 6 inches wide and is available with spike-teeth or rubber rub bars. Heads only are passed through the cylinder. Straw passed through the cylinder will not be removed from the sample if the straw pieces are heavier than the seed, as is often the case with forage. The thresher is self-cleaning within 3 seconds. It is powered by a ½ h.p. electric motor. Constructed of heavy-gauge metal, it is mounted on a coaster wagon truck for portability. Dimensions, including truck, are 15 by 38 by 46 inches high.

### All-Purpose Nursery Plot Thresher

The Allan all-purpose thresher is used to thresh, separate, and clean samples of soybeans, wheat, oats, barley, flax, grasses, and other similar seed without loss. Construction is such that it may be easily inspected and cleaned between samples to prevent cross-contamination. Simple mechanical features permit fast adjustment of the cylinder blowers and shaker sieves to meet varying conditions of crops being threshed.

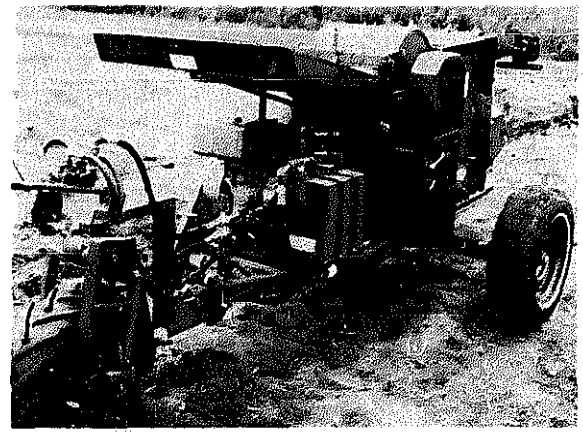
Standard equipment is an eight-bar, all-metal, rasp bar cylinder, five-bar adjustable concave, beater and straw puller, shaker pan with interchangeable no-choke sieves, adjustable catch pan, and two cleaning fans. A belt variator gives infinitely variable belt speeds to 2,000 rpm without affecting the speed of the shakers and blowers. Optional equipment includes rubber-faced rub bars.

The above threshers are available from:
ALMACO, Allan Machine Co.
P.O. Box 112
Ames, IA 50010

Burrows Equipment Co.
1316 Sherman Ave.
Evanston, IL 60204

### Low-Profile Plot Thresher

Constructed with an eight-bar rasp bar cylinder and underslung grated concave, the low-profile thresher is hand fed from ground level. The stationary, towable machine was developed exclusively for threshing small and medium test plots of legumes, cereals, forages, and other



*This low-profile plot thresher has a hydrauiically operated unit for moving it as operators thresh row after row.*
Allan Machine Co.

special crops. It comes with a galvanized metal shaker pan with choice of interchangeable no-choke sieves. With a 7 or 9 h.p. gasoline engine, the unit measures 113 by 40 by 57 inches and weighs 1,250 pounds.

**LPT Stationary Thresher**

Available in three types of overshot cylinders and concaves, each of which is interchangeable, the thresher will efficiently thresh a wide range of crops from small test plots up to ⅓ acre or larger in size. Cereal grains such as wheat, oats, barley, and sorghums; legumes including soybeans, cowpeas, and field beans; and forage crops such as grasses and sunflowers have been threshed without material loss of seed.

Its simple mechanical features permit easy changes of cylinders and concaves, no-choke sieves, varying cylinder speed, air blower, and seed catch pan to meet varying conditions for each crop being harvested.

Power to operate the standard-equipped thresher is provided by a 9 h.p., single-cylinder, four-cycle, air-cooled, gasoline engine with a rope-pull starter and hand-operated clutch take-off assembly.

The thresher, completely equipped, weighs approximately 1,375 pounds and measures 9 feet long, 5 feet wide, and 5 feet high. It is light enough to be moved easily by workers in the field or towed behind a car, truck, or tractor from one area to another.

*Researchers feed sheaves into the ALMACO-LPT Stationary Plot Thresher.*
Allan Machine Co.

Both threshers are available from:
ALMACO, Allan Machine Co.
P.O. Box 112
Ames, IA 50010

**Single-Head Plot Thresher**

Single head selections can be easily threshed in this single-head plot thresher. A ribbed rubber roller threshes the head by a crushing action against a spring-loaded rough rubber concave. The concave is hinged to allow the roller and concave to self-clean. A fan is built into the bottom of the thresher to blow out the chaff. The cleaned sample is collected in a small drawer.

L.A. Mennie
1029 Manahan Ave.
Winnipeg 19, Manitoba, Canada

**Single-Head Thresher**

Single heads or the product of short rows are threshed with this machine. It is self-cleaning, enabling a large number of single heads or small lots to be threshed and cleaned rapidly. The heads are pushed through a funnel-shaped chute to a peg-tooth cylinder. The straw is not passed through. Chaff is thrown into the chaff receiver by the cylinder air blast. The cleaned sample is collected in a drawer at the base.

Bridge & Tank Western, Ltd.
Winnipeg 2
Manitoba, Canada

**Kemp Stationary Plot Thresher**

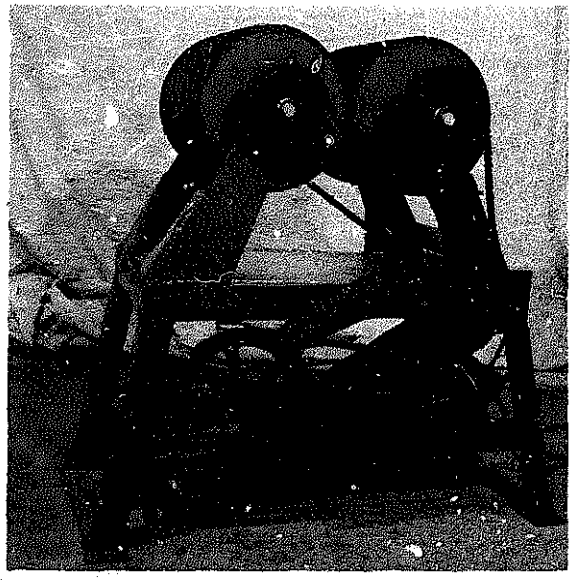
The Kemp stationary plot thresher has a spike-tooth cylinder that is 10 inches wide, with a 10-inch diameter base and a 7-foot long separating deck. The openings in the deck are varied in size to act as both a sieve and straw walker. Two blowers are used for cleaning. Unthreshed heads are delivered to a tailings drawer to be passed through the cylinder a

second time. The thresher can be used for threshing many crops including clover and forage crops. Peas and beans are threshed by operating the cylinder in reverse.

Bridge & Tank Western, Ltd.
Winnipeg 2
Manitoba, Canada

**Roller Thresher**

Plant material contained in cotton bags can be threshed by passing the bags through the rollers of this thresher a number of times. Mixing and seed loss are eliminated but the material must be cleaned in a separate cleaning device. The rubber-covered rolls are 14 inches in diameter, and contrarotate differentially at speeds of 50 and 68 rpm.



*Roller Thresher*
Agriculture Canada

Machine Services and Repair
47 Landsdowne Ave.
Winnipeg 4, Manitoba, Canada

**Swanson Plot Thresher**

Developed to thresh a wide variety of crops, the Swanson plot thresher has a low profile for easy operation and inspection. A special air device gives precise air adjustments for efficient separation. The 18-inch-wide cylinder and concave are built to close tolerances to eliminate lodging of seeds within the thresher. The cylinder has a speed range from 450 to 900 rpm.

Swanson Machine Co.
24-26 E. Columbia Ave.
Champaign, IL 61820

**Harmond-type Plot Thresher**

The Harmond-type Plot Thresher has a rubber rasp bar overshot cylinder with a speed control and an rpm indicator. A feeder-beater is used to present the material to the cylinder. Cleaning is by air-assisted sieve action using an adjustable sieve. The thresher has been used on a range of materials from bent grass to pistachio nuts. The capacity is 30 pounds per minute of wheat straw and 10 to 20 pounds per minute of grass straw.

## INTERNATIONAL SOURCES OF POWER THRESHERS

### Labour-Ear Thresher

The Labour-Ear thresher for single plants is unique in that it has a clear plastic side so the threshing and cleaning process can be observed. A hinged gate at the bottom of the cylinder keeps the material in the cylinder until threshing is completed. Chaff removal is by a suction fan with cleaned samples collected at an envelope chute. The unit is electrically powered and has variable speed pulleys for changing the cylinder speed. The thresher is claimed to be capable of threshing cereals, grasses, clover, and legumes.

F. Walter & H. W'ntersteiger K.G.
4910 Reid im Innkreiss
Frosch allgasse 19, Postfach 124
Dimmelstrasse, Austria

### 2 TD Thresher

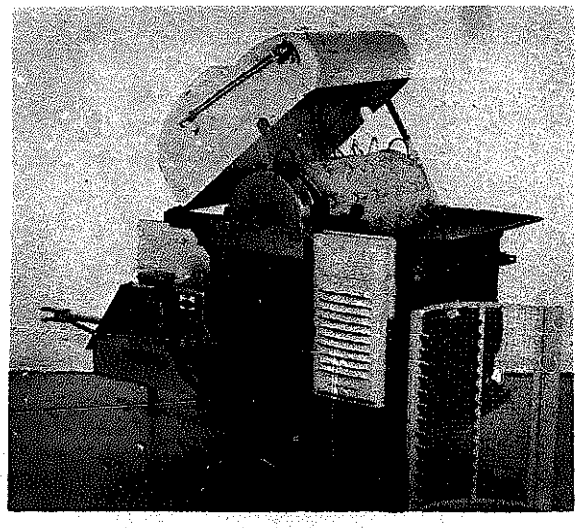
The 2 TD thresher has two threshing cylinders with adjustable concaves. The first cylinder does most of the threshing, while a second cylinder operates at a higher speed to shake and transport the straw during threshing. Cleaning is done by air currents. Straw and chaff are blown out at the top of a cyclone separator and the grain is collected at the bottom. The auxiliary air current necessary to blow the straw out of the top of the cyclone is shut off after each sample is threshed to drop any material held in the airstream. The thresher is powered by a 7 h.p. gasoline or electric motor.

Saat Und Erntetechnik
3440 Eschwege
Postfach 748, Germany

### Garvie 14-inch Portable Thresher

This 14-inch-wide portable thresher is available with either a spike-tooth or rubber rub bar cylinder, and has a straw shaker and two clean-

ing sieves with an air fan. The machine is self-cleaning and can be inspected while it is running. It is powered by a 3 h.p. engine.



*A typical Japanese thresher, similar to the treadle designs. This one is powered by a gasoline engine for a higher production capacity.*
Agriculture Canada

**Garvie Bench Threshers**

Garvie bench threshers are available in 10- or 14-inch widths, with spike-tooth or rasp bar beaters and a variety of cleaning apparatus including a winnower, a cleaner (with up to three sieves or with a riddle case), and a fan.

R.G. Garvie & Sons
2 Canal Rd.
Aberdeen, Scotland

**CeCoCo Portable Thresher**

This is a lightweight, portable, and economical thresher suitable for small-scale rice and wheat growers. The all-metal construction unit is equipped with a 1.5 h.p. gasoline engine. It delivers unbroken grain at a capacity of 180 kilograms per hour.

**CeCoCo Self-feeding Power Thresher**

The CeCoCo Self-feeding Thresher is made for the purpose of threshing rice or wheat which is reaped as full stalks, gathered, and bound in sheaves. Paddy stalks to be threshed are placed on a feed table attached to the machine and are inserted continuously by hand in small quantities into the feeding end of the rotating chain. Inserted paddy straws are threshed while being shifted by the moving chain under the rotating threshing drum.

## SPECIFICATIONS OF CECOCO SELF-FEED POWER THRESHER

| Type | Capacity in paddy/hour | Power Required | Rpm | | Dimension in mm | | | Net Weight | Gross Weight | Shipping Measurement |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | Rice | Wheat | Height | Width | Length | | | |
| No. 1 | 500-1,000 kg | 3-4 h.p. | 570 | 670 | 1,380 | 1,010 | 1,350 | 150 kg | 295 kg | 60 cu. ft. |

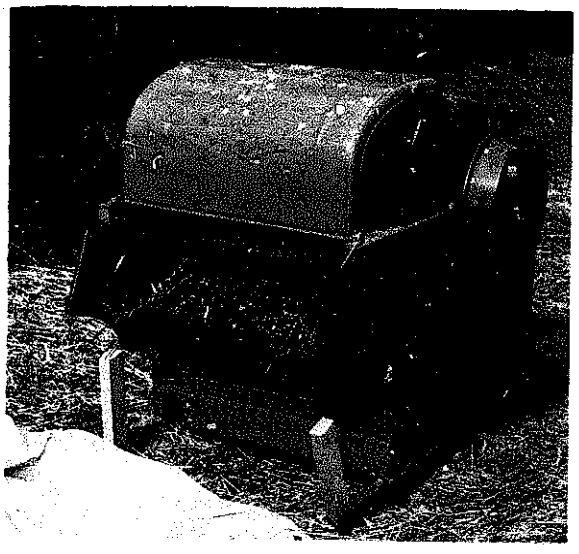
| No. 4 | approx. 500 kg | 1-2 h.p. | 530 | 630 | 1,090 | 1,000 | 1,370 | 100 kg | 140 kg | 40 cu. ft. |

**CeCoCo Power Thresher No. 1 Double Drum, No. 2, 3, and 4 Single Drum**

These units are for long- or short-cut stems of rice, wheat, sunflower seed, and sorghum. The crops are fed by hand into the threshing chamber and a perfectly cleaned grain exits from the outlet on the side of the conveyor-elevator after being completely threshed. The machine is equipped with winnower, conveyor, thrower, and speed adjuster which controls the air velocity.

**CeCoCo Universal**

CeCoCo Universal Power Thresher Type T25H is capable of threshing various kinds of beans, pulses, rice, sunflower seed, and wheat by replacing the screen and V-belt between the pulleys of the threshing drum and winnower. Separation is adjustable and no winnowing is necessary. Second separation of grain and stalks scattered at the second outlet is also possible; therefore, complete separation can be made without waste. The interchangeable screen can easily be replaced according to the size of grain in order to prevent breakage.



*CeCoCo Universal Power Thresher*
Rob Johnston

## SPECIFICATIONS OF CECOCO UNIVERSAL GRAIN THRESHER

| Type | Capacity per hour | Power Required | Rpm | Size of Screen | Dimension in mm | Size of Drum | Net Weight | Gross Weight | Shipping Measurement |
|---|---|---|---|---|---|---|---|---|---|
| T25H | rice 500 kg | 2-3 h.p. | 550-600 | 750 × 595mm | 1,100 H | 756mmW | 115 kg | 220 kg | 80 cu. ft. |
| | wheat 500 kg | | 650-700 | | 1,300 W | × | | | |
| | beans 1,500 kg | 3-5 h.p. | 250-550 | | 1,500 L | 364mmϕ | | | |

**CeCoCo Bean Thresher**

The CeCoCo bean thresher is made for threshing various beans and seeds of full length or short stalks. The materials are fed into the threshing chamber and threshed by a threshing drum with multiteeth. Only the pure and complete beans or seeds are carried by the screw conveyor to the vertical screw elevator, and then outside through the outlet of the elevator. Screens are easily interchangeable.

## SPECIFICATIONS OF CECOCO BEAN THRESHER

| Type | Capacity per hour | Power Required | Rpm | Dimension in mm | | | Net Weight | Gross Weight | Shipping Measurement |
|---|---|---|---|---|---|---|---|---|---|
| | | | | Height | Weight | Length | | | |
| M | 30 ares in soybean | 2-3 h.p. | 600-650 | 1,010 | 860 | 1,010 | 110 kg | 160 kg | 50 cu. ft. |

**CeCoCo Peanut Thresher**

This machine will thresh peanuts from peanut plants harvested with vines. Care should be taken to give proper speed of revolution to the machine. If it is too fast, it will damage not only the husks but also the kernels. If it is too slow, it will mix stalks, because imperfect separation will retard the threshing efficiency.

## SPECIFICATIONS OF CECOCO PEANUT THRESHERS

| Type | Capacity per hour | Power Required | Rpm | Dimension in mm | | | Net Weight | Gross Weight | Shipping Measurement |
|---|---|---|---|---|---|---|---|---|---|
| | | | | Height | Width | Length | | | |
| No. 1 | 0.37 acre | 2 h.p. | 350 | 1,400 | 1,000 | 1,260 | 150 kg | 280 kg | 80 cu. ft. |
| No. 2 | 0.25 acre | 1 h.p. | 350 | 1,380 | 830 | 1,230 | 115 kg | 200 kg | 65 cu. ft. |

The above threshers are manufactured by:
CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Porta-fast Grain Thresher**

This is a mini-size portable thresher for easy transport for in-field operation. With a built-in winnower and 5 h.p. gasoline motor, it has a capacity of 12 to 20 CAV per hour and 15 to 25 CAV per hour with an 8 h.p. motor.

Jamandre Industries, Inc.
88 Rizal St.
Iloilo City 5901, Philippines

**Small-Capacity Motor-Driven Thresher Model TDG-400**

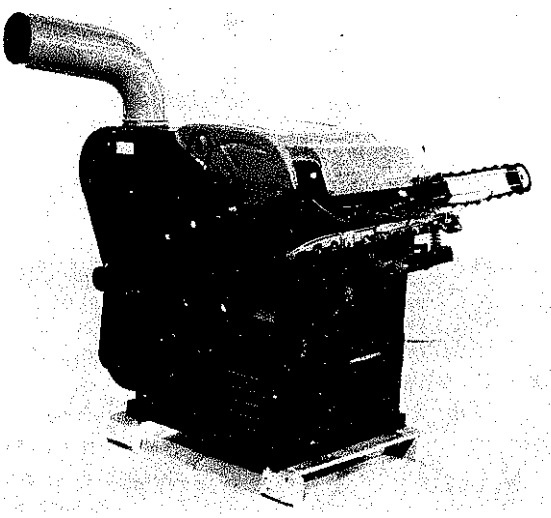
Designed mainly for threshing rice and wheat, this machine adapts well to wet threshing work. The machine consists primarily of a main drum, auxiliary drum, feed chain, sieves, grain conveyor, winnowing fan, and a 5.4 h.p. electric motor. It can thresh 600 to 1,000 kilograms of rice or 350 to 750 kilograms of wheat per hour. It weighs 164 kilograms and measures 130 by 1,392 by 1,150 millimeters.

China Agricultural Machinery Import and Export Corp.
Tientsin Branch 14, Chang Teh Road
Tientsin, China

**Thresher Models D710S, D610S, and D510S**

The differences in Iseki's three models stem from the three different cylinder widths: 500, 400, and 355 millimeters, respectively. Its power requirements range from 0.7 to 4.5 h.p. for an output capacity ranging from 10 to 30 ares (one are = $\frac{1}{20}$ acre) per hour.

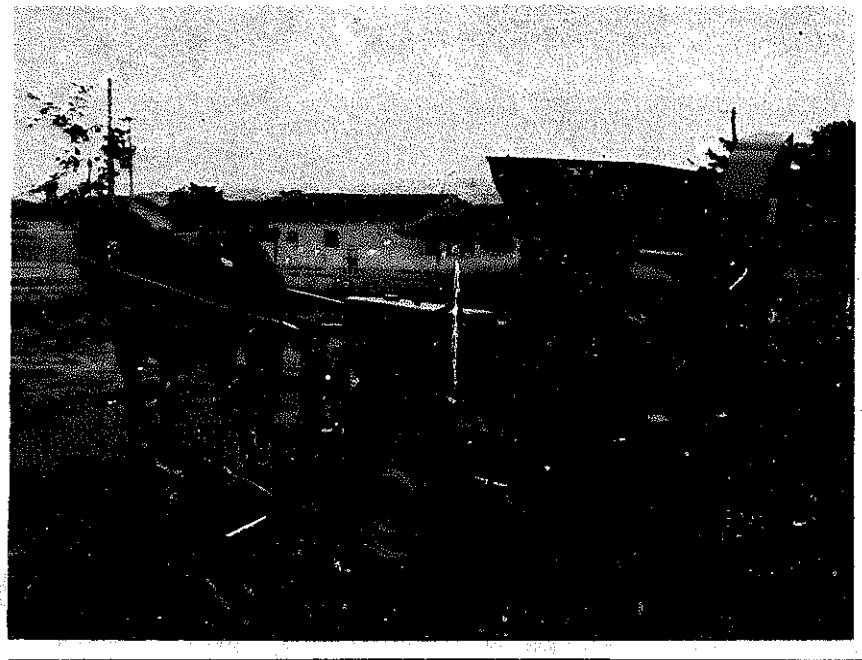
Iseki Agricultural Machinery Mfg. Co., Ltd.
2-1-3 Nihonbashi, Chuo-ku
Tokyo 13, Japan



*Iseki Power Thresher*
Agriculture Canada

**Bel-500 Thresher**

This unit was specially designed for stationary threshing and for cleaning corn and beans. It requires a 5 to 7 h.p. electric motor, or it can be run from a tractor's PTO. It will produce from 6,614 to 7,937 pounds per hour, tractor- or horse-drawn.



*Laredo Cereal Thresher*

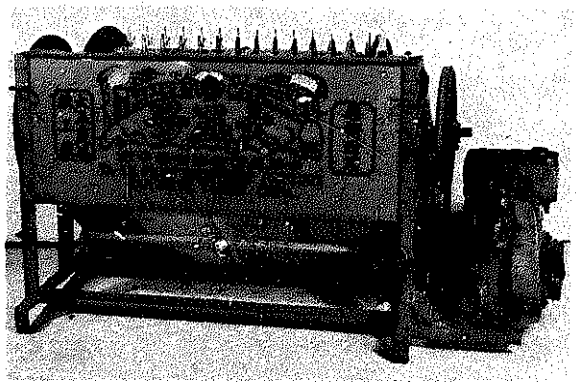
Laredo S.A.
Rua 1 de Agosto, 11-67-17.100
Bauru (SP) Brazil

**TY-200**

This unit threshes grains while separating leaves and roots from the grain with the powerful blower. It can be used with damp crops, weighs 120 kilograms, and measures 68 by 45 by 39 inches. It has an output of 1,000 kilograms per hour using a 5 to 6 h.p. motor.

Tien Chien Enterprises Co., Ltd.
P.O. Box 20-18 Taichung
Taiwan R.O.C.



*Tien Chien Thresher*
Tien Chien Enterprises

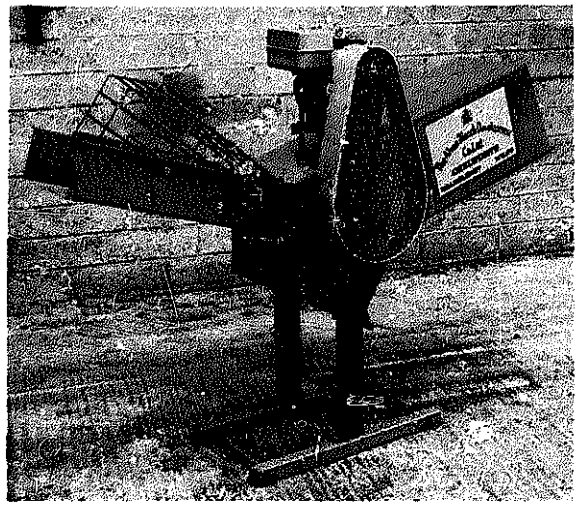
**Agrima Rice Thresher Model TAP-20**

This is a 3 h.p., gasoline engine thresher adapted from a treadle unit. It measures 55 by 120 by 68 centimeters and weighs 69 kilograms.

China Agricultural Machinery Co. Ltd.
17 Nanking Road, East, 1st Sec.
Taipei, Taiwan R.O.C.

**Midget II Thresher**

The Midget MKII is comprised of a basic



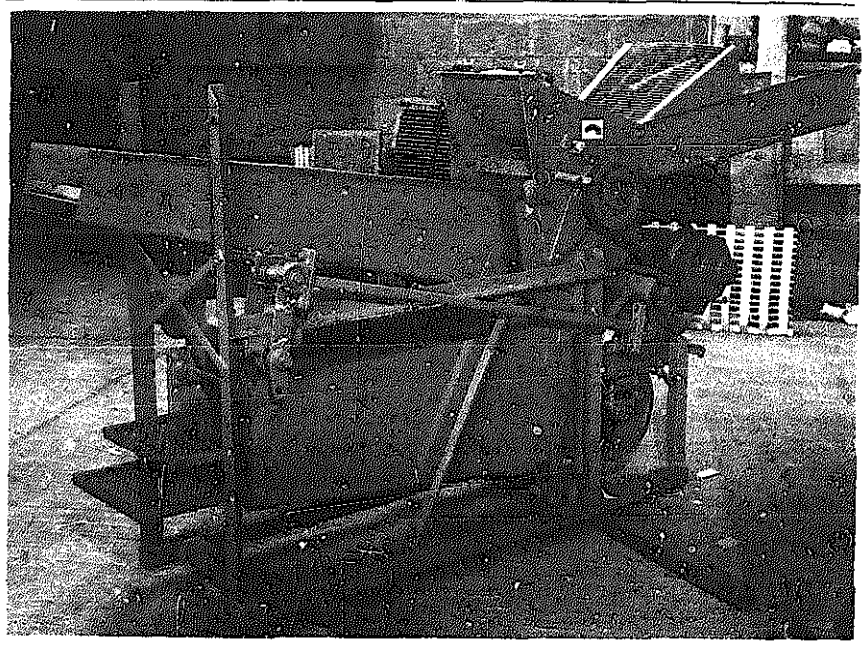
*Alvan Blanch Midget II*
Alvan Blanch Development Co.

rasp bar drum and concave, feed shute, and discharge cowl, and a collecting tray with a canvas shield. It requires 3 h.p. and can be driven by a gasoline or electric engine or tractor PTO. It weighs 280 pounds, measures 1 foot 11 inches by 4 feet 8 inches by 6 feet 3 inches and puts out up to 1,500 kilograms per hour of rice. Its other suggested uses include wheat, barley, oats, beans, peas, sorghum, maize, and millet.

**Super Midget II**

Requiring 5 h.p., this unit will put out up to one ton of rice per hour. Other larger units are also available.

Alvan Blanch Development Co., Ltd.
Chelworth, Malmesbury
Wiltshire, SN16 9SG, England



*Alvan Blanch Super Midget II*
Alvan Blanch Development Co.

**Small-Size Automatic Thresher**

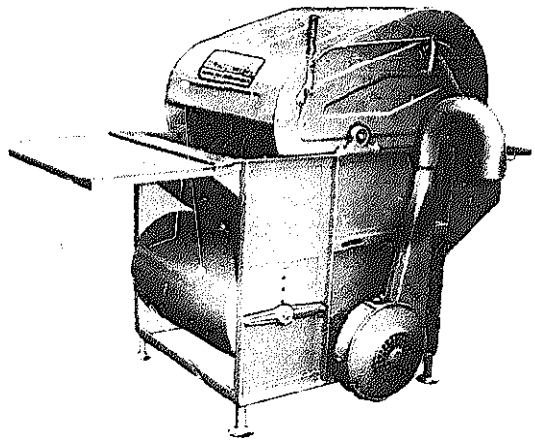
This Indian thresher can be run by a 10 h.p. electric motor, 12 to 14 h.p. gasoline motor, or the PTO of a 14 to 20 h.p. tractor. Larger units are also available.

New Bharat Industries (Regd.)
Industrial Area
MOGA (Punjab) India

**Power Wheat Thresher-Cum-Winnower**

Fifteen h.p. is required to run this thresher with a 1.06-meter-wide drum for a capacity of 400 to 500 kilograms per hour.

Rajasthan State Agro Industries Corp., Ltd.
Virat Bhawan, C-Scheme
Jaipur 302 006, Rajasthan, India



*Akshat AK-58 Thresher*
American Spring and Pressing Works

**Akshat AK-58 Thresher**

The Akshat AK-58 consists of a threshing

chamber, separator, dust-discharging device, and a grain-conveying and elevating mechanism. The threshing chamber contains a drum with fifty steel wire loops and a concave grill.

Stalks are held with both hands in a bunch, and the heads are inserted into the threshing chamber. The revolving drum combs out the grain, which falls through the grill into the winnowing chamber. Clean grain is raised by the elevator for bagging. The thresher requires 2 h.p. and can thresh 200 kilograms of rice per hour. Weight: 112 kilograms.

American Spring & Pressing Works Pvt., Ltd.
P.O. Box 7602 Malad
Bombay 400 064, India

**Embee Power Thresher**

This all-steel thresher is fitted with a threshing cylinder, grain auger, and elevator. The crop bundle is held in both hands and the heads are threshed between the loops of the rotating cylinder and the concave screen. The grain is separated from the chaff by a blower. The unit requires a 2 to 3 h.p. motor to put out 60 to 120 kilograms per hour of rice, or 100 to 150 kilograms per hour of wheat. Martin Burn also offers a conventional model thresher in which the complete crop is fed into the machine rather than just the heads.

Martin Burn, Ltd.
12 Mission Row
Calcutta 1, India

**Wheat Thresher**

The Wheat Thresher is designed primarily for wheat, although it will handle other crops. It is equipped with a winnowing fan and fills bags automatically. It has an output capacity of 200 kilograms per hour with a 5 h.p. motor.

Union Forgings
Sherpur, G.Y. Road
Ludhiana, Punjab, India

**Model 42 Thresher**

This simple thresher has no cleaning mechanism. It has an output of 1,300 to 1,600 kilograms per hour of straw and grain and requires approximately 2 h.p. to drive the machine. Larger models with cleaning mechanisms are also available.

Ets Cimon Freres
B.P. 47
50104 Cherbourg, France

**ST-70 Thresher-Cum-Winnower**

The ST-70 employs a rasp bar drum and concave to thresh rice, wheat, barley, beans, peas, maize, and other crops. It has an 18-inch drum which revolves at from 460 to 1,460 rpm for a wheat output of 1,500 to 2,000 kilograms per hour and a maize output of 3,000 to 4,000 kilograms per hour.

Vicon, Ltd.
Mudambai House, Lavelle Road
Bangalore-1, India

**Jeco Threshers**

Available in small and large sizes.

Jeco Engineering Co. (Regd.)
Near Shama Cinema, G.T. Road
P.O. Box No. 46
Gujranwala, Pakistan

**Vogel-type Paddy Thresher**

Similar to the Allan Vogel thresher described earlier, this unit is designed to yield grain of seed quality by avoiding damage to the grain. Damage to the kernel limits its germination capabilities. This machine has a 500-millimeter-wide drum, requires 10 h.p. to run, and produces 500 to 700 kilograms per hour.

**Midget Rice Thresher**

Similar to the Alvan Blanch Midget II thresher, this unit has a capacity of from 900 to 1,000 kilograms per hour. A 12 h.p. motor is required to run the 690-millimeter-wide drum.

A.P. Rodriguez Agro Industrial Machineries
Bitas
Cabantuan City, Philippines

# THE AXIAL FLOW THRESHER

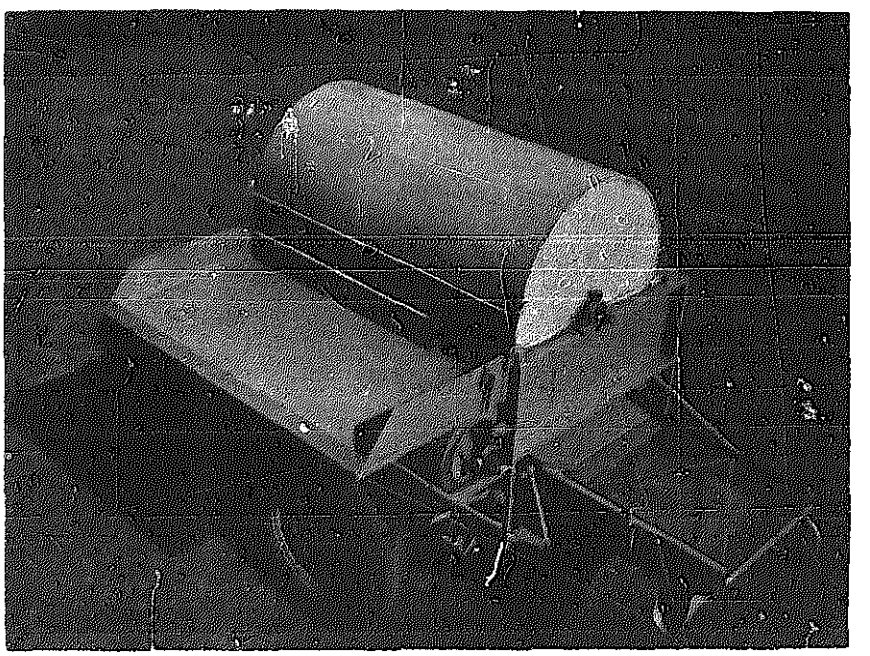
## by The International Rice Research Institute

The widespread use of combines for harvesting and threshing crops in developed countries has led to a decline in the production and use of stationary threshers. Yet traditional methods are no longer suitable for threshing large quantities of rice, particularly in areas of multiple cropping. High-moisture paddy is difficult to thresh with conventional threshers available in the less-developed countries. The threshing output of the Japanese stripping-type thresher is generally low, and such machines are difficult to manufacture in less-developed countries. The International Rice Research Institute has developed the axial flow thresher for small- and medium-scale tropical farmers to use either through individual ownership or through contract threshing.

This machine can efficiently thresh rice, sorghum, soybeans, and other small grain crops over a wide range of grain moisture levels with low crop losses. The throw-in feed design and the axial movement of materials are distinguishing features of this machine. Separation and cleaning efficiency are excellent, and power requirements are low.

The thresher is mounted on two large wheels to provide good mobility on rough roads. It can be pulled easily with a power tiller or jeep, or it can be moved manually over shorter distances. A self-propelled version of the thresher has a motorized third wheel mounted on the front. The same seven horsepower engine provides power for threshing and transport. The self-propelled version is designed for custom threshing operations, which often require repeated movement of the thresher. When the ground is too soft to support the wheels, skids are available to attach to the underside of the thresher so that it can be pulled by animals.

The thresher can be powered by a seven to ten horsepower, air-cooled, gasoline engine. Power is transmitted through a series of V-belts to the five major components: the threshing cylinder, delivery auger, centrifugal blower, rotary screen, and aspirator fan. The threshing mechanism consists of a peg-tooth cylinder which rotates inside a full-circle cylindrical concave in two sections. The upper concave has spiral deflectors which move the threshing material axially between the threshing drum and the concaves.



*IRRI Axial Flow Thresher*
Union Tractor Workshop

This machine is well accepted and is gaining popularity among farmers across the Philippines. Twelve Philippine companies now produce the thresher. It is also being produced on a limited basis in Ghana, India, Indonesia, Pakistan, South Vietnam, Sri Lanka, and Thailand, and is being evaluated in Bangladesh, Guatemala, Peru, Korea, and Malaysia. The machine is being marketed for threshing soybeans and sorghum as well as paddy, and work is underway to adapt it for wheat threshing.

Engineering designs are available to manufacturers who are seriously interested in producing the thresher. Each request must be submitted on company letterheads with a history of the company and a list of available equipment, staff, capital structure, and product lines, along with tentative plans for production and marketing. Write to: The Agricultural Engineering Department, International Rice Research Institute, PO Box 933, Manila, Philippines.

An example of the IRRI-designed axial flow thresher is pictured here, manufactured by the Union Tractor Workshop in India.

### 7.5 Axial Flow Thresher

This unit was developed for small- and medium-scale farmers to use either through individual ownership or through contract threshing. This machine can efficiently thresh rice, sorghum, soybeans, and other small grain crops over a wide range of grain moisture levels. Distinguishing features of this machine include throw-in feeding, axial movement of materials, low power requirement, and excellent separation and cleaning efficiency. Paddy output is about 1 ton per hour when operated with a three-man crew and a 7.5 h.p. motor.

Union Tractor Workshop
8-B, Phase II, Maya Puri Industrial Area
New Delhi 110 027, India

### Portable Axial Flow Thresher

The Portable Axial Flow unit has an output of 300 to 600 kilograms per hour of threshed paddy with a 5 h.p. engine. Two or three people are required to feed the machine, thresh, and bag the grain, and two men are required to move it. It has a multicrop capability for rice, sorghum, and other small grains. The unit weighs 105 kilograms with the engine, measures 96 by 76 by 138 centimeters, and uses about 1 liter of fuel per hour.

## POWER DRUMMY THRESHERS

Drummy threshers usually incorporate 12

beaters inside a threshing drum to separate wheat from its hull. A winnowing fan attached under the machine separates straw from the grain but does not leave a cleaned grain; an average of 3.5 percent waste is left. There is no bagging arrangement with most of these machines, though adaptations can be made. The minimum power needed to thresh with a minimum amount of grain breakage is 470 revolutions per minute, as established by the Indian Council of Agricultural Research in New Delhi. At a lower speed, more breakage takes place.

## SOURCES OF DRUMMY THRESHERS

### Union Tractor Drummy Thresher

This is a very simple machine, particularly suitable for areas where farmers are being introduced for the first time to mechanical threshing. The threshing cylinder is the same as that on a complete thresher-winnower, but the threshed material falls directly onto the ground. A fan blows most of the chaff away from the grain, but some hand winnowing is still necessary.

Two sizes of threshers are available. The 75 centimeter size uses a 5 h.p. motor to produce 150 kilograms per hour and the 90 centimeter size uses a 10 h.p. motor for 250 kilograms per hour.

Union Tractor also has a full range of larger threshers and winnowers available, as well as the Pusa-40 Spike-Tooth Thresher, designed by the Indian Agricultural Research Institute, and the 4T-90 wheat thresher.

### Power Threshers

U.P. State Agro Industrial Corp., Ltd.
Agricultural Workshop, Talkatora Road
Lucknow, U.P. India

### Allied Drummy Thresher

Drum width on these units comes in five sizes ranging from 2¼ to 3½ feet, for an output of anywhere from 100 to 275 kilograms per hour. There are three 5 h.p. units, one 10, and one 15.

Allied Trading Co.
Railway Road
Ambala City 134 002
Haryana, India

### Gepco Drummy Threshers

Gepco makes drummy threshers in three sizes. The 5 h.p. unit has a 76-centimeter drum and threshes at a rate of 180 kilograms per hour.

The 7½ h.p. unit has a 90-centimeter drum and a capacity of 300 kilograms per hour, and the 10 h.p. machine has a 105-centimeter drum and produces 450 kilograms per hour. Other units are also available.

Narela, Delhi, India

**Wheat Thresher**

This small thresher is not fitted with a bagging mechanism and requires a power input of 5 to 7 h.p. Larger models and complete thresher-winnowers are also available.

New Bharat Industries
Industrial Area, Moga
Punjab, India

**Saeco Power Wheat Threshers**

The 90-centimeter (2½-foot) size has an output of 200 kilograms of clean grain per hour and requires 5 h.p. to run. Larger sizes are also available.

Standard Agricultural Engineering Co.
824/825 Industrial Area B
Ludhiana 141 003, Punjab, India

**Hira Drummy Thresher**

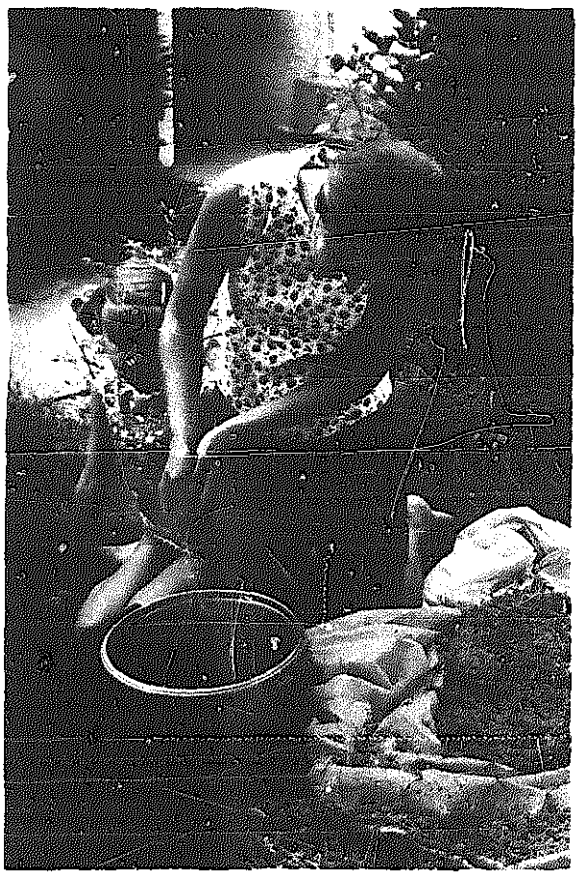
Four large drummy threshers are available from International Manufacturing. The drum sizes range in width from 24 to 42 inches. Power requirements vary from 3 to 10 h.p. for outputs of from 1,500 to 4,000 kilograms per hour. Complete combination thresher-winnowers are also available.

International Mfg. Co.
Hospital Road, Jagraon
Ludhiana, Punjab, India

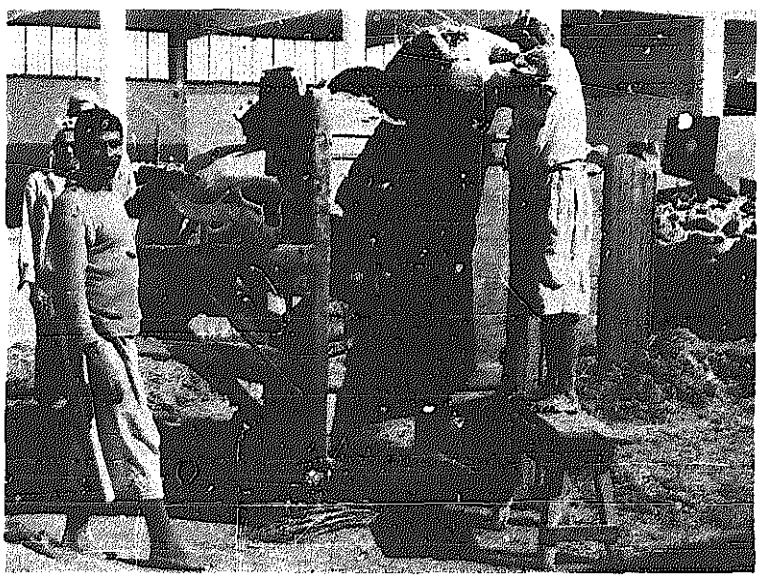
## WINNOWERS

The practice of winnowing consists of using air moving in a horizontal direction to separate grain from chaff or dust by allowing the mixture to fall vertically in a thin stream across the path of the airflow. The lighter chaff is carried further by the moving air while the heavier grain falls nearer to vertical, with the material in between these grades occupying intermediate points according to their weight. This principle has been implemented by farmers for centuries in its simplest form, where the natural breezes in the open-air threshing yard are used. A fan can also be used, since it gives a steadier and more reliable air flow.

In a well-designed winnowing machine, the blast of air is produced by a fan rotating inside a suitable casing, while the material to be cleaned and graded falls vertically from a hopper held immediately above the fan outlet spout. In a combined winnowing and grading machine, after passing through the airstream the partially cleaned grain passes through a perforated shaker screen which retains the larger waste but allows the product to fall onto a second perforated shaker screen where small waste and dirt fall out. Finally, the product passes to the discharge chute. To achieve the maximum extraction of waste, the velocity of the airflow in the separation chamber can be adjusted over a wide range. The perforated shaker screens are usually se-



*With the help of a fan or a good strong breeze, chaff is blown away as the heavier grain falls straight into the bucket.*



*This hand-operated thresher was manufactured in this Egyptian village with locally available materials and craftsmen.*
Dr. B. N. Ghosh

cured by spring clips which are manually released so that the screens can be easily removed for changing or cleaning. A range of screen sizes are available to deal effectively with almost all kinds of seed. The cleaned grain can also be delivered to bagging spouts by using a bucket elevator.

The quality of work done by a winnower is

limited, and it also suffers from the disadvantage of the dust nuisance, not only in the simplest machines but also in the more complex units. The remedy lies in making proper arrangements at the time of installation for the collection and disposal of dust in an effective manner. The usual method is to blow the dust and chaff into a large settling box provided with a wire-covered outlet.

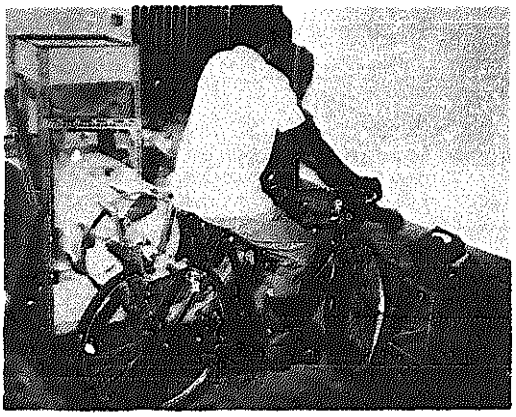
Since much of the threshing in developing countries is carried out by hand or by using simple machinery as described previously, winnowing frequently has to be conducted as a separate operation and is often done by hand. The output of hand winnowing is approximately 45 kilograms of grain per hour. A hand-driven mechanical winnower can achieve outputs of between 200 and 1,200 kilograms of grain per hour and produce a very clean sample suitable for seed.

The simplest winnowers consist of hand- or pedal-driven fans without any sieves or separation devices. The other winnowers described in this section can be adjusted for different crops and can also be fitted with a range of metal sieves. For example, a special hand-powered rotating screen device is available for separating groundnuts from husk and dirt.

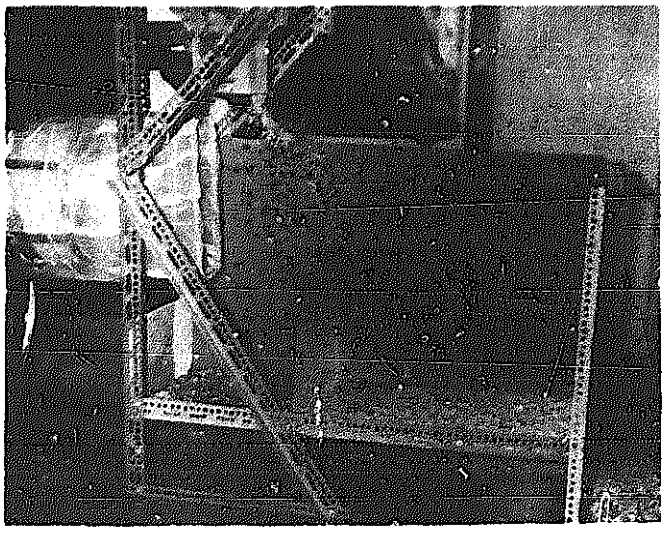
In developed countries, the winnowing process is usually incorporated into the function of the thresher. Hence, sources of winnowers alone are scarce in North America.

### Prototype Pedal-Power Winnower

Most commercially available winnowing machines employ an electric motor or an internal combustion engine to drive the fan. These machines are too expensive for the small-scale farmer, and their capacities usually exceed his requirements. To meet the needs of the peasant



*Dr. Ghosh's prototype pedal-powered winnower.*
Dr. B. N. Ghosh



*A demonstration of the pedal winnower in action. Notice that the larger, heavier matter falls first and that the lighter chaff is blown far away as the grain mixture falls from a hopper above.*
Dr. B. N. Ghosh

farmer in India, an inexpensive winnowing machine which can be easily attached to and operated by a pedal bicycle (a vehicle which some peasant farmers already possess) is being developed by Dr. Biswa Ghosh.

**An Old-Fashioned Winnower**

This simple type of winnower predates hand-operated grain cleaners by a few hundred years. About the only improvement that has been made over traditional basket models is the addition of a screen to allow the fines, dust and dirt, to fall through. In use, the threshed grain is tossed into the air on a windy day—the wind blows away the chaff, dust, and the lighter seeds, the sand and smaller particles fall through the screen—and with any luck, what is left is cleaned grain. The sides are made of galvanized sheet metal, 8 inches high. The screen is galvanized and is riveted to the sides. Its size is 24 inches wide, and 24 inches deep (from front to back).

**An Indian Winnower**

The air draft on this model is controllable, and you can replace the sieves as necessary. It runs on four ball bearings and is operated by hand.

Rajasthan State Agro Industrial Corp., Ltd.
Virat Bhawan, C-Scheme
Jaipur 302 006, Rajasthan, India

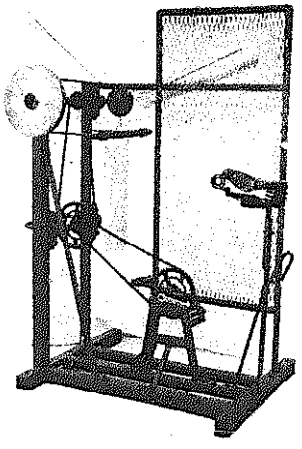
**A British Winnower**

This unit consists of a hopper, feed control slide, oscillating sieve assembly, and fan. It is available in two models with approximate capacities of 800 kilograms per hour and 1,000 kilograms per hour. Both models can be hand- or power-operated.

The Alvan Blanch Development Co., Ltd.
Chelworth, Malmesbury
Wiltshire SN16 9SG U.K.

**Cycle Winnower**

With a capacity of 1,500 to 2,000 kilograms per hour, this simple pedal-driven fan aids the farmer when natural breezes fail to blow. The blades have a span of 1,200 millimeters (48 inches) and are fitted onto a shaft running on two ball bearings. There are two freewheels in the gear train along with a flywheel. A seat is provided on this all-steel, 80,000-kilogram, framed unit. Enough air current is provided to keep four people winnowing at one time.

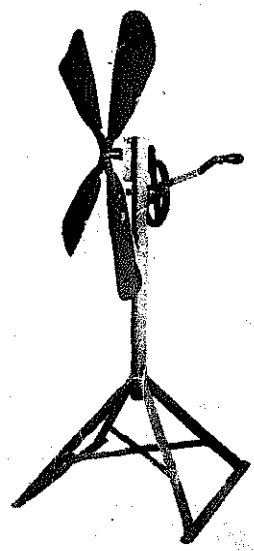


*Cossul Cycle Winnower*
Cossul and Co.

**Cossul Hand Winnower**

This hand-driven model has a capacity of 500 to 800 kilograms per hour, and will keep two people busy winnowing at a time. The blades are fitted to a post, and the unit weighs 25,000 kilograms.

Cossul Co. Pvt. Ltd.
Industrial Area
Fazalgunj, Kanpur, India



*Cossul Hand Winnower*
Cossul and Co.

**The Winnower Kit**

A winnower has been developed by the Overseas Liaison Department of the National Institute of Agricultural Engineering in England to meet the need for a hand-driven device for separating grain from chaff and groundnut kernels from their shells. The design is simple, and manufacture should be well within the capability of village craftsmen using normal hand tools.

The winnower consists of a frame supporting a feed hopper, separating duct, fan, and drive mechanism. The frame is made of ten wooden pieces bolted together. The hopper is formed by the two upper frame members, the top of the fan casing, and one side of the separating duct, which has a shuttered feed aperture level with the hopper floor.

The duct is of rectangular cross-section, roughly S-shaped, with a long vertical center part. The shaped sides are cut from thick plywood and the sheet metal front and back are screwed to the edges of the plywood. The fan is a plain paddle blade unit. The casing is constructed in the same way as the duct to which it is attached by a bolted, flanged joint. A six-blade wooden rotor is carried on a steel shaft running in plain wooden bearings bolted to the frame.

The drive is transmitted by bicycle chain from a crank and chain wheel to a small sprocket on the fan shaft. All the components are standard bicycle parts. The pedal crank and chain wheel are soldered to a steel shaft which runs in bearings bolted below the hopper. The small sprocket on the fan shaft is made from the ring of teeth from a bicycle freewheel pressed onto a wooden boss which is pinned to the shaft.

The following table summarizes the performance results of a prototype at an N.I.A.E. trial. Measurements of output were taken during short runs without stops for refilling the hopper. The rate of work over several hours may be lower, depending on the number of operators and their efficiency.

| Crop | Crank Speed, Revolutions per Minute | Average Output Kilograms per Hour | % of Chaff or Shell Removed |
|---|---|---|---|
| Rice (long grain) | 70-90 | 400 | 75-95 |
| Groundnuts (North African) | 84-94 | 250 | 83-99 |
| Groundnuts (Gambian) | 90 | 180 | 98 |

When the trial was conducted, researchers found that some of the rice samples contained short straw which could not be blown out. In the North Africa groundnut trial, the winnower's high crank speed gave a very clean result, but the Gambian groundnut trial yielded a poor sample, with 40 percent of the nuts left unshelled.

Overseas Department
National Institute of Agricultural Engineering
Silsoe, Bedford MK45 4HS England

**A Dutch Winnower Kit**

This kit offers the option of assembling the winnower after completing construction of the individual parts or assembling from a pre-assembled kit. This winnower is made of wood with metal working parts. Only the simplest shop tools are necessary for its construction.

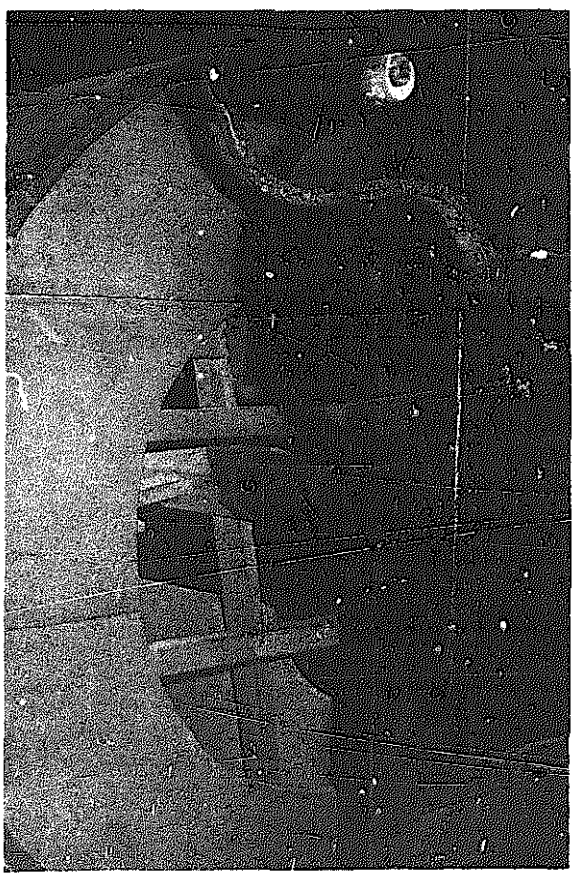
Postbox 525
Eindhoven, Netherlands

## CLEANING AND GRADING

Specially designed cleaning and grading machines can improve the quality of a sample grain to a considerable extent beyond the capabilities of the winnower. There are several reasons why such high-quality grain is desirable:

1) Grain required for seed purposes should be clean and uniform;
2) Removing weed seeds means that cultivation of the growing crop will be less costly;
3) An increased yield can be obtained from using cleaned and graded grains for seed purposes;
4) Seed-drilling machines perform better when clean and properly graded seed is used;
5) You can get better prices for graded samples;
6) Removal of insects and other foreign matter during cleaning ensures better and safer storage;

*A hand-operated seed cleaner constructed entirely of wood. The crank powers a wooden-bladed fan for winnowing while screens in the foreground separate seed from chaff. Cleaned seed is deposited in a drawer below. No longer being made in the United States, these machines are easy to find at farm auctions but are now gaining in value as antiques. Construction plans are available from IRRI, Box 933, Manila, Philippines.*



*The hand crank, gears, and a peek at the wooden fan blades of an old seed cleaner.*

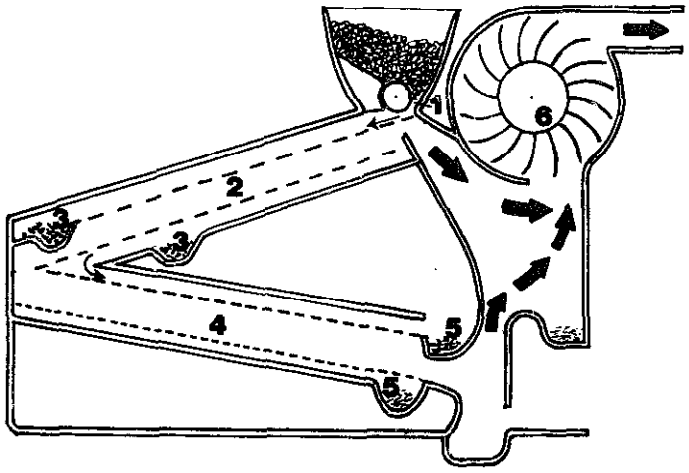
7) Grain that is precleaned before drying improves the efficiency of the drying machine and produces a more uniformly dried sample.

In cleaning grain or seed, the main object is to separate all chaff, straw, weed seeds, broken and inferior seeds, dust, and other assorted rubbish from the sample. (However, some of this material can be a useful by-product with commercial value.)

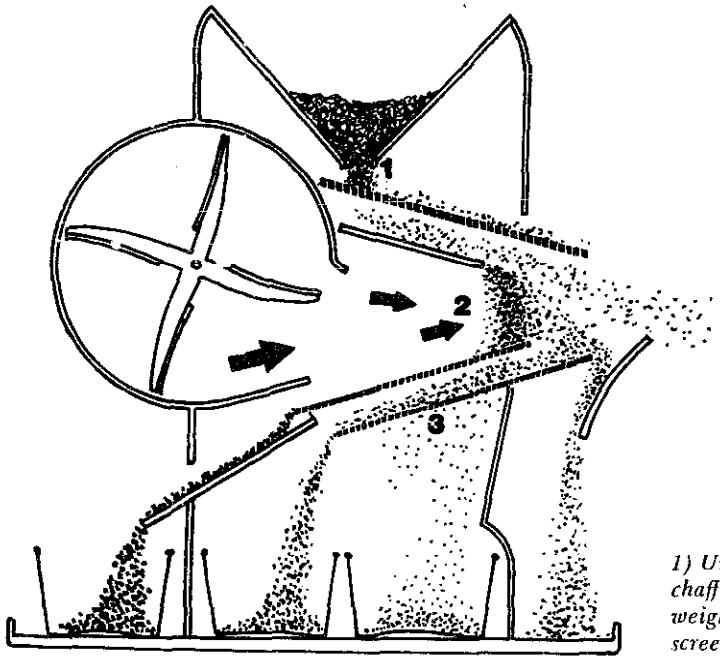
Most machines used for cleaning also grade the grain according to size, shape, specific gravity, and/or weight of the seed. Seed cleaners commonly used on farms vary considerably in the quality of work done. The cleaner may be a very simple riddling or winnowing machine, or a complex dresser which employs a number of processes to treat or dress the grain. Some of the processes commonly used by seed cleaners are:

1) Screening over a sieve in order to remove stalks, stones, and other large roughage.
2) Separation by a blast of air, using either a winnowing or an aspirating device.

*Two Methods of Cleaning and Grading Seed.*



*1) Uncleaned mixture leaves hopper and 2) passes across large mesh screen. 3) Large matter collects in pockets at end. 4) Mixture passes over finer meshed screens into 5) more collection pockets. 6) Fan keeps dust and fine particles moving to exit.*



*1) Uncleaned mixture leaves hopper. 2) Fan blows chaff through exit hole and separates seed by weight. 3) Seed passes across different meshed screening for four grades.*

3) Rotary screens or nests of sieves usually separate the grain or seed into a number of samples according to width.
4) Indented cylinders or pockets are used to separate the sample according to length.

Some machines will simultaneously clean and grade a sample of grain or seed, while others will perform only one of these functions. They are grouped below according to the mechanism used for cleaning and/or grading.

## OPERATING AND ADJUSTING CLEANERS AND GRADERS

Considerable skill is required to operate efficiently the various types of cleaners and graders that are available for farm use. Grain samples are variable and the correct setting for one particular sample may not be appropriate for the next sample. The following adjustments are usually available to properly set a machine for a given sample of grain:

1) The air blast can be adjusted by either regulating the fan blind or altering the speed of rotation.
2) The slope, length, and frequency of vibration of a machine can be adjusted to suit the requirements of a particular sample.
3) The sieves themselves are interchangeable for different sizes and types of grains.

## NORTH AMERICAN SOURCES OF SEED CLEANERS

### The Model 30 Burrows Seed Cleaner and Grader

This is a small-sized seed cleaner and grader, suitable for seed testing or cleaning small lots of seed. It has a small chaff or scalping screen on top and large cleaning and grading screens below. Standard equipment includes any four chaff–grading screens and any four double-grading screens. A suction fan removes chaff, and the screens remove large particles and damaged seeds. Its capacity for wheat and other grains is 20 to 30 bushels per hour. For clover and other seeds, it can process 2 to 10 bushels per hour. Shipping weight of this cleaner is 145 pounds. The screens weigh extra. This unit can be operated by hand or a ¼ h.p. motor. A bagging attachment is available.

### Model 75 Burrows Seed and Grain Cleaner and Grader

This unit has a capacity of 60 to 75 bushels per hour when cleaning and grading wheat or other heavy grains, and 10 to 25 bushels per hour when cleaning and grading clover and other lighter seeds. This is a four-screen machine which has two separate shoes with two screens in each shoe. The scalping screens remove sticks, stems, pods, and other large particles; the grading screens clean the seed or grain and separate the cleaned seed into two grades when two screens are used. A high-speed multivane fan removes chaff and other light material. The Model 75 Burrows requires a ½ h.p. electric motor for use without an elevator. When a charging elevator is used with the cleaner, a ¾ h.p. electric motor is needed.

### Burrows Heavy-Duty Double-Spiral Separator

This machine separates anything round from anything that is not round, according to the manufacturer. Vetch, peas, soybeans, pepper, rape, turnip, coriander, milo, mustard, and other round seeds are easily separated from wheat, oats, barley, flax, corn, screenings, rodent chips, etc. No power is needed. The Double Spiral separates by gravity to remove round seeds from oblong grains, screenings, or weeds.

The machine consists of two units of spirals which feed from the same hopper and deliver together at the bottom. At the top is a large hopper with an adjustable feed plate for each unit of spirals. The seed leaving the hopper runs over a cone divider which spreads the seed evenly to each of the five flights in each unit. Going down the flights, the round kernels travel at a much faster rate of speed than the other kernels. Their momentum increases until they run over the edges of the spirals, drop to the housing spiral and roll into a tray at the bottom of the machine. A single discharge chute is standard unless the double chute is specified. The double chute separates the round seed into two grades, portions of which can be controlled by adjusting levers.

The unit is built from galvanized steel, is set in a strong steel frame, and measures 77 inches high, 42 inches wide, and 22 inches deep. Its capacity is 10 to 50 bushels per hour (30 to

35 bushels per hour for soybeans). Shipping weight: 200 pounds. Available options include self-cleaning hopper, laboratory sample spiral (single, 5 feet by 20 inches, with two flights), heavy-duty single spiral (20 inches diameter).

### Spiral Grain Cleaner Model 2825

As the screen and spiral rotate in this model, the spiral moves the grain over the screen. Because of the movement of the screen and spiral and the horizontal construction of the machine, the grain flow is completely controlled and distributed more effectively than in an operation depending on gravity. The spiral in the grain cleaner assures that the grain will be carried over the largest possible screen area. The result is thoroughly cleaned grain that dries faster to help eliminate spoilage. This cleaner is belt-driven for economical and reliable power. Easily interchangeable screens are available for most grains. The cleaner was designed for easy maintenance, and performance-tested to insure best results. Model 2825 is 24 inches in diameter and 6 feet long, with a capacity of 1,200 to 1,500 bushels per hour (for dry corn). It requires a 1 h.p. motor.

All the above cleaners are available from:
Burrows Equipment Co.
1316 Sherman Ave.
Evanston, IL 60204

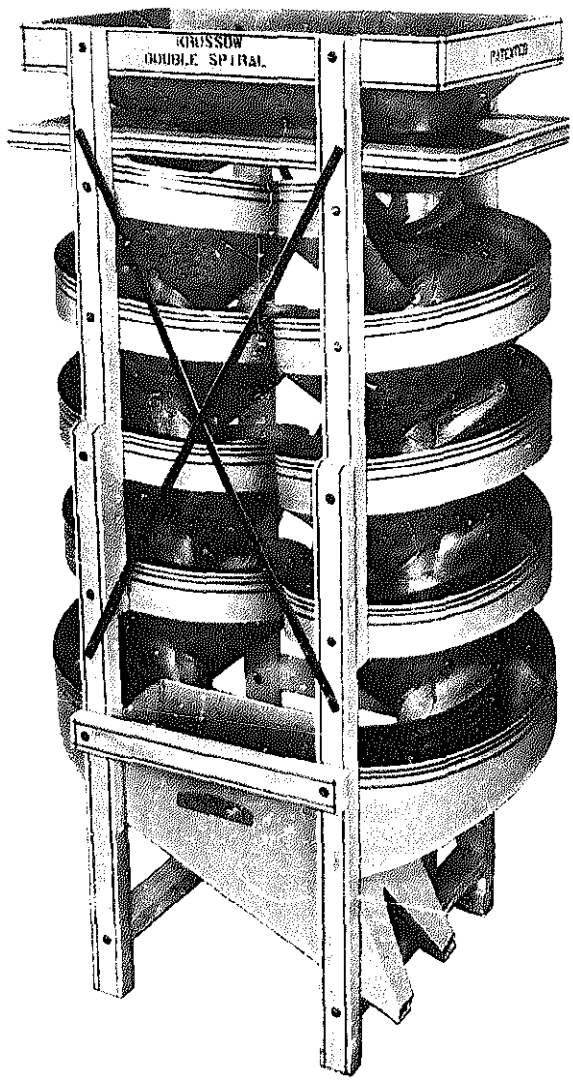
### Seedburo Cleaner

The Seedburow No. 464 seed cleaner is similar to the Burrows No. 30.

Seedburo Equipment Co.
1022 W. Jackson Blvd.
Chicago, IL 60606

### Power-driven Seed and Grain Cleaner

This unit cleans and grades 2 to 10 bushels of small seed and 20 to 30 bushels of large grains per hour. It has a galvanized steel housing, smooth-action upper scalping or chaff screen, controlled-vibration lower cleaning and grading screens, and the suction of an adjustable airstream. Eight screens provide 12 different screening combinations. The cleaner requires little operating or storage space; it measures 23 by 38 by 40 inches high. It is shipped from the factory near Columbus, Ohio.

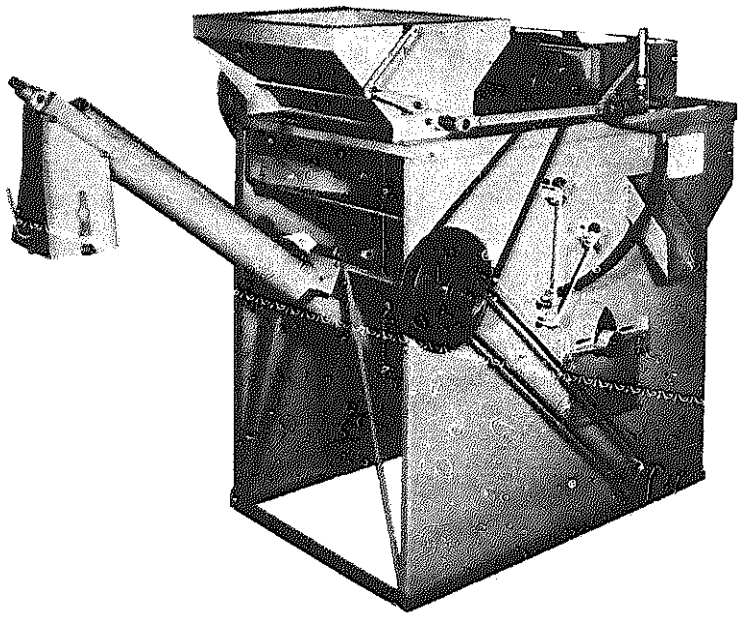


*Spiral Separator*
Seedburo Equipment Co.

Sears, Roebuck & Co.
Farm and Ranch Catalog

### The Clipper for Sample Testing

The shoe of this model uses two 10- by 15-inch screens, one for top and the other for lower separation. The clipper also features a powerful blast fan driven by three step pulleys and controlled, adjustable shutters on air intake openings to provide intermediate air regulation. In



*Clipper Seed and Grain Cleaner M-2B*
Seedburo Equipment Co.

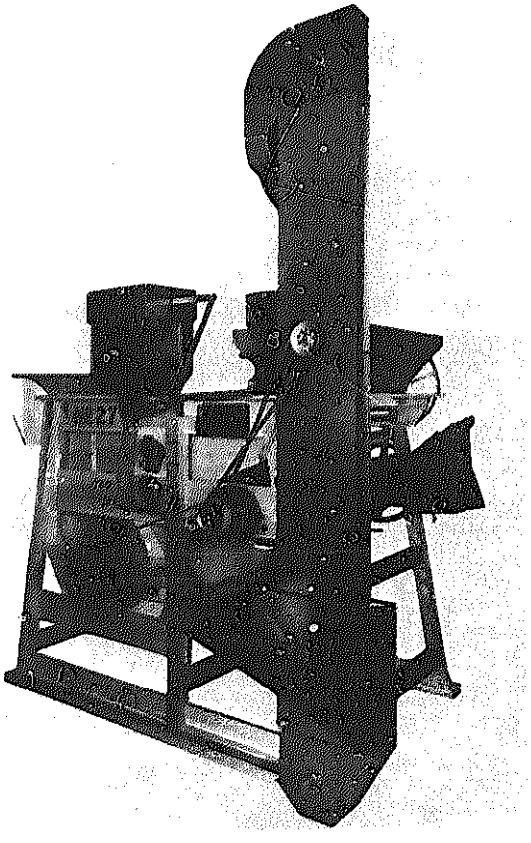
addition, it has a grain box and an air screening receptacle wth removable trays. This cleaner is operated either by a hand crank or by a ⅙ h.p. motor. The hand crank is furnished only if the motor is not mentioned on the order. Ten screens of the customer's choice and the cleaner drive pulley come as standard equipment. The Clipper Office Tester is 30 inches long, 15 inches wide, 23 inches high and weighs 45 pounds. Shipping weight: 90 pounds.

**Clipper Hand-Testing Screens**

Clipper Hand-Testing screens provide a liberal assortment of screens, enabling you to experiment with various separations and select the correct screens for each cleaning problem. For household use, you can use these hand screens to clean just as much as you intend to use. A storage rack is available.

**Clipper M-2B**

In this model, grain is fed to the hopper which spreads it evenly across the full width of the top screen. The top screen perforation is selected with large openings to hold up and scalp off large foreign matter while the grain drops through to the second screen. The lower screen is selected with openings slightly smaller than the grain. Dirt, splits, weed seeds, and im-



*Clipper Seed and Grain Cleaner No. 27.*
Seedburo Equipment Co.

mature kernels drop through this lower screen, and the clean grain discharges in the form of a curtain through the Bottom Air Blast Column. The bottom air is adjusted to remove any remaining lightweight trash or underweight kernels. This air separation is selective because the fan is precisely adjustable over a wide range. With a screen size of 24¼ inches by 22¼ inches and all-screen construction, this unit will clean up to 40 bushels per hour.

**Crippin A-234, A-334 Seed Cleaners**

The general construction and operation of the two-screen and three-screen models are similar. The first scalper on the three-screen model removes the largest trash and relieves the second scalper screen of this trash to provide more capacity and closer screening. In grading work, one more size can be obtained with this screen. All screens are interchangeable. With a 1 h.p. requirement, the Crippin Cleaner handles from 25 to 150 bushels of seeds per hour depending upon the stage of the seed.

These cleaners are available from:
Ferrell-Ross
1621 Wheeler St.
Saginaw, MI 48602

**Nursery or Test Plot Threshers**

These plot threshers, 14 inches standard or 18 inches heavy-duty, come assembled and ready for threshing small lots of grain such as sorghum, wheat, oats, soybeans, barley, and peas. Cylinder speeds are adjustable; the intake hoppers have baffles to prevent the grain from flying back out, and the air flow is adjustable for the type of grain being threshed. Both threshers have a secondary cleaning system that improves efficiency.

Maintenance is no problem: all pulleys, belts, and bearings are standard shelf items, and engine parts are easily available. Optional equipment includes a bagging spout and an extension hopper. Dimensions are 30 by 30 by 27 inches. The units weigh 200 pounds and require a 3 h.p. gasoline engine or a ¾ h.p. electric motor.

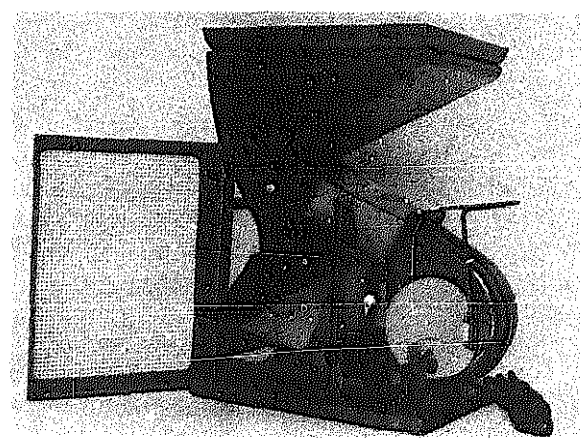
**Lee Grain Cleaner**

Lee's Model A Cleaner uses a waterless cleaning process, tumbling each grain kernel between a rotating stone wheel and a stationary wheel. Each kernel is polished, scrubbed, and the outer hull scoured away by the rubbing action of the stones, without disturbing the germ. Following the dry scrubbing phase, the grain passes through an air separator which removes fine particles of dirt, dust, chaff, and bee's wings, or loose hulls. With the cleaner properly adjusted, dirt and foreign matter amount to about 2 percent of the final product by weight. The cleaner uses a dual voltage ¾ h.p. single-phase motor to clean 150 to 200 pounds of grain per hour.

Lee Engineering Co.
2023 W. Wisconsin Ave.
Milwaukee, WI 53201



*ALMACO Air Blast Seed Cleaner* Allan Machine Co.

**Air Blast Seed Cleaner**

Designed for the precision work of research experiments, the Air Blast Seed Cleaner has two interchangeable screens with 1/8-, 1/4-, 3/8-, and 1/2-inch wire mesh openings, two seed catch pans, and a 180-cubic-feet-per-minute blower. It is made of wood; dimensions are 20 by 12 by 23 inches.

ALMACO, Allan Machine Co.
P.O. Box 112
Ames, IA 50010

**Grain Cleaner**

The AVI Grain Cleaner is patterned after the simple, efficient fanning mill cleaner-separator that was common around the turn of the century. This mill is designed for hand operation but may also be driven by any external power source. In operation, the threshed wheat is poured into the top hopper and is shaken through a series of screens which separate the grain from the dirt and chaff. The reciprocating action is accomplished by a cam and pitman arm attached to the camshaft. The fan itself is driven by a hand-operated sprocket and chain and essentially blows away all the chaff, dust, and lighter seeds. The cleaned and separated grain is ejected from a trough at the rear of the machine. All hardware is made of cast iron and steel. All screens are galvanized. The frame is of oak, and hopper and screen housings are of alder or maple. The fan is galvanized sheet metal, and is driven by a 6:1 ratio sprocket and chain assembly. The width of this cleaner is 28 inches, length is 42 inches, and height is 36 inches. Weight: approximately 125 pounds.

## INTERNATIONAL SOURCES OF GRAIN AND SEED CLEANERS

### The N.I.A.E. Cleaner

The N.I.A.E. cleaner was developed for cleaning grain samples received from plot combines and threshers. As these samples often contain 60 to 70 percent chaff and straw, an air aspirator is used to remove this material first. The semicleaned sample then passes over a double sieve-cleaning riddle. Capacity is 25 samples per hour, based on samples received from the N.I.A.E. plot combine.

R.G. Garvie & Sons
2 Canal Road
Aberdeen, Scotland

### CeCoCo Paddy Separator

Because of the different sizes, shapes, and degrees of maturity of grain, no rice huller can hull every paddy completely in one operation. Any attempt to hull all of a paddy will result in excessive breakage. When a mixture of hulled and unhulled rice is fed into the hopper of separator, it glides down along the surface of multistaged, inclined wire screen and separates the rice into four kinds: (a) completely cleaned, hulled rice, (b) unhulled rice, (c) unripened and imperfect rice, and (d) broken rice with mud, sand, or dust. It is also used for sorting the polished rice for grading. It is made of hardwood and can be dismantled and folded down for storing. Wire screens of different sizes are furnished to meet varying needs. It will separate paddies at a rate

of about 70 bushels per hour and also grades brown rice.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka, Pref. 567 Japan

**Heid Saat 6**

The Heid Saat 6 seed cleaner produces unadulterated seed grain from all kinds of large and small seeds, such as wheat, rye, barley, oats, pulse, clover, vegetables, linseed, millet, and colza. The machine is of compact, all-steel construction and its design combines all the standard elements used in conventional seed cleaning: coarse sieves, sand or grading screens, air sifter, and trier cylinder. Suitable screens and indent cylinders are available for all varieties of crops. The Heid Saat 6 is equipped for drive by either electric motor or a handwheel. Weighing no more than 150 pounds, the machine can be trundled from place to place like a wheelbarrow by a single person. It has a 0.4 h.p. requirement and an output of 300 pounds per hour.

**CeCoCo Bean Separator and Grader**

This machine will automatically separate and clean beans from dust, grit, stone, mud, sand, seeds, or any other foreign matter and classify them into three grades—small, medium and large—by means of interchangeable screens. Of wood construction, the separator is available in four sizes:

| Type | Hourly Capacity | Power Required |
|---|---|---|
| No. 1 | 50-60 bushels | ½-1 h.p. |
| No. 2 | 40-50 bushels | ¼-½ h.p. |
| No. 3 | 8 bushels | Hand |
| No. 4 | 12-16 bushels | ¼ h.p. |

**CeCoCo Bean Cleaner and Separator**

This unit is specifically for use with the red bean and other round-shaped beans. The input funnel is equipped to regulate an even flow of beans to the first separating device, which removes impurities, husks, and dust, and onto the second separating plate, which removes imperfect or immature beans. There are provisions for adjusting the machine to fit the specific bean being cleaned.

**CeCoCo White Rice Cleaner**

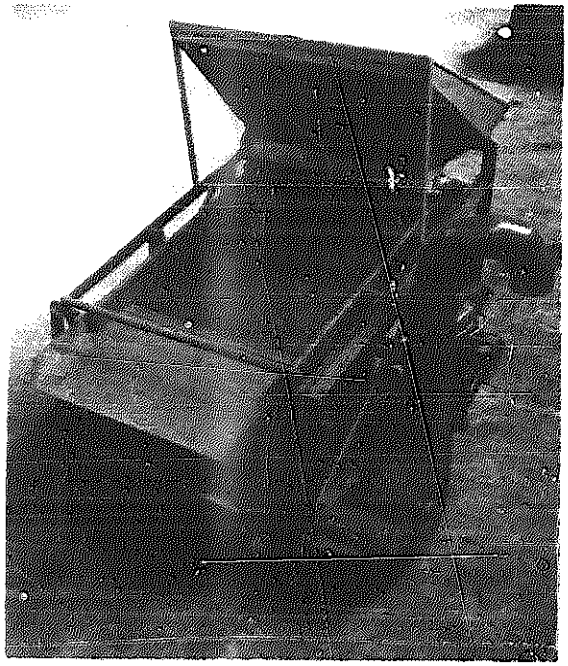
Using the difference in weight between grains and the accompanying impurities, this machine will separate rice from dust, sand, stone, grit, and other foreign substances. The machine is light; the heaviest of the four models weighs 110 kilograms. Also, it requires only 1/12 to ½ h.p. to operate.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka, Pref. 567 Japan

**IRRI Power Grain Cleaner**

The Power Grain Cleaner uses rotary screens in conjunction with an air blast. This combination simplifies the design and permits extended exposure of a tumbling mass of grain to air, resulting in improved cleaning.

It is ideally suited for tropical countries and was designed particularly for rice mills, farms, warehouses, and experimental stations. The grain is cleaned by means of two concentric cylindrical screens. The inner screen retains large impurities but lets the grain through.



*Power grain cleaner with 1.6 to 2.5 ton per hour capacity.*
International Rice Research Institute

Smaller impurities like sand, dust, and weed seeds pass through the outer screen. This cleaner has an adjustable air opening for quality cleaning and an adjustable feeding rate. The three pulley settings result in approximate cleaning capacities of 1.6, 2.0, and 2.5 metric tons per hour by powering with a 1 h.p. electric motor.

**Improved Portable Grain Cleaner**

The International Rice Research Institute has released an improved and simplified model of the small, oscillating grain cleaner for manufacture which has a 1-ton per hour capacity. It includes a 12-millimeter plywood body attached to a light-gauge angle iron frame and legs. An integral, eccentric drive and blower arrangement provide for both screen oscillation and air discharge to aid the grain cleaning. It is equipped with a small motor. Construction plans and sources of machinery are available from IRRI.

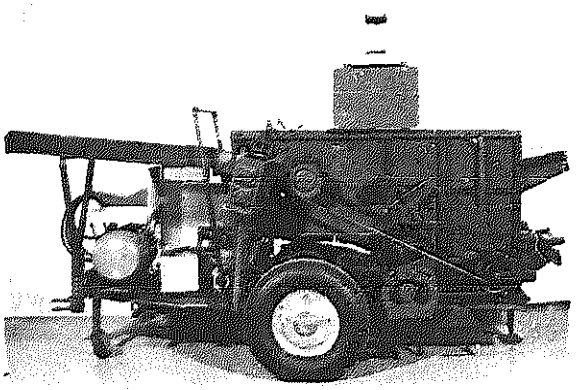
**Oilseed Thresher**

This thresher, designed for a variety of oilseed crops such as safflower, flax, sunflower, and others, cleans by means of a straw walker, sieve, and fan combination. Spring-loaded crushing rolls and variable cylinder speeds from 200 to 1,200 rpm are used. The Engineering Research Service at Agriculture Canada found this to be one of the best research threshers because it will also handle a number of other crops, from field beans to alfalfa. It is, however, expensive to produce, and is not available commercially. Interested parties should contact:



*Oilseed Thresher*
Agriculture Canada

Engineering Research Service
Agriculture Canada
Ottawa, Ontario, K1A OC6, Canada

**Forage Plot Thresher**

This small-capacity thresher, which cleans by means of a straw walker, sieve, and special aspirator fan, uses a radial rubber rub bar against a rubber mat for hard-to-thresh forage plants. The plans are available from the Engineering Research Service of Agriculture Canada, but only on microfilm. Inquiries about possible manufacture should be directed to:

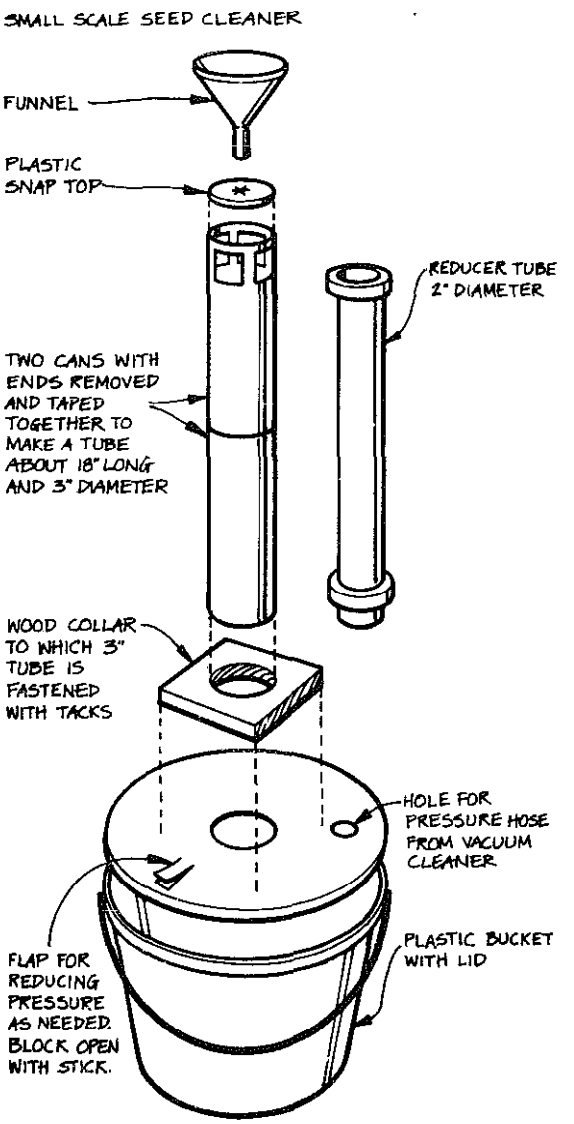
9 King Street
London, WC2E 8HN, England

**Small-Scale Seed Cleaner**

Farmers have been inventors for hundreds of years. As long as there are jobs to be done, individuals like Tim Sanford of Alexander, Maine, will be devising easy, inexpensive tools like his seed cleaner.

The cleaner, which uses a vacuum cleaner, a plastic snap-cover pail, a funnel, and a mailing tube, can clean over 100 pounds of seed per hour, though we wouldn't recommend it for anyone with over 1,000 pounds of seed to clean. "It works quite well, but not perfectly, for wheat and our seeds," Sanford explains.

To operate the seed cleaner, a steady stream of the grain to be cleaned is poured into the funnel. If it clogs, a thin stick will unclog it.



Adjust the airspeed (the vacuum should be blowing into the bucket) so the good seeds (the heavier parts) will be just heavy enough to escape being blown from the chaff holes at the top and will fall to the bottom. The inner tube (Sanford uses a cardboard mailing tube) can be made smaller to get more force from a vacuum cleaner with low pressure.

# -8- Processing Equipment

## GRINDING AND CRUSHING EQUIPMENT

In processing a crop for either human or animal consumption, it is generally necessary to reduce its size by either grinding or crushing it. This process is useful for correct feeding of livestock, since it increases the digestibility or palatability of the crop and also facilitates mixing it with other constituents of the feed. There are three basic kinds of mills used to crush or grind the harvest: (1) burr mills with either stone or steel burr plates, (2) roller mills, and (3) hammer mills. Before it is stored, the ground material is usually graded by sieving, as different sizes of material are used for feeding the various farm animals. For example, a coarser mixture is used for beef cattle, sheep, or laying hens, and a finely ground feed is more suited to high-producing dairy cows and young chickens. Oats, owing to the presence of fiber in the husk, are usually ground to a fine state for poultry feeding.

According to W. C. Krueger, author of an article entitled "Basic Principles Involved in the Design of the Small Feed Grinder," which appeared in the July 1927 issue of *Agricultural Engineering*, "the problem of feed reduction has always been of vital interest to farmers. From the time of the first horsepower burr mills to the largest present-day attrition mills, the progress in mill development has been towards faster, cheaper, and more economical grinding. Custom mills operated by waterpower or steam supplanted the use of the individual horse-operated mills. The development of the gas engine, however, resulted in a revival of the individual farm mill, improved and reduced in cost by this time."

Krueger goes on to explain that with the coming of electrical power to villages and country towns, custom feed-grinding enjoyed a brief revival. The new attrition mills produced a feed of better quality than that ground in farm mills, and farmers once again brought their feed crops into town for grinding. Later, when electricity was available to everyone, even rural dwellers, farmers began investing in electric motors to run their own mills.

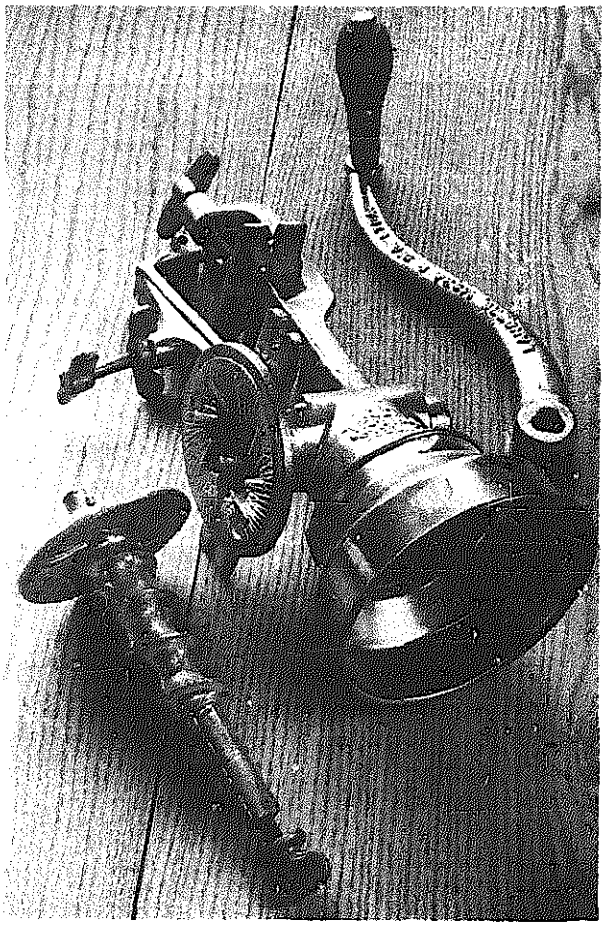
Today, most milling is done right on the farm. The self-sufficient small farmer needs a mill which will serve a variety of functions involving both the household and farm. He should seek long-term economy and durability while satisfying his every milling need.

A burr mill is generally a better choice than a hammer or roller mill if you will need to do fine milling for household flour. Hammer mills are quite popular on the farm for grinding animal feed, but they do not produce a uniform grind, and are therefore not appropriate for milling flour. They are rugged and can grind different kinds of dry material at one time into different textures. Probably the most expensive mills to buy, yet the cheapest to operate, are the roller mills. They put out a good-quality feed, produce little waste, have a high-production capacity and require little power.

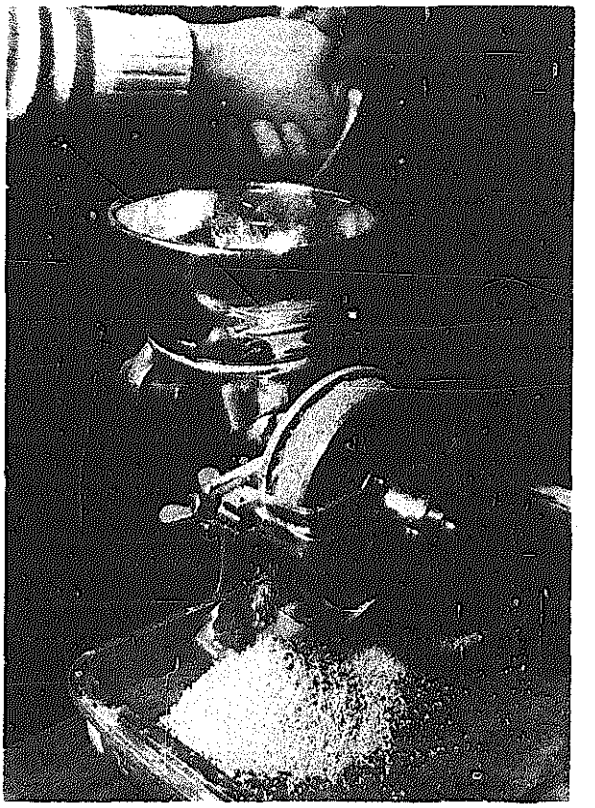
### SMALL GRINDING UNITS

Many kitchen-scale grinding units are available for grinding both feed and household flour. Their output is considerably lower than that of mills specifically designed for farm use, but their versatility makes them worthy of consideration when only a few animals are kept on the farm.

Domestic mills are either hand-cranked or run by a small motor. Metal burr grinding plates are suitable for grinding and cracking grains, hulling some seeds, splitting peas, grinding coarse cereal, and making flour of a degree of fineness acceptable for bread. For a pastry-fine flour, stone mills are best. They can be used only with dry grains and seeds of 12 percent moisture or less. Moist seeds have a tendency to glaze the stones. If this happens, passing very hard winter wheat or very dry corn through the stones at their widest setting will clean the glaze away.



*A cast-iron, steel burr mill disassembled to show feeding auger, stationary burr plate and interchangeable burr plate on auger.*



*Grinding pastry-fine flour with a stone burr combination hand mill.*

But these mills are not made for certain jobs, and the manufacturers' guidelines should be followed carefully.

The most versatile type of mill is called a burr/stone conversion. One plate is a stationary burr which cannot be removed. The operator has the choice of interchanging a stone or burr for the other plate. A fine flour can be obtained from the burr/stone combination while the burr/burr combination will crack grains, handle oily seeds, and make nut butters.

Most electric mills designed for small-scale household use have stones. Often a hand crank is available in the event of a power failure.

## SOURCES OF HAND MILLS*

### All-Grain Mills

The H-1 Metal Burr plate mill is designed for cracking cereals; Model H-10 has stones and burrs. The grooved stones are designed for slow turning and will grind fine flour the first time through.

* For specifications and more detailed information on 75 household grain mills, write to *Organic Gardening* Readers' Service, 33 E. Minor St., Emmaus, PA 18049.

All-Grain Distributing Co.
3333 South 900 East
Salt Lake City, UT 84106

**BH Grain Mill**

This mill has a cast aluminum body with a chrome steel auger. Its artificial, adjustable stones will grind fine flour or coarse cereal.

Agri Resources
RR 3, Napanee
Ontario, K7R 3K8 Canada

**Corona Burr Mill**

This cast-iron burr mill grinds one pound of cereal per minute. It is adjustable for fine flour (which must be run through several times) or coarse cereal. The Corona Stone Mill with two stones is available for grinding fine flour the first time through. A conversion mill is also available.

**Red Chief Feed-Grinding Mill**

The Red Chief, which can be used with all small grains and is especially recommended for poultry feed, grinds 1 to 2 bushels per hour. Spring tension regulates the fineness of ground material. Triplex and flat steel burrs are used in the process. The mill fastens to a box or barrel.

Cumberland General Store
Route 3, Box 479
Crossville, TN 38555

**S.A.M.A.P. Cereal Grinder**

Also designed for specialized milling of very dry grains, the S.A.M.A.P. Cereal Grinder is a vertical-axis mill using natural stone granules embedded in stabilized magnesite cement. Fineness of grinding and the rate of grain feed between the stones are adjustable. Controlling the rate at which the grain is fed is a unique feature to the S.A.M.A.P. mill which allows the operator to determine the difficulty of his grinding stroke. The weight of this unit is 19¼ pounds (8.75 kilograms). (See photo on page 337.)

**Stone Miller**

The AVI Stone Miller grain grinder is specifically designed to make it easy to grind wheat into fine flour in one grinding. It should be pointed out, however, that what is gained in ease is lost in speed. Although primarily designed for hand power, this mill can be efficiently run with an external power source. It is made of reinforced cast iron with gears providing a 2:1 reduction for easy grinding. The 18-pound, 16-inch diameter flywheel handle drives an auger which feeds grain between two 5-inch stones. The stone separation is adjustable and the hopper holds 4 pounds of grain. Total weight: approximately 55 pounds.

**Little Gem Hand Mill and Juicer**

This is an adjustable cast-iron, stone, hand mill. Turn the handle to the left to grind grain, to the right to make juice.

Little Gem Mills
23655 S.W. Francis
Beaverton, OR 97005

**O.B. (Quaker City) Steel-Stone Grinder**

This model has two sets of metal burrs—coarse burrs for cracking grains and grinding oily grains and seeds, and sharpened burrs which grind flour from oily grains that would clog stone grinding surfaces. This company also carries the Victoria stone-burr combination mill. (See photo on page 337.)

Sterling H. Nelson & Sons, Inc.
525 South 500 West P.O. Box 1296
Salt Lake City, UT 84110

**Victor Stone-Burr Mill**

This cast aluminum and durable plastic mill has a stone grinding surface and a stainless steel screen to sift flour to a uniform texture. Pulleys are available to attach the mill to a motor.

Victor Mfg. Co.
8141 4th SW
Seattle, WA 98106

**Little Ark Hand-Electric Stone Mill**

This mill is designed to grind all dry grains and should not be used to regrind flour previously ground or to grind damp grains. It can be motorized, but the stones should be set at 150 rpm or less to avoid damaging them. A ⅓, ½, or ¾ h.p. motor can be used.

Retsel Corp.
Little Ark Division
McCannon, ID 83250

## SOURCES OF ELECTRIC MILLS

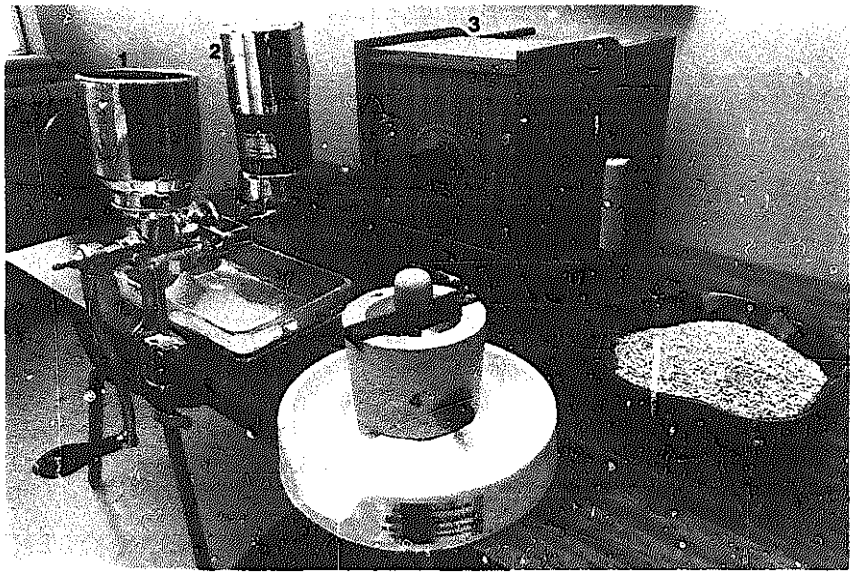
**All-Grain**

The All-Grain has a turbine-cooled air mechanism. The silicon carbide stones are placed horizontally inside a metal housing. There is a five-year unconditional guarantee on the mill, your choice of a ⅓, ½, or ¾ h.p. motor, and the stones. (See photo on page 337.)

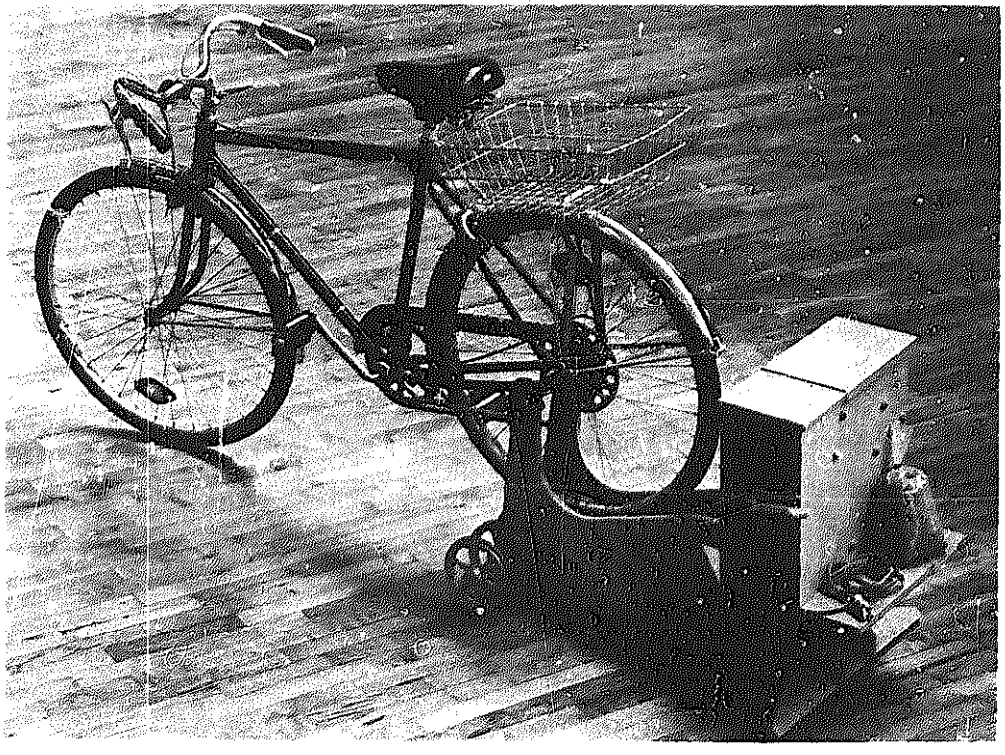
All-Grain Distributing Co.
3333 South 900 East
Salt Lake City, UT 84106

**Lee Engineering Company Mills**

This firm offers either fully adjustable grind or fine grinding mills. An automatic mechanism feeds the aluminum oxide grinding stones. The polyethylene hopper holds approximately 4 pounds of grain. Grinding rates for the ⅙ h.p. mill are 3 to 5 pounds per hour of fine flour, 20 to 25 pounds per hour of coarse meal. Rates for the ¼ h.p. mill are 6 to 10 pounds per hour for fine flour, 40 to 45 pounds per hour for coarse meal.



*1) Victoria Combination Hand Mill. 2) All-Grain Power Mill. 3) Marathon Uni-Mill. 4) S.A.M.A.P. Hand Mill*



*Homestead Industries in California once made this power transfer unit to adapt their mill to pedal power. It is no longer available commercially but the technique is simple enough for the tinkering miller to duplicate. A wheel secured against the rear bicycle tire transfers power to a pulley which can operate any mill whose driving mechanism can be fitted with a pulley and run with a V-belt.*

Lee Engineering Co.
2023 W. Wisconsin Ave.
Milwaukee, WI 53201

**Marathon Uni-Mill**

This unit has a particle board cabinet with a ½ h.p. motor and a direct-drive handle for

manual operation. The adjustable stones have a shear-slice grinding action which grinds 1 pound of flour per minute and 2 pounds of cereal per minute. (See photo on page 337.)

The Grover Co.
2111 S. Industrial Park Ave.
Tempe, AZ 85282

**The Harvest Mills Mill**

The spring tension on the stones in this mill prevents them from locking due to the heating of grinding, and it absorbs the shock from foreign materials entering the grinding area. The mill has a ¾ h.p. motor with a 1-year guarantee, stainless steel hopper and drawer, and an oak cabinet. It produces flour at a rate of 60 to 70 pounds per hour. A hand-crank adapter is provided.

KBL Enterprises
3471 South West Temple
Salt Lake City, UT 84115

**Excalibur**

This mill has a ½ h.p. capacitor-start motor with a ¾ h.p. motor optional. The ¾-inch birch cabinet is standard, but other woods are available as options. The 5- by 1-inch stones are fed by a 7-cup capacity hopper producing 42.1 pounds of fine flour per hour.

Excalibur Products
57711 Florin-Perkins Rd.
Sacramento, CA 95828

**Golden Grain Grinder**

The stainless steel inserts on this model crack the grain before it enters the stones, producing less grit in the flour and less wear on the stones. The self-cleaning stones produce up to 40 pounds of flour per hour. A ¾ h.p. motor and hand crank are provided.

Golden Grain Grinder
Division of Kuest Enterprises
Box 110
Filer, ID 83328

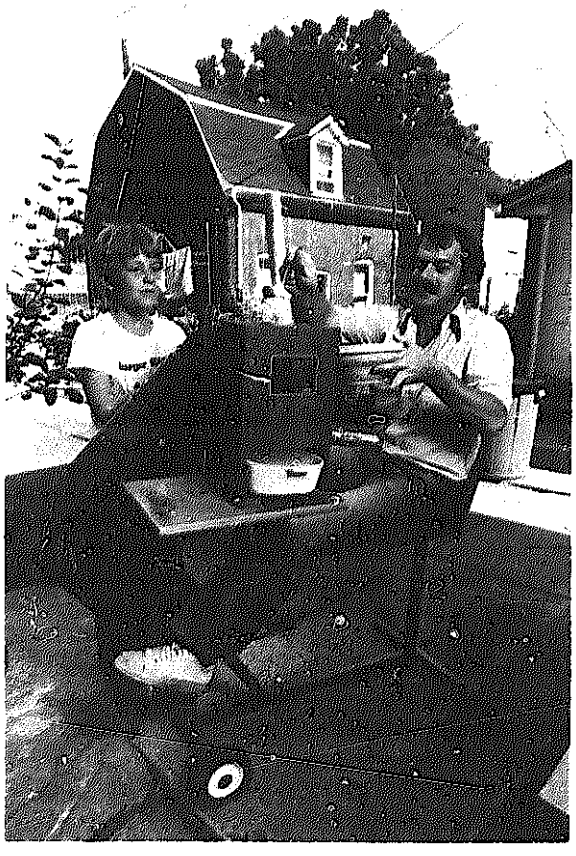
**Little Gem Mill**

A ⅓ h.p. motor gives the Little Gem a grinding rate of 25 pounds of fine flour per hour and 100 pounds of coarse meal per hour. The mill comes with a hand conversion kit and birch cabinet.

Little Gem Mill
23655 S.W. Francis
Beaverton, OR 97005

**Miller Boy Mill**

On this model, a ⅓ h.p. motor powers the tungsten-carbide shears which cut the grain before it is fed into the stones. The mill will grind approximately 36 pounds per hour. Two cabinets are available with different bin capacities.



*The Miller Boy Mill seen here has been modified from electric to pedal power. The pedal power unit, called the Energy Cycle, is a product of Rodale Resources Division, Emmaus, Pa.*

Magic Valley Industries, Inc.
405 Highway 30
Filer, ID 83328

**Mil-Rite Stone Mill**

The 5-inch adjustable stones of this mill are powered by a ¼ h.p. motor, for a grinding rate of 12 to 15 pounds per hour. Hand conversion is provided. The model carries an unconditional 2-year guarantee.

**Romper Stone Mill**

This mill grinds 3 pounds of flour per hour. Hand conversion is available.

R & R Mill Co., Inc.
45 West First North
Smithfield, UT 84335

**Great Northern Flour Mill Kit**

The tools needed to assemble this mill include a hammer, screwdriver, wrench, nails, and glue. The kit includes milling stones with a mounting arbor, ready-to-finish birch cabinet pieces, a Dayton ½ h.p., 3,450 rpm capacitor-start motor with cord and switch, a 17-cup capacity flour pan; a 6-cup capacity grain feed funnel, and all the necessary hardware and instructions. The stones are guaranteed for 10 years, and can be converted to hand- or bicycle-powered operation.

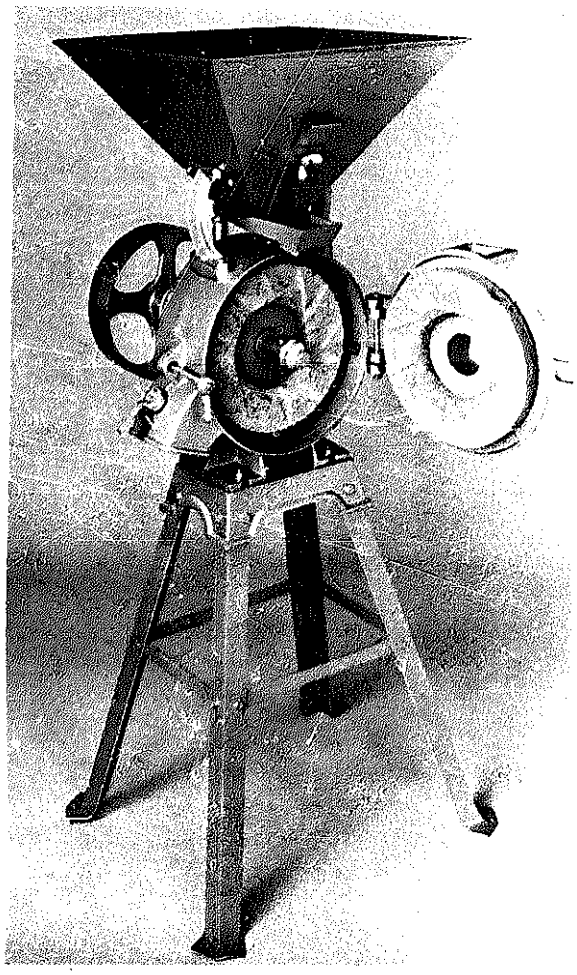
Great Northern Distributing Co.
325 W. Pierpont Ave.
Salt Lake City, UT 84101

## FARM-SCALE MILLS

### *Burr Mills*

The hand-operated grinding stone, the earliest grinding device used on the farm, somewhat resembled a mortar and pestle in form. It consisted of two pieces of stone roughly cut in the shape of flat discs. The top disc was rotated by hand over the stationary bottom disc, and the material to be ground was fed through the space between the two discs. The old-time grist mill driven by water, wind, or mule power is a good example of a mechanized version of the grinding wheel.

The modern burr-stone mill is a further development of the grinding wheel and is often referred to as an attrition mill, meaning a mill which grinds by friction. The burr mill consists of two disc-shaped stones with burrs or grooves cut into their grinding faces. The grain is fed at the center of the stones and is cracked without crushing as it passes toward the periphery. The stone discs have generally been replaced by chilled, cast-iron plates (hence the name plate mill) with corrugations or projecting cutting edges cast into the rubbing surfaces.



*The stone plates of the Moderne Mill with grooves cut on their grinding faces. The pattern is designed wide and deep for cracking near the center where grain is first fed into the mill and gradually shallows to reduce the grain to a fine flour.*
Renson Et Cie

The space between the plates is controlled by a spring-loaded, spacing screw, and the plates are usually corrugated on both sides to make them reversible. When starting a plate mill, the grain feed is blocked off and the spring pressure relaxed, leaving the plates at their coarsest setting. Once the mill is rotating at normal speed, the grain is fed into the mill. The plates are gradually forced together by tightening the spring until the desired texture is obtained.

This kind of mill is best suited for grinding meal and flour for household use since it grinds the finest and loses none of the whole grain. When set correctly, the tight hulls on barley and oats will come off in stone grinding. The ground material comes out as a flour and crushed hull mixture. The hulls, which now resemble flakes, can be sifted away. Steel-burr plates grind the entire kernel, making separation of hulls and grain much more difficult. Small, hand-operated barley pearlers are available to shatter the hull away from the kernel before the grain is milled.

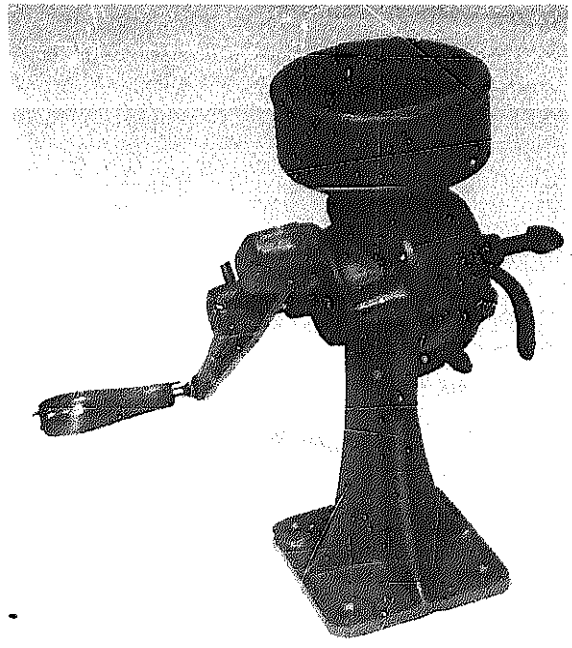
*Among the weeds, a power-take-off burr mill about to be sold at an auction.*

The main advantages of a burr or plate mill are relatively low speeds of operation (around 1,200 rpm), better adaptability for grinding texture than hammer mills, uniform grade of grinding, and fairly low power requirement. This is the farm mill best suited for kitchen use, since it grinds the finest and loses none of the whole grain. Disadvantages of a burr mill include: fast-wearing plates, the possibility of equipment being damaged by foreign objects like stone or metal fragments, a relatively high power requirement for finer grinding, and the possibility of damaging the plates when operating the mill empty, unless the pressure between the plates has been released.

## NORTH AMERICAN SOURCES OF BURR MILLS

### C. S. Bell Number 2 Hand Model

For dry grinding only, the No. 2 Model Hand Grist Mill can grind all dry, small grains, shelled corn, beans, peas, coffee, and even dried bones. The cone burrs are easily adjusted for a fine or coarse grind. The mill is furnished with a counterbalanced crank to help ease operation and allow a capacity of approximately 25 pounds

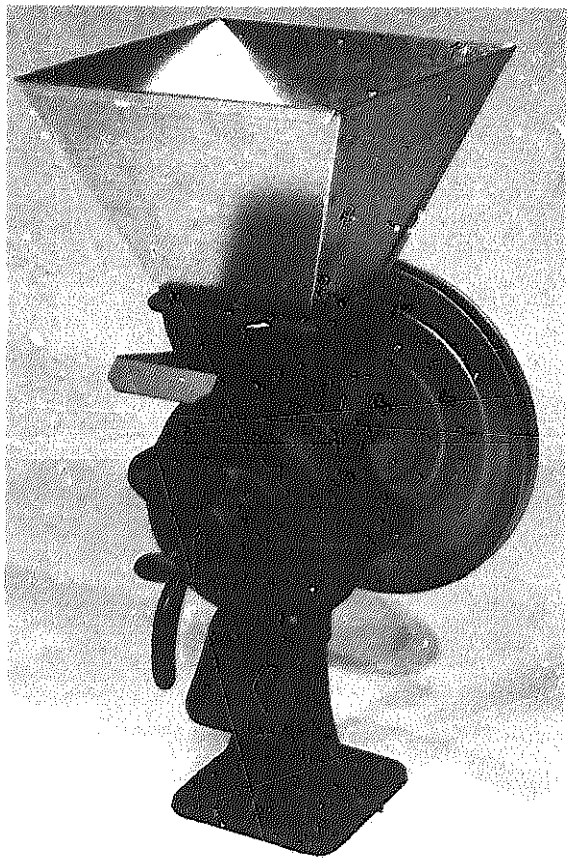


*Bell No. 2 Hand Burr Mill*
C.S. Bell Co.

per hour depending on the material being ground.

### C. S. Bell Number 60 Model Power Mill

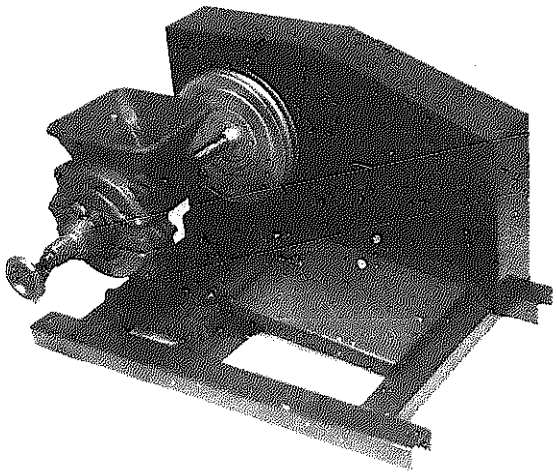
For dry grinding only, the No. 60 Model Power Mill is designed for grinding all small grains, shells, roots, bark, and salt. The unit is available with a set of coarse, fine, and extra fine grinding burrs to be operated by a 1 to 2 h.p. electric motor. A 3 h.p. motor is recommended for extra fine grinding. Depending upon the material being ground, the fineness of the grind, and the size of the motor, this mill has a capacity of 100 to 300 pounds per hour. Shipping weight: approximately 52 pounds.



*Bell No. 60 Power Mill*
C.S. Bell Co.

### C. S. Bell La Milpa

La Milpa is a large, power grist mill which can handle wet or dry grinding of grain, soybeans, bananas, wheat, and tortillas at a rate of up to 1,400 pounds per hour. The 6-inch steel alloy burrs are adjustable for coarse or fine grinding and are fed with a large feed worm for maximum capacity. A 5 h.p. motor is recommended for hard-to-grind material to maintain high capacity; however, a 3 h.p. motor will do the job. Ready for shipment, the unit weighs 110 pounds without the motor.



*C.S. Bell La Milpa Power Mill*
C.S. Bell Co.

The above three models are available from:
C. S. Bell Co.
P.O. Box 291
Tiffin, OH 44883

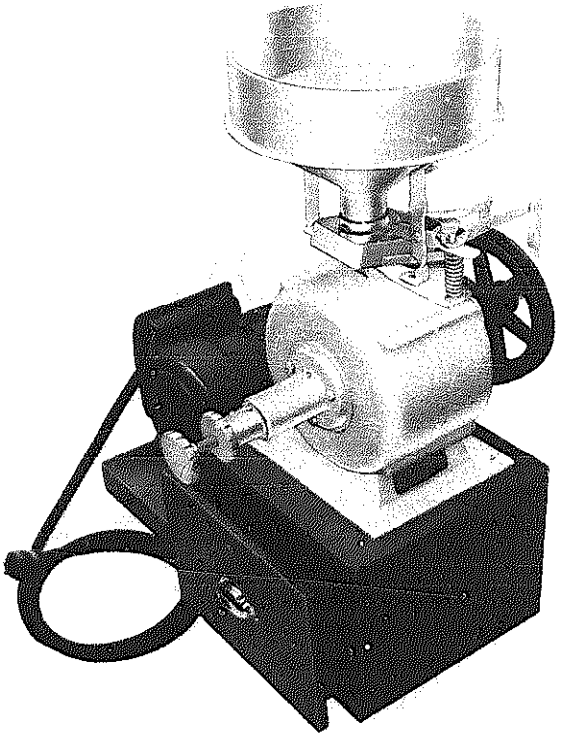
### Speed King Cracker

Incorporating 14- to 16-inch burrs powered by a 5 to 10 h.p. motor to yield a 2 to 5 ton per hour capacity, the Speed King Corn Cracker cracks and grinds shelled corn, small grains, and other grindable granular products. Shipping weight: 450 pounds.

### S-Crusher

Slightly larger than the Speed King Cracker, the Speed King S-Crusher can be driven with a 5 to 20 h.p. motor to yield a capacity from 2 to 15 tons per hour. It is designed for grinding and cracking ear corn and small grains, and for size reduction of other grindable products.

Both these units are made of cast-iron components with adjustable burrs. The product is



*The Meadows 8-inch Stone Burr Mill*
The Meadows Mill Company

cut rather than impact-ground, to eliminate undigestible particles.

Winona Attrition Mill Co.
1009 W. Fifth St.
Winona, MN 55987

**Meadows Household 8-inch Stone-Burr Mill**

Stones housed in cast iron are machined male and female for a precision fit. This mill is available with a wooden base and receiving drawer or mounted on a steel stand for bottom discharge into a bag. Eight-inch diameter stones are made of natural granite. Dry, free-flowing, small grain enters the mill at an adjustable feed-flow rate which requires no attendance.

Meadows Mill Co.
North Wilkesboro, NC 28659

## INTERNATIONAL SOURCES OF BURR MILLS

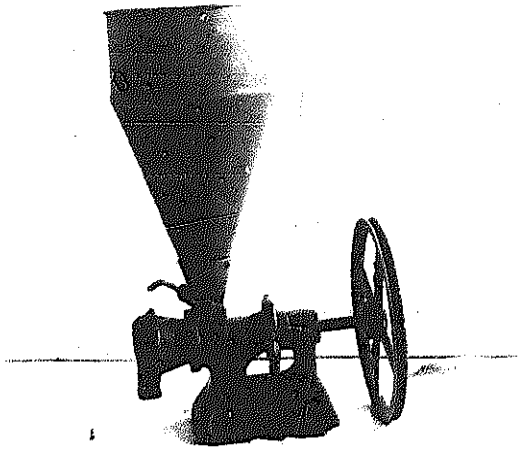
**Dandekar Mills**

Dandekar offers four vertical grinding mills employing 12- to 18-inch natural kurund stones for dry milling. The motor requirements range from 5 to 8 h.p. for capacities of 200 to 350 pounds per hour.

Dandekar Brothers
Sangli, Maharashtra
India

**CeCoCo Hand Grinder Type D**

This model is made of metal, with easily adjustable burr plates for fine or coarse grinding.



*CeCoCo Hand Grinder Type D*

It is adaptable for grinding flour from all kinds of grain and other materials such as rice, buckwheat, soybeans, and even fried fish! It has a grinding capacity of from 5 to 50 kilograms per hour, a hopper capacity of 10 kilograms, and a gross weight of 40 kilograms.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Diamant Domestic Mill**

As with all burr mills, the Diamant is suitable for grinding any kind of grain, coffee, spice, or sugar, in wet or dry form. It is easily dismantled for cleaning without special tools and comes with a selection of plates for milling different materials. By hand, its output for grinding grains is approximately 70 kilograms per hour. The handle is mounted on a large flywheel to

ease operation. A groove in the flywheel supplies the option of operating this mill with a V-belt connection to an electric motor. The features of the Diamant mill typify the different features available on most hand mills.

**Dunia Hand-Operated Grinding Mill**

This small, hand-operated plate mill is constructed of all-welded steel and has been designed in Africa for grinding maize, wheat, coffee, and other foodstuffs. The front cover can be removed for cleaning and inspection by unscrewing three wingnuts.

Ndume Products, Ltd.
P.O. Box 62
Gilgil, Kenya

**Gaubert Mini-Grinder**

This French mill is designed for crushing wheat, barley, corn, millet, and coffee. It mounts on a table or workbench with two screws and has a 350-millimeter diameter wheel with a handle for manual operation; the flat wheel rim will accommodate a belt drive to a small electric motor. This mill has interchangeable 90-millimeter grinding wheels made of cast iron. An adjustment screw varies the separation between the wheels to provide for coarse or fine grinding.

**Gaubert Senior and Junior 170 Mills**

The Senior 170, a standing mill, offers an hourly production of 150 to 400 kilograms, depending on the fineness of the grind. It operates at a speed of 450 rpm, and contains 300-millimeter emery stones. The bearings are fitted with interchangeable self-lubricating bronze rings. Options for this model include a 3 h.p., 1,500 rpm electric motor or bearing, and a mounting for tractor drive. A smaller model, the Junior 170, with a reduced hourly production, is also available.

Atlas Works, Earls Colne
Colchester, Essex CO6 2EP, U.K.

Distributed by:

Self-Sufficiency & Small-Holdings Supplies
The Old Palace, Priory Road, Wells
Somerset, BA5 1SY, U.K.

**Superb Mill**

The Superb burr mill is suitable for grinding all types of cereals. Its 270-millimeter plates are powered by a 5 h.p. motor for an output ranging from 230 to 270 kilograms per hour.

E.H. Bentall & Co., Ltd.
Maldon CM9 7NW
Essex, U.K.

**Amuda Domestic Mill**

Designed to be driven by a ½ h.p. motor, the Amuda Domestic Mill can grind all cereals finely at a rate of 18 kilograms per hour and kibble at a rate of 50 kilograms per hour.

**Amuda Flat Plate Mill Number 1**

A spring mechanism allows the plates to open and avoid damage if any hard substance enters this burr mill. It is designed for grinding all cereals, beans, spices, cocoa, coffee, and wet or dry corn. The rate of feeding the material to be ground into the milling chamber can be adjusted by regulating the shaker feed mechanism.

Both the Amuda mills are available from:
Rajan Trading Co.
P.O. Box 250
Madras 600 001, India

**Diamant Vertical Mill**

The Diamant Vertical mill employs stones of special composition available in 300-, 400- and 500-millimeter diameters for grinding dry cereals. A continuous feed flow from the hopper provides constant grinding. Diamant mills can be operated with motors ranging from 2 to 10 h.p. for outputs from 100 to 650 kilograms per hour. Another model, with steel-burr plates, has an output of 300 kilograms per hour with a 5 h.p. motor and 1,100 kilograms per hour with a 15 h.p. motor.

A.B.C. Hansen Comp. A/S
Hauchsvej 14
DK—1825 Copenhagen V, Denmark

**Moderne Mill**

The Moderne Mill has an agitator feed from a 35-liter capacity hopper into its 300-millimeter diameter grinding wheels. It has a screw adjustment for fineness of grinding. Its output ranges from 200 to 300 kilograms per hour when powered by a 4 to 5 h.p. motor. (See photo on page 339.)

Renson Et Cie
B.P. 14
59550 Landrecies, France

**Type S Cereal Breaker**

The Type S Cereal Breaker is suitable for crushing maize, rice, barley, beans, and poultry or cattle feed. It can be turned by hand or by a ¼ h.p. motor for a capacity of 40 to 60 kilograms per hour.

**CeCoCo Feed Grinder**

The Feed Grinder is an ideal machine for grinding corn, oats, soybeans, green peas, and wheat, and also for coarsely crushing fish meal and shells. Grinding plates are adjustable for either coarse or fine grinding. The double-faced grinding plates are reversible and interchangeable.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**R2 Grinding Mill**

This model's 210-millimeter diameter, vertical millstones powered by a 2 h.p. motor provide an output of fine grist at 110 kilograms per hour for wheat, 80 kilograms per hour for barley, and 90 kilograms per hour for oats.

Iruswerke Dusslingen
7401 Dusslingen
Postfach 128, West Germany

**CeCoCo Multipurpose Grinder Model FG-61**

The Star brand FG-61 feed grinder is designed to meet almost every grinding requirement. It will uniformly grind all types of dry grain such as wheat, oats, and barley, as well as peas and shelled corn, to any desired grist. The adjustable grinding plates are reversible and interchangeable. Two to four h.p. are required to operate at a capacity of from 8 to 13 pounds per hour. The unit weighs 132 pounds.

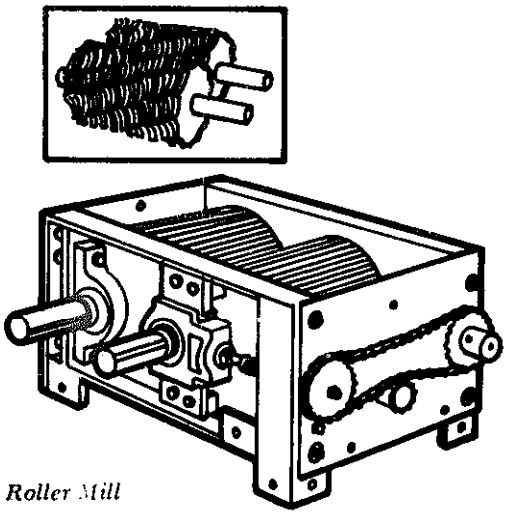
P.O. Box 8, Ibaraki City
Osaka, Pref. 567, Japan

### *Roller Mills*

The ruggedness of a roller mill makes it the most expensive to purchase of the three types available. Grain is mashed between two serrated rollers which operate with the same action as a clothes wringer, so that the teeth on one roller fit the space between the teeth on the other. One roller is usually fixed and the other can be moved to adjust the clearance between the two.



*Roller Mill*

Roller mills are inexpensive to run and have a high capacity per horsepower because they reduce particles less than other mills. This mill's low power requirement does not provide it with the power to start with even a few kernels between the rollers—it must be completely clean to work. Its function in preparing animal feed is merely to break the hard, outer seed coat of a grain to make digestion easier and more complete. This process provides an important advantage over hammer mills, in that it keeps the percentage of fines (small particles, powder, and dust) to a minimum, producing less waste.

Grain can be hulled, cracked, crushed, or ground with a roller mill; the better models are even capable of producing a fine flour. Special crushing rollers will handle any kind of grain, wet or dry, and can be used to chop green corn and barley for making silage.

## SOURCES OF ROLLER MILLS

**Stationary Roller-type Feed Mill**

The roller-crushing action of the Sears mill

minimizes dust waste. Two heavy-duty rollers (6 inches long, 9 inches in diameter) run on self-aligning ball bearings. This mill allows crimping or crushing of hard grain shells and makes feed more palatable than grain which is finely ground. It has a large 19 by 23½-inch, 16-gauge steel hopper. The hopper height, 32 inches, facilitates loading. The mill is furnished with a motor mount bolted to a stand and a 16-inch V-belt pulley. The overall measurement is 22 by 34 by 32 inches high. Requiring a 2½-inch motor pulley, this mill operates with a 4 h.p. gasoline engine or a 1½ h.p. electric motor for a capacity of 15 bushels of oats, 50 bushels of cracked corn, or 35 bushels of wheat per hour.

Sears, Roebuck & Co.
Farm and Ranch Catalog

### W-W Roller Mills

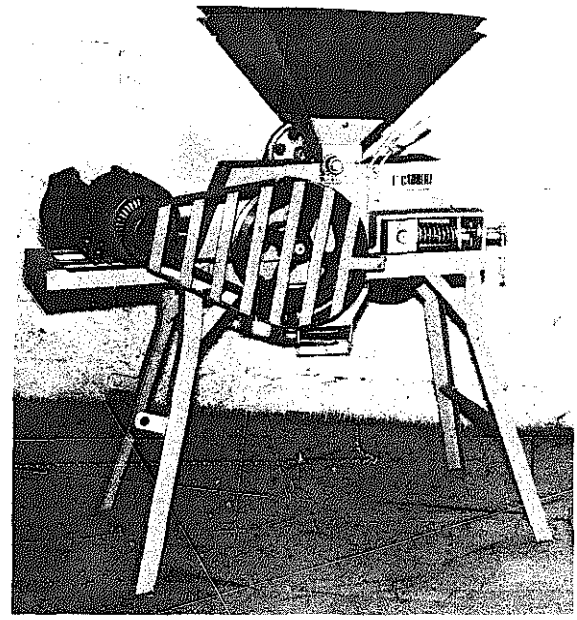
The W-W roller mill handles any type of small grain: shelled corn, oats, barley, sorghum grains, or wheat. It crimps, cracks, or crumbles, depending upon the degree of fineness desired. This mill has a heavy-duty construction, and the chilled, white-iron, 10-inch diameter rolls do not chip or peel and can be regrooved when necessary. A single control wheel handles all the adjustments. Roller sizes vary from 6 to 36 inches in diameter. Optional accessories are available.

Burrows Equipment Co.
1316 Sherman Ave.
Evanston, IL 60204

### Grain Rollers

Particularly of use in raising goats, cattle, and sheep, the Gaubert grain rollers come with two equal cylinders 300 millimeters in diameter and 130 millimeters in width. The grain-feeding mechanism is mounted in self-lubricating bronze rings powered by a 3 h.p. motor driving through a set of double pulleys and two V-belts, or through a one-flat, three-ply belt. Grains are rolled without crushing at a rate of 200 to 400 kilograms per hour, depending upon the grain.

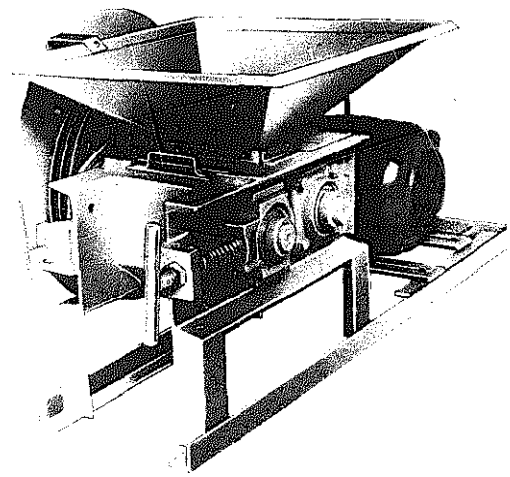
Gaubert S.A.R.L.
B.P. 24 16700 Ruffec
France



*Gaubert Roller Mill*
Est. A. Gaubert

### 6 by 6 Single Roller Mill

This 1 to 2 h.p. mill has solid white-iron rollers which are available without a corrugated surface for flaking, or corrugated for chopping, cutting, or crumbling. Its capacity for milling dry corn is 180 bushels per hour and 140 bushels per hour for high-moisture corn. Many other models are available in larger sizes.



*Roskamp 6 by 6 Roller Feed Mill*
Roskamp Manufacture Inc.

Roskamp Manufacture, Inc.

Cedar Falls, IA 50613

**BearCat Grain Roller Mills**

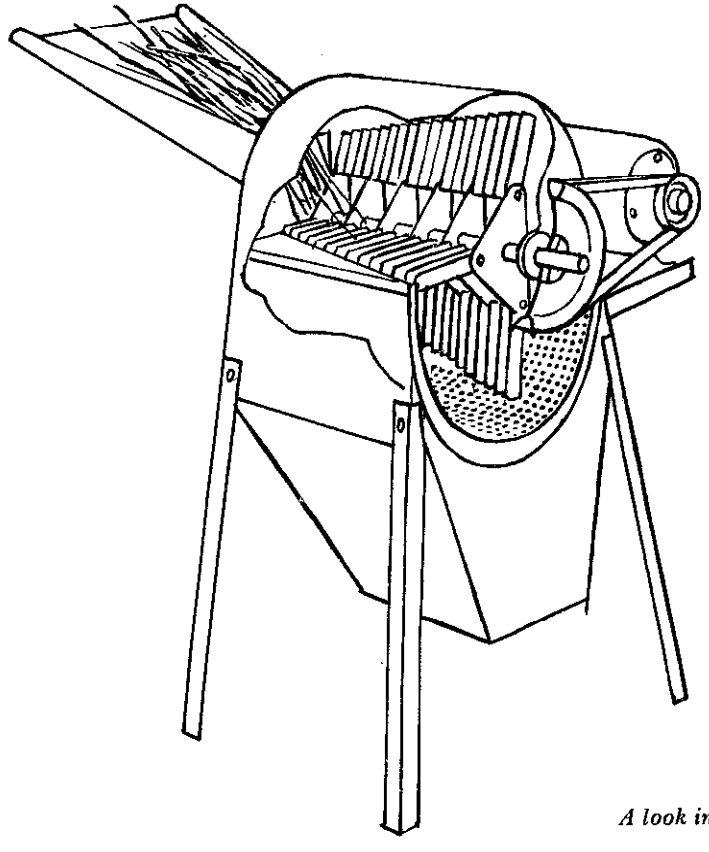
BearCat Roller Mills are available in a range of sizes between 5 and 30 h.p. and a number of power arrangements: stationary-mounted with electric motor drive; trailer-mounted with PTO drive; and stationary-mounted with PTO drive. An elevating auger feeder is available as an accessory. Rollers are one of three sizes: 10 by 12, 10 by 18, or 10 by 24 inches. BearCat also carries large hammer and burr mills.

Westernland Roller Co.
Hastings, NE 68901

### *Hammer Mills*

The hammer mill is most often used today to grind feed for livestock and poultry. Instead of having burrs for the grinding process, the hammer mill employs rows of free-swinging, steel flails whirling at high speeds with an action similar to that of a leaf shredder. The impact of these hammers reduces the particle size. The screen under the hammers controls the fineness of the ground feed; the finer the mesh, the finer the feed. Hammer mills will grind all kinds of feed, even mixed grains, ear corn, and hay.

Large units are generally driven by the power take-off shaft of a tractor. A unit which requires 20 h.p. to drive produces 10 to 20 hundredweight of ground material per hour. The smaller hammer mills are popular for farm production of animal feed and concentrate mixes, and they are usually operated by an electric motor. The actual capacity depends on the rate of feeding, the speed of the hammers, the amount of power available, the kind of material being ground, fineness of grind, size of screen mesh, and the size of the mill. The capacity of a hammer mill for a given fineness and horsepower



*A look inside a hammer mill.*

is ultimately limited by the size of the grading screen.

The main advantages of a hammer mill are its simple construction and low replacement cost for spare parts, availability in a large range of sizes, durability of hammers combined with no reduction of efficiency during their lifetime, and there is little chance of damage from hard foreign objects like stones or from empty running of the machine. The main disadvantages are an initial high cost, high power requirements, inability to produce a uniform grind, and production of a high percentage of fines.

Though a hammer mill will not produce a uniform grind, some people feel that it produces a satisfactory flour if a fine enough screen is used during milling and the material is sifted afterwards. Hammer mills are used for a number of other functions besides grinding feed—primary seed cleaning, for example. The C. S. Bell Company has successfully used their hammer mill for such homestead tasks as processing garbage for compost, grinding wood and bark for mulch, and even shredding paper for worm-farm bedding.

## NORTH AMERICAN SOURCES OF HAMMER MILLS

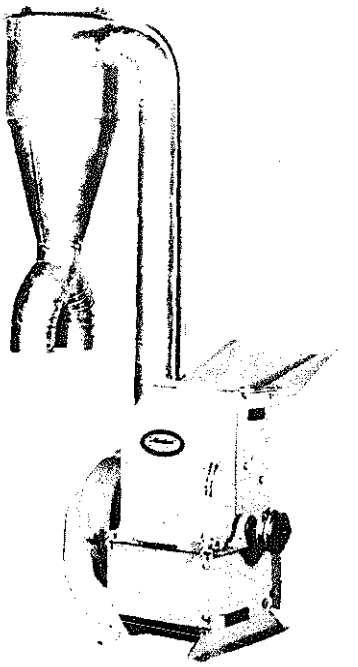
### Sears Hammer Mill

The Sears 10- and 17-inch hammer mills offer rapid handling of any dry feeds such as wheat, oats, barley, ear and shelled corn, as well as roughages like hay and stalks. With 60 hammers, the 10-inch mill runs from a 10 h.p. tractor power take-off (PTO). The larger 17-inch mill requires a 15 h.p. PTO to operate its 80 hammers.

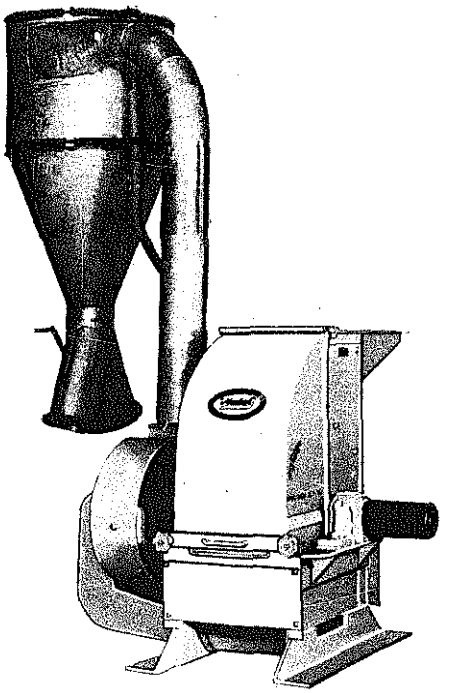
Sears, Roebuck & Co.
Farm and Ranch Catalog

### Meadows Number 5 Hammer Mill

The Meadows No. 5 hammer mill is designed for farm and specialty use. It has a V-belt drive to 24 hammers from a 5 to 10 h.p. motor. The screen measures 9 by 17 inches, and the unit employs a 4-inch fan. Shipping weight is approximately 280 pounds. Meadows also manufactures three other mills with horsepower requirements ranging from 20 to 65.



*The Meadows Mill No. 5 Mighty Marvel, requiring 5 to 10 h.p.* The Meadows Mill Co.



*The Meadows No. 25 Trojan hammer mill requiring from 20 to 65 h.p.* The Meadows Mill Co.

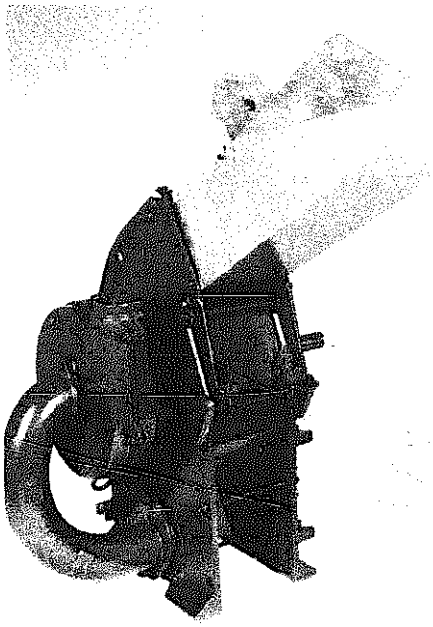
**C. S. Bell Hammer Mills**

The Bell hammer mills are available in three sizes: No. 10, with a 6-inch width; No. 20, which is 9 inches wide; and No. 30, which is 12 inches wide. All are available with or without feed table; some have a blower discharge, others a bottom discharge. All models perform a variety of tasks.



*C.S. Bell No. 10 Blower Hammer Mill*
**C.S. Bell Co.**

C. S. Bell Co.
P.O. Box 291
Tiffin, OH 44883

**Viking Electric Mills**

The Viking electric mill's hardened steel hammer blades, which are mounted directly on the motor shaft, turn 3,600 times a minute within the full-circle screen, converting the grain kernels to correctly sized ground feed.

Viking mills are available in 1, 7½, 21, and 51 h.p. motor sizes and can mill a range of perforations from 1/16 to ½ inch. Capacities vary according to the items being milled, the perforation size, and the size of the motor. The 1 h.p. unit can mill 375 pounds per hour with a ⅛-inch mesh screen.

**W-W Hammer Mills**

W-W hammer mills have a Star Cylinder design that functions as a flywheel to reduce power requirements without sacrificing capacity. Spécial heat-treated reversible hammers, hard surfaced, always maintain a cutting edge. This mill is available in a range of sizes up to 150 h.p. The screens, which are easily changeable, are available with perforations ranging from 1/32 to 2 inches. As an option, this mill can be provided with a dust collector and a 20-foot pipe (without bagger). Gooseneck models are available where floor space is limited. Pulleys, sheaves, master

baggers, feed tables, PTO drive, and direct motor drive can also be obtained.

Burrows Equipment Co.
1316 Sherman Ave.
Evanston, IL 60204

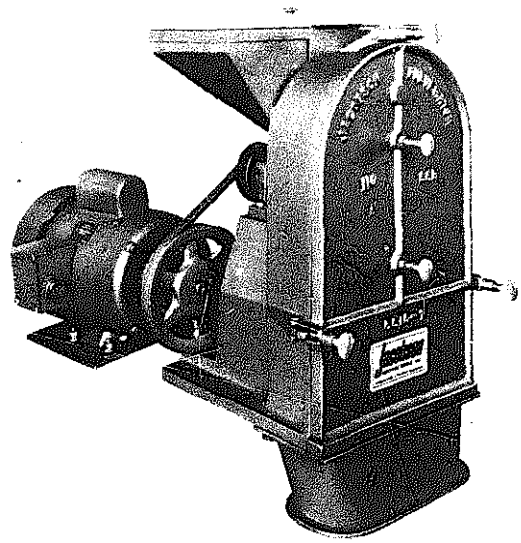
**Model MG Hammer Mill**

The Model MG hammer mill has a 15-inch wide throat and can be powered by a 5 to 30 h.p. motor. It is used to pulverize or reduce a wide variety of industrial materials including chemicals, plastics, grain, and dyes. It is also used as a finisher to smooth out a mixed product before bagging or final delivery. Direct-drive or belt-driven, this hammer mill can be mounted directly over the inlet or discharge point of a horizontal or vertical mixer in order to pulverize material before mixing or to smooth out mixtures after they are blended.

The Duplex Mill & Mfg. Co.
Springfield, OH 45501

**Jacobson Models 66 and 88**

Models 66 and 88 laboratory-size pulverators are belt-driven to provide a choice of grinding characteristics. They can be arranged to discharge into a bin, conveyor, or sack. Cast aluminum and steel construction assures resistance to corrosive materials. Featuring easy cleaning and a quick screen change, Models 66 and 88 have rigid hammers and adjustable feed gates and are available in two sizes, ¾ and 1½ h.p.



*Jacobson's new lab model Full Circle Pulverator hammer mill, Model 66-B.*
Jacobson Machine Works, Inc.

**Jacobson Models 120 and 160**

The Models 120 and 160 utility pulverators are generally used for moderate-capacity installations of a wide variety of free-flowing materials. Of standard welded-steel construction, they are also available in stainless steel, if required. The feed hopper is equipped with a slide gate for controlled feeding. These mills are available in either belt- or direct-drive, and with power requirements ranging from ¾ to 200 h.p.

Jacobson Machine Works, Inc.
2445 Nevada Ave. North
Minneapolis, MN 55427

**Speed King Hammer Mills**

Speed King hammer mills are high-capacity, impact grinding machines which come in seven sizes. They have hinged hammers and screen sizing. Other features include changeable wear plates, feeders, auger discharge, blower and pneumatic discharge, and other special features to suit the customer's needs. Horsepower re-

## INTERNATIONAL SOURCES OF HAMMER MILLS

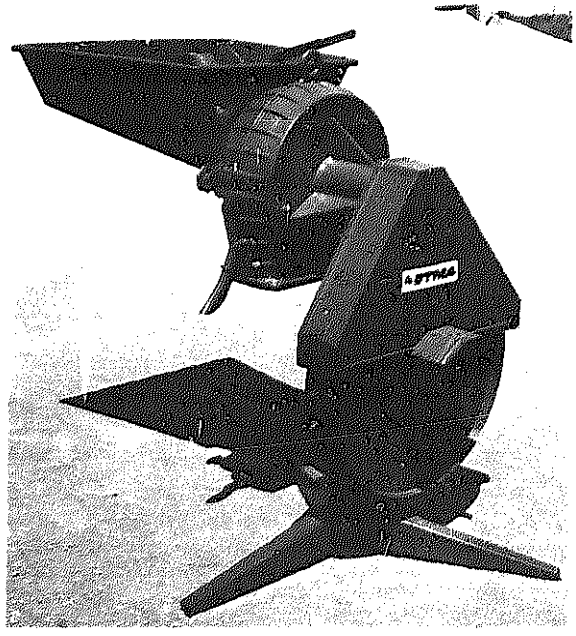
### CeCoCo Model HM-10, Type S

The power requirement for the model HM-10 ranges from 7.5 to 10 h.p. to provide an hourly capacity of 650 kilograms of corn or 500 kilograms of dried hay. Type S requires a ¼ h.p. motor to yield 40 to 60 kilograms per hour of crushed cereals, beans, and most other material going into animal feeds.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

### Hammer Mills Model MF

This model comes with three screen sizes: 100, 120, and 150 millimeters, for three units with a combined power requirement ranging from 20 to 70 h.p. The smallest unit has a capacity of 200 to 300 kilograms per hour for cereals.



*OTMA Hammer Mill Model MF*
OTMA

OTMA
06018 Trestina Di Citta Di Castello (PG)
Italy

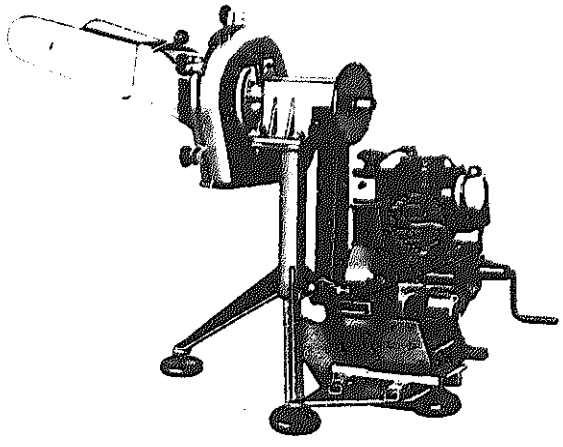
### Vulcano Mini

The Vulcano Mini can work with knives or hammers or both. It is mounted on a column, has three fastening points for hitching to a tractor, and is available with an electric motor option. With a minimum power requirement of 15 h.p., it will mill from 500 to 1,500 kilograms of grain per hour. Larger models are also available.

F. Lli Deidone
Villafranca Verona
via a. messedaglia, 20, Italy

### Funcor Fodder Grinder

This unit is specially designed for grinding many types of materials for a more complete use of animal foods. It grinds both green and dry fodders, corn cobs, oyster shells, straw, grains, and other feed materials. The unit calls for 5 h.p. and is available with either a tractor PTO link or a diesel engine. Milling size is adjustable and capacity varies accordingly.



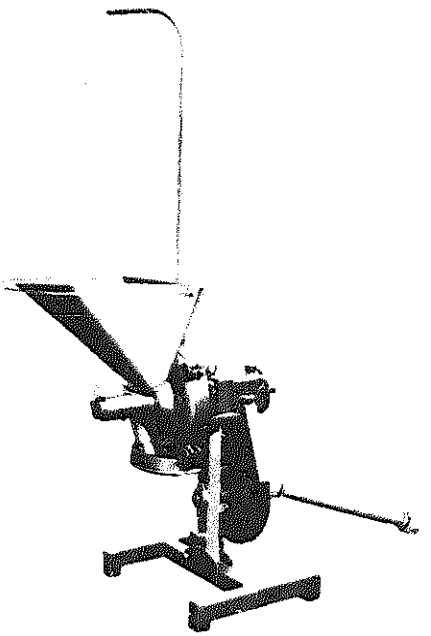
*Funcor Fodder Grinder with Mounted Motor*
Funcor Maquinaria Agricola

### Funcor Hammer Grinder

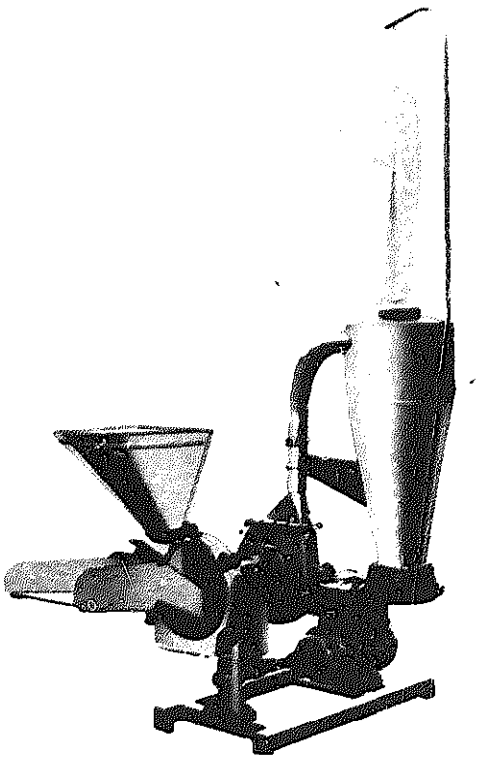
This is a 5 h.p. machine for grinding and milling all types of grains.

### Funcor Combined Grinder

This machine combines the operations of



*Funcor 5 h.p. Hammer Grinder with Tractor PTO Connector*
Funcor Maquinaria Agricola

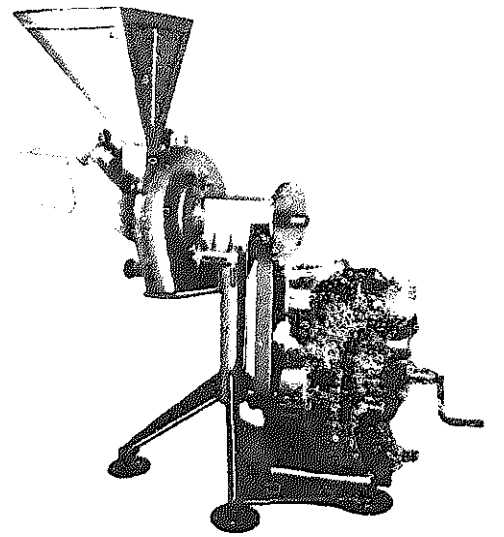


*Funcor Combined Grinder with Tractor PTO*
Funcor Maquinaria Agricola

the Fodder Grinder and Hammer Grinder, and it can mill all kinds of grains, green and dry fodders, corn cobs, bagasse, and straw. It also has a 5 h.p. motor.

**Funcor Hammer Grinder Model-A**

A feeding hopper on this model can be adapted for grinding dry fodder. This larger unit has an 8 h.p. requirement. It grinds all types of grains and dry fodders, is provided with a collector-bagger cyclone, and can be joined to one or two mixers for the complete preparation of the compound fodder.



*Funcor Hammer Grinder Model A with Gasoline Motor*
Funcor Maquinaria Agricola

The above mills are manufactured by:
Funcor Maquinaria Agricola
Elorrio (Vizcaya)
Spain

**Nogueira Disintegrator**

The Nogueira Disintegrator is a versatile machine, useful for either dry or green products. It cuts sugar cane, grass, boughs, roots, and tubercles, grinds corn with husk and cob, rice straw, corn stalks, and all sorts of grain. It can produce coarse, medium, fine, and extra fine cornmeal without heating the meal. It is available in three sizes with electric motors ranging from 5 to 10 h.p., and will produce cornmeal at rates ranging from 60 to 200 kilograms per hour.

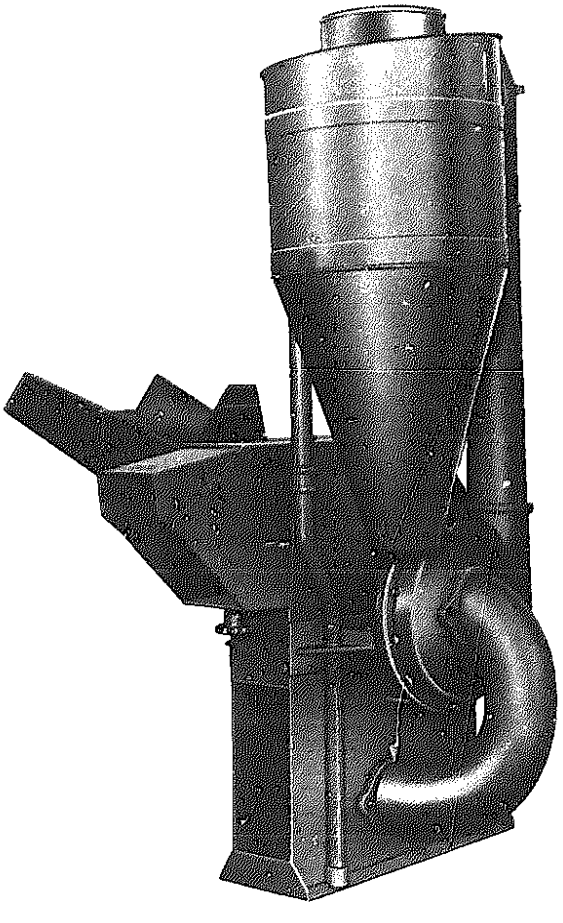
### Jumil Model 6 Hammer Mill

The Jumil Model 6 is constructed of sheet metal and is powered by a 10 h.p. electric motor. The top part of the disintegrator is removable, which facilitates changing sieves and checking and changing knives and hammer rotation. Available equipment includes three types of sieves—one type for regular cornmeal, one for corn grits, and one for whole grains. Large, perforated sheets are used when chopping sugarcane, and a smaller sheet is used when pul-



*Jumil Hammer Mill*
Jumil

verizing. The extra-reinforced flywheel, welded directly to the shaft, has two chopping knives and four hammers, and is made from a special steel to chop or pulverize as required. The machine pulverizes dry materials such as corn stalks with cobs, corn cobs with or without shucks, manioc, soybeans, and other dry fodders. It also pulverizes green fodders such as sugarcane, sorghum, pumpkins, and napier grass.

## JUICE PRESSES

Homemade fruit juices, fruit butters, cider, vinegar, wine, brandy—these are all good reasons for including a juice press on the list of tools that belong on a small, self-sufficient farm. Designs for juice presses consisting of five basic components—grinder, press, framework, juice-funneling system, and catch basin—are available from various companies as plans, kits, and fully constructed units. Use of the juice press need not be confined to that short time in autumn when cider appears on roadside stands. Fresh cider can be made as long as your supply of apples lasts in cold storage. Outside of apple season, the juice press is ready to go to work just as the blueberries, strawberries, cherries, peaches, and pears come into season to make fine homemade juices, jellies, and wines.

The single most important element in juice extraction is the efficiency of the grinding mechanism in turning the fruit into pulp. For maximum yield, every cell should be crushed. The press itself is only responsible for squeezing the juice from ruptured cells and does little to whole fruit. For this reason, grinders can be acquired separate from the pressing mechanism and framework.

A sharp, stainless steel-bladed roller is needed to cut through the tough skins of apples and chop them into pulp. Softer fruits like grapes and berries require less chopping. The squeezing action of cast-iron, ridged rollers does an adequate pulverizing job on these softer fruits. Both hand-operated and motorized crushing rollers are available. The best hand grinders have a flywheel and a three- or four-to-one gear ratio for the handle to give momentum to and take the rough spots out of the stroke.

The pressing plate can be driven by a hand-cranked press screw, a hydraulic jack, or even a car bumper jack. It is important that the framework of the press be rugged, and it is usually made of cast iron or rigidly constructed hardwood. After the fruit is crushed, the pulp is

wrapped in cheesecloth and placed either inside a framework of vertically arranged wooden slats or on press trays composed of horizontal slats. The pressure exerted by the press sends the juice through the grooves in the framework to an exiting funnel.

### Small Home-Built Juice Press *

This small juice press can be constructed from fairly easy-to-find discarded materials, the most important of which is an automobile bumper jack to act as a pressing mechanism. No grinder is provided on this unit, but apples may be satisfactorily pulverized with a kitchen food grinder before pressing.

Three pounds of ground fruit can be pressed at one time. Wrapped in cheesecloth, the pulp is placed inside a strong-framed press box. Routered grooves lead to exit holes which allow the juice to drain to a pan below.

#### MATERIALS NEEDED

**Wood**

| | | |
|---|---|---|
| 1 piece 2 x 12 x 4 feet | or | **Bench:** 1 piece 2 x 12 x 36 inches<br>**Press:** 1 piece 1½ x 7¼ x 8 inches (act. meas.) |
| 1 piece 2 x 4 x 10 feet | or | **Legs:** 4 pieces 2 x 4 x 11 inches<br>**Uprights:** 2 pieces 2 x 4 x 34 inches |
| 1 piece 2 x 4 x 8 feet | or | **Crossmembers:** 4 pieces 2 x 4 x 19 inches<br>**Mounting blocks:** 2 pieces 2 x 4 x 6 inches |
| 1–2 feet x 4 feet sheet ¾ inch ext. plywood | or | **Juice box:** 4 pieces 8 inches x 9¼ inches |
| 1 piece 1 x 1 x 2 feet | or | **Cleats:** 2 pieces 1 x 1 x 11¼ inches<br>2 pieces 1 x 1 x 10 inches |

**Hardware**

16d nails
Glue
8d nails
6d nails
3–4½" x 5/16" bolts w/nuts
8–5/16" ID fender washers
4–6" x 5/16" bolts w/nuts
Enamel paint

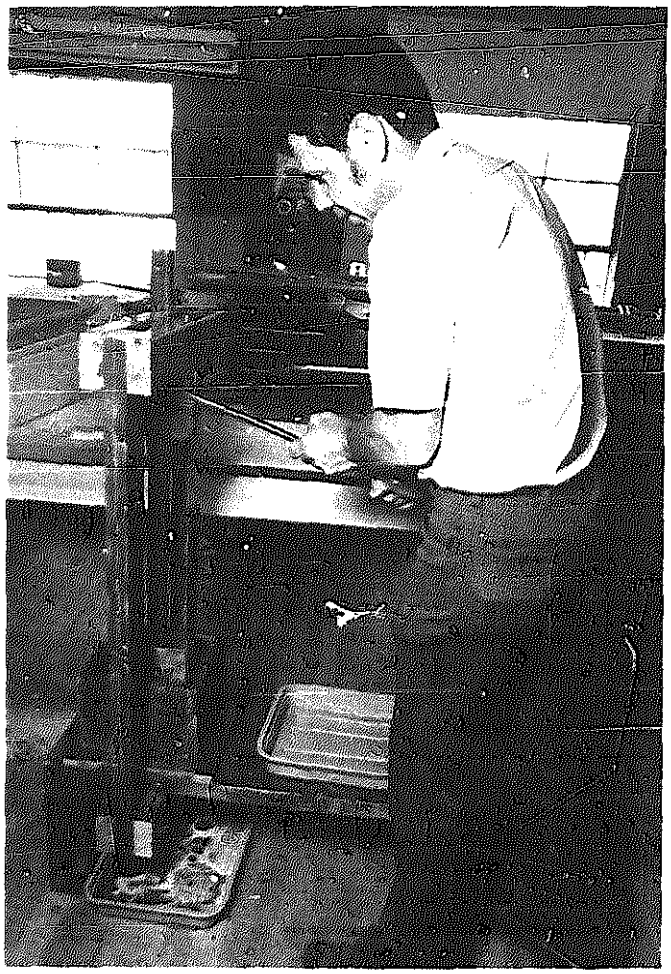
**Miscellaneous**

1 bumper jack

Construction

1. Cut a 36-inch length of 2 x 12 and four 11-inch lengths of 2 x 4. Using 16d nails and glue, fasten the 2 x 4 legs to the bench.
2. Cut four 19-inch lengths of 2 x 4 for jack support crossmembers. Fasten one to the bottom of the bench, against the front legs. A narrow face of the 2 x 4 should be against the bench bottom, a broad face against the legs. Use glue and 16d nails, driving the nails through the support into the legs, and through the bench into the support. Using a short 2 x 4 as a temporary spacer, locate the second lower support crossmember and glue and nail it in place. Then remove the spacer.
3. Construct the box. The press can have a plywood box, but you can construct yours of 1 x 10 material. Cut four 8-inch by

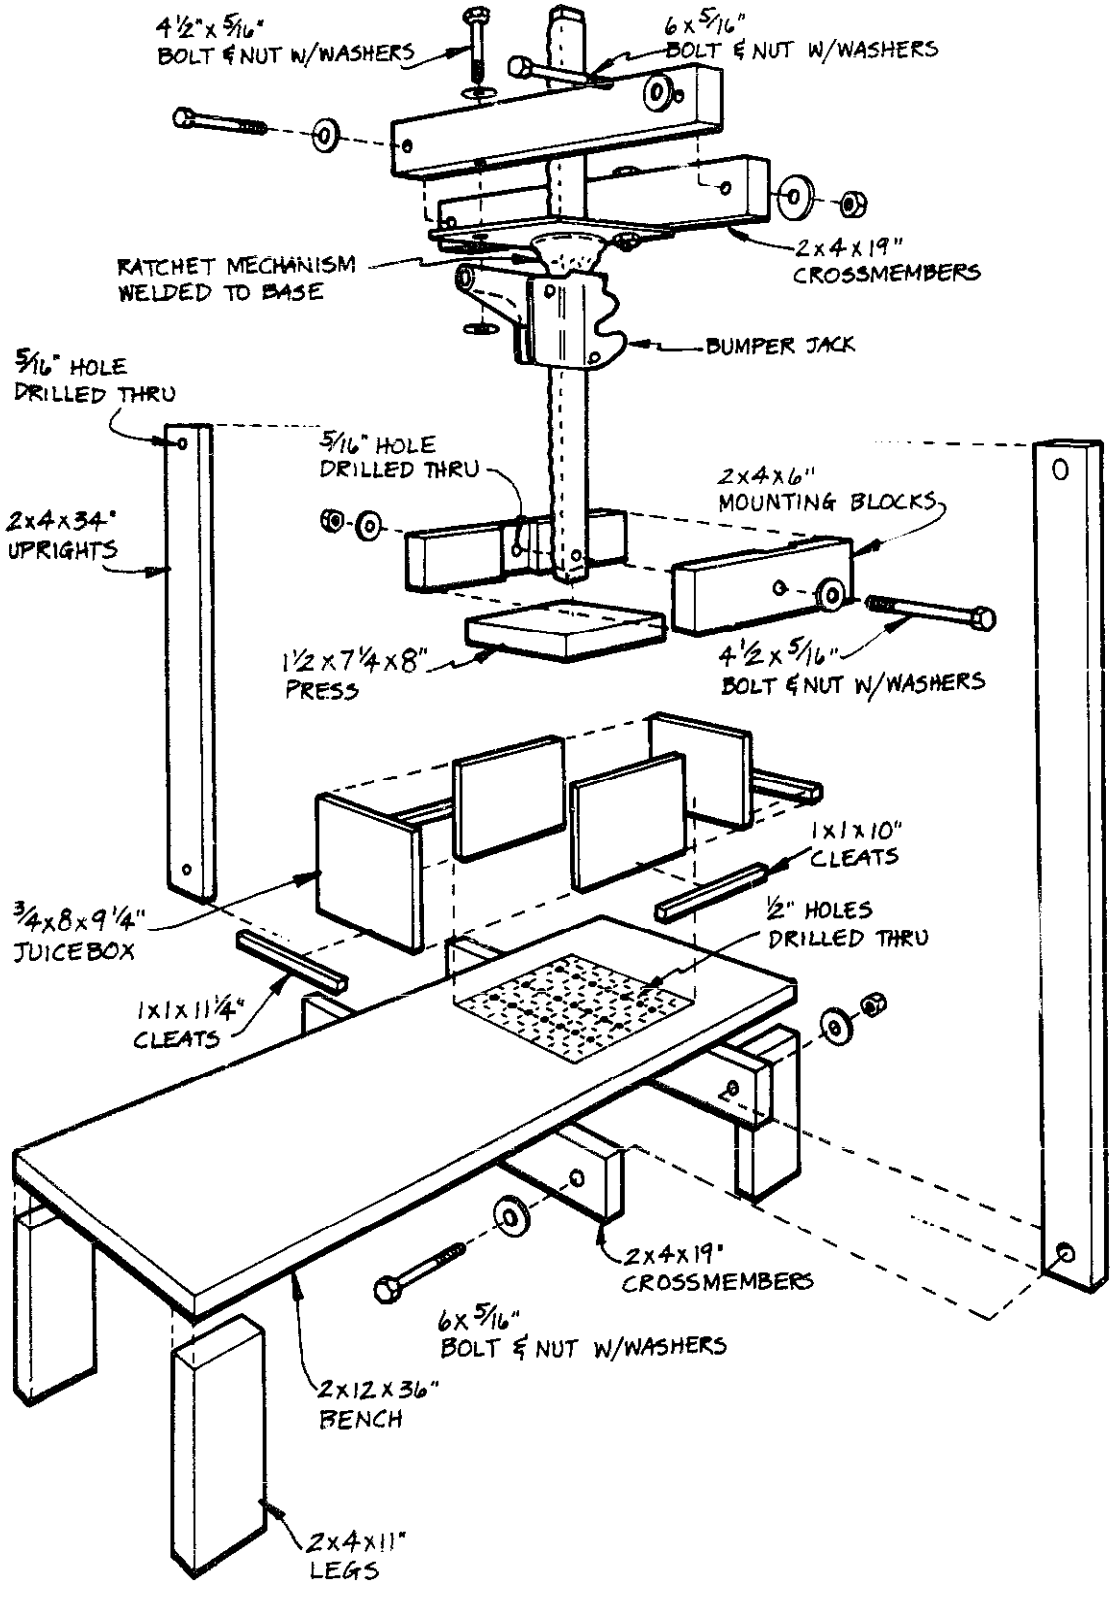
* Reprinted from *Build It Better Yourself*, by the editors of *Organic Gardening and Farming* (Emmaus, Pa. Rodale Press, Inc. 1977).



*Bumper Jack Juice Press*

9¼-inch pieces of ¾-inch plywood, then glue and nail them together, using 8d nails, forming the juice box.

4. Place the box in position, centered on the bench between the supports. Scribe a line on the benchtop around the inside of the box. Remove the box, then drill three rows of ½-inch holes through the bench. You must locate the rows of holes so they penetrate the bench in front of, between, and behind the supports. The juice will run out of the box through these holes. To speed that process, a crosshatch pattern of grooves should be routered into the bench within the confines of the box. In doing this, be sure not to damage your router bit on the nails you've driven into the bench to secure the jack support crossmembers. Now replace the box and toenail it in place with 6d nails. Cut two 11¼-inch and two 10-inch lengths of 1 x 1 stock and using 6d nails, fasten them to the bench around the outside of the box.
5. Modify the bumper jack. The jack shaft socket in the base must be cut off so the shaft will pass through the base. Then the ratchet mechanism must be welded to the base, so the base moves up and down the shaft with the ratchet mechanism. A welding shop can do this work quickly and inexpensively.
6. Cut two 6-inch lengths of 2 x 4. With a backsaw and chisel, cut a groove across the center of a broad face of each to accommodate half the thickness of the jack shaft. The two blocks are then sandwiched with the end of the shaft between them, as shown. Drill a 5/16-inch hole through the three-piece



4½"x 5/16" BOLT & NUT W/WASHERS
6 x 5/16" BOLT & NUT W/WASHERS
RATCHET MECHANISM WELDED TO BASE
2x4x19" CROSSMEMBERS
BUMPER JACK
5/16" HOLE DRILLED THRU
5/16" HOLE DRILLED THRU
2x4x6" MOUNTING BLOCKS
2x4x34" UPRIGHTS
1½x7¼x8" PRESS
4½x5/16" BOLT & NUT W/WASHERS
1x1x10" CLEATS
½" HOLES DRILLED THRU
¾x8x9¼" JUICEBOX
1x1x11¼" CLEATS
2x4x19" CROSSMEMBERS
6x5/16" BOLT & NUT W/WASHERS
2x12x36" BENCH
2x4x11" LEGS

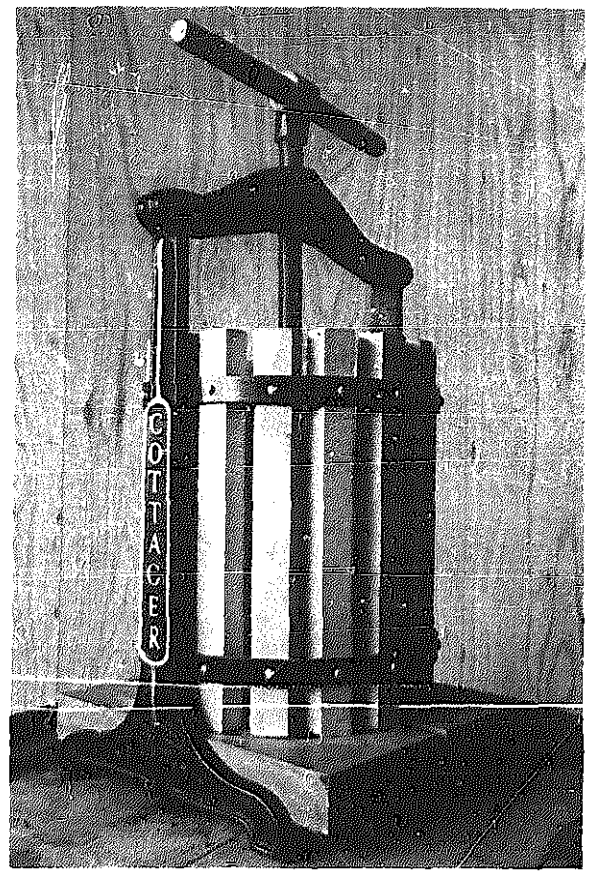
assemblage and fasten it together with a 4½-inch by 5/16-inch bolt. Use fender washers on each side of the assemblage.

7. Cut an 8-inch length of 2 x 12, then rip it to the width of a nominal 2 x 8, that is, an actual 7¼ inches. Nail this piece to the 2 x 4s fastened to the end of the jack shaft, being sure to position the wood grains of the two parts perpendicular to each other. Use 16d nails.
8. Cut two 34-inch lengths of 2 x 4, for the jack support uprights. Slip one between the two crossmembers on each side of the bench, drill a 5/16-inch hole through crossmembers and upright, then bolt them together with a 6-inch by 5/16-inch bolt and nut with fender washers. Set the jack in place, then take the two remaining upper jack support crossmembers (cut at the outset of the project) and, after drilling the appropriate holes, bolt them to the support uprights. Use 6-inch by 5/16-inch bolts and nuts with fender washers.
9. Slide the jack-base/ratchet mechanism up the shaft until it seats firmly against the upper crossmembers. Drill a 5/16-inch hole through the metal base and each crossmember. Then secure the metal jacking mechanism to the crossmembers with 4½-inch by 5/16-inch bolts and nuts, with a fender washer included against the wood surface.
10. Paint the entire press with a high-quality nonleaded enamel paint.

## SOURCES OF JUICE PRESSES

### The AVI Cottager

The Cottager is a simple, heavily constructed tabletop fruit or wine press. It is designed for squeezing soft fruits, but it is only efficient if the fruit is either sliced or ground beforehand. No grinder is provided. The hardwood tub has beveled staves for easy cleaning, stands 11 inches high and is 9 inches in diameter. The cast-iron frame and oak base produce a maximum in strength and rigidity. The ¾-inch press-screw passes through a heavy cast-iron crossarm and applies pressure to an iron foot attached to a wooden disc that fits inside the tub. The base



*AVI Cottager*

is 11 inches square, height is 21 inches, and the weight is 30 pounds.

### The AVI American Harvester

The American Harvester double-tub cider mill is a hand-operated mill capable of doing both pressing and grinding at the same time. The double-tub feature becomes a practical advantage when you're processing a large number of apples. The quantity of apples processed depends on the speed of the operator(s). Experience has shown that two people can produce as much as 30 gallons in one hour (that's the current record), but ordinarily, two people working at a steady pace should not expect to produce more than 80 gallons of cider in an average day.

The basic frame is constructed entirely of oak, the tray and hopper of maple and alder, respectively. All joints are dadoed (rectangular grooves are cut in them) and cross-bolted for

*AVI American Harvester*

structural rigidity. The hardwood tubs are 12 inches high and 13½ inches in diameter, and have beveled staves for easy cleaning. The press-screw is 1½ inches in diameter; the grinder housing is all cast iron. The grinding cylinder is laminated hardwood with inserted stainless steel teeth. A 16-inch flywheel and 3 to 1 gear ratio accompany the handle. Overall size is 22 inches wide, 36 inches long, and 45 inches high. The press weighs approximately 200 pounds.

### The Villager

The Villager is a single-tub cider or wine press with the same basic frame and press-screw assembly as the double-tub model. It has been specifically designed as an all-purpose fruit press which is capable of grinding and squeezing a variety of fruits, including apples. The grinding attachment is mounted directly over the tub, allowing the pulped fruit to be squeezed in place. The large bevel-staved tub holds about a bushel of pulped apples and will yield from 1 to 3 gallons per press (depending on the kind of apples used). The handle is a heavy flywheel with direct drive attached to the grinding shaft. The overall size is 18 by 22 by 42 inches high. Weight is about 125 pounds.

### Berarducci Brothers

Berarducci Brothers are manufacturers, exporters, and importers of Italian specialty equipment for the kitchen. Their product line includes a variety of electric and manual fruit

crushers and both hydraulic and press-screw fruit presses, for example:

Superior Electric—A ¼ h.p.-driven mill for grapes. The roller is of cast aluminum, 9 inches by 4¼ inches. Weight: 100 pounds.

Ontario Electric—A ¼ h.p.-driven mill for apples, pears, and plums. Roller is cast aluminum, 5¾ inches by 17 inches. Weight: 75 pounds.

Erie Electric—A grape crusher with 10 by 3½ inch cast aluminum rollers. It is driven by a ¼ h.p. motor. Weight: 37 pounds.

Michigan—A manual press with all red oak frame and hopper, and double-aluminum rollers; handle-driven for grapes. Weight: 25 pounds.

Erie—A manual press with all-aluminum hopper, sharp teeth-type aluminum single-roller mounted on an aluminum frame, and red oak hardwood cross handles; handle-driven for grapes. Weight: 21 pounds.

Superior—A manual fruit crusher with all red oak wood frame and hopper, double-aluminum rollers, and adjustable bearings for spacing rollers; flywheel-driven for grapes.

The six sizes of hydraulic fruit presses are constructed of selected red oak hardwood to purify and not taint the delicately flavored juices. All cast-iron parts are machine finished for easy operation and painted with a heavy, blue, acid-resisting enamel. The diameter of the pressing plate varies from 16 to 25 inches, according to the size of the model. Its capacity for crushed pulp ranges from 150 to 800 pounds.

One press-screw press is available with a ratchet system handle, 11-inch diameter press plate and ¾-inch diameter press screw. It weighs 30 pounds and has a capacity for 60 pounds of crushed pulp.

Berarducci Brothers Mfg. Company, Inc.
1900 Fifth Ave.
McKeesport, PA 15132

**Fruit Press**

The Colonial-style grinding unit of this fruit press has stainless steel cutters mounted in a 4-inch wooden roller with a 12-inch diameter flywheel. A bushel of apples can be ground in 15 to 20 minutes. Pressing 3 gallons of cider takes only 3 minutes. The fruit press stands 4 feet high, and is made of hardwoods, spruce, and exterior plywood. Attached to the press, the grinder will drop fruit pulp directly into the pressing tub, or it can be removed and bolted to another support. This way, two people can work together, one grinding and the other pressing. The press plate is driven by a 1-inch diameter, threaded steel press-screw. The unit comes unassembled.

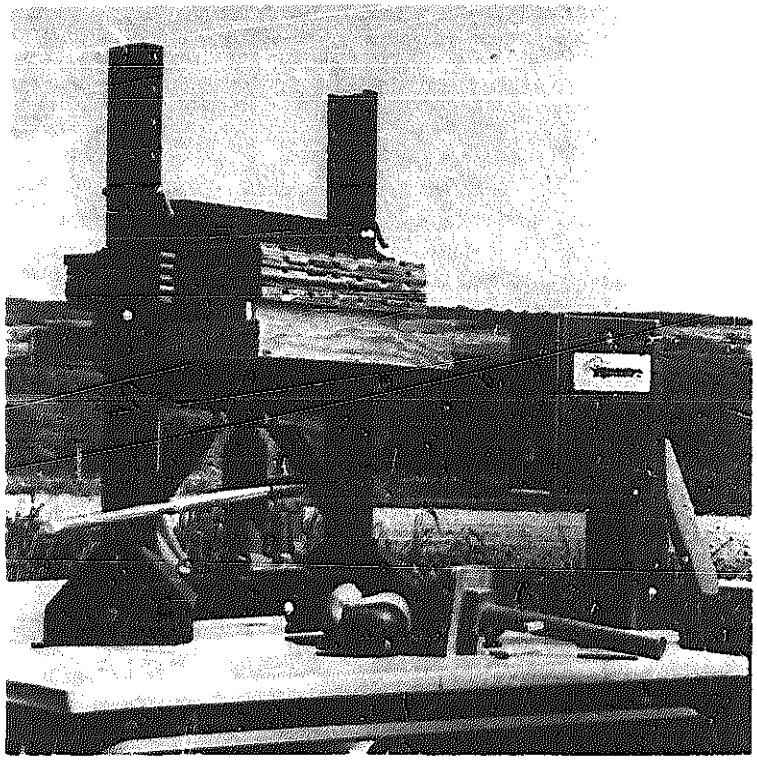
Crossville, TN 38555

Farnam Sunrise Equipment & Supplies
P.O. Box 12068
Omaha, NE 68112

Garden Way Research
Charlotte, VT 05445

**Good Nature Fruit Press**

Good Nature Products offers three sizes of hydraulically operated fruit presses. The hydraulic jack employed can apply 6,000 pounds of pressure and will retract itself with one turn of a valve, unlike the old press-screws which had to be cranked backwards before starting a second batch. The familiar slotted tub of other models is replaced in this one with several layers of slotted, flat wooden racks between which cloth bags full of pumice are squeezed. The racks insure that no drop of juice has to force its way through more than one inch of pulp, whereas the old tub presses required that juice travel through as much as 10 inches of packed fruit pulp. This press yields about 3 or 4 gallons of juice from each bushel of apples. The grinder design incorporates a rotating drum with short, stainless steel blades that shave apples gradually as they rotate, forcing the pulp through a narrow slot from which a coarse applesauce emerges. The drum is turned with a hand crank, electric drill, or ¼ h.p. electric motor. Available models



*The Goodnatured Fruit Press*
Good Nature Products, Inc.

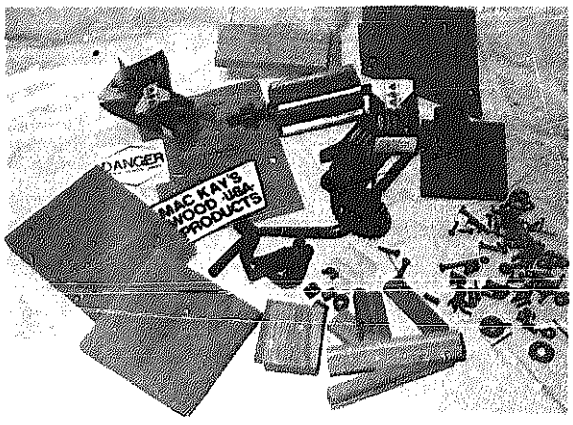
include a 130-pound press with a capacity of 1 to 5 bushels for a maximum output of 60 gallons per hour, a 110-pound press with a capacity of 1 to 2½ bushels for a maximum output of 30 gallons per hour, and a 55-pound table press with a 1-bushel capacity for an output of 12 gallons per hour.

Good Nature's electric grinder is self-feeding, has all stainless steel parts, grinds up to 30 pounds of apples per minute, and is powered by a ½ h.p. electric motor. It can be used to grind or shred any fruits, vegetables, or cheeses. The company's manual grinder is hand crank operated, but may be automated with an electric drill. The polyvinyl chloride drum with stainless steel blades will grind almost any fruit or vegetable.

Good Nature Products, Inc.
4879 Old Buffalo Rd.
Warsaw, NY 14569

### Hand Crank Hopper Kit

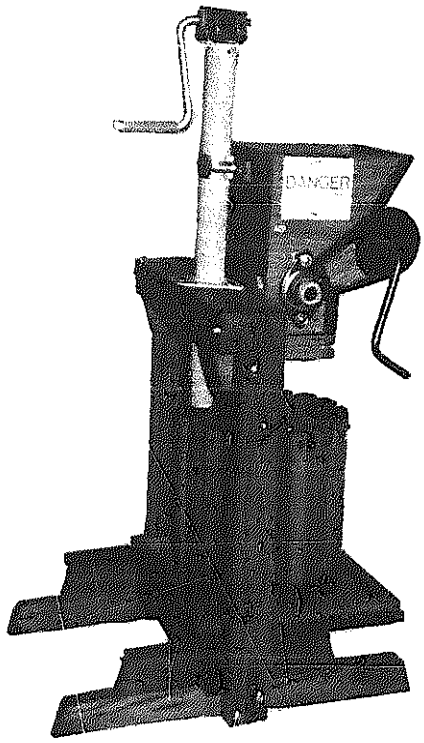
This kit includes a precut oak frame, crushing roller, and all the hardware you need, ready for assembly.



*Hand Crank Hopper Kit*
MacKay's Wood Products

### Portable Hand Crank Press

This press is of the oak stave barrel-type. The grinder is positioned directly over the press tub and is manually operated with a gear reduction crank. The press is hand cranked also. The



*MacKay's Portable Hand Crank Press*
MacKay's Wood Products

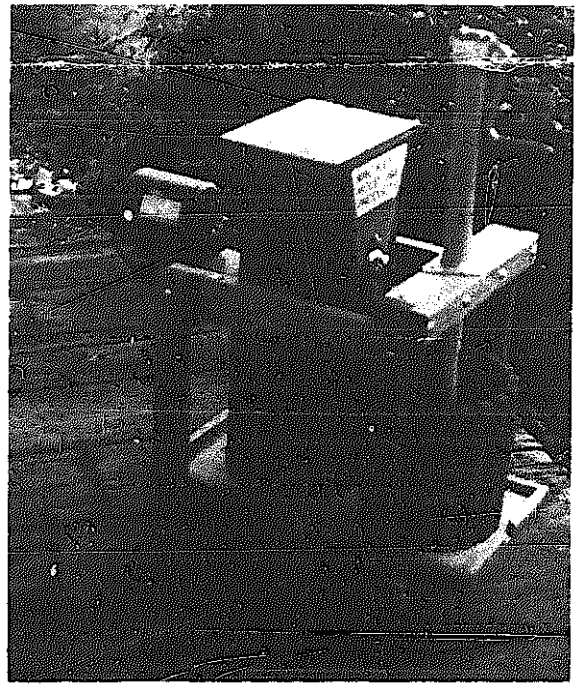
unit is 18 inches wide, 22 inches long, and 35 inches high: Weight: 60 pounds.

### Electric Press Models A223 and A203

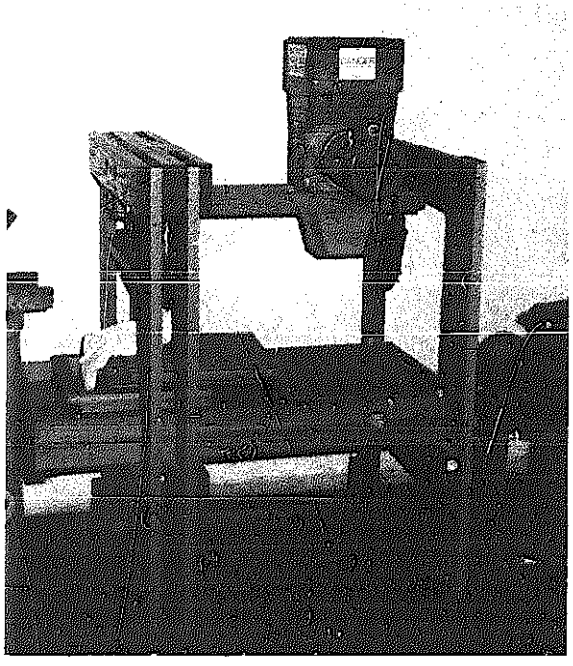
Complete and ready to run, this press is supplied with either one or two oak drums. A ¼ h.p. electric motor drives the grinder. The press is hand cranked. This press is 18 inches wide, 29 inches long, and 30 inches high. Weight: 100 pounds.

### Commercial Press

This press replaces the stave press barrel with a 17-inch oak press rack. It has a high-speed, six-knife cutter head in the grinder which is powered by a 1 h.p. electric motor. Thirty-inch, heavyweight, nylon cloths are provided to contain the fruit pulp during pressing. Pressing is done by a 3,000 pound hydraulic jack. Model C1K1 comes with six press cloths, seven oak racks and one oak cheese form. Model C2K2



*MacKay's Electric Press*
MacKay's Wood Products



*MacKay's Commercial Press*
MacKay's Wood Products

comes with 12 press cloths, 13 oak racks and one cheese form.

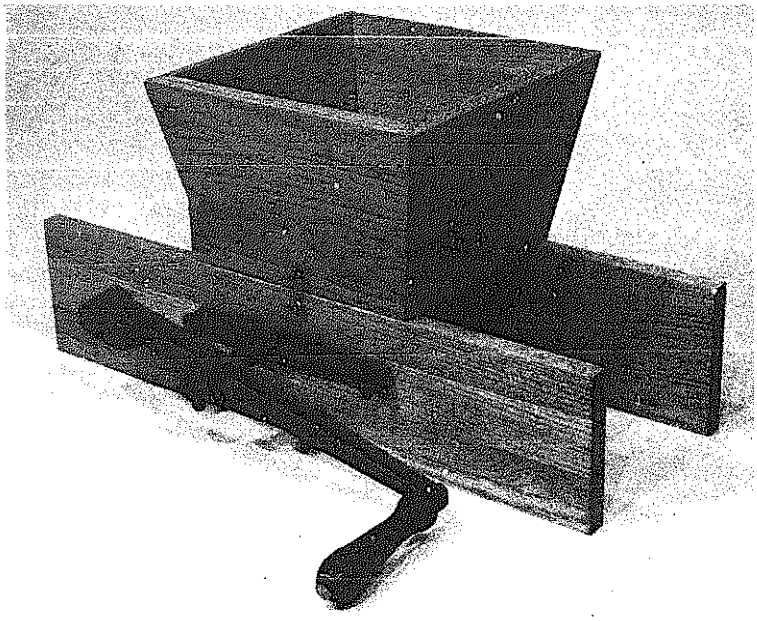
The above four presses are manufactured by:
MacKay's Wood Products
10th and Taylor Ave., P.O. Box 1023
Bellingham, WA 98225

**Bell's Hand-Turned Crusher**

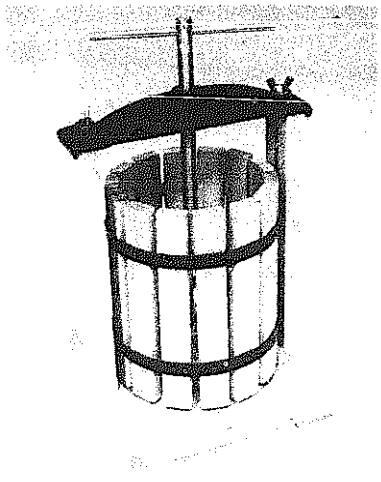
This press has a finished hardwood hopper and sides with cast-iron cutter, side mounting plates, and a counterbalanced crank. A perforated screen allows apples and fruits to be ground to the proper size. The grinder will process approximately 90 pounds of apples per hour. The 24 by 13 by 13-inch grinder is easily disassembled for easy cleaning. Shipping weight: 38 pounds.

**Bell's Fruit-Wine Press**

This press is constructed of cast iron and white oak (a wood that is favored because it will not impart any undesirable taste to the juices.) It has a vertical-slat press tub and hand-operated press-screw. Shipping weight: 35 pounds.



*Bell's Hand-Turned Crusher*
**C.S. Bell Co.**



*Bell's Fruit-Wine Press*
**C.S. Bell Co.**

Both presses are manufactured by:
C. S. Bell Co.
170 W. Davis St., Box 291
Tiffin, OH 44883

**Sears' Hand-Turned Fruit Crusher**

This model comes with cast-iron crusher teeth, steel crusher screen, and oak hopper and sides. It holds one peck of apples and measures 24 by 9½ by 13 inches.

Sears, Roebuck & Co.
Farm and Ranch Catalog

**Five-Quart Fruit Press**

Of cast-iron and hardwood construction, this press has a capacity of approximately 5 quarts. It has a vertical-slat tub and hand-

operated press-screw. Shipping weight: 24 to 25 pounds.

Belknap, Inc. (distributor)

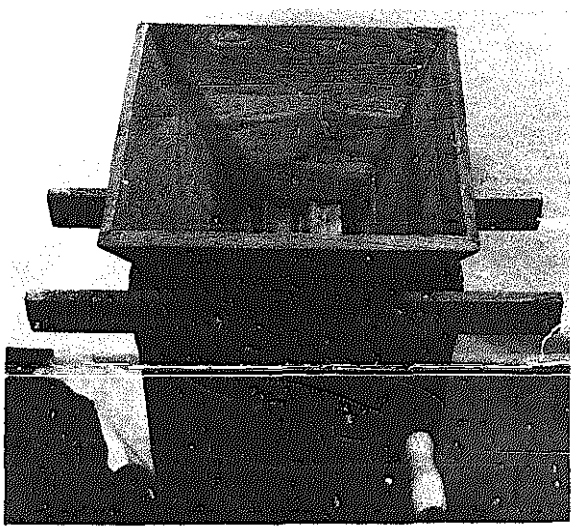
**Cumberland's Fruit Crusher**

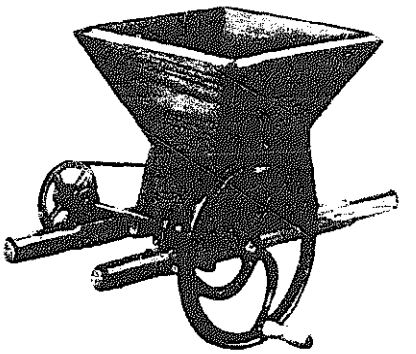
For grapes, berries, cherries, and other soft fruits, excluding apples, this crusher has an oak frame and an 18½ by 18-inch hopper which holds 30 pounds of whole grapes. Its two stationary rollers are made of aluminum. Shipping weight: 25 pounds.



*Fruit Crusher*
Cumberland General Store

**Apple Crusher**

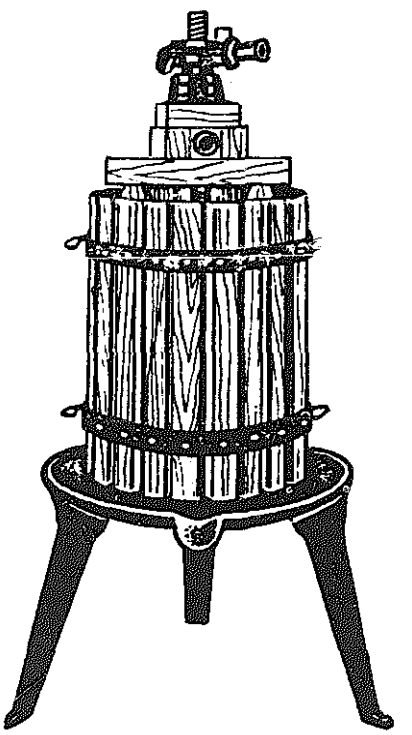
The machined claw-cut teeth on this press work well to extract juice from all kinds of fruit, especially apples, which are difficult to grind. A selected hardwood 18½ by 17-inch wide hopper with a 45-pound capacity feeds a 32 by 16½-inch cast aluminum roller. The handle operates on a 17-inch diameter flywheel.



*Apple Crusher*
Cumberland General Store

**Cider Press**

Constructed of red oak for purer juice and for strength, this press weighs approximately 90 pounds and can hold 250 pounds of crushed apples. Its cast-iron parts are machine finished and painted with acid-resisting enamel. The press stands 43 inches high, and tub size is 12 by 18 inches.



*Cider Press*
Cumberland General Store

### Kits

Cumberland also carries a fruit grinder kit and a cider press kit. Both kits contain plans, and all the hardware necessary for building. No lumber is included.

The above four presses are available from:
Cumberland General Store
Rt. 3, Box 479
Crossville, TN 38555

### Day Equipment

Both electric and hand-operated presses are available from this company for use in roadside stands and small orchards. Graders, press racks, cloths, labels, filters, pasteurizers, picking bags, cutters, and all the accessories needed for a small operation are also available.

Day Equipment Corp.
1402 E. Monroe
Goshen, IN 46526

### Hydraulic Cider Presses, Palmer-Style

These presses are specially suited to roadside stand and orchard use. A full line of accessories is available.

Orchard Equipment & Supply Co.
Conway, MA 01341

### Wine, Fruit, and Cider Press Plans

Plans for a wooden-framed, slat-sided, oak, basket-style press with a hand-cranked press-screw are included in a catalog from New Jersey. An electric drill and router are required to build the press, but no other special tools are needed. Instruction plans only are provided.

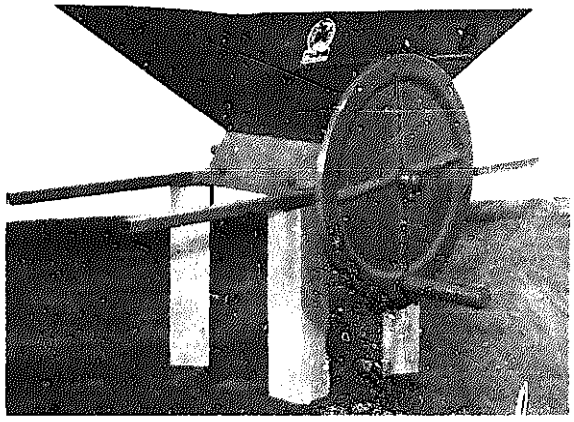
Dorsay Poor Man's Catalog 3
240 Kinderkamaca Rd.
Oradell, NJ 07649

### Mearelli Presses

Mearelli offers a full line of hand-operated and electric fruit crushers, hydraulic, vertical-staved presses, and hammer mill-type electric crushers. Units range in size from models appropriate for the home and small farm to large commercial applications, with a full range of sizes in between. Mearelli also offers accessories for all your wine-making needs, including wood kegs, wine pumps, and bottle corkers.

### Manual Fruit Crusher

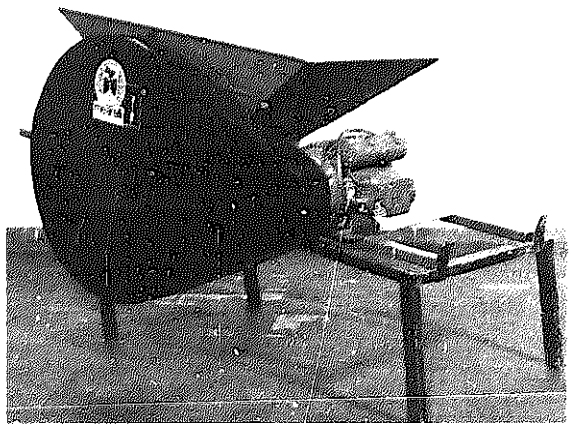
This manual crusher, available in either wood or iron, has roller supports and gears enclosed in cast iron. Five sizes are available in iron, ranging in weight from 28 to 45 pounds. Three sizes are available in wood, ranging from 30 to 39 pounds.



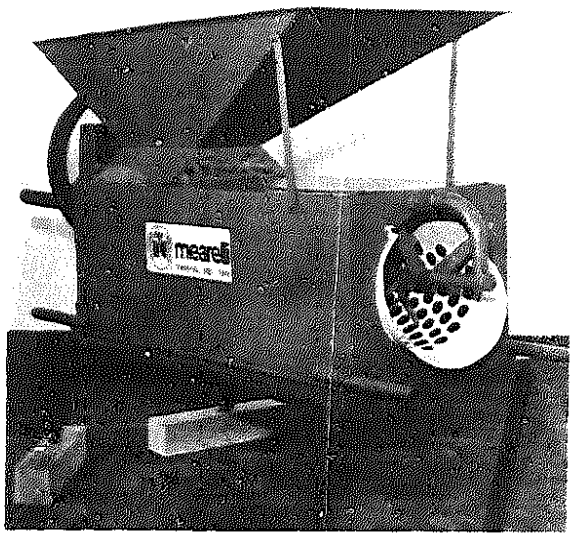
*Iron Manual Crusher*
Mearelli S.P.A.

### Motored Crusher

Two models of this powered crusher are available, with either monophase 0.5 h.p. motor weighing 56 kilograms, or three-phase 0.5 h.p. motor weighing 59 kilograms.



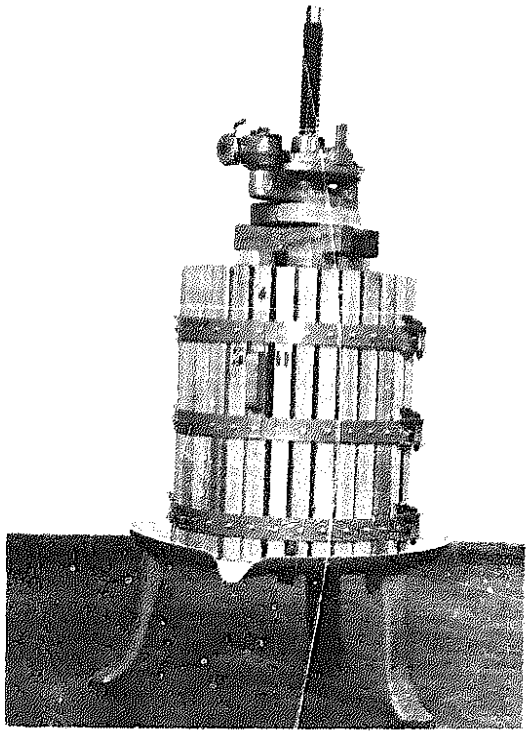
*AM Motored Crusher*
Mearelli S.P.A.



*PVD/15 Manually Operated Stemmer-Crusher*
Mearelli S.P.A.

**PVD/15**

This model is a manually operated stemmer-crusher, with a removable screen for maintenance. Weight: 60 kilograms.



*Lever Press*
Mearelli S.P.A.

**Lever Press**

This lever press comes in fourteen sizes ranging in weight from 17 to 750 kilograms.

**Hydraulic Press on Wheels**

Utilizing a hydraulic jack, this press operates with glycerine oil and attains pressures of 350 to 400 atmospheres. Eight models are available, ranging in weight from 160 to 830 kilograms.

At this time, Mearelli is interested in locating distributors for its products in North America.

## CORN SHELLERS

Feed mills grind cobs and kernels together for cattle feed, but hand- or power-operated

shellers are required to separate the kernels from the cobs before the corn can be ground into meal for people and for most other animals.

Several manufacturers produce small, hand-operated shellers which can be clamped onto a board or the edge of a box or barrel. Larger shellers are turned by a handle, by pedals, or by belt drive from an engine or electric motor as required. Large power-driven maize shellers are often fitted with cleaning fans and screens to separate the grain from husks, dust, and spent cobs.

**Hand Corn Sheller**

Appropriate for shelling small amounts of a wide variety of corn, this hand sheller is especially desirable for shelling seed corn because it does not break off the germ ends of the kernels. It is similar to the sheller described in the following article.

# A MAIZE SHELLER FOR EVERY HOUSEHOLD*

by Dr. D. J. Hilton

Senior Lecturer, Dept. of Mechanical Engineering, University of Nairobi, Kenya

One type of hand sheller currently sold in parts of Africa is made from a metal tube, with internal ribs set in the direction of the cylinder axis. The sheller is held in one hand while the other hand pushes the maize cob into the tube with a twisting action. The internal ribs strip the kernels from the cobs, and the kernels fall out the bottom of the tube. This sheller, which is now being made from an aluminum casting, has been found to have two disadvantages. First, the ribs are too numerous and tend to become clogged with grain. Second, the sheller is really only suited to one diameter of cob. Where both traditional and hybrid varieties are grown, therefore, it is not capable of stripping all cobs satisfactorily.

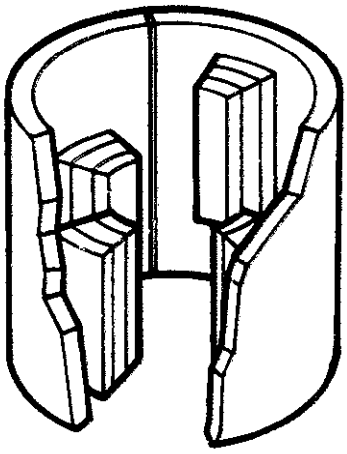
I have overcome these difficulties by redesigning the tube sheller and incorporating two novel features. At the same time, the cost has been lowered by a change of material.

The tube of the new sheller is constructed from a short length of 2-inch diameter rigid, polyvinyl chloride water pipe. This is a readily available material in industrial centers in most countries. The ribs are made from the same pipe, cut into thin strips, and glued together in stacks of three or four. For glue, a polyvinyl chloride solvent is used which is supplied for use with polyvinyl chloride water pipe by all distributors. Four such ribs are then glued to the inside of the tube at 90-degree intervals. This placement allows the ribs to reach the core of the maize cob, and still leaves enough space between them to allow the grain to drop through. The two novel features I introduced are as follows:

1. A slit is made along the tube to allow it to expand when very large cobs are being stripped. This is made possible by the elasticity of the material. Residual stresses in the material, as a result of the pipe extrusion process, ensure that the tube normally remains well closed.
2. One of the four internal ribs is positioned higher up the tube than the other three and this is the rib which does most of the stripping. It is found that this feature results in an easier stripping action than when four ribs strip off the grain simultaneously.

The performance of the new maize sheller is quite impressive and a dry cob can be stripped in about 5 to 7 seconds. This compares very favorably with the performance of other designs, though

* Reprinted with permission from *Appropriate Technology*, August 1976.



*A cutaway view of a PVC sheller with a slit in one side for expanding with the size of the cob.*

it is accepted that the vigorous wrist action involved could not be maintained for prolonged periods. The tools required for manufacturing this sheller are minimal; they consist of a hacksaw, small clamp or vice, and sandpaper. The cement used is a standard polyvinyl chloride solvent which produces a very powerful bond, provided the surfaces are free of grease.

The material cost including normal waste is low, and each sheller takes around 1 to 1½ hours to assemble by hand. The product is beginning to sell in a few areas on a trial basis and indications are that demand will be considerable when the product is given a little promotion.

# A SIMPLE MANUAL MAIZE-SHELLING DEVICE*

**by Professor A. S. Rana**

Head of the Department of Agricultural Engineering
and Land Planning, University of Dar-es-Salaam

In many developing countries, most of the maize (corn) is produced by small subsistence farmers, and whatever little surplus is available is sold at the market. The subsistence farmers in many countries in Africa grow only a few hectares of maize, and these are often intercropped. The yields in general are low, about 1,000 kilograms per hectare. Under these conditions all the shelling is done by hand, and the following methods are generally used:

1. With bare hands, holding the cob in the palm with four fingers, a person removes the grains one by one with the movement of the thumb. The shelled corn is consumed or sold as is without cleaning or grading.
2. Rubbing a shelled cob on a cob to be shelled is faster than the first method but is more tiring and requires skill and practice. It is not very suitable for maize with a high moisture content, as the grains are sometimes bruised and the shelling rate is low. The shelled grains are used as in the first method.
3. This method involves putting the husked cobs in a bag and beating them with a stick while turning the bag. Later on, the cobs and grains are taken out of the bag and cobs are picked. Any grains remaining on the cobs are taken off by hand as in the first method.
4. There are some variations of this method, but basically, the cobs are spread on a raised platform made of sticks and bamboo poles, with small gaps between the adjoining pieces. The spread cobs are beaten with a stick; the shelled grains fall through the gaps; the remaining grains on the cob are removed by hand.

* Abridged from *Appropriate Technology*, vol. 2, no. 1, May 1975.

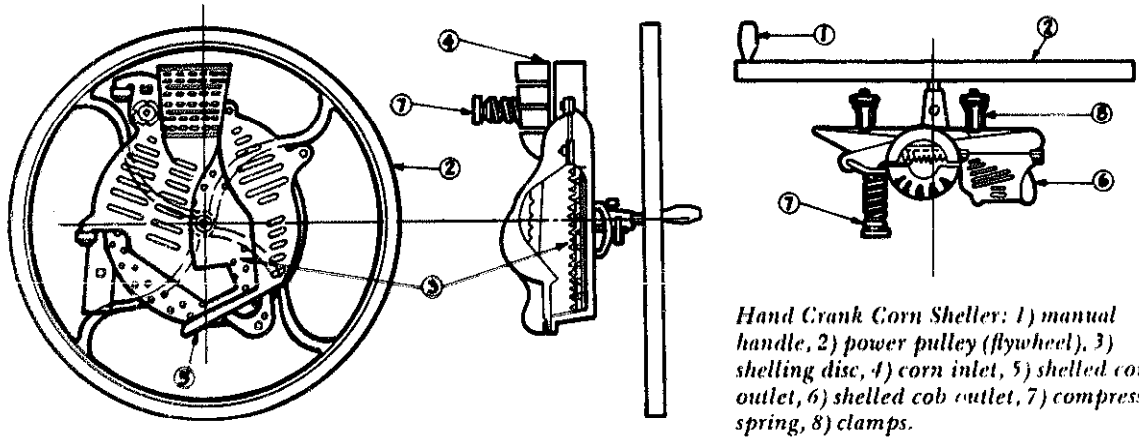
Maize shelling is not a labor bottleneck for the small producer, especially if he is only growing for home consumption. The family sits together in the evening and shells maize by hand, while talking for a few hours. One evening of shelling is sufficient for a week's supply of corn. Most of the maize being brought to the market by the peasant farmer is shelled by one of the four methods described above.

For larger producers, such as those who grow corn to feed their livestock as well as themselves, these simple shelling methods aren't sufficient. The following device has been found to be, on the average, about three times more efficient than the methods described above.

The shelling section consists of U-nails (also called staples) arranged on a wooden board in a way that will facilitate the smooth rubbing of the maize to be shelled. Various arrangements of fixing the U-nails on the wooden board were tried. The best results have been obtained by fixing the U-nails in two rows parallel to each other 1.9 to 2.0 centimeters apart, and 2.5 centimeters between the nails within the row.

## HAND-CRANKED CORN SHELLER

A manual cranking handle, sometimes accompanied by a flywheel, powers this simple but effective corn sheller. A compression spring adjustment enables the sheller to adapt to the size of each cob as it enters the feed opening. Husked corncobs are forced by hand into a feeding device which delivers the cob between one stationary and one rotating, toothed, cast-iron shelling plate, and are held in place by spring-loaded stripping claws. The action of the rotating plates causes the cob to rotate in a spiral fashion against the teeth, with the kernels flying off as it feeds through. After shelling is completed, the bare cob follows an ejection path automatically and makes way for the next cob to follow directly, as soon as the operator can feed it into the opening. The least expensive models clamp directly to a fence or tub side while the sturdier, generally faster models come inside a wooden or metal housing. Many come with an attachment for shelling walnuts.



*Hand Crank Corn Sheller: 1) manual handle, 2) power pulley (flywheel), 3) shelling disc, 4) corn inlet, 5) shelled corn outlet, 6) shelled cob outlet, 7) compression spring, 8) clamps.*

### CeCoCo Sheller Type Number 4

Sheller No. 4 is treadle-operated and attached to a stand with driving gears, flywheel, and pedal. The body is made of cast iron, the stand of angle iron. Its capacity ranges between 300 and 350 bushels per hour at a standard rate of 250 revolutions per minute. Shipping weight: 75 kilograms.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

## NORTH AMERICAN SOURCES OF POWER CORN SHELLERS

### Burrows Corn Sheller

Burrows' Model 22 is the smallest of three available shellers with aspirator and cob blower. Operable with either a 10 or 15 h.p. motor, it will yield a capacity of up to 400 bushels per

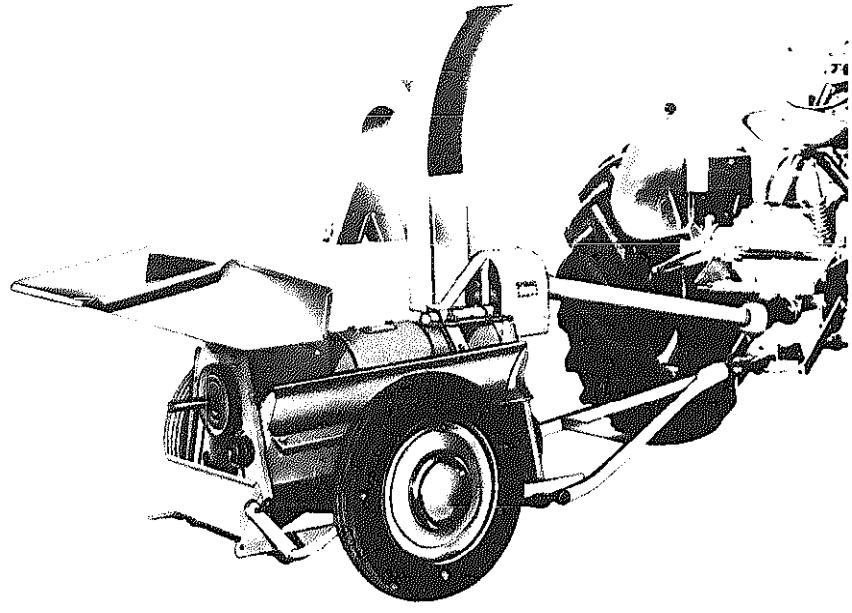
* Intermediate Technology publications can be ordered from International Scholarly Book Service, Inc., Box 555, Forest Grove, Oregon 97116.

hour. The 8-inch diameter cob pipe can be up to 100 feet long with up to 45 feet of vertical pipe left. Height of the sheller is 4 feet. Models are also available to be run with 25, 30, 40, and 50 h.p. motors.

Burrows Equipment Co.
1316 Sherman Ave.
Evanston, IL 60204

**Haban Number 101-007 Husker-Sheller**

The Haban No. 101-007 Husker-Sheller is made to shell corn of any variety or size. Corn is fed into the machine at a comfortable height of 32 inches. A corn thrower is used to elevate the shelled corn into a truck or storage container. This model is available on wheels or as a stationary unit with a power take-off drive. It requires a 15 to 25 h.p. gasoline or 5 to 7 h.p. electric motor.



*Haban No. 101-007 Husker Sheller, complete with two wheel trailer.*
**Haban Mfg. Co.**

## SHELLING CAPACITY IN BUSHELS PER HOUR

| Condition of Corn | Moisture Content of Corn (Percent) | | |
|---|---|---|---|
| | 17 Percent and Less | 17 to 25 Percent | 25 Percent and Greater |
| Clean corn (no husks) | 350 to 500 | 250 to 350 | 200 to 250 |
| Corn with 50 percent husks | 250 to 350 | 200 to 250 | 150 to 200 |
| Corn with 100 percent husks | 200 to 250 | 150 to 200 | 100 to 150 |

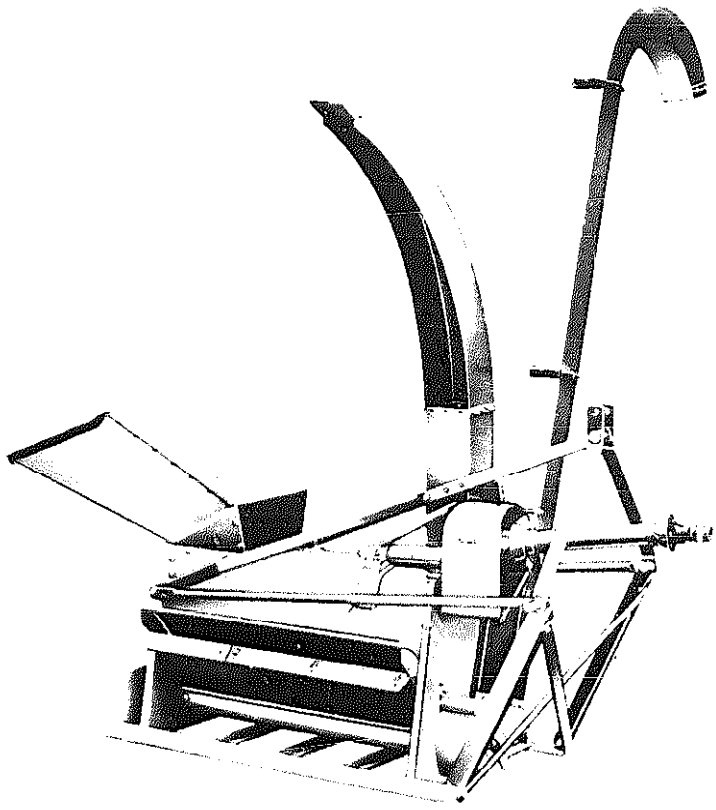
**Haban Husker-Sheller**

Haban's smaller unit, powered by a 6 h.p. gasoline or 2 h.p. electric motor, also handles all types and sizes of corn. It separates husks, cobs, dirt, and dust. Feeding height is 33 inches.

Both shellers are made by:
Haban Mfg. Co.
Racine, WI 53404

**Sears Husker-Shellers**

Until 1978, Sears offered a three-point hitch



*Haban No. 101-005 Husker Sheller, complete with 3-point lift.*
Haban Mfg. Co.

and pull-behind husker–sheller operated off a tractor's power take-off shaft. It could strip husks, extract cobs, and separate and clean shells of most types of corn. The sheller was constructed of 36 by 27 by 56-inch-high, heavy-duty galvanized steel units with low, four-way adjustable hoppers for convenient loading. The cob stacker pipe discharged husks and cobs at many positions. A large cleaning fan and sieve with controlled air blasts cleaned shelled corn three times. Sears discontinued its sheller for lack of demand, but they may return it to the market if a demand reveals itself!

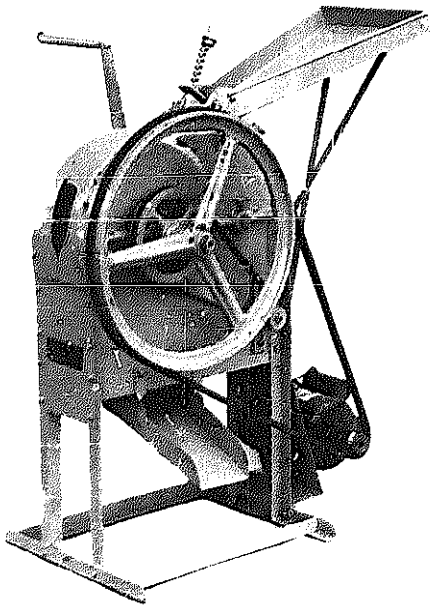
Farm and Ranch Catalog

## INTERNATIONAL SOURCES OF POWER CORN SHELLERS

### Cossul Hand and Power Maize Sheller

This one-hole, spring-type sheller can be operated by hand, yielding 100 to 200 kilograms per hour, or by a 1 h.p. motor supplied with a belt pulley, yielding 200 to 300 kilograms per



*Cossul Hand and Power Maize Sheller*
Cossul & Co.

hour. The unit is of all-steel construction, weighs 94 grams, and has a built-in cleaning fan.

Cossul & Co. Pvt., Ltd.
Industrial Area, Fazalgunj
Kanpur, India

**CeCoCo Corn Sheller Type Number 2**

Operated by hand, this sheller yields 100 to 150 kilograms per hour; with a ½ h.p. motor, it puts out 250 to 300 kilograms per hour. This machine has a flywheel and can be attached to any box or barrel. It measures 24 by 10 by 7 inches.

**CeCoCo Corn Sheller Type Number 3**

This sheller has a 2 h.p. motor and yields 750 to 1,125 kilograms per hour.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka, Pref. 567, Japan

**Allied Power Maize Sheller**

This sheller has a winnowing fan which separates the corn kernels without breaking them. A 5 h.p. motor is required to run the machine.

Allied Trading Co.
Railway Rd., Ambala City 134 002
Haryana, India

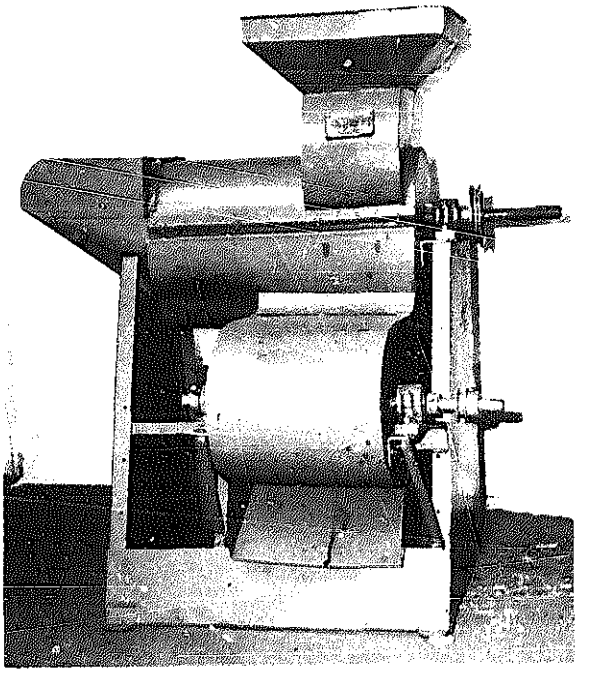
**Dandekar Power Maize Sheller**

This company offers a 5 h.p. machine which shells up to 1,500 kilograms of corn per hour, and separates the dust and chaff from the grain.

Dandekar Brothers
Sangli
Maharashtra, India

**Unitrac Maize Sheller**

The Unitrac shells corn by a rolling action at a speed of 600 rpm. It has a shelling capacity of about 2 tons of grain per hour with a 10 h.p. motor.



*Dandekar Power Maize Sheller*
Dandekar Brothers

Union Tractor Workshop
8B Phase II, Mayapuri Industrial Area
New Delhi, 110 027 India

**Laredo Corn Shellers**

Laredo's Model MDL-900 is a powerful sheller which produces 3,600 to 6,000 kilograms of shelled corn per hour. It can be operated by a 15 h.p. electric engine or an 18 h.p. diesel/gasoline engine.

Model MDL-500 is attached to a tractor three-point hitch and powered either by the power take-off shaft or by a stationary engine. It will generate 3,000 to 3,600 kilograms per hour with a 5 to 7.5 h.p. electric motor or with an 8 to 10 h.p. gasoline/diesel engine.

Laredo Models S.A. Industria E. Comercio
Rua 1 de Agosto M-67
17.100—Bara(SP) Brazil

**Power Maize Sheller**

This sheller has an output of 100 kilograms

per hour when driven by a 1 h.p. motor or engine. Shelling gaps are adjustable.

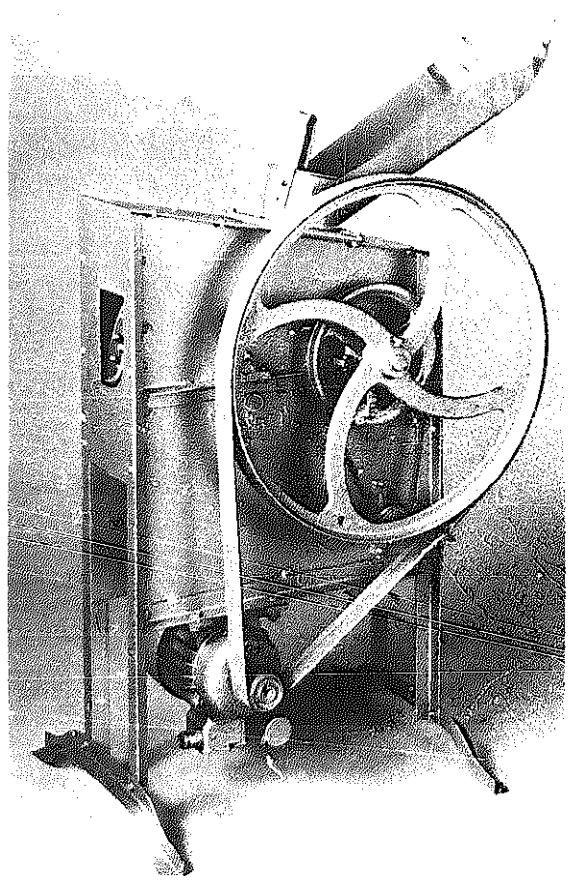
Rajasthan State Agro Industries Corp. Ltd.
Virat Bhawan, C-Scheme
Jaipur 302 006, Rajasthan, India

**Ransomes Power Maize Sheller**

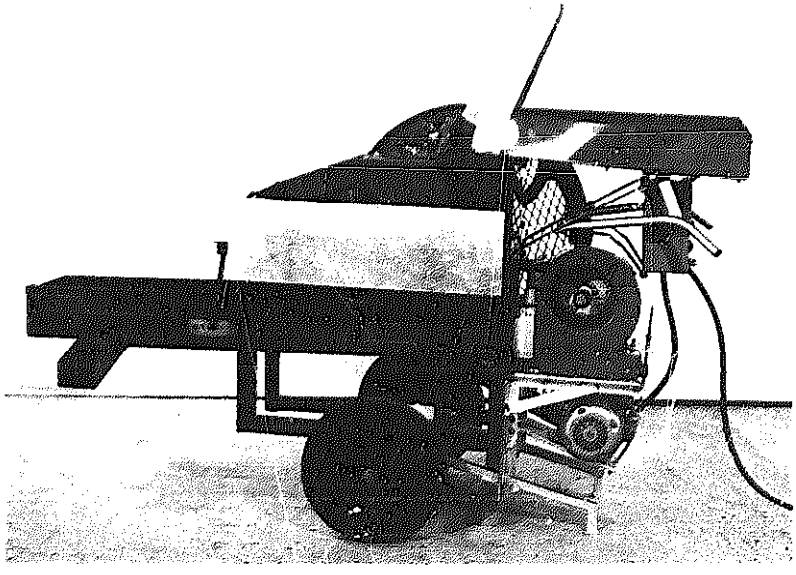
This is an all-steel-construction sheller with a belt-driven winnowing fan. When driven by a ½ h.p. motor, it has an output of 300 kilograms per hour.

**The Ransomes 4A**

The Ransomes 4A is manufactured for small farmers in developing countries. Husked ears of corn are shelled individually on both sides of a rotating, toothed, shelling plate as the cobs are forced past the plate by rotating, feeding drums. Spring-loaded stripping claws hold the ears against the shelling plate while shelling takes place. The spring tension and the size of the opening are adjustable. Below the shelling mechanism is a cleaning shoe where corn is cleaned and graded. Three screens are provided for the sheller: a 19-millimeter round-hole upper sieve, a 10-millimeter grading sieve, and a 5-millimeter lower sieve to remove chaff. The cleaning shoe is oscillated by a crank pin.



*Ransomes Power Maize Sheller*
Ransomes, Sims and Jefferies, Ltd.



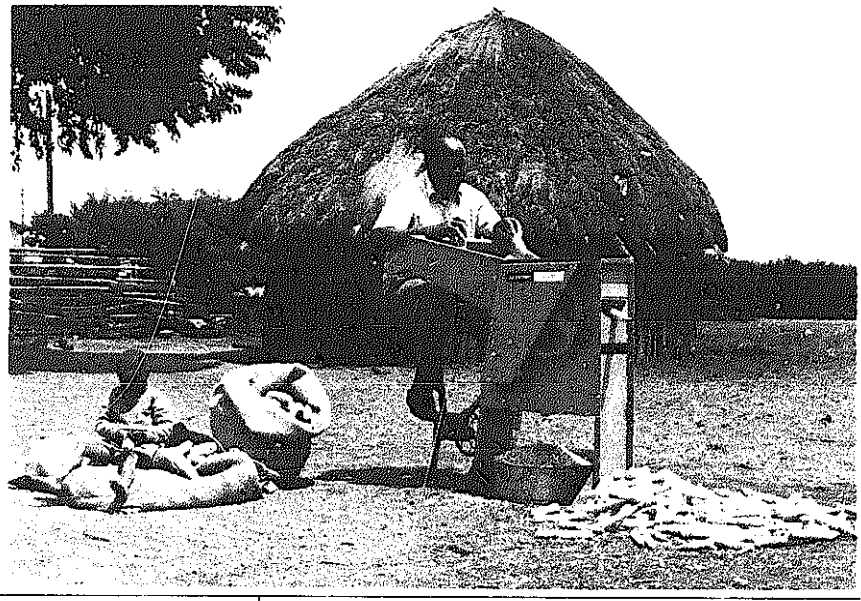
*Ransomes 4A Sheller, modified for experimental work.*
Agriculture Canada

### Moon Sheller

This unit consists basically of a shelling cylinder fitted with renewable pegs. A powerful fan at the bagging point removes flakes, silks, and dust from the corn. This sheller can strip 2,700 to 4,500 kilograms of kernels an hour from husked cobs. It requires 4 to 6 h.p. to maintain a speed of 6,000 rpm. Weight: 200 kilograms.

### Cobmaster Sheller

Specially designed for the smaller farmer, the Cobmaster sheller is available with a choice of hand, pedal, or motor drive. Husked cobs are hand-fed from a hopper into two feed holes with adjustable rubbing pads. The internal cleaning fan gives a flywheel effect and will blow light refuse out the front of the machine. The crop falls through the bottom of the machine. Maximum output with a ½ h.p. motor is 750 to 900 kilograms per hour (1,600 to 2,000 pounds).



*The Cobmaster Sheller*
Ransomes, Sims and Jefferies, Ltd.

The above four shellers are manufactured by:
Ransomes, Sims, & Jefferies, Ltd.
Nacton Works
Ipswich IP3 9QG U.K.

### Jumil DM-30

For a production capacity of 30 sacks per hour, this corn sheller-thresher can be operated either as a stationary unit or attached to a tractor power take-off and hydraulic lift system. Shelled corn is obtained without crushing the kernels.

# SILAGE CUTTERS AND CHOPPERS

## CHOPPING SILAGE BY HAND

One way of providing succulent animal feed throughout the year is to cut or chop grass, hay, straw, root crops, or forage crops into small pieces and convert the material into silage. Stored in a silo, anaerobic acid fermentation converts green fodder into succulent feed, a form in which it can be stored through the year.

For small acreages where only one or two animals are to be fed, a simple method of hand chopping can be used to prepare green fodder for storage. All you need are a butcher's knife and chopping block. Hold a bundle of material in one hand and chop against the block with the other. Output and efficiency of this method is low, of course, and the work is tedious. Some foreign companies have devised hand-operated equipment to make the job easier.

A typical hand-operated silage cutter consists of a feed trough with or without conveyor rollers. At the end of the trough, straw is gripped between two toothed rollers which feed it over a shear plate. A pair of rotating knives mounted on a hand-cranked flywheel chops the feed into short lengths. Two men are required for the operation—one to turn the flywheel and the other to feed the machine.

For this cutting tool to function efficiently, it is important that the knives be kept well sharpened, and a few spare sets of knives should be available for regular changing. Even more important, you must keep the correct bevel on the cutting edge (instructions should be provided by the manufacturer). Finally, the knives should be adjusted so that they lightly touch the mouth of the machine over its full width.

## SOURCES OF HAND-OPERATED SILAGE CHOPPERS

### Dandekar Hand-Operated Chaff Cutter

This implement cuts chaff into 1-inch (25 millimeter) segments.

Dandekar Brothers
Sangli
Maharashtra, India

### Silex Chaff Cutter

This machine also cuts chaff into 1-inch (25 millimeter) segments.

Ernest H. Johnson (Pty.) Ltd.
Box 7536
Johannesburg 2000, South Africa

### Ajanta Silage Cutter

This implement has two blades and runs on ball bearings. The worm gear drive can be set to either of two fodder-cutting lengths with segments ranging from 5/8 inch (15.9 millimeters) to 7/8 inch (22.2 millimeters). The output for dry fodder is 200 to 250 kilograms per hour and 250 to 300 kilograms per hour for green fodder.

## POWER-OPERATED SILAGE CUTTERS

The feeding mechanism of the power-operated silage cutter does not differ much from the hand-operated type, although the cutting mechanism itself may differ a bit. Two types of

cutting heads are available, a cylinder type and a flywheel type. In both cases, a fan is provided for blowing the cut material into a silo through a vertical blower pipe. A power-operated silage cutter performs three functions—feeding the material into the blades, cutting, and elevating material into a storage bin.

The capacity of a silage cutter depends on the width and height of the throat, length of cut, number of knives, and speed of operation. One-half inch is an average length of cut, but this can be regulated by the speed of the apron and feed rollers. Faster feeding results in longer cuts while slower feeding will give correspondingly shorter cuts.

## SOURCES OF POWER-OPERATED SILAGE CHOPPERS

### Nogueira

This model cuts all kinds of forages into lengths varying from 4 to 32 millimeters. It will throw the cut product to a height of 10 meters while the adjustable outlet allows it to be deposited in any preselected place.

Irmaos Nogueira S.A.
Rua 15 De Novembro, 781
Caixa Postal, 7
Itapira, Est. Sao Paulo, Brazil

### Atlas

Fitted with forward, stop, and reverse action and controlled by a safety stopping lever, the Atlas comes supplied with two pairs of change wheels which will cut a range of lengths from ¼ to ¾ inch. The output for ¼ inch lengths ranges from 7 to 15 hundredweights per hour, depending upon the blades used.

R. Hunt & Co., Ltd.
Atlas Works, Earls Colne
Colchester, Essex CO6 2EP, U.K.

### Laredo Chopper

This unit works coupled to the three-point hitch of a tractor or powered by a stationary engine—electric or fuel. It is a combination hammer mill–silage chopper capable of producing from 220 pounds of fine corn flour to 2 tons of chopped grass in an hour.

Laredo
Rua 1° de Agosto
11-67—17.100
Bauru (SP) Brazil

### Tien Chien Silage Chopper

The Ta-Yu Silage Cutter and Potato Slicer is treadle-powered but can be operated with a ¼ to ¾ h.p. motor. It weighs 84.6 kilograms, measures 27 by 34 by 39 inches, and produces at a rate of approximately 300 to 500 kilograms per hour.

# ROOT AND VEGETABLE CUTTERS

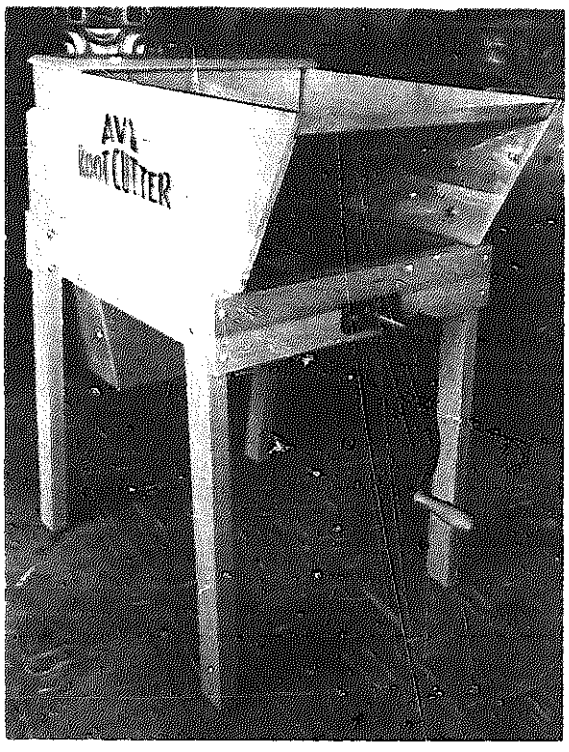
The root and vegetable cutter is a very simple tool for slicing potatoes, turnips, sugar beets, carrots, and other root crops into small pieces suitable for animal feed or compost. It is not designed to handle branches or heavy brush. In practice, the hopper is filled with semihard fruits or vegetables which are then sliced and shredded by the action of a heavy, cast-iron wheel with a number of small cutters attached to it.

## SOURCES OF ROOT CUTTERS

### A.V.I. Root Cutter

The 18 inch, cast-iron disc of this hand-operated cutter is mounted on a 1 inch diameter shaft. Cutter teeth are of a heavy-gauge stainless steel. The basic frame is made of oak, the hopper of alder or Western maple. The unit weighs approximately 75 pounds and measures 40 by 24 by 36 inches.

American Village Institute
440 Meyers St.
Kettle Falls, WA 99141



*The AVI Root Cutter*

**Hand-Powered Root Cutter, Series B**

This unit is made of cast iron, has a cutting cylinder measuring 200 by 380 millimeters, and has a flywheel diameter of 600 millimeters for a hand-powered operation. Weight: 100 kilograms.

Renson et Cie
B.P. 14
59550 Landrecies, France

**Hand-Operated Root Cutter**

Of Polish manufacture, this machine is hand operated and has an output of 500 kilograms per hour. At the base of the hopper are a pair of concave discs facing each other, each with 26 short, curved blades projecting from the surface. The crank is on a flywheel which helps rotate the cones at a slow, steady speed. The hopper can hold 22 kilograms of harvested roots, and guide plates ensure that they are pressed by their own weight against the moving blades. As the discs are rotated, the blades gouge out short chips which then drop through the opening below the discs.

## SORGHUM AND SUGARCANE PRESSES

Pressing the juice from nonwoody plants like sorghum and sugarcane requires only simple tools and yields a sweet extract which can be processed for use as table sugar. The most common technique for pressing sorghum and sugarcane involves passing the stalk between two rollers, similar to the rollers on an old wringer washing machine. The weaker units require passing the stalk through a number of times, or splitting or pounding the material with a hammer before pressing.

If you're interested in improvising to build your own press, you may want to consult a book called the *Lik Lik Buk* from Papua, New Guinea (available from VITA, 3600 Rhode Island Avenue, Mt. Rainier, MD 20822). It illustrates a simple two-man sugarcane crusher that has no gears but has an adjustment screw at the top. Sugarcane is passed through the crusher three or four times, with the adjustment screw being tightened each time. The rollers are made of four-inch galvanized pipe, eight inches long; shafts are one-inch mild steel, and bearings are of hardwood. The top pair of bearings slides up and down depending upon the thickness of the stalk. Another unit has preset, spring-loaded rollers which require no further adjustment.

This setup may sound suspiciously like an old wringer washer to you, but heed this word of warning from the *Lik Lik Buk*: "If you think you can crush effectively with an old clothes mangle or wringer, you're wrong. Save yourself the bother. The springs aren't strong enough and if they are, the rollers might break."

### SOURCES OF SUGARCANE AND SORGHUM PRESSES

Hand-, animal-, and engine-powered crushers are available for crushing sorghum and sugarcane. For convenience of the drive layout, it is usual to employ vertical rollers in animal-powered crushers and horizontal rollers in hand- and engine-powered machines. Hand crushers are normally used only for domestic purposes and extract a rather small percentage of the sap. Animal- and engine-powered crushers can employ higher crushing pressures and obtain better extraction percentages.

## TAPPING SWEET SORGHUM

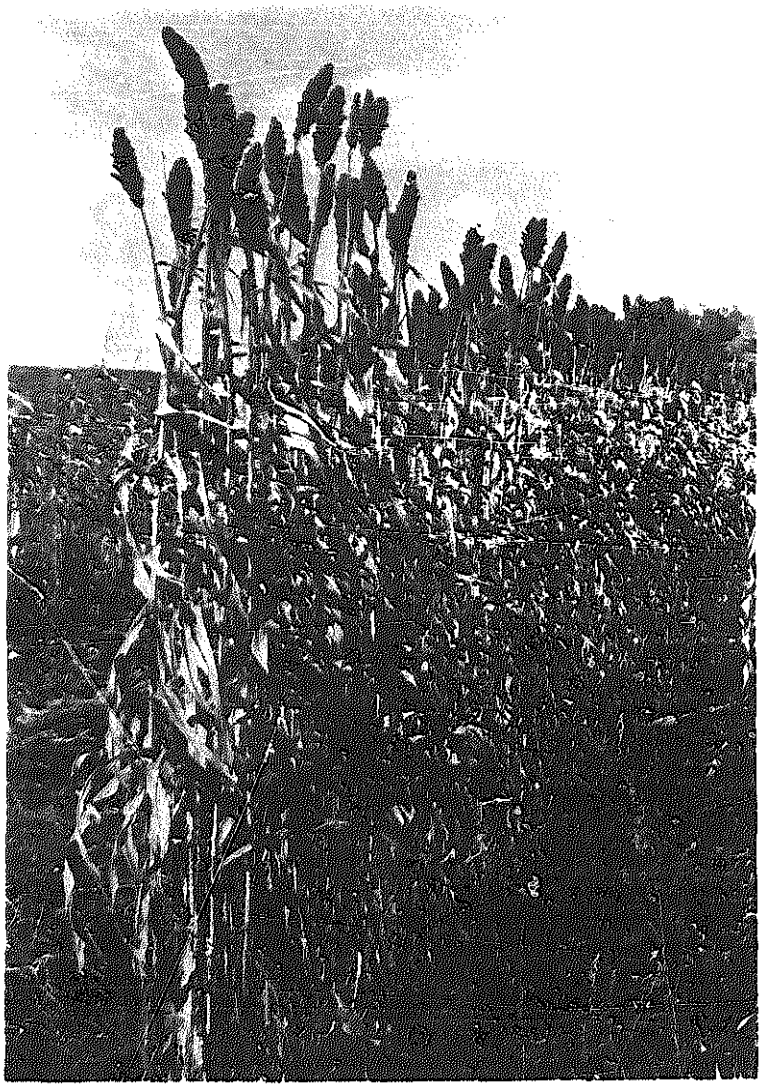
The tedious, old-fashioned production of sorghum syrup is rather like an old soldier: it keeps fading away but never dies. In fact, sweet sorghum may be making a comeback. Gardeners and homesteaders know it provides a tasty substitute for store-bought sweeteners. They also think that sorghum may be a practical cash crop they can grow for a sideline income without too much competition from big commercial farmers, since harvesting is still a process done pretty much by hand.

Now that the USDA (at the Agricultural Research Service Food Crops Utilization Research Lab in Weslaco, Texas) has found a way to remove starch from sweet sorghum so that it can be made into raw sugar, and not just syrup, small growers are bound to get even more interested. Experts say that the United States could replace 30 percent of the sugar it now imports with its own sorghum sugar, once the destarching process is perfected.

Gene Logsdon of Ohio grew two rows of sweet sorghum last year, each about 150 feet long, to see how well it would grow in the North. "I'm interested in it strictly as a northern source of sweetening," he explains. "I don't have bees yet, and only two maple trees large enough to tap. I wanted another alternative to buying sugar."

Drew Langsner in North Carolina looked more at sorghum's possibilities to add income to his homestead. "We were told that we could make up to 120 gallons of molasses per acre which could be sold direct to customers for as much as $12 a gallon," he says. "Moreover, the plant has few insect enemies here and is not critically affected by blights. Also, not only do you get the syrup, but the seed heads and leaves can be used for livestock feed."

Actually, sorghum in some areas can produce a good deal more molasses than what the Langsners



*Sorghum is planted the same time corn is, about one to two inches deep. Begin cultivating right over the row two days after planting, when the weeds are beginning to germinate, but the sorghum is not yet up.*

were shooting for—three times that amount. Or it can produce a good bit less and sell as low as $5 per gallon, depending on supply and demand. But any way you look at it, with a little luck and a *normal crop, sweet sorghum ought to gross at least $1,000 per acre and maybe as much as $2,000 per* acre—or enough money left over after expenses to repay you fairly well for the hard work involved.

The Logsdons didn't know precisely when to harvest their sorghum for juice, so they relied on advice from Amish farmers who grew it. The farmers said to wait until the seed heads had turned from green to reddish brown, when the seeds are past the milky stage, but still soft. However, the stalks didn't have to be cut immediately at that stage. Any time from then on was okay, so long as the harvest was finished before hard frost hit the plants.

At any rate, the first harvest step is stripping off the leaves, a job that's more easily done when the stalks are still standing. Wear gloves and just slide your hands down the stalks, knocking off most of the leaves. It doesn't hurt for the stalks to stand stripped of their leaves for a week.

"Stripping the leaves off is drudgery," says Langsner, "especially when, as in our case, many of the stalks have fallen over. We bind about half the stripped leaves into bunches to dry for winter livestock feed, and the rest we let fall on the ground for mulch."

Next, the stalks are cut and the seed heads lopped off. The Logsdons just cut the stalks with a corn knife as they do corn and pile them in bundles beside the row. Then they carry the bundles to the pickup truck, whack off the heads from an entire bundle with one blow of the corn knife, and load the stalks on the truck.

The seed heads should be spread out in the barn for drying, then stored for feeding. They need not be threshed except for grinding into flour. Rolling a seed head vigorously between the palms of your hands will easily thresh out the grains. But the seed heads can be fed directly to chickens, rabbits, and other livestock.

From their half acre, the Langsners harvested 102 bushels of seed heads—or roughly about 30 bushels of seed. That much nutritional energy bought at the feed store in the form of conventional grains would cost at least $100, so the seed alone may justify the labor involved.

Finding a press, if you don't have one, is not as difficult as it might seem, even in the North. They're still around—just keep asking. Gene Logsdon found at least three within easy driving distance of his place, but had you asked him two years ago, he'd have said there were none. Once you haul your stalks to the press, don't worry if the man can't get yours pressed and boiled down right away. The canes can lie two weeks without any noticeable loss of juice.

Many presses are now powered with motors, but a surprising number are still turned by horse or mule—the animal walks in a wide circle, pulling a sweep that turns the gears that make the rollers run. The operator shoves the stalks through the rollers, which squeeze the juice into a waiting barrel through a screen. The crushed stalks fall to one side in a pile. They can be used for mulch or composting, or even fed to cattle as silage if laced with some of the syrup skimmings produced during the boiling-down process.

A sorghum cooker can be built at home. The farmer who boils the Logsdons' sorghum made his own cooker—a cement fireplace about eight feet long and two feet wide, with a ten-foot chimney at one end and a roof overhang to protect the cooker from rain. The fire is built near the open end of the fireplace, and the draft pulls the heat evenly under the cooking pan and out the chimney.

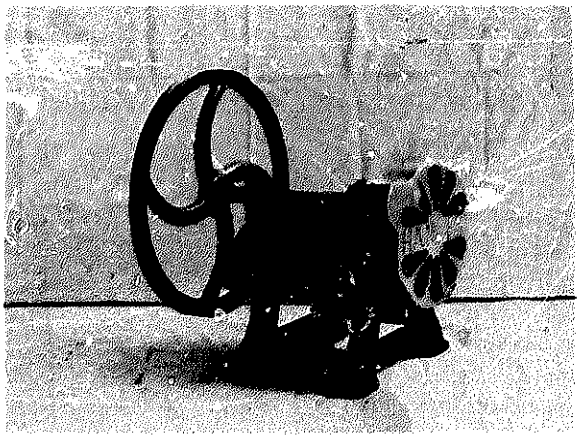
"The pan can be a very simple affair made of 2-by-8 inch boards for sides and ends and a sheet metal bottom," says one expert, "the whole pan should be about six feet long and two feet wide to fit nicely over the fireplace. Don't use galvanized metal, because the zinc coating on it might react adversely with the acids in the syrup."

## SOURCES OF SUGARCANE PRESSES

### CeCoCo Hand Sugarcane Squeezer

Employing three rollers to do the squeezing, this unit can be powered by hand or by a ½ h.p. motor for a production capacity of 115 kilograms per hour of cane. CeCoCo also manufactures larger cane mills with capacities ranging from 6 to 15 tons of cane per hour.

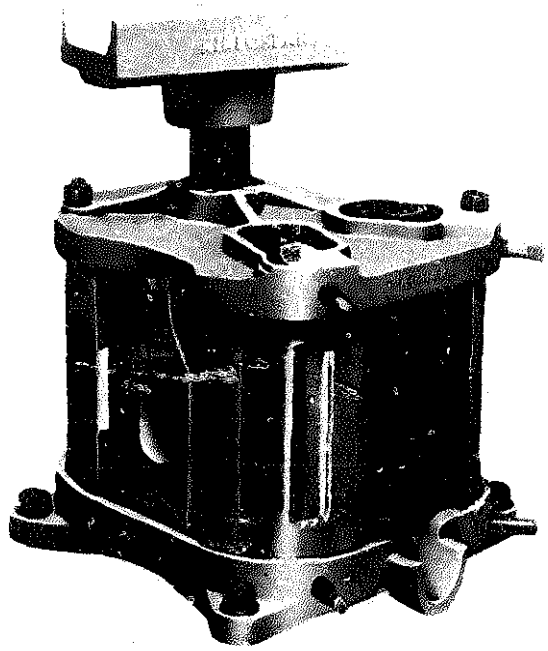
CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan



*CeCoCo Hand Sugar Cane Squeezer*

### Kumar Cane Crusher

This is a vertical three-roller sugarcane crusher which can be driven with one pair of animals. Its capacity falls between 300 and 350 pounds of cane per hour (136 to 158 kilograms per hour). Two other units with higher capacities are available—the Karmat and Kamal vertical three-roller crushers.



*Kumar Cane Crusher*

Kumar Industries
Edathara Post, Palghat District
Kerala State, South India

**Konya-a Cane Crusher**

This is a horizontal crusher designed to be operated by a 4 or 5 h.p. motor. It has a crushing capacity of 800 to 1,000 pounds per hour (365 to 455 kilograms per hour). Higher capacity units with three or five rollers are also available.

Kirloskar Brothers, Ltd.
Udyog Bhavan, Tilak Rd.
Poona 411 002 India

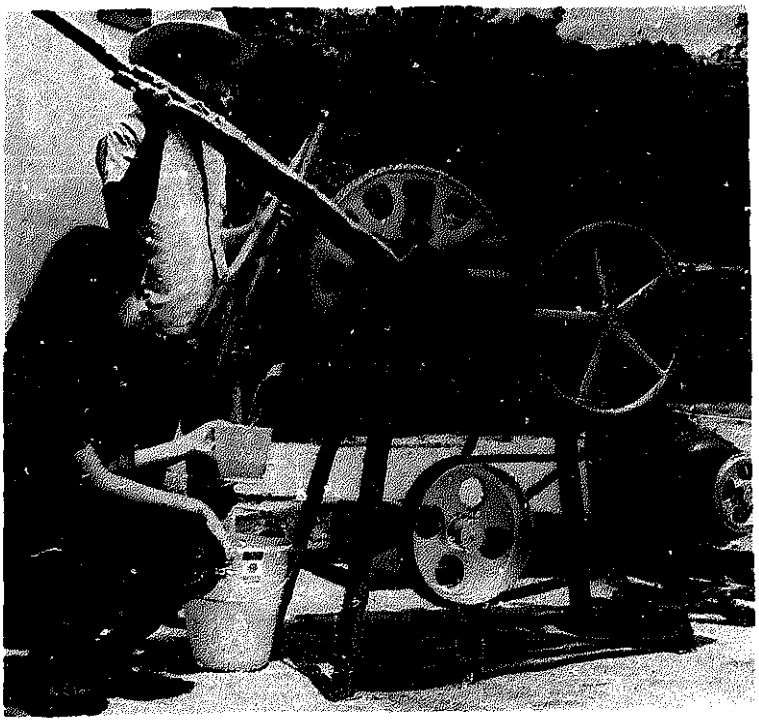
**Raja Horizontal Sugarcane Crusher**

With a crushing capacity of 1,500 to 1,700 kilograms per hour and a juice extracting capacity of 1,300 to 1,600 liters per hour, this machine requires a 5 to 7½ h.p. motor to run it.

Raja Trading Co.
P.O. Box 250
Madra 600 001 India

**Nogueira Sugarcane Crusher**

Constructed of rust-resistant iron, the Nogueira crusher can be powered by a 2 h.p. electric, 5 h.p. gasoline, or 3 h.p. diesel engine. The 95 by 165 millimeter rollers are designed for



*Nogueira Sugarcane Crusher*
**CIMAG**

self-feeding so that the cane does not have to be forced through the rollers. Adjustments and maintenance on the 125 kilogram unit are simple. It has a production capacity ranging between 300 and 400 liters per hour.

CIMAG, Comercio & Industria De Maquinas Agricolas LTDA.
Rua Padre Rogue n.° 1.840
Mogi-Merim S.P., Brazil

## SEED OIL PRESSES

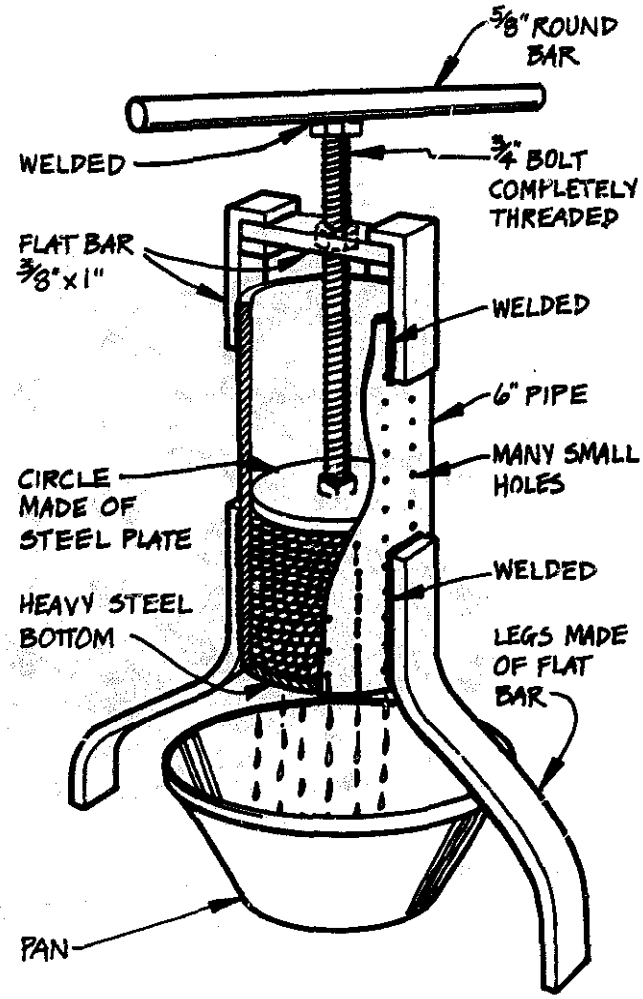
Pressing oil from seeds requires much more force than what's needed to press cane or sorghum. Prior to pressing, the seeds are ground or mashed and often heated in water until the water boils. Some oil may have collected on the surface of the water; this should be skimmed off and saved. The ground, cooked seed mash is then put in a cloth bag and pressed. A second boiling and pressing could yield a bit more oil.

Unfortunately, we have not been able to locate any sources of oil presses presently under manufacture in the United States, although many people are seeking such units.

### SOURCES OF OIL PRESSES

***Lik Lik Buk* Press**

The Papua, New Guinea *Lik Lik Buk* (distributed by VITA, 3600 Rhode Island Avenue, Mount Rainier, MD 20822) pictured this oil press design as a build-it-yourself suggestion for villagers. It was designed as a sturdy unit which will exert a great deal of pressure on a small



*Hand Oil Press*

amount of seeds. Reducing the capacity raises the amount of pressure generated for any given torque on the operating arms and downward thrust of the piston.

### CeCoCo Oil Mill

CeCoCo provides equipment for all stages of the oil-expelling process. A Seed Scorcher is used for drying the product, to reduce its moisture content to 4 or 5 percent. The oil expelling is done by tightening a screw worm, either by hand or motor. Finally, a filter press is used for filtering the raw crude oil through filter cloths and papers. This system works for many kinds of beans and seeds including rape, mustard, sesame, cotton, and sunflower seeds, and palm pericarp, peanuts, castor beans, and dried coconut, or copra.

## SPECIFICATIONS FOR CECOCO OIL MILL MACHINERY

| Machine's Name | Type | Capacity per hour | Power Required | Rpm | Dimension in mm | | | Net Weight | Gross Weight | Shipping Measurement |

When inquiring about an oil mill plant, please let CeCoCo know: (a) name of raw material to expel oil; (b) desired capacity per hour or 24 hours in raw material; (c) how you will use the oil produced; (d) whether you need group-driven or individual-driven equipment: if motor driven, also specify phase, voltage, frequency, current, and other details.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

### Table Oil Expeller

Four models of oil expellers are available from S. P. Engineering. Two presses, each with a 3 h.p. motor, yield 30 or 40 kilograms per hour, and two with 5 h.p. motors yield 50 or 55 kilograms per hour. All four units operate at 450 rpm.

S. P. Engineering Corp.
P.O. Box 218, 79/7 Latouche Road
Kanpur, India

# COFFEE PROCESSING MACHINERY

Coffee cherries, the ripened fruit of the coffee shrub, each contain two coffee beans. Two different techniques are utilized to remove the covering and pulp to produce clean coffee beans, the desired product.

The wet process begins with the pulping of the fruit by a pulping machine or pulper. Additional operations involving fermentation and washing may be needed to remove the pulp residue that remains. The seeds are then dried in the sun or in driers, until the moisture content has reached 12 percent. The seed parch-

ment is then removed in additional mechanical operations.

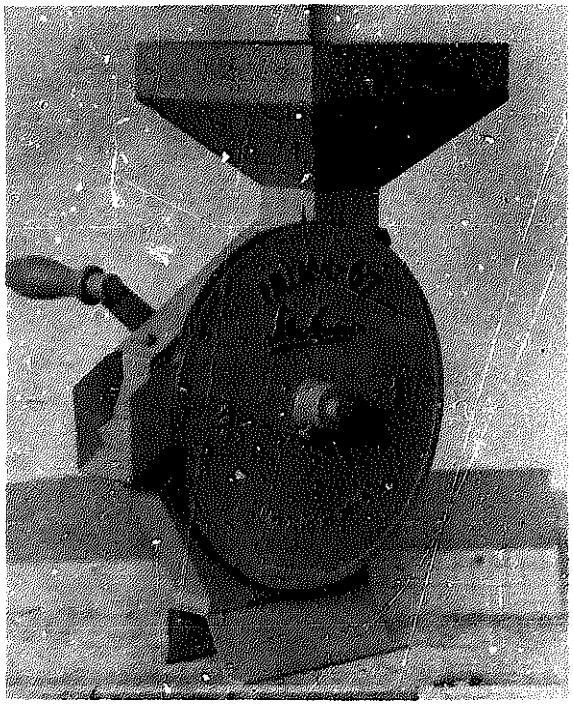
The dry process begins with the drying of the ripened fruit, either in the sun or driers. When the fruits are dry, hullers are used to remove the seed coverings. Graders are then used to separate varieties, sizes, and shapes of coffee beans offering a standard of sale.

## SOURCES OF COFFEE PULPERS

### IRIMA-67 Disc Coffee Pulper

This small machine pulps the coffee by squeezing the cherries between the rotating disc and the fixed pulping chop. The disc is of smaller diameter than standard and carries bulbs on one face only. Normally, the disc has cast-iron bulks of No. 75 pattern suitable for Robusta and Arabica coffees. Alternative discs can be supplied for use with Arabica and Liberica varieties.

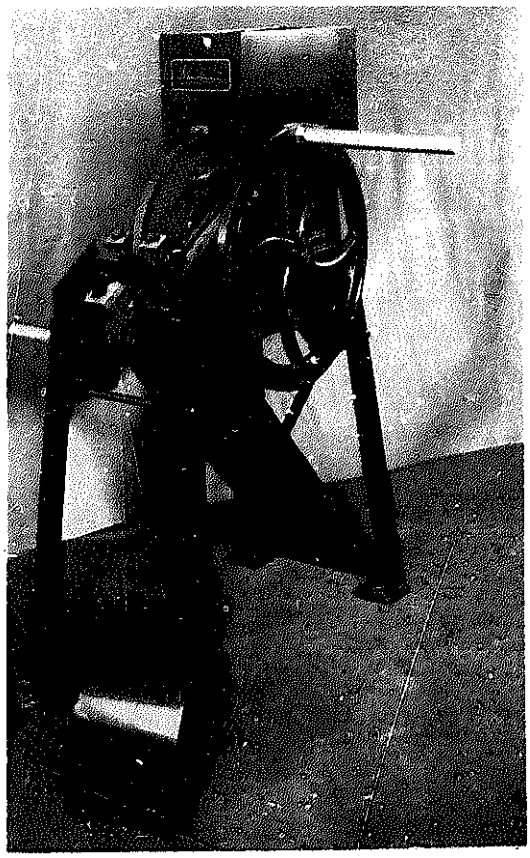
The capacity of the machine is 594 to 792 pounds (270 to 360 kilograms) an hour of ripe coffee cherries, which should be fed into the machine with water on the same day as it is picked. The machine weighs 55 pounds (25 kilograms).



*IRIMA-67*
John Gordon

### DG Disc Coffee Pulper

The DG coffee pulper is a single-disc machine which employs pulping bars and a pulping disc. The bars are straight, with a renewable steel edge, and are fitted with a cam device for ease in setting the chop relative to the disc. It has an index to enable the setting to be found again easily, and the chops are readily removable for cleaning.



*DG Disc Coffee Pulper*
John Gordon

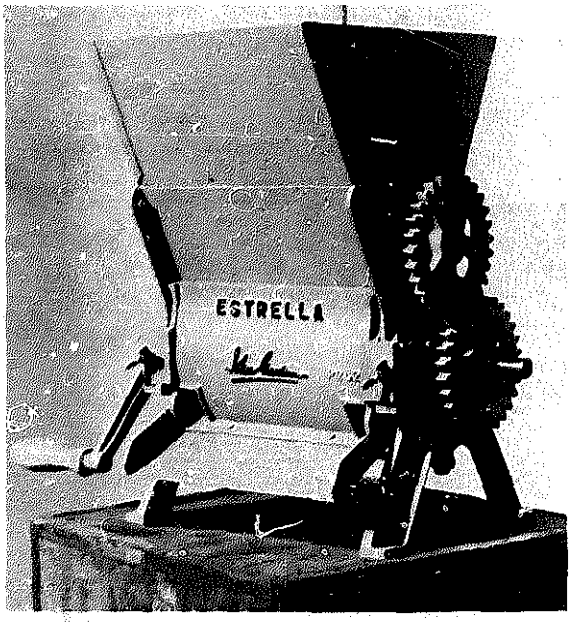
For treating Robusta and Arabica coffees, copper discs No. 75 or cast-iron bulbed discs No. P75LC are available. For other varieties, copper discs only are supplied, No. 71 for Liberica and No. 77 for coffees allied to Liberica but slightly smaller, or for large Arabica.

The machine can pulp up to 1,540 pounds (700 kilograms) of ripe coffee cherries per hour.

They should be fed to the pulper with an abundance of water on the same day as they are picked. The DG pulper has a net weight of 294 pounds (133 kilograms).

**Estrella Coffee Pulper**

This is a cylindrical coffee pulper, which squeezes the coffee cherries between the rotating, embossed cylinder and the fixed breast. It is made in two models. In one, a stirrer is fitted in the hopper, which has no stone trap. In the other, the hopper has a stone trap but no stirrer. In both models, the distance between the breast and the cylinder is adjustable. The machine is suitable for Arabica and Robusta coffees, but not for Liberica. It can pulp up to 594 pounds (270 kilograms) of ripe coffee cherries an hour depending on type and condition. The coffee should be pulped the same day as it is picked and fed to the machine with water. The machine with stirrer weighs 103 pounds (47 kilograms) and without stirrer, 85 pounds (38 kilograms).



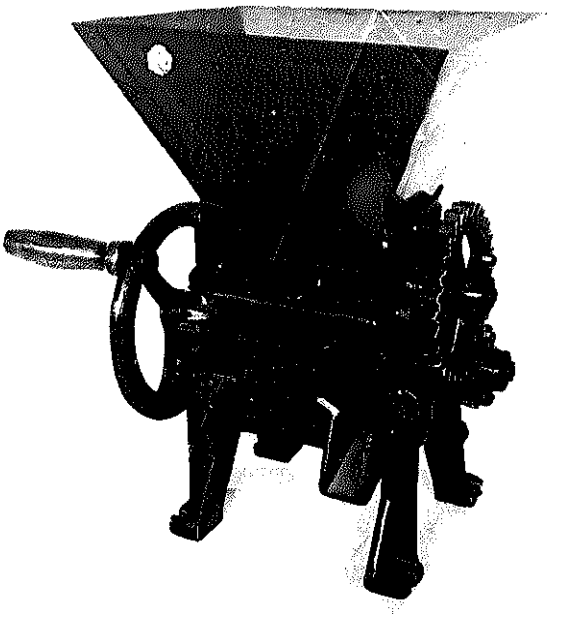
*Estrella Coffee Pulper*
*John Gordon*

**MTOTO Coffee Pulper**

This small coffee pulper is intended for use on small plantations but is also useful for treating the first crop on larger plantations. It is of the cylindrical type. The machine is suitable for Arabica and Robusta coffees, but not Liberica, and can pulp up to 100 pounds (45 kilograms) of ripe coffee cherries each hour. The cherries should be fed into the machine with water on the day they are picked. The working surface of the breast is machined, and the iron barrel has a renewable embossed cover.

A different version of the MTOTO called the Starlet Major is available without a stirrer but with a stone trap.

The machine weighs 34 pounds (15.5 kilograms).



*MTOTO Coffee Pulper*
John Gordon

All the above pulpers are available from:
John Gordon & Co. (Engineers, Ltd.)
196a High St.
Epping, Essex, England

**Atom Coffee Pulper**

This pulper is suitable for Arabica and Robusta coffees, but not suitable for Liberica coffee. Its output of ripe cherry pulp is 55 kilograms per hour. Weight: 15 kilograms.

**McKinnon Number 1 Disc Pulper**

This model is fitted with ball bearings, cast-iron disc, flywheel, and handle for hand operation.

Both models available from:
William McKinnon & Co., Ltd.
Spring Garden Iron Works
Aberdeen, AB9 LDU, U.K.

**Baby Pulper**

The Baby Model No. 2 yields 127 kilograms per hour and No. 2½ yields 254 kilograms per hour. No. 2½ is hand-operated and can be supplied with a flywheel grooved for V-belt power drive.

**Sunbeam Pulper**

This unit is power-driven with an output of 550 to 650 kilograms per hour when driven by a 1 h.p. engine.

The above models are manufactured by:
E. H. Bentall & Co., Ltd.
Maldon
Essex, CM9 7NW, U.K.

## SOURCES OF COFFEE HULLERS AND SEPARATORS

Engelberg Huller Company carries two sizes of coffee hullers and separators. These ball- or roller-bearing machines will hull coffee in the whole (coco) cherry or parchment form, separate and discharge the hulls, and deliver cleaned coffee beans.

Model No. 1 has a capacity of 1,600 pounds per hour for pulped coffee, and uses 10 to 12 h.p. Model 0, using 15 to 18 h.p., has a capacity of 3,400 pounds per hour. This larger model is also available with tight and loose pulleys.

Engelberg Huller, Co., Division
U.S. Route 11, P.O. Box 277
Factoryville, PA 18419

**Number 5 African Huller**

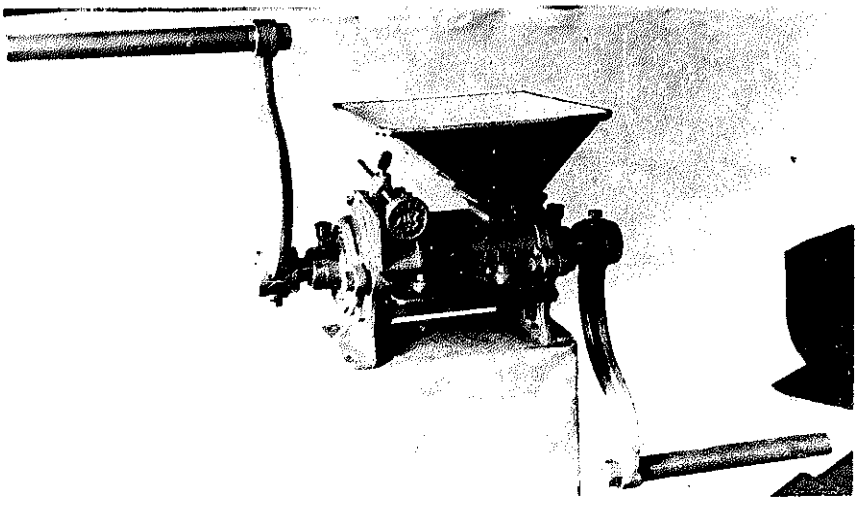
This model's output of clean coffee from dry cherries is 114 kilograms per hour. Output of clean coffee from parchment coffee is 127 kilograms per hour.

Power required is 5 h.p. The No. 5 weighs 216 kilograms. Larger models are also available.

E. H. Bentall & Co. Ltd.
Maldon
Essex, CM9 7NW, U.K.

**Number 10 Africa Coffee Huller**

This coffee huller can be conveniently operated by hand power and is ideal for small-scale farmers. It is normally fitted with two handles but it can also be supplied fitted with a pulley 229 millimeters in diameter by 76 millimeters wide, requiring 1.5 h.p. The machine can shell dry cherry coffee and also parchment coffee. It will treat Arabica, Robusta, and Liberica varieties,



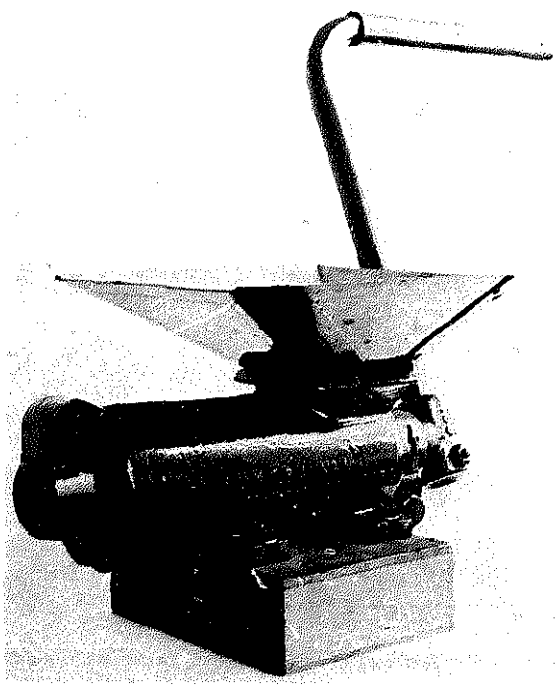
*No. 10 Africa Coffee Huller*
John Gordon

although with hand power, dry cherry Liberica coffee is too difficult to shell. The machine is fitted with two adjustable hulling blades, a feed slide and a weight to regulate the pressure on the discharge door, all of which are adjustable to obtain optimum performance. A perforated plate, which is easily detachable for cleaning purposes, is fitted to the bottom of the machine. Dust and small flakes of shell pass through it. The coffee is delivered shelled but mixed with large flakes of shell; it should be winnowed afterward.

Dry cherry Arabica coffee can be shelled at the rate of 48 pounds (22 kilograms) of clean coffee an hour, and parchment Arabica coffee at the rate of 79 pounds (36 kilograms) an hour. For Robusta, these outputs are about 30 percent more, and for Liberica about 30 percent less. The machine has a net weight of 95 pounds (43 kilograms).

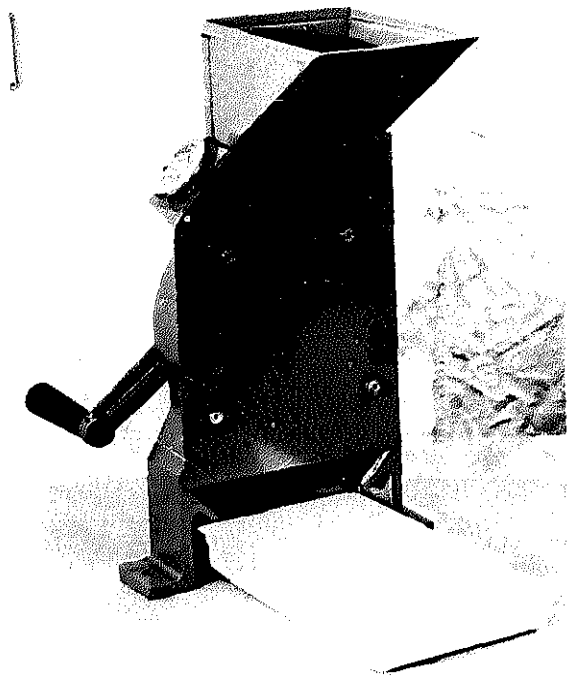
### Bukoba Coffee Huller

This small huller is designed for shelling dry cherry coffee, but it will also shell parchment coffee. Its use is indicated for small-scale farmers, and as a sampling machine for larger mills.



*Bukoba Coffee Huller*
John Gordon

The machine is strongly constructed and has no adjustments. The coffee is simply fed to it and the handle turned. The shelled coffee is discharged mixed with the shells and dust and must then be winnowed and sieved. Dry cherry coffee can be shelled at the rate of 20 pounds (9 kilograms) of clean coffee an hour. Parchment coffee can be shelled at the rate of 60 pounds (27 kilograms) an hour. The coffee must be quite dry and crisp when fed to the machine, which is not suitable for the treatment of Liberica coffee. The net weight of the machine is 29 pounds (13.5 kilograms).



*Limprimita Coffee Sheller*
John Gordon

### Limprimita Coffee Sheller

This is a small huller which is very useful in coffee-cleaning mills and also to those coffee buyers who purchase parchment or dry cherry coffee. According to the manufacturer, the advantage of this model over other sampling machines is that any quantity from one bean to several kilograms can be shelled rapidly, completely, and safely.

A ribbed roller operates in conjunction with an adjustable, flexible block. The lightest pres-

sure consistent with good performance is applied by adjusting this block. The roller is turned before the coffee is fed into the machine, and this should be done gradually and evenly. The coffee is discharged mixed with the loose shells, and should then be winnowed. The machine should be fixed firmly to a table. It is 17 inches (43 centimeters) high and its net weight is 29 pounds (13 kilograms).

The above hullers are manufactured by:
John Gordon & Co. (Engineers, Ltd.)
196a High St.
Epping, Essex, England

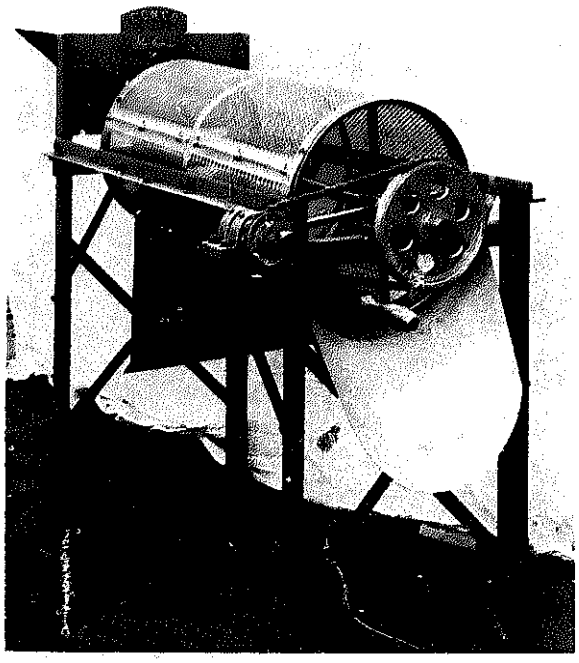
## SOURCES OF COFFEE GRADERS

**Congo Coffee Grader**

This little grader is especially suitable for use in an installation of small, hand-driven coffee hullers. Its output is 110 pounds (50 kilograms) an hour. The cylinder is composed of a perforated plate with two sets of perforations, thus giving three grades. The grades may be determined to suit the requirements of the planter, and about 2 pounds (1 kilogram) of coffee should be sent to the manufacturer when passing the order to make sure that the most suitable perforations are provided. The perforated plate is easily detachable. With spare plates of different perforations, it is possible to treat several varieties of coffee in the same machine. Plates are available with three perforations, thus giving four grades, but the output is less. The shafts are mounted in ball bearings.

A larger grader of the same design, having a capacity of 495 pounds (225 kilograms) an hour, is also available, and can be supplied for hand power or complete with small electric motor. The small grader weighs 187 pounds (85 kilograms), the larger, 495 pounds (225 kilograms).

John Gordon & Co. (Engineers, Ltd.)
196a High St.
Epping, Essex, England



*Congo Coffee Grader*

## MAPLE SUGARING EQUIPMENT

Equipment for collecting and processing maple syrup is so very specialized that all the necessary implements can generally be obtained from the same source. For collecting, there are plugs, sap bags, collection tubs, and buckets. Evaporators and skimmers are used for processing, and for the small commercial venture, there is a need for molds, cans, bottles, and filters.

Instead of itemizing the tools and accessories available from the different companies, we recommend you send for their fully illustrated catalogs. Instruction books are available for the novice maple sugarer from these companies:

G. H. Grimm Co., Inc.
Box 130
Rutland, VT 05701

Leader Evaporator Co., Inc.
25 Stowell St.
St. Albans, VT 05478

Small Brothers, Inc.
P.O. Box 160
Dunham, Quebec JOE 1MO, Canada

Les Specialites Techniques De Valcourt, Inc.
746 rue St. Joseph, C.P. 68
Valcourt, P.Q. JOE 210, Quebec, Canada

*Down to a science: Ralf Clark and Fred Behringer of Waterford, Connecticut, keep the wood stacked high a year ahead of time to dry, use it as a barrier against the weather, and have the system arranged with pulleys so that their sugaring project stays a one-man job.*

# GOLD IN THE TREES

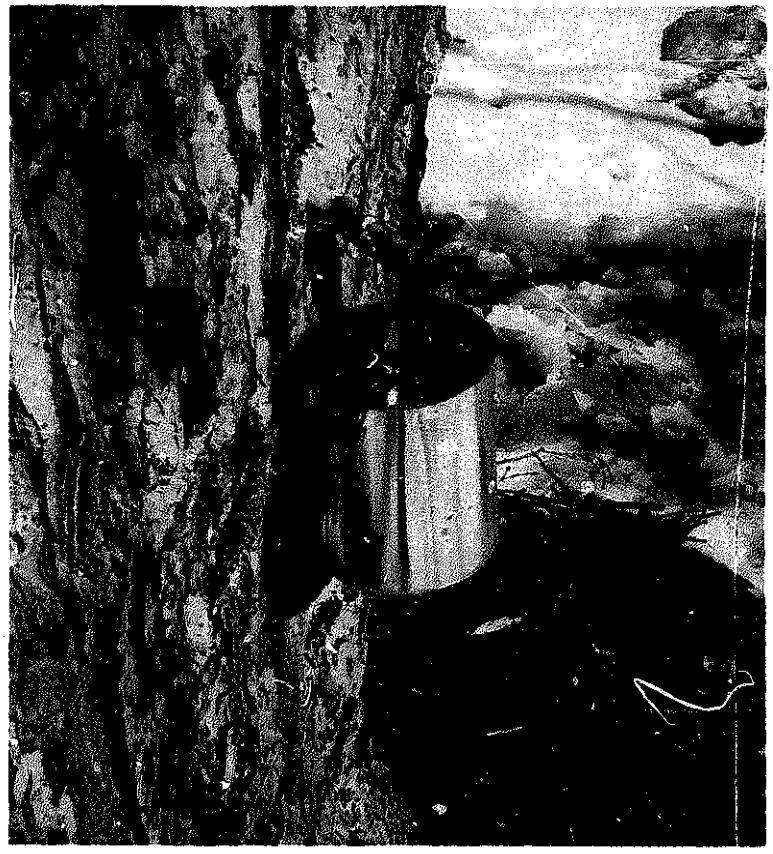
**by Bruce Mays**

Two years ago, my neighbor and I devised a system that yields three gallons of maple syrup every year from a total investment of under 12 dollars. If we can do it, anyone can. Boiling your own maple syrup is surprisingly easy. And when that syrup is free, boiled during the first hint of spring in your own backyard, you know you're living well.

Sugar sap is manufactured by maple leaves all summer long, then stored for the winter in the roots. The following year, that sugar supplies a ready-made energy reserve to the growing tree until new leaves are able to photosynthesize their own. During the first thaws of spring, the roots must move that sap through the trunk to the branches. Only if conditions are right, only if the sap is racing like an elevator between the roots and branches, can the tree be bled. Warm, sunny days draw the sap from the earth. Freezing nights pull it back down. That combination is essential; any other locks the sap motionless in one spot or another. In the South, or by late spring, there are no freezing nights that will gather the sap to the roots. But don't despair. If you live in sugar country and the season is right, there is no mistaking it. Morning ice will cover the bark, and by afternoon, the branches will sweat with glistening sap.

The first step in sugar production involves drilling holes through the bark. A general rule of thumb calls for the holes to be drilled no closer than one foot apart in a waist-high circumference around the trunk. Each year the holes should be shifted three inches to one side or the other, making sure no new holes are above or below the old. Since sap flows only through the newest growth directly beneath the bark, the holes should be angled upward no deeper than three inches toward the center of the tree. Tap primarily the southern face: sunlight coaxes a quicker flow. The standard drill bit is $\frac{7}{16}$ inch; hardware store taps are made with that size in mind.

A tap is nothing more than a stiff pipe plugged into the hole that funnels the sap out of the tree. Any tubular, soft piece of wood will do. My own yard abounds with one-inch diameter sumac trees. Once the branches have been cut into six-inch lengths, it is a simple matter to ram a red-hot straight iron through the spongy pith. All that remains is to whittle one end of the shaft to a taper and drive the tapered end into the tap hole like a bung into a barrel of wine. The sumac will swell with the first run of sap, sealing the tap tightly against each hole. Professional buckets are made of



*The top shaft should be tapered at one end and driven into the tree at an angle. It is best to have a covered collection can.*

galvanized steel, come complete with a hood to keep out unwanted rain and snow, are very handsome, and cost $4 each. For that price, I can empty ugly homemade buckets every time it rains or snows. A friend of my neighbor's gave him three dozen unused number ten tin cans—for free. Any large container will do, of course. The tin cans were simply the most convenient for us. I have seen plastic gallon milk jugs and unused paint-stirring cans used with great success. By punching a hole on each side near the top and looping a length of wire between them, we produced three dozen collecting buckets in less than an hour. And when we hung the buckets from our homemade taps, the fit was extraordinary. Forty-nine-cent taps stick out only about an inch from the bark; our homemade variety extends five inches from the trunk, far enough to direct sap into the very center of each bucket. By carving a small notch near the end of each tap, the collecting cans were safe from even the strongest breezes.

Our total investment so far was nothing. By the second week of March, our taps carried clear sap in a stream, filling each two-quart can within hours. And if you hate the thought of all that boiling, stop there—maple sap in place of water makes the most exquisite tea and coffee you've ever tasted.

If you do boil it, there are a few considerations to prepare for before you begin. If you have a job during the week, you will probably want to boil only on the weekends. That means storing your daily collections for at least six days. Twenty-gallon trash cans with plastic liners are about as large a storage container as you want to get and still be able to move them easily.

Now, however, you must keep the sap cold during the week. Left by itself, on a warm day, collected sap soon clouds to a bacterial soup. The easiest solution is to keep the trash cans in daylong shade. Each night, a skim of ice will form to protect the sap during the following day. And when warm weather still threatened to melt the ice and spoil the sap, we simply froze some fresh sap

overnight in milk cartons and floated the chunks of ice in the cans. As long as even a small ice cube remained until dark we knew we were safe.

After eight days of collecting we were ready to boil. Once again, we were in a potentially expensive situation. From every 40 gallons of sap, 39 gallons of water must be evaporated. That takes a tremendous amount of heat. The only realistic way for a home maple boiler to produce syrup is to cook the sap over an outdoor wood fire. Our three gallons of syrup demanded about two cords of wood.

Four years ago, I used an old ten-gallon lobster pot for the actual boiling. For someone with only a few maple trees, this is fine. But remember, it takes 40 gallons of sap to produce one gallon of syrup, and the evaporation rate of that excess water is a direct product of the size of the pot. Water will evaporate only from a surface in contact with the air; no amount of heat can alter that fundamental rule. Anyone planning to produce more than a pint of syrup in less than a lifetime of boiling will be forced to use a professional evaporator. We were, and now I know we were right.

*From every 40 gallons of sap, 39 gallons of water must be boiled off. Three gallons of sap call for about two cords of wood.*

Don't let the word professional scare you. It means simply a very large pan. The smallest of them, like ours, is about five feet long by three feet wide and ten inches deep. That is enough to hold 50 gallons of sap and presents an evaporating surface of 15 square feet—a twenty-fold improvement over my lobster pot. Fancier, more expensive evaporators have baffled compartments to route the finished syrup away from the new sap, inlet spigots and outlet faucets, and mysterious coils winding along the bottom. But beyond all that finery is still the simple physics of a larger evaporating surface. My neighbor found our small, used pan in a local newspaper for $10. Five dollars each, and we had made our last expenditure.

It remains only to get the fire underneath the pan. In our case, that meant piling used bricks in a three-sided structure 18 inches high, making sure that the edges of the evaporator pan would sit snugly on the inner brick wall. I suppose the bricks should be cross-stacked for maximum strength, but by the time we set the pan, leveled it out, poured in the sap, and stoked two cords of wood, our neat rectangle was something of a shambles anyway. The real trick is to concentrate as much of the heat uniformly onto the pan while still allowing enough air into the blaze to keep it burning hot. That meant removing a stray brick for ventilation here and there, sticking an old stove pipe from

the back end as a chimney, maybe sealing the gap between the evaporator and the bricks with mud. Generally, though, it meant just watching the fire at all times to balance its needs.

There are some things to be remembered during your boiling day. If the boil slows, the evaporation rate decreases. Too much heat in one spot tends to melt the solder holding the pan seams together. You have to work on the furnace a little to prevent those annoyances. We slanted a dug pit towards the rear of our rectangle and tried to keep most of the burning wood near the bottom. The heat then tends to climb up the slope towards the mouth of the furnace and disperse somewhat evenly across the bottom of the pan.

Be sure to add fresh sap steadily throughout the boiling. Too much cold sap all at one time will quench your good boil and slow the evaporation rate. Each time new sap is added, a scum will rise to the top. Skim these impurities from the broth with a slotted spoon.

Finally, the sap will taste distinctly mapley. Since our three gallons of syrup made a dangerously shallow layer in the pan, we found it prudent to remove the syrup from the fire when it was obviously brown and sticky-sweet, but still too thin for good syrup. This meant boiling the last few gallons in pots on the kitchen stove, but that way you can watch the syrup more carefully as it thickens. Books will tell you to dip in candy thermometers, or to measure the specific gravity and weigh the sugar content. At that point, the usual rolling boil is replaced by a kind of brown foam that sudses above the syrup. Syrup at just the right stage will cling to the spoon like thin taffy as it cools.

Your new syrup should be poured through muslin or felt at least once to pick up stray flecks of ash left by the fire. If you're planning to store the syrup for longer than a few months, be sure to fill each container right to the top while still hot and cap it immediately. When the syrup cools, it will hold the cap down with vacuum and never spoil. Pint or quart mason jars are perfect for this, but old bottles or food jars—anything with a sealing lid—can be used. If the syrup ever does cloud, simply boil it again and rebottle it. In a cool spot it should keep for years.

By the end of the day everyone is exhausted. Last year we began at six in the morning and were still sitting in a freezing drizzle at eleven o'clock that night. In between, a half ton of sap was poured by cupfuls into the steaming evaporator, the fire was tended, new sap was collected, and spare wood split.

And yet every winter I am restless for sugaring season. By late February, I swear I can smell the sweet air from other boilers. There is something very special about this first outdoor project of the year, something very satisfying about using your hands and brains to produce such an indecently delicious syrup.

# NUT SHELLERS

## GROUNDNUT DECORTICATORS

Groundnuts, peanuts for example, have fibrous cellulose shells which need to be removed prior to consumption. The task requires a rubbing-stripping action and a method for cleaning. Most hand-operated decorticators do not do this and so require a separate winnowing step.

## SOURCES OF MANUAL DECORTICATING EQUIPMENT

### Handy Groundnut Decorticator

Built from steel and cast iron, the Handy is simple to operate and easily transported. Nuts are placed in a receptacle and the operating handle moves forward and backward, rubbing the nuts against spiked rustlers and the shelling grid. Kernels are not separated from the shells after decortication with this device.

Harrap Wilkinson, Ltd.
5 North Phoebe Street
Salford M5 4EA, U.K.

### R. Hunt and Company Groundnut Decorticator

The distance between the galvanized, heavy mesh screen and the rubbing bars on this unit can be adjusted to accommodate a variety of sizes of nuts. Four different sizes of screen are available for this hand-operated sheller.

R. Hunt & Co., Ltd.
Atlas Works, Earls Colne
Colchester, Essex CO6 2EP, U.K.

**CeCoCo Model 300D Peanut Sheller**

In this model, revolving beaters shell the peanuts, and kernels are separated from the shells by a screen and fan. Output is 40 to 50 kilograms per hour, and kernel breakage is 2 to 3 percent.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Groundnut Sheller**

A hand-operated groundnut sheller is available from:

Ubungo Farm Implements
P.O. Box 2669
Dar Es Salaam, Tanzania

**Hand-Operated Groundnut Decorticator**

For more information write to:

Dandekar Brothers
Sangli
Maharashtra, India

*Hindsons Treadle Power Groundnut Decorticator*
M/s. Hindsons Pvt., Ltd.

**Hindsons Groundnut Sheller**

This is a foot-operated, portable device designed to quickly separate nuts from their shells. The balanced flywheel eases operation, and the blower separates shells from the nuts. Maximum output of the unit is 441 pounds per 8-hour day.

M/s. Hindsons Private, Ltd.
The Lower Mall
Patiala, India

## SOURCES OF POWER-DRIVEN SHELLING MACHINERY

**CeCoCo Peanut Sheller**

In the CeCoCo sheller, threshed and cleaned peanuts are shelled by a revolving beater mechanism. After being run through the machine, unshelled and shelled peanuts are separated with a fan and screen. Unshelled nuts should go back in the implement until shelling is complete. Breakage of kernels is between 2 and 3 percent. Four model types are available using 1, 2, or 3 h.p. motors and with outputs of 120 to 420 kilograms per hour depending on the model.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

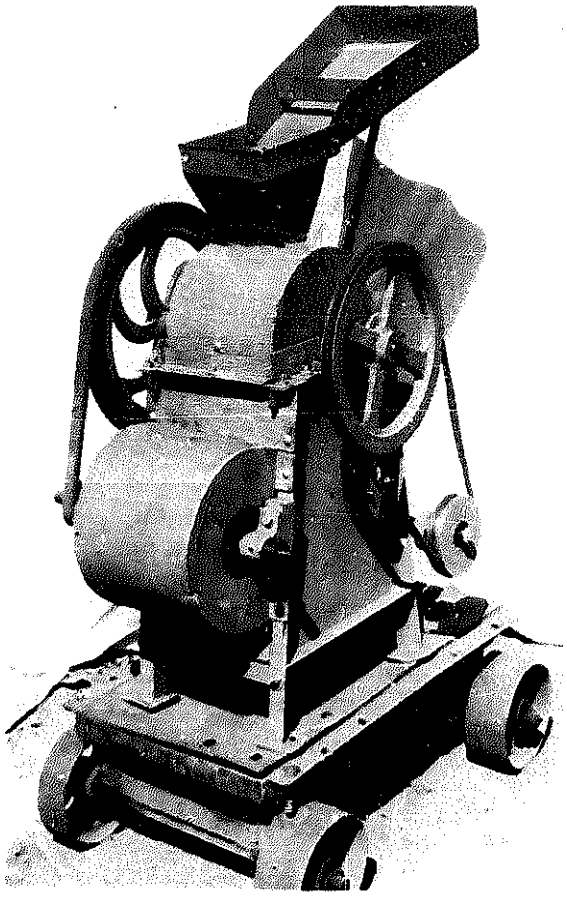
**Harrap Wilkinson, Ltd. Automatic Groundnut Decorticator**

Nuts to be shelled are placed in a hopper at the top of this machine. The nuts pass into a beater chamber by means of a ribbed feed roller; the rate is adjustable. Rotating, flexible beaters break the shells, and a blower mechanism separates the shells so that only the kernels are in the delivery chute. Wilkinson's No. 2 machine has a 1½ h.p. motor and an output of 254 to 406 kilograms per hour.

Harrap Wilkinson, Ltd.
North Phoebe St.
Salford M5 4EA, U.K.

**Dandekar Brothers Groundnut Decorticator**

Dandekar Brothers manufactures four types of power-driven decorticators. Type A needs a 5 h.p. motor and has an output of 80 (180 pound) bags per (12 hour) day. Type B requires a 6 h.p.



*Dandekar Power Groundnut Decorticator*
**Dandekar Brothers**

motor and will produce up to 100 bags a day. Type C is powered by a 7 h.p. motor and will shell up to 120 bags per day, and Type D uses a 10 h.p. motor for a maximum output of 200 bags per day. The hopper is on the upper part of the machine. Nuts pass from there into an opener cylinder where the shells are broken and separated from the kernels. The shelled nuts fall on the ground to be collected.

Dandekar Brothers
Sangli
Maharashtra, India

## SINGLE NUT NUTCRACKERS

### New Dynamic Nut Cracker

Designed to crack any size nuts except hickory nuts or hard-shell walnuts, this sheller locks and cracks them automatically. Kernels and shells fall out for rapid repeats, and the safety shield protects the operator from flying shell particles. This electrically operated device requires 110 volts and 60 cycle alternating current. The cracker is guaranteed for 1 year, and has an estimated life of 10,000 pounds of nuts.

L.H. Powell
8647 Wingate Drive
Dallas, TX 75209

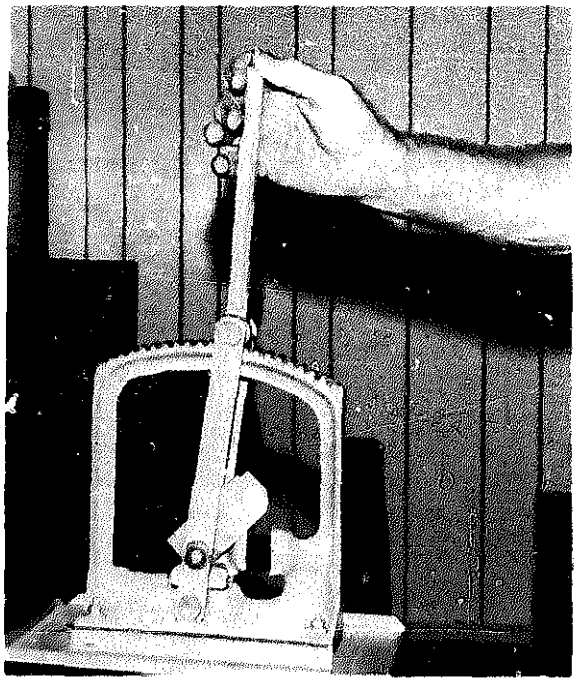
### Texas Native Inertia Nutcracker

Made of oak and aluminum, this device will

*Texas Inertia Nutcracker*
**R.P. Industries, Inc.**

crack any type of pecan, Brazil nut, filbert, almond, macadamia, and English or California walnut. The cracker operates by placing the nut between two sockets, pulling the safety shield over the nut, pulling back the knocker stick, and releasing it. The kernel is left in the sockets, and the shell falls away from it. The tool is guaranteed for 1 year, and can crack up to 30 nuts in a minute.

R.P. Industries, Inc.
610 W. Johnson St., P.O. Drawer 10938
Raleigh, NC 27603



*The Potter Walnut Cracker*
**Fred Klingensmith, Inc.**

**Potter Walnut Cracker**

This device cracks walnuts one at a time. Heavy-duty crackers are also available.

Fred Klingensmith, Inc.
Sapulpa, OK 74066

# RICE HULLING

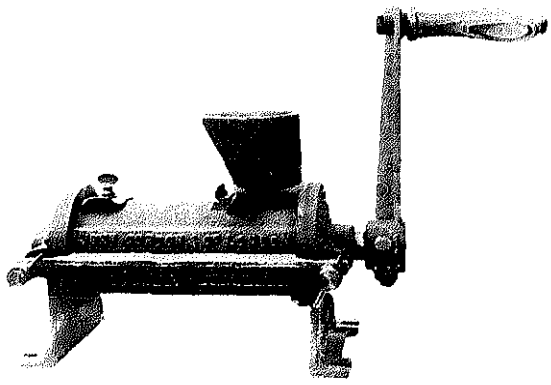
Similar to wheat, rice grows with a bran layer and an outer hull covering the kernel. For the grain to be edible, the hull must be removed in the hulling process. An unnecessary second step, polishing, removes the bran and the germ, and along with them, much of the grain's B-vitamin content. Rice that is hulled but unpolished is called brown rice. Both the hulling and polishing processes require a milling action, often by two rollers rubbing the kernel between them. Most hullers are designed for power operation, but a few hand-operated models are still being made.

## SOURCES OF RICE HULLERS

**Java Hand-Powered Rice Huller**

This is a small machine intended for the grower of small quantities of rice paddy, and for domestic use. It replaces a model called the Paddy Pounder. Paddy can be shelled at a maximum rate of about 30 pounds (14 kilograms) an hour, but the capacity may vary considerably depending on the type of rice and its condition. The machine has three adjustments controlling the feed, the discharge, and the hulling knife. A perforated plate allows dust to escape, and the machine can be opened easily for cleaning. Strongly made, its net weight is 23 pounds (10.5 kilograms), and it is provided with holding-down screws and spanners.

John Gordon & Co. (Engineers, Ltd.)
196a High St.
Epping, Essex CM16 4AQ, U.K.

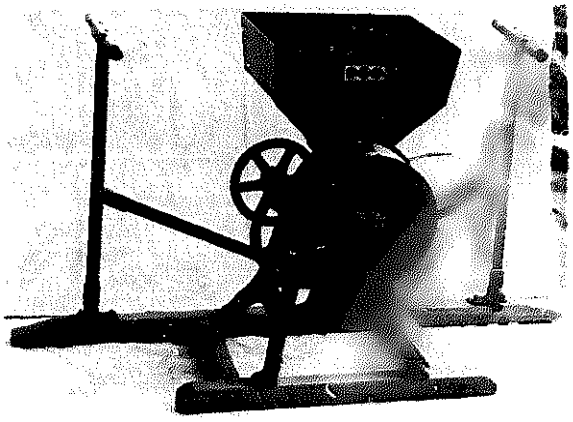


*Java Hand-Powered Rice Huller*
**John Gordon**

**CeCoCo Two-Man Rice Huller**

Two men operating the hand levers will rotate this huller at 3,500 to 4,000 rpm, hulling

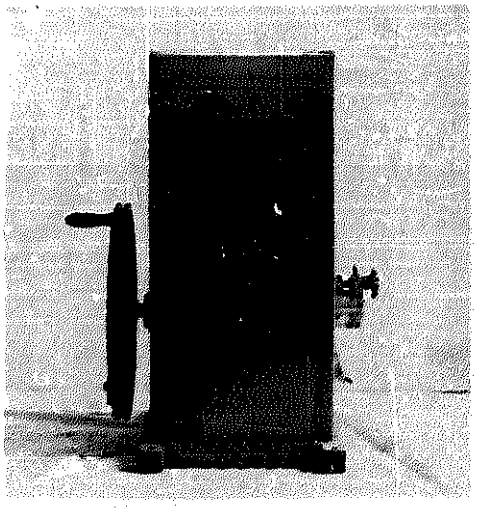
250 kilograms per hour with 90 percent hulling efficiency. Net weight: 60 kilograms.



*CeCoCo Two-Man Rice Huller*

### CeCoCo Hand Rice Polisher Type E

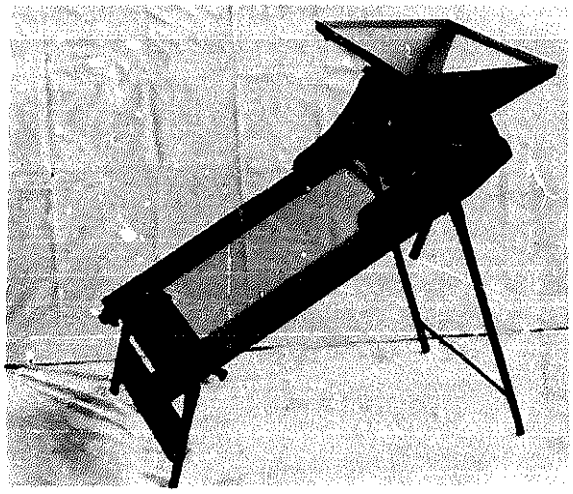
Operated either by hand or by a ¼ h.p. motor, the Type E Polisher will polish unhulled rice that has already been dried and winnowed. Capacity is 10 to 15 kilograms per hour by hand, and 30 kilograms with a motor. Weight: 22 kilograms.



*CeCoCo Hand Rice Polisher Type E*

### CeCoCo Hand-Hulled Rice Separator and Sorter

Constructed of steel and easily dismantled for storage, the four models of this sorter have capacities ranging from 20 to 32 bushels per hour. Hulled rice is fed into a hopper, and while sliding across the surface of the piano-wire screen, it will separate into whole hulled rice, unhulled rice, unhulled paddy rice and immature rice, mud, and sand. It may also be used to sort polished rice for grading.



*CeCoCo Hand-Hulled Rice Separator and Sorter*

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

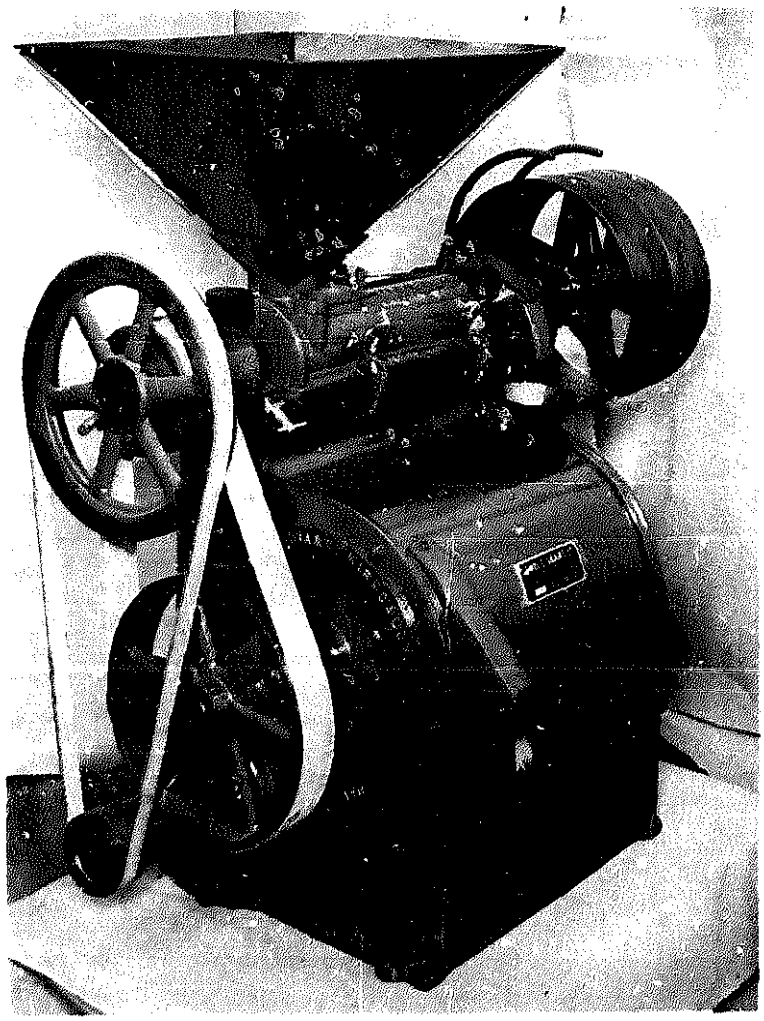
### Amuda Rice Hullers

These power-driven machines can be used as hullers alone or supplied with polishing attachments. Three models are available, requiring 5, 12, or 15 h.p. They will hull rice from the paddy or shelled rice. From the paddy, the smallest huller will produce 36 to 45 pounds of cleaned rice; the middle, 136 to 204 pounds; the largest, 250 to 295 pounds per hour. When using shelled rice, production capacity is a little less than double those amounts per hour.

Rajan Trading Co.
P.O. Box 250
Madras 600 001, India

### Grantex Rice Hullers

Three sizes of Grantex hullers are made. The smallest, requiring 5 h.p., produces 80 to 100 pounds of polished rice per hour. The amount is doubled if shelled rice is being polished. The two larger models utilize 12 and 15 h.p., respectively; they produce 300 to 450 and 500 to 650 pounds per hour. The two larger models can



*Grantex Rice Huller*
Lewis C. Grant, Ltd.

produce five separate products directly from the paddy: white rice, coarse meal, fine flour, bran, and husk. Optional extras include polishers, aspirators, fans, drive units, and reciprocating sieves.

Lewis C. Grant, Ltd.
East Quality St., Dysart
Kirkcaldy, Fife, KYI 2UA U.K.

**Iseki Rice Polishers**

The Iseki Model JE25 is an automatic, cabinet body machine. Horsepower required to operate the polisher is 4 to 5, and 300 to 350 kilograms of rice can be polished per hour. The manufacturers recommend combined use with a rice huller, but state that it can also be used as a rice-hulling and -polishing machine. Three larger models are available, either in cabinet or strip enclosures. Efficiency ranges from 300 to 1,000 kilograms per hour. None of the Iseki models include their own power units.

Iseki Agricultural Machinery Mfg. Co., Ltd.
1-3, Nihonbashi 2-chome, Chuo-ku
Tokyo, 103 Japan

**CeCoCo Automatic Rice Hullers and Combinations**

CeCoCo, with its wide variety of all types of machines, offers seven automatic rice processors, with many sizes of each type. Their automatic hullers feature rubber rollers, which they claim will increase output recovery of hulled rice 15 to 20 percent. They also recommend that rubber-rolled rice be stored and shipped as brown rice,

with any polishing to be done at the destination of the shipment to avoid deterioration of the product.

1. Rubber Roll Rice Huller: The original model consists of a hulling head and installation bed. Separation of brown rice and husks is necessary. Seven models are available, ultilizing 1 to 10 h.p. or V-belt drive; capacities range from 500 to 4,000 kilograms per hour in paddy.
2. Combination: Three models, with or without suction husk exhaust, are offered. The basic unit includes a huller and husk winnower. The suction exhaust model is recommended for use in buildings. The three sizes utilize from 2 to 5 h.p., with capacities ranging from 500 to 2,000 kilograms per hour.
3. Automatic KL-A: This self-contained unit includes hulling head, winnower, double elevator, separator, and rice elevator. The smaller model requires 4 to 5 h.p. and produces 600 to 700 kilograms per hour; the larger requires 5 to 6 h.p. and produces 1,000 to 1,200 kilograms per hour.
4. Automatic AM and ME: These are miniaturized versions of the complete unit, suitable for a single farmer or a group of farmers. The one-body construction includes huller, winnower, and separator.

Three larger rubber roller units, having hourly capacities of 1,200 to 4,000 kilograms, are also available.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Nogueira Rural Rice Mill**

The Nogueira Rice Mill husks and polishes rice, then separates polished rice, husks, rice bran, and broken rice. It will utilize a 3 h.p. electric motor, a 6 to 9 h.p. gasoline motor or a 5 to 8 h.p. diesel-oil motor. Production capacity is approximately 2 sacks (60 kilos or 132 pounds) per hour. The cabinet is metal and weighs 236 kilograms.

CIMAG: Comercio e Industria de Maquinas Agricolas Ltda.
Rua Padre Roque no.° 1,840, Mogi-Mirim S.P.
Brazil

**Genuine Engelberg Combined Rice Huller and Polisher Number 3**

Powered by flat belt-drive pulley, this 3 h.p. machine will, in a single operation, hull, scour, and polish rice as it is received from the thresher. An optional built-on exhauster is available to carry away chaff and dust.

This item is suggested for small mill operators or larger growers. The No. 3 has a capacity of 80 to 100 pounds of rough rice per hour, and two larger models are capable of up to 700 pounds per hour.

**Genuine Engleberg Huller Number 4**

Similar in design to the No. 3 Rice Huller and Polisher, the No. 4 does not contain the polisher attachment. Two larger models of hullers are also available.

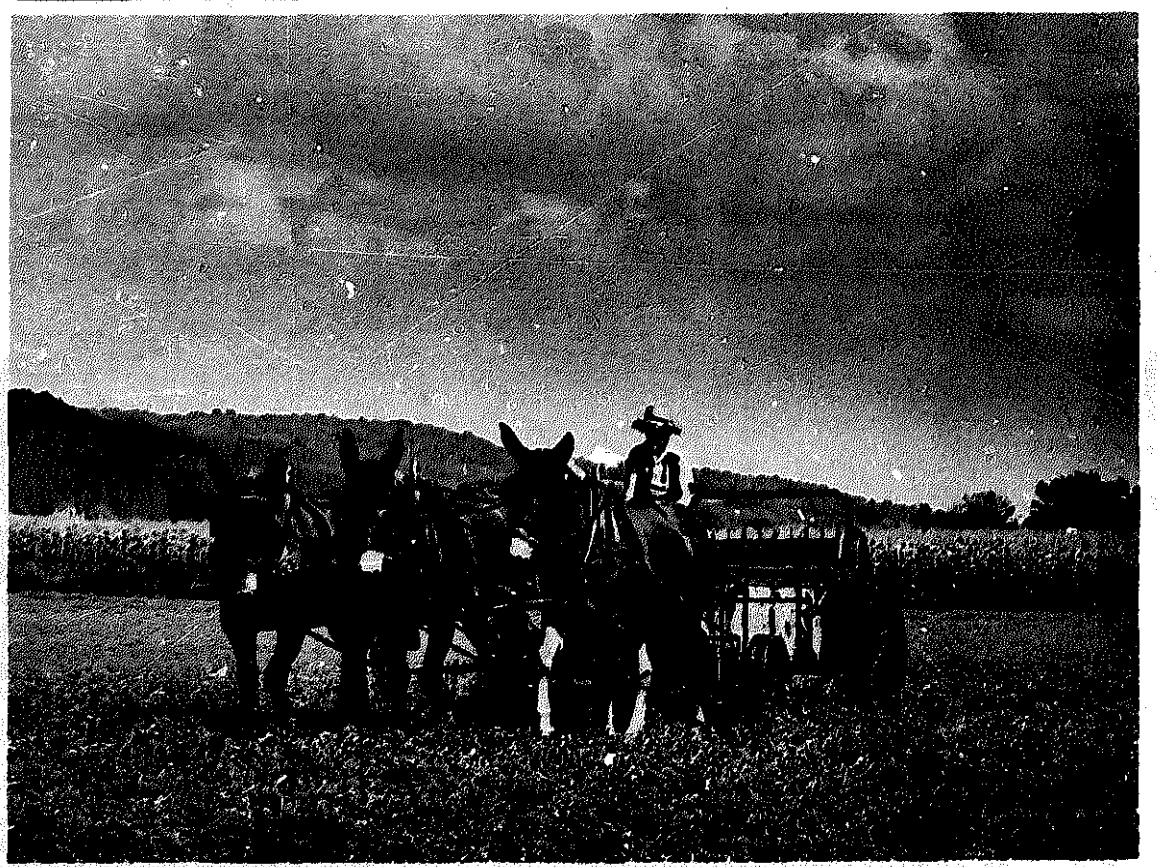
Engleberg Huller Co. Division
P.O. Box 277
Factoryville, PA 18419

# -9- Tools for Adding Organic Matter to the Soil

To the practitioners of today's chemical agriculture, a fertilizer is a substance that has a measurable quantity of at least one of the major nutrients required by growing plants. The most widely used chemical fertilizers are those which contain three primary plant nutrients: nitrogen (N), phosphorus (P), and potassium (K) in varying combinations.

Organic growers, on the other hand, rely on natural fertilizers to maintain and replenish all the elements in their soil that are necessary to plant growth. They view soil fertility as a broader, more complex concept which involves not only specific plant nutrients, but also organic matter, the living organisms present in the soil, and the very structure of the soil itself. To them, humus content and tilth are important aspects of soil fertility. Unlike those farmers who employ chemical fertilizers to supply their crops with specific nutrients in forms that are readily available, organic farmers use a variety of natural materials to maintain and improve overall soil quality. In this way, soil fertility and health are improved even as crop yields increase.

Direct application of livestock manures has been the farmer's traditional approach to return-



*Mule-Drawn Manure Spreader*
*Reading Eagle*, Lancaster County, Pa.

ing organic materials to the soil. Originally, manure was spread over the soil surface from a cart, with a many-tined pitchfork called a manure fork. Then came the development of the manure spreader, a horse-drawn cart with a ground-driven set of chopping blades in the rear. Manure fed into the blades was chopped into small pieces and evenly distributed onto the field.

## SOURCES OF MANURE SPREADERS

Most manure spreaders made today are designed for pulling behind large tractors beyond the scope of this book. They are easy to locate through most agricultural equipment dealers. Farm auctions are the best source for smaller units in North America.

### Uebler Mini

One company to appear with a mini manure spreader, requiring only the power of an 8 to 12 h.p. tractor, is Uebler. Their smallest model has a capacity of 18 bushels which it distributes under power from its own 4 h.p. gasoline engine or a power take-off shaft. Their next size larger has a 50-bushel capacity.

*Uebler Mini Manure Spreader*
**Uebler Manufacturing Co.**

Uebler Mfg. Co.
Vernon, NY 13476

### New Idea

The smallest manure spreaders put out by New Idea are a 138-bushel model with the combined chopping action of a cylinder and paddle, and a 146-bushel, single-beater model.

### OrBilt Manure Spreader

The main beater of this spreader is made from heavy channel iron. These channels are welded around the beater pipe in two opposing spirals. This beater will tear apart the toughest manure, whether it is from a feedlot or pen, even if it is frozen. Strings don't catch or hang on this beater as they do on others. A lower-splash blade beater has the specific purpose of breaking up and scattering both liquid and clumps. This lower beater is particularly useful if you are spreading on a hay field or some other place where large lumps could smother patches of a crop.

The sliding pusher and false front endgate move as one unit to the rear of the box. The speed is controlled from the tractor seat by a variable flow, hydraulic valve. The pusher, replacing the traditional conveyer apron, is the heart of the entire machine. Part of the hydraulic cylinder is enclosed by the center housing

*OrBilt Manure Spreader*
**O'Reilly Manufacturing**

of the sliding pusher; the other part extends out over the tractor hitch. The entire inside of the box is lined with tough plastic. Manure does not penetrate or stick to the plastic, nor does it freeze to plastic as it does to wood or steel.

O'Reilly Manufacturing
Rt. 3
Goodhue, MN 55027

**Prototype Material Spreader**

Charles E. Fox, of Jonesboro, Louisiana, has invented a spreader wagon that hitches to a tractor and distributes material such as pulverized chicken fertilizer, sawdust, or ground bark. It is a two-wheeled cart with a series of arched platforms in its bed that funnel material onto a conveyor belt, and then through a gauging or measuring device. The gauge limits the amount of material laid per foot. The belt can be disconnected for transport. Mr. Fox is currently seeking a manufacturer for his spreader with the help and guidance of the Raymond Lee Organization. His invention, covered by a patent application pending in the United States Patent Office, is designed primarily for organic farmers.

# COMPOSTING

Manure spreaders are still a necessary tool on the organic farm, but increasingly they are being used to spread composted manures and other organic wastes. Composting is the biological process of decomposition during which wastes are broken down into their basic chemical parts and made ready to be used again in building another plant. The product is called humus.

With the proper microorganisms present in the soil, humus will evolve by simply applying organic wastes to the soil surface. However, composting speeds the process, and by following a basic composting recipe, a more-balanced nutrient fertilizer is produced.

## COMPOSTING AS A MANURE MANAGEMENT SYSTEM

**by Richard Thompson**

Editor's note: Richard Thompson was born and raised on his present farmstead, consisting of 300 acres outside Boone, Iowa. He graduated from Iowa State University with a B.S. in Animal Husbandry and an M.S. in Animal Production.

Composting, in my opinion, is a sensible, practical, economical way to deal with animal waste on the farm. My reasons for starting to compost followed the same pattern as my reasons for changing to organic farming back in 1967, namely—problems.

Back then I was on a continuous corn program, applying chemical N-P-K, herbicides, and insecticides. The fences were removed from between the fields, cattle were brought in and confined to barns and lots.

We live in a low, flat area so the barns and lots needed to be cemented. This situation brought about all kinds of sickness in the cattle. It seemed like it was just one thing after another. I got to the point where, out of frustration, I said, "There has to be something better than this." In the spring of 1968, we stopped using all chemicals and started putting fences back, so the cattle could have limited pasture. The cropping system was changed to a corn-soybean-corn-oats-hay rotation.

Even with all-chemical N-P-K added to the continuous corn program, I had to dispose of all the manure from the cattle and hogs. Note that I say dispose of, not use. The manure was hauled out of sheds and lots during the winter and early spring, and applied to frozen, plowed fields that were often covered with snow. This was a very poor utilization of the nutrients, especially the nitrogen content in manure which would turn into ammonia, dissipate in the air, and be completely lost. Also the raw manure would move with the melted snow and end up in creeks and rivers, polluting our water supply.

After I stopped using the artificial N-P-K, the corn yields stayed at 120 bushels per acre for the next seven years. The corn yields, previously, were about the same, averaging 120 bushels per acre.

My yields, on the organic program, were oats: 70 to 80 bushels, soybeans: 35 to 45 bushels which, I felt, were good and also competitive with the neighbors. The hay fields also seemed to improve each year. After about seven years of organic farming, the field of corn following soybeans dropped to the 80- to 90-bushel range. The cornfield following hay remained in the 120-bushel range. The profit on the 80- to 90-bushel yield would probably be okay, since the expenses per acre were $40 to $50 lower than those of the neighbors on chemical methods. However, I felt with all this manure and only 80 to 90 bushels, something must be wrong. This was where composting came into the picture.

Composting is a way of turning a liability into an asset on the farm.

In the spring of 1975, we decided not to spread the manure on frozen ground during the winter. The manure was pushed up into large piles in the yards during the winter. On June 5, we started to clean out these piles and haul to our compost site on the edge of the hay field. This manure was cold and had large chunks of ice in it.

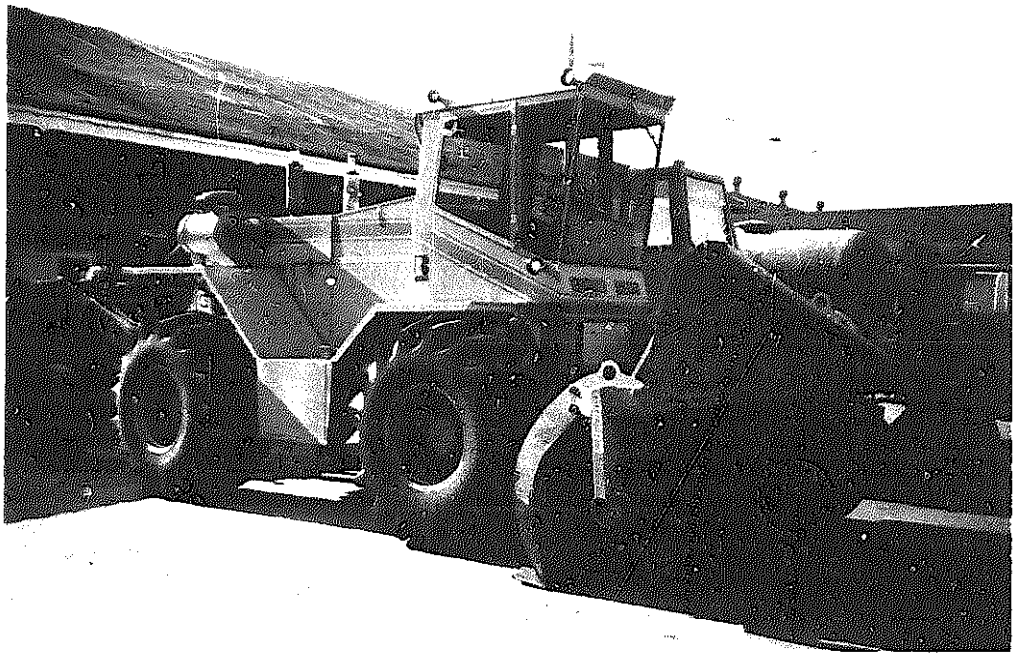
A bacteria starter was spread on the manure piles in the yard, loaded in the spreader, and taken to the compost site located centrally between our farmstead and the neighbors'.

The spreader needs to be power take-off-operated so it will unload in a stationary position. When the manure builds up to the beaters, the spreader is moved forward about one foot and the rest of the load is unloaded in this fashion. I feel the ideal pile is about eight feet wide at the bottom and four feet high. In two days' time we saw a miracle happen. This cold, frozen manure which had a temperature of about 30 to 40 degrees heated up to 140 degrees, and steam was coming out of the top of the windrows. I feel that, in my situation with all the manure off concrete, I need the added bacteria to get the action started, as little earth was combined with the manure. We tried some windrows without bacteria and the action was very slow.

One of the important keys to good composting is moisture content. This should be in the 40 to 60 percent range. If the manure is wetter than 60 percent, it will take more turnings with the spreader to get it dried down. If the manure is too dry, water needs to be added. Generally, I take some wet manure and mix it with dry manure and this usually comes out about right. Much has been written about carbon-nitrogen ratios in composting; they should be 20 to 30 parts carbon to one part nitrogen. For the farmer, I think this means simply that what creates a good environment for livestock will make good compost. If cattle or hogs are kept clean and dry with bedding, the carbon-nitrogen ratio will be excellent.

My windrows were turned by reloading the spreader and unloading to make a parallel windrow. The windrows need to be turned until the temperature stays below 100 degrees. However, if it is time to spread on fields, incomplete compost that is still steaming can be applied to fields and disked in the same day. We initially applied four tons of compost per acre in fall after the soybeans were combined and bean straw was stacked. The N-P-K analysis of the compost was 2-1-2.

This year I bought an Easy Over compost-turning attachment for my tractor. With this attachment



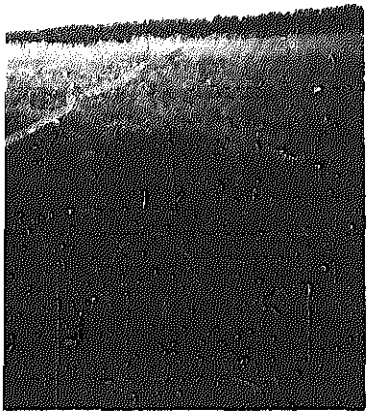
*The Brown Bear Integral Auger Tractor*

*Feedlot manure and crop residues are composted with the aid of the Brown Bear turning machine at the University of Nebraska's Mead Field Station.*

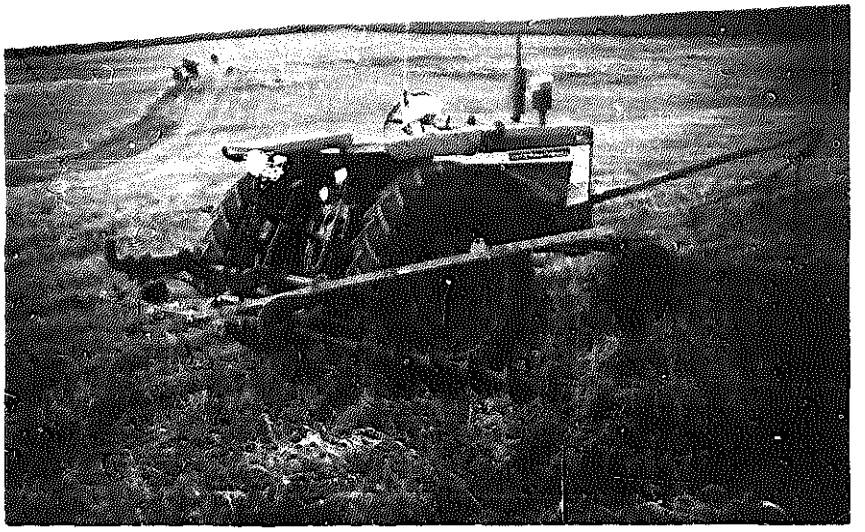
including a gearbox, tool bar, and silage-unloading auger. The auger is used to aerate, break up, and mix the pile. Afterwards, a tractor loader is used to repile the materials.

Wuebben has been keeping daily records of the temperatures within the compost at 50 different points along his 500-foot windrow. The records have indicated that the temperatures of the pile rose substantially after each turning and also following rains that occurred between turnings. The increase in temperature following a rain would indicate that the moisture content of the compost wasn't adequate for optimum bacterial activity.

*Edgar Wuebben's home-built compost turner.*



atory to be analyzed with the



*Edgar Wuebben's home-built compost turner.*

*Wuebben's compost turner in action.*

A sample of the finished compost was taken to an Omaha laboratory to be analyzed with the *following results:*

| | |
|---|---|
| Moisture | 34.80% |
| Nitrogen (N) | 0.80% |
| Phosphorous ($P_2O_5$) | 0.62% |
| Potassium ($K_2O$) | 1.17% |
| Organic Matter by Combustion | 14.40% |
| pH | 7.3 |
| Total Organic Carbon | 8.5 % |
| Carbon-Nitrogen Ratio | 10.6 |

A tractor-powered, turning machine built by the Mehlaf Machine and Manufacturing Company of Freeman, South Dakota is used to turn compost at the rate of 400 to 500 tons per hour. This unit is used by Town and Country Park, Inc., in Sioux Falls, South Dakota, which processes sewage sludge, paunch manure, and stockyard pen wastes.

At the McGinley-Schilz feedlot in Brule, Nebraska, a specially designed machine aerates the windrowed manure. The compost is made under contract with the Colorado-Nebraska Compost Corporation owned by Jack E. Martin and Lester R. Kuhlman of Sterling, Colorado. The machine, known as the Scarab, was developed by Fletcher Sims of Canyon, Texas.

"About 20 tons of raw manure to the the acre would have to be applied to equal the benefits derived from two tons of compost," says Martin.

"It's turned our feedlot waste problem around. Instead of manure being a nuisance, it's a valuable asset," Schliz was quoted in an *Omaha World-Herald* article.

## SOURCES OF COMPOSTING EQUIPMENT

### The Cobey Composter

An Ohio feedlot has effectively used the Cobey Composter for processing animal wastes. This unit is a diesel-powered, self-propelled machine which straddles the windrows.

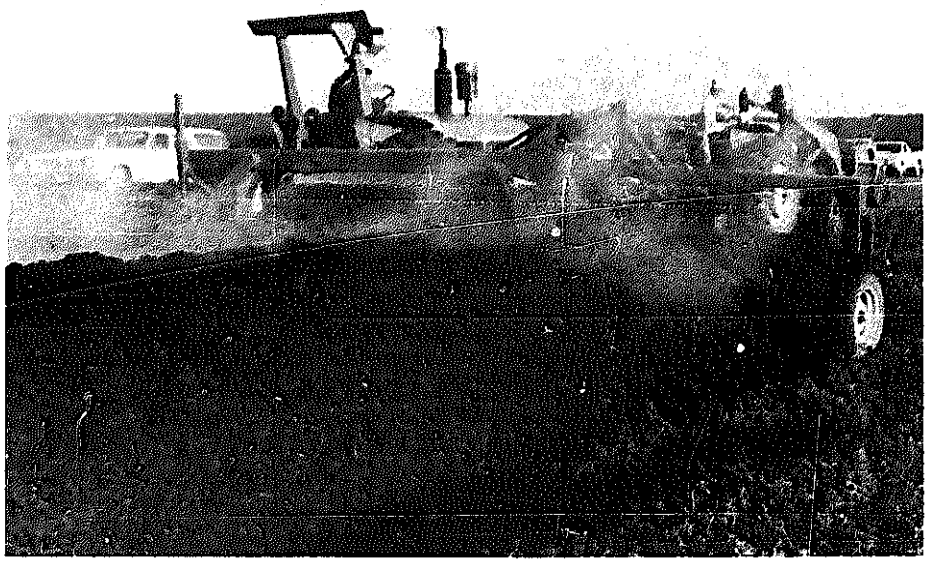
Manufactured by:
Eagle Crusher Co., Inc.
Rt. 2, Box 72
Galion, OH 44833

### The Easy Over Composter

Another composting machine was developed by the late Elton Schaeffer of Menno, South Dakota "out of his own necessity." The machine has knives similar to those of a garden tiller, for lifting material up and back into the windrow. One-half of a compost windrow is taken with each pass of the machine, compared to the full windrow taken by larger machines. The operation, according to Schaeffer, is best accomplished with a hydrostatic-drive tractor for slower ground speed.

Schaeffer's machine now has the commercial name of Easy Over, and is distributed by:

General Corp.
322 S. 16th St.
Philadelphia, PA 19102



*The compost turning machine used on the Elton Schaeffer farm at Menno, S.D., for composting manures brought to the farm from the local livestock sales barn.*

*Schaeffer's composting machine has tines similar to those of a garden tiller, to lift material up and back into the windrow.*

**Accelerator Compost Bin**

This 34 by 36 inch circular bin is made up of green, rigid, polyvinyl chloride interlocking and sliding panels. Waste is added through the top of the bin which has an inflatable cover to repel rain. Ventilating holes in the panels allow for ventilation while helping to hold in heat and insulate.

## SHREDDERS

Today's shredder-grinders are better than they've ever been—thanks largely to 20 years of organic gardening experience contributed and shared by a multitude of backyard growers. They're also more available in greater variety—some larger and more powerful, and some more compact—but all are designed to do a specific gardening job better.

The type of shredder you buy should depend on the kind of gardening operation you run, the size of your place, and the kind of organic materials you're going to feed through it. A good shredder will handle all kinds of garden wastes and residues without clogging, and it should be easy to move around, which means you can take the tool to the work—to the compost pile, the garden row, or the pile of wood chips that were dumped at the end of your driveway.

Today, there are two main types of shredders: the low center of gravity shredder-bagger with its big-mouth hopper, and the classic stand-up shredder-grinder designed to handle a greater volume and variety of materials.

Many combinations of accessories and functions are now available in one machine. The once-reluctant gas engine has been made a lot more dependable and easier to start. You can also find electric-powered shredders which are a lot quieter, easier to start, and also free of fumes. But they have to stay closer to the house and there is always the danger of playing around with electricity outdoors on the damp ground.

Many shredders, both low-profile baggers and the bigger grinders, are equipped with a chipping fixture which is usually a rotating knife that operates through a side slot and can

*To keep a shredder from clogging, it's sometimes best to remove the screen, especially when shredding wet, soggy leaves.*

handle branches up to two or even three inches thick. The MacKissic, Roto-Hoe and Lindig machines are three models with this feature.

Then there are the shredder accessories or attachments that fit onto a small riding tractor or a walking power unit that also functions as a rotary tiller, a mower, a chipper, a snowblower, or even a dozer blade.

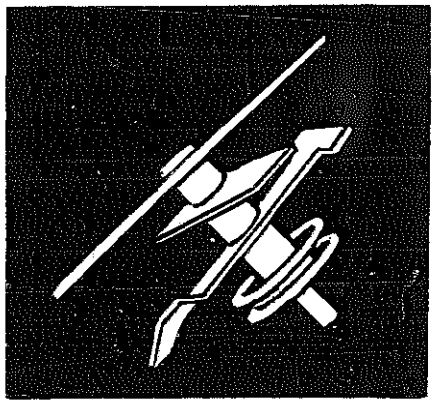
Overloading any machine will result in jamming and stalling it. This especially holds true for the shredder whose job it is to chop up fibrous, damp, or wet materials and then eject them through a screen or grid. We recommend working with as large a screen as possible—the 1¾ inch screen on the Lindig is excellent. Gilson, W-W, and Roto-Hoe offer a grating of rods or square roller bars which seem almost jam-proof. Another solution to the problem is the Winona's "wet mat rack" which encloses only half the shredding chamber.

If you're shredding with very wet, soggy, and rubbery leaves, here's a sure way to eliminate frustration and loss of time—remove the screen. Without it, the action of the cutters chops the leaves into a satisfactory aggregate which can be used either for compost or mulch. If you're working with a shredder-bagger, you may find it speeds up the task to remove the bag. You'll also find it's a good idea to deposit the aggregate immediately in the compost pile or the planting row.

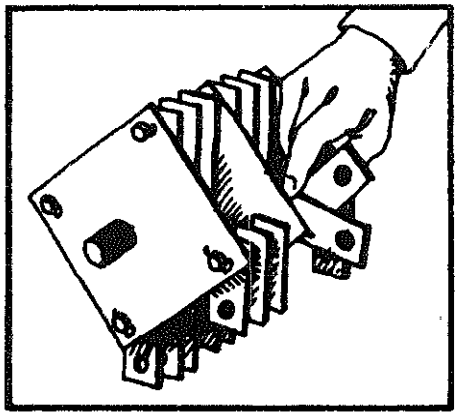
You may also find that a clutch, either centrifugal which depends upon the speed of the motor to actuate it, or one that is manually operated, helps avoid jams. This calls for alert operation of the machine, but it can save a lot of time spent clearing out the inside of your shredder.

Check the wheels on the shredders you are considering. They should have at least a pair, rugged and rubber-tired, and placed so they will comfortably and safely support the machine when you move it. Some of the larger models

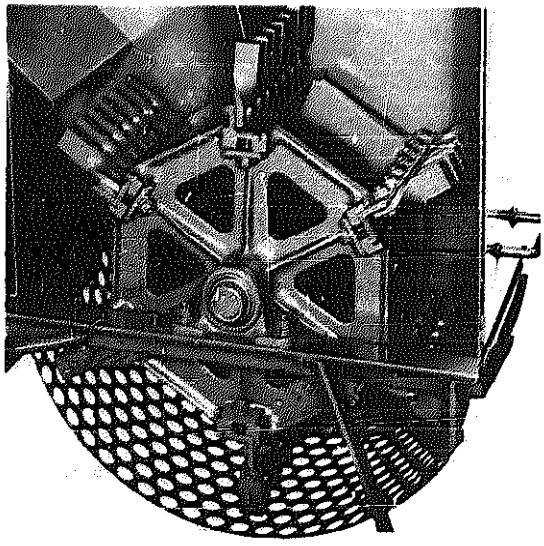
## FOUR TYPES OF CUTTING MECHANISMS



*Three-Cutter Rotary System*

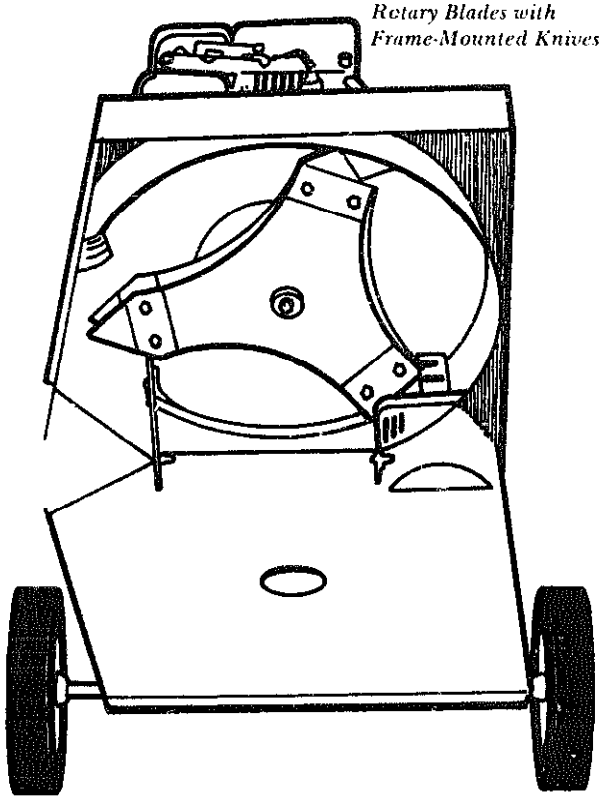


*Hammer mill Unit*



*Rigidly Mounted Knives on Horizontal Shaft*

*Rotary Blades with Frame-Mounted Knives*



***Rotary blades that whirl through stationary knives mounted on the frame chop and fling the mass of particles out the side vent.***

***Another time-tested system is a series of knives rigidly mounted in a revolving horizontal shaft. The fabble plates and a screen tend to hold the material against the cutting action of the blades.***

come with three wheels, and some with four. Make sure the machine you are thinking of buying handles easily and comfortably.

One of the most sensible gardening arrangements we've ever seen was at the Golden Acres Farm in lower Bucks County, Pennsylvania, where a double track of sturdy rails was erected over and along a series of compost bins. A king-sized shredder was mounted on the rails and traveled from bin to bin, depositing its aggregate as it went.

There are three or four basic systems for reducing and mixing your organic wastes. Hammer mill tempered steel flails revolve freely on a rotating shaft, and so have the ability to absorb shocks from hitting stones. There also seems to be a minimum of blockage in the mixing chamber caused by wet materials. Sets of hardened steel teeth or knives, fixed rigidly on a revolving shaft, work in combination with interior baffle plates and the bottom screen, which tend to keep the material in contact with the knives. The smaller shredder-bagger machines work with a series of two or three rotary blades similar to a lawn mower's. In some models, these whirling knives pass between stationary cutters that are part of the frame or chassis to achieve more complete cutting. The turbulence created by the rotary blades also whirls the aggregate out through the vent, which permits you to deposit it right where it is needed—either in the compost pile or in the planting row.

Any matter that is organic and compostable can be reduced to a workable aggregate or mass in your shredder. You will find that there is plenty of material on your home grounds to keep your shredder and you busy for a series of weekends, particularly in the late summer and fall. There are the weeds, the grass clippings, the crop residues, and the leaves. Add to these local benefits the contents of your garbage pail; it combines well with just about anything.

Next, there are the wood chips from the local road department, sawdust from the neighborhood lumberyard, and corncobs from the nearest feedmill (if you can get them ground). All of these varieties of cellulose are fine for mixing with the garbage. Working with unground corn cobs, though, can be tricky. The tough cobs have a habit of flying back up out of the hopper, right at your head. Some gardeners have reported that a thorough soaking (up to a week) of the cobs softens them and makes shredding easier.

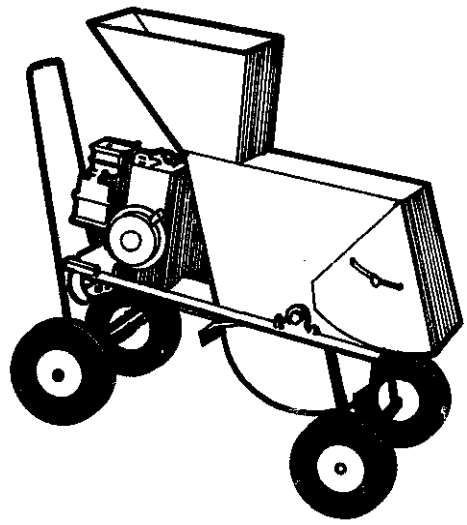
No garden chore is easier or pleasanter than shredding dry, autumn leaves. But if your leaves have wintered over and are tough, wet, and rubbery, feed them into the shredder in very small handfulls which are followed by dry sawdust, and again, be prepared to work without a screen.

## TYPES OF SHREDDERS AVAILABLE

Think over your shredding needs carefully before you begin to shop for a machine. There are many different shredders on the market today, and rather than trying to list them all, we've decided to describe the basic types available and give some examples of each type. Keep in mind that models change from year to year, and be sure to investigate all the features of the models you're considering.

### Large Shredder-Grinders

Most of the shredders in this group comprise the classics of the industry—the Amerind-MacKissic, Gilson, Lindig, and W-W. To them should be added the Royer, the Ariens, the Roto-Hoe, the Hahn-Eclipse and the Winona, all of which feature the larger machine in their wide-ranging lines.



*Four-Wheel Shredder-Grinder*

In general, these shredder-grinders are designed for the 1- to 5-acre place in the country, although you may be perfectly happy with one of these bigger machines on your suburban ½ acre. You'll find that they can handle a greater diversity of materials than the shredder-baggers and also a greater volume. And, thanks to their rugged framework and wheels, it's a lot easier than you would think to roll them out into the garden or up to the compost pile. It's also good to be able to report that shredders last for years with very minor repairs (made easily by the local dealer), so their cost can be amortized over quite a period.

Ameriud-MacKissic Model 12-P is a 6 h.p. combination log chipper and shredder-grinder. In addition to handling conventional organic composting materials including corncobs, it reduces logs up to 3 inches to wood chips. Model 9-P is powered by a 4 or 5 h.p. engine and works through a series of 24 free-swinging knives. Power take-off units are available for many popular small estate tractors.

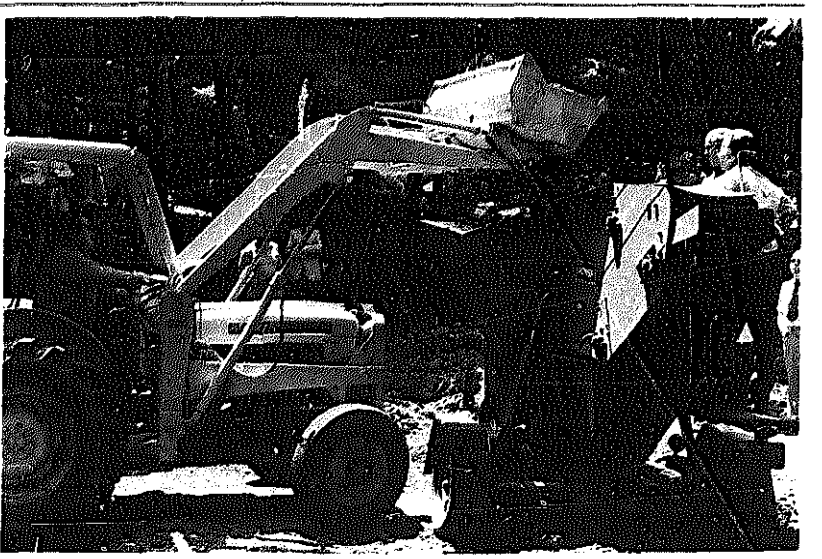
The 6 h.p. Gilson Chopper features nine, square, rotating cutter bars instead of a screen, which are ideal when you're grinding wet, soggy, fibrous materials. Cutting action comes from three sets of rotating double-edged knives—12 cutting surfaces. The gravity-feed hopper is king-sized—almost 17 by 17. The Chopper is belt-driven with an idler clutch.

The Lindig Concho is also available with an electric motor or a 5 or 7 h.p. engine. It offers a wide range of grinding screens from ¼ inch to 1¾ inch. A side-vented brush and wood chopper feed directly into the mixing chamber. The cutting and shredding unit is a series of free-swinging hammers. The steel frame is supported by three wheels, one up front which pivots plus two in the rear.

The 8 h.p. Roto-Hoe Cut'n Shred heavy-duty shredder-mulcher includes a side-feed which leads directly to three knives passing by a hardened block. We have used this feature to shred long, tough corn stalks, and found it did a good job. Built of 12-gauge steel, the frame sits on four wheels and has a long tow handle for easy mobility. The steel bar grate is wide-spaced to reduce jamming.

The Royer 8 is a specially designed machine whose endless shredding belt is lined with tempered steel cleats mounted in rows. Models 8, 10, and 12 are electric or gas powered with a capacity that ranges from 5 to 12 cubic yards per hour of soil, peat, and other organic materials. Many municipalities use the larger models for shredding prior to composting them. This is a well-made machine designed for blending, potting, and soil compost mixes.

In addition to a conventional screen, the W-W Model 62-G offers a grating of six rods and rollers for use when shredding wet materials.



*The Royer Shredder*

Powered by a 5 h.p. engine, it works through a series of tempered, hammer mill flails and can handle all conventional organic materials up to 1½ inch tree trimmings, small bones, phosphate rock, tin cans, and bottles. Optional grinding screens handle corn, wheat, or milo.

The Winona Model JR-AW comes mounted on four wheels, but Model JR-S can be mounted on a garden tractor or over the compost pit. The Winonas are electric or gas driven and have changeable racks including a wet mat rack for gummy materials which is a short screen covering only half the mixing chamber. Powered by a 2 h.p. engine, it works through a cutting unit comprising 16 hinged knives.

**Lickity Chipster**

The Chipster has an 8 h.p. gasoline-powered feed roll, a clutch to disengage the feed roll, a hammer mill-type rotor, shredding screen, and chip direction head. There are two wheels for convenience in moving, but the Chipster is not to be hauled as a trailer. The brush feed chute is 16 inches wide and 13 inches long with an opening to the rotor that permits feeding branches up to 2 inches in diameter. The self-feeding roller, located at the end of the chute, feeds the branch into the hammer mill-type rotor where it is shredded, screened, and dropped on the ground in front of the Chipster. If the dynamically balanced, hammer mill rotor should become overloaded, the powered feed roll will automatically stop until the overload has been cleared and then will automatically start again. Weight: 215 pounds.

**Lickity Chipper Model PTO-5**

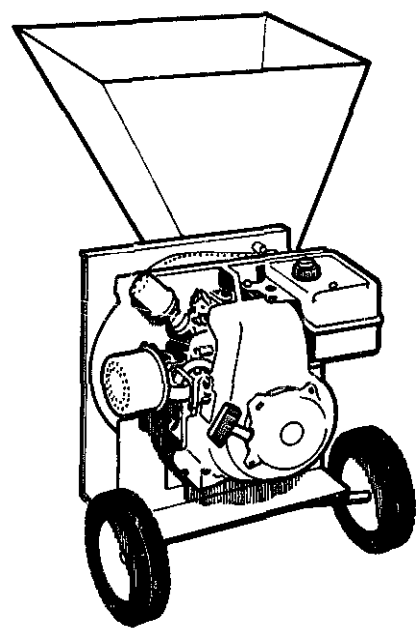
The Brush Chipper utilizes the power take-off of a tractor. The PTO model is equipped with wheels, tires, and tubes as standard equipment. It can be towed to the job at normal highway speeds behind any vehicle. The feed chute can be folded up and the blower discharge chute adjusted to make towing easier. The PTO model is equipped with a pin-type hitch coupler. The hammer mill rotor handles limbs up to 5 inches in diameter at a rate of 50 feet per minute.

A.M. Leonard & Son, Inc.
P.O. Box 816
Piqua, OH 45356

**Diadem Brush Chipper**

The Diadem Chipper will handle up to 3 inch diameter limbs. Brush self-feeds through the chipper and is converted into small chips in just a few seconds. Small brush can be processed in bundles at a time. It is constructed of heavy-duty plate steel with a 6 gauge (5 mm.) engine deck and a solid cylinder rotor. Imbedded in the solid rotor are two 0.4 inch thick cutting knives of specially hardened chrome vanadium steel. The wheeled Diadem is 30 inches wide; it can be taken anywhere for on-the-job brush disposal. All tires are fully pneumatic. You can choose from a three-point hitch PTO and 8, 10, and 12 h.p. models.

Vandermolen Corp.
119 Dorsa Ave.
Livingston, NJ 07039



*Top-Vented Shredder-Bagger*

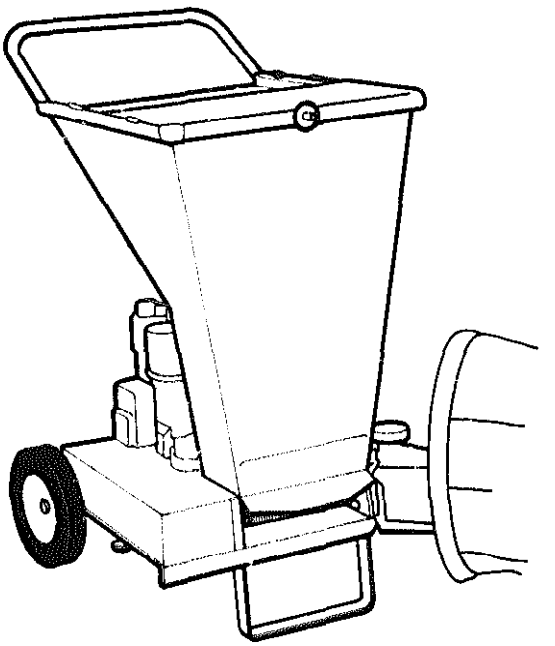
**Top-Vented Shredder-Baggers**

A top-vented, compact shredder-bagger will throw a stream of chopped aggregate into the garden or compost pile. The Hahn 3½ h.p. Mighty Compact and International Harvester 35P are in many ways identical. They are low-

profile, with wide-mouth, gravity-feed hoppers and a pair of wide-set, rubber-tired wheels for extra stability plus mobility. Both models feature hammer mill cutters and optional baggers.

Free-swinging, hardened steel hammers, a large feed hopper, and an adjustable discharge chute are built into the low center of gravity-feed McDonough Snapper. Model 30-S has been designed to handle leaves, bush trimmings, tree prunings up to ½ inch thick, and cornstalks. It is powered by a 3 h.p. engine with centrifugal clutch and belt drive.

A large (22 inches wide) drop chute for raking in leaves and other lawn debris plus a side-mounted chipping opening for branches are features of three top-vented shredder-baggers that are almost identical in design. They are the Columbia Model 654-4, the Jacobsen No. 50080, and the MTD No. 244-650. Powered by a 5 h.p. engine, each machine features a three-stage cutting action consisting of a single, flat reversible blade, nine flail knives, and four cutting fingers. In addition to the novel drop chute, these shredders each have extra-wide hoppers.



*Bottom-Vented Shredder-Bagger*

**Bottom-Vented Shredder-Baggers**

The Atlas, Cross, Kees, Roper, and Sensation models, while more or less identical in appearance—wide, low-set hoppers, each with a set of sturdy wheels, and engines mounted directly over the cutting units—are somewhat different in the features they offer.

The 5 h.p. Atlas does its cutting with three steel blades plus eight shear bars which permit it to cut wood up to 1 inch thick. Blade drive is direct from the engine. A poker rod has been built into the hopper for breaking up twigs and vines.

Cross shredders come in two models, the 3½ h.p. 4365, and the 5 h.p. 4650. Both shredders deposit chopped material in a bag and feature a sweep-in hopper that makes lawn cleanup easy. Power goes direct from the engines into the double-bladed rotary cutters.

The Kees Kom-Pak also has a rake-in hopper, an optional extra. Its steel cutting blades will handle wood up to 1 inch on the 5 h.p. model or ¾ inch for the 3½ h.p. Three bags are packed with each machine.

The 3½ h.p. Roper works with two high-speed blades to chop up leaves, twigs, and vines. It is worth noting that the accompanying Roper photos show it handling corncobs. The 6 h.p. model depends on triple cutting blades plus breaker bars in the chopping chamber. There is a fixed steel deflector on the discharge chute for directional control of the shredded matter. Bags are also available.

Power in the Sensation Eager Beaver goes directly from the engine to the double set of reversible blades without belts or chains; a safety clutch has been designed to protect the engine against shocks. The Eager Beaver dismantles easily for transport by car, thanks to large-diameter hand knobs.

The Sears 8 h.p. Super-Shredder resembles a rotary mower with its engine mounted directly over the three high-speed cutting blades. Shredded particles—leaves, vines, twigs, and garden debris—are vented at the bottom in a bag. The wide-mouthed but shallow hopper may be lowered for raking and sweeping in of lawn debris. Five bags are included.

The Toro comes in two models, 3½ and 5 h.p. Each features a big, slanting, gravity-feed

hopper with a pusher rod to handle the material. The engine sits directly over the cutter blades--two in the smaller model and three in the larger—which work in conjunction with the shredding bars at the bottom vent. An optional bagging kit is available.

## MULCHING

Mulching is an important technique employed by the organic farmer for maintaining weed control, retaining of soil moisture, and increasing the amount of organic matter or humus present, hence improving the soil's tilth. Specially adapted lawn mowers are good for chopping grasses and weeds for mulch on a small scale. But we know of only one source of equipment for applying mulch on a serious scale.

### SOURCES OF MULCHING EQUIPMENT

**Rotary Mulching Mower**
Manufactured by:
FMC Corp., Outdoor Power Equipment Div.
215 S. Park St.
Port Washington, WI 53074

**Rotary Mulching Mower Conversion Plans**

240 Kinderkamack Rd.
Oradell, NJ 07649

*Down to a science: Ralf Clark and Fred Behringer of Waterford, Connecticut, keep the wood stacked high a year ahead of time to dry, use it as a barrier against the weather, and have the system arranged with pulleys so that their sugaring project stays a one-man job.*

# GOLD IN THE TREES

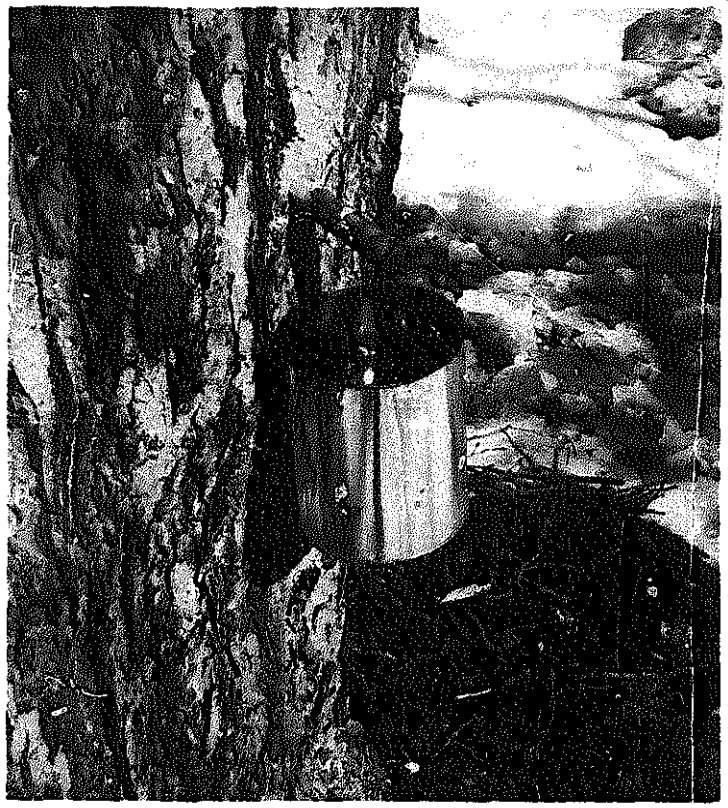
**by Bruce Mays**

Two years ago, my neighbor and I devised a system that yields three gallons of maple syrup every year from a total investment of under 12 dollars. If we can do it, anyone can. Boiling your own maple syrup is surprisingly easy. And when that syrup is free, boiled during the first hint of spring in your own backyard, you know you're living well.

Sugar sap is manufactured by maple leaves all summer long, then stored for the winter in the roots. The following year, that sugar supplies a ready-made energy reserve to the growing tree until new leaves are able to photosynthesize their own. During the first thaws of spring, the roots must move that sap through the trunk to the branches. Only if conditions are right, only if the sap is racing like an elevator between the roots and branches, can the tree be bled. Warm, sunny days draw the sap from the earth. Freezing nights pull it back down. That combination is essential; any other locks the sap motionless in one spot or another. In the South, or by late spring, there are no freezing nights that will gather the sap to the roots. But don't despair. If you live in sugar country and the season is right, there is no mistaking it. Morning ice will cover the bark, and by afternoon, the branches will sweat with glistening sap.

The first step in sugar production involves drilling holes through the bark. A general rule of thumb calls for the holes to be drilled no closer than one foot apart in a waist-high circumference around the trunk. Each year the holes should be shifted three inches to one side or the other, making sure no new holes are above or below the old. Since sap flows only through the newest growth directly beneath the bark, the holes should be angled upward no deeper than three inches toward the center of the tree. Tap primarily the southern face: sunlight coaxes a quicker flow. The standard drill bit is $\frac{7}{16}$ inch; hardware store taps are made with that size in mind.

A tap is nothing more than a stiff pipe plugged into the hole that funnels the sap out of the tree. Any tubular, soft piece of wood will do. My own yard abounds with one-inch diameter sumac trees. Once the branches have been cut into six-inch lengths, it is a simple matter to ram a red-hot straight iron through the spongy pith. All that remains is to whittle one end of the shaft to a taper and drive the tapered end into the tap hole like a bung into a barrel of wine. The sumac will swell with the first run of sap, sealing the tap tightly against each hole. Professional buckets are made of



*The top shaft should be tapered at one end and driven into the tree at an angle. It is best to have a covered collection can.*

galvanized steel, come complete with a hood to keep out unwanted rain and snow, are very handsome, and cost $4 each. For that price, I can empty ugly homemade buckets every time it rains or snows. A friend of my neighbor's gave him three dozen unused number ten tin cans—for free. Any large container will do, of course. The tin cans were simply the most convenient for us. I have seen plastic gallon milk jugs and unused paint-stirring cans used with great success. By punching a hole on each side near the top and looping a length of wire between them, we produced three dozen collecting buckets in less than an hour. And when we hung the buckets from our homemade taps, the fit was extraordinary. Forty-nine-cent taps stick out only about an inch from the bark; our homemade variety extends five inches from the trunk, far enough to direct sap into the very center of each bucket. By carving a small notch near the end of each tap, the collecting cans were safe from even the strongest breezes.

Our total investment so far was nothing. By the second week of March, our taps carried clear sap in a stream, filling each two-quart can within hours. And if you hate the thought of all that boiling, stop there—maple sap in place of water makes the most exquisite tea and coffee you've ever tasted.

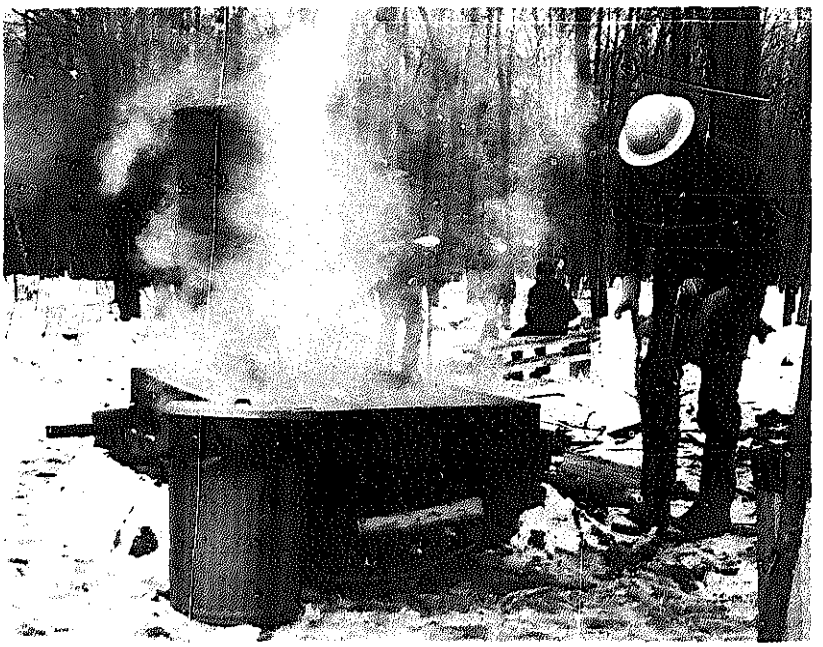
If you do boil it, there are a few considerations to prepare for before you begin. If you have a job during the week, you will probably want to boil only on the weekends. That means storing your daily collections for at least six days. Twenty-gallon trash cans with plastic liners are about as large a storage container as you want to get and still be able to move them easily.

Now, however, you must keep the sap cold during the week. Left by itself, on a warm day, collected sap soon clouds to a bacterial soup. The easiest solution is to keep the trash cans in daylong shade. Each night, a skim of ice will form to protect the sap during the following day. And when warm weather still threatened to melt the ice and spoil the sap, we simply froze some fresh sap

overnight in milk cartons and floated the chunks of ice in the cans. As long as even a small ice cube remained until dark we knew we were safe.

After eight days of collecting we were ready to boil. Once again, we were in a potentially expensive situation. From every 40 gallons of sap, 39 gallons of water must be evaporated. That takes a tremendous amount of heat. The only realistic way for a home maple boiler to produce syrup is to cook the sap over an outdoor wood fire. Our three gallons of syrup demanded about two cords of wood.

Four years ago, I used an old ten-gallon lobster pot for the actual boiling. For someone with only a few maple trees, this is fine. But remember, it takes 40 gallons of sap to produce one gallon of syrup, and the evaporation rate of that excess water is a direct product of the size of the pot. Water will evaporate only from a surface in contact with the air; no amount of heat can alter that fundamental rule. Anyone planning to produce more than a pint of syrup in less than a lifetime of boiling will be forced to use a professional evaporator. We were, and now I know we were right.



*From every 40 gallons of sap, 39 gallons of water must be boiled off. Three gallons of sap call for about two cords of wood.*

Don't let the word professional scare you. It means simply a very large pan. The smallest of them, like ours, is about five feet long by three feet wide and ten inches deep. That is enough to hold 50 gallons of sap and presents an evaporating surface of 15 square feet—a twenty-fold improvement over my lobster pot. Fancier, more expensive evaporators have baffled compartments to route the finished syrup away from the new sap, inlet spigots and outlet faucets, and mysterious coils winding along the bottom. But beyond all that finery is still the simple physics of a larger evaporating surface. My neighbor found our small, used pan in a local newspaper for $10. Five dollars each, and we had made our last expenditure.

It remains only to get the fire underneath the pan. In our case, that meant piling used bricks in a three-sided structure 18 inches high, making sure that the edges of the evaporator pan would sit snugly on the inner brick wall. I suppose the bricks should be cross-stacked for maximum strength, but by the time we set the pan, leveled it out, poured in the sap, and stoked two cords of wood, our neat rectangle was something of a shambles anyway. The real trick is to concentrate as much of the heat uniformly onto the pan while still allowing enough air into the blaze to keep it burning hot. That meant removing a stray brick for ventilation here and there, sticking an old stove pipe from

the back end as a chimney, maybe sealing the gap between the evaporator and the bricks with mud. Generally, though, it meant just watching the fire at all times to balance its needs.

There are some things to be remembered during your boiling day. If the boil slows, the evaporation rate decreases. Too much heat in one spot tends to melt the solder holding the pan seams together. You have to work on the furnace a little to prevent those annoyances. We slanted a dug pit towards the rear of our rectangle and tried to keep most of the burning wood near the bottom. The heat then tends to climb up the slope towards the mouth of the furnace and disperse somewhat evenly across the bottom of the pan.

Be sure to add fresh sap steadily throughout the boiling. Too much cold sap all at one time will quench your good boil and slow the evaporation rate. Each time new sap is added, a scum will rise to the top. Skim these impurities from the broth with a slotted spoon.

Finally, the sap will taste distinctly mapley. Since our three gallons of syrup made a dangerously shallow layer in the pan, we found it prudent to remove the syrup from the fire when it was obviously brown and sticky-sweet, but still too thin for good syrup. This meant boiling the last few gallons in pots on the kitchen stove, but that way you can watch the syrup more carefully as it thickens. Books will tell you to dip in candy thermometers, or to measure the specific gravity and weigh the sugar content. At that point, the usual rolling boil is replaced by a kind of brown foam that sudses above the syrup. Syrup at just the right stage will cling to the spoon like thin taffy as it cools.

Your new syrup should be poured through muslin or felt at least once to pick up stray flecks of ash left by the fire. If you're planning to store the syrup for longer than a few months, be sure to fill each container right to the top while still hot and cap it immediately. When the syrup cools, it will hold the cap down with vacuum and never spoil. Pint or quart mason jars are perfect for this, but old bottles or food jars—anything with a sealing lid—can be used. If the syrup ever does cloud, simply boil it again and rebottle it. In a cool spot it should keep for years.

By the end of the day everyone is exhausted. Last year we began at six in the morning and were still sitting in a freezing drizzle at eleven o'clock that night. In between, a half ton of sap was poured by cupfuls into the steaming evaporator, the fire was tended, new sap was collected, and spare wood split.

And yet every winter I am restless for sugaring season. By late February, I swear I can smell the sweet air from other boilers. There is something very special about this first outdoor project of the year, something very satisfying about using your hands and brains to produce such an indecently delicious syrup.

# NUT SHELLERS

## GROUNDNUT DECORTICATORS

Groundnuts, peanuts for example, have fibrous cellulose shells which need to be removed prior to consumption. The task requires a rubbing-stripping action and a method for cleaning. Most hand-operated decorticators do not do this and so require a separate winnowing step.

## SOURCES OF MANUAL DECORTICATING EQUIPMENT

### Handy Groundnut Decorticator

Built from steel and cast iron, the Handy is simple to operate and easily transported. Nuts are placed in a receptacle and the operating handle moves forward and backward, rubbing the nuts against spiked rustlers and the shelling grid. Kernels are not separated from the shells after decortication with this device.

Harrap Wilkinson, Ltd.
5 North Phoebe Street
Salford M5 4EA, U.K.

### R. Hunt and Company Groundnut Decorticator

The distance between the galvanized, heavy mesh screen and the rubbing bars on this unit can be adjusted to accommodate a variety of sizes of nuts. Four different sizes of screen are available for this hand-operated sheller.

R. Hunt & Co., Ltd.
Atlas Works, Earls Colne
Colchester, Essex CO6 2EP, U.K.

**CeCoCo Model 300D Peanut Sheller**

In this model, revolving beaters shell the peanuts, and kernels are separated from the shells by a screen and fan. Output is 40 to 50 kilograms per hour, and kernel breakage is 2 to 3 percent.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Groundnut Sheller**

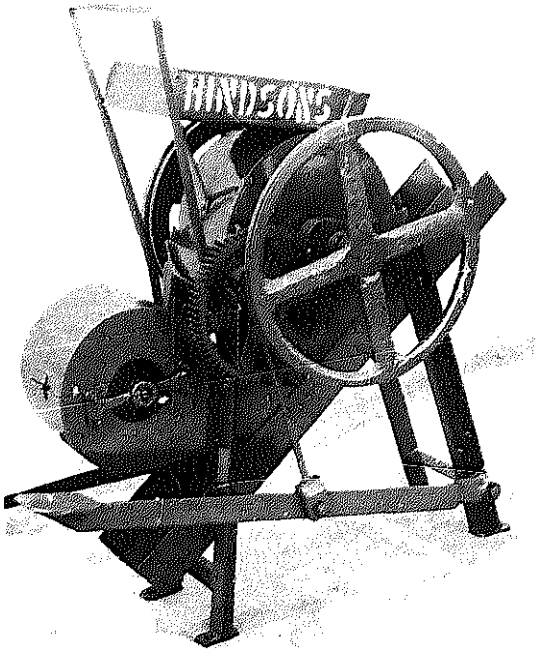
A hand-operated groundnut sheller is available from:

Ubungo Farm Implements
P.O. Box 2669
Dar Es Salaam, Tanzania

**Hand-Operated Groundnut Decorticator**

For more information write to:

Dandekar Brothers
Sangli
Maharashtra, India



*Hindsons Treadle Power Groundnut Decorticator*
M/s. Hindsons Pvt., Ltd.

**Hindsons Groundnut Sheller**

This is a foot-operated, portable device designed to quickly separate nuts from their shells. The balanced flywheel eases operation, and the blower separates shells from the nuts. Maximum output of the unit is 441 pounds per 8-hour day.

M/s. Hindsons Private, Ltd.
The Lower Mall
Patiala, India

## SOURCES OF POWER-DRIVEN SHELLING MACHINERY

**CeCoCo Peanut Sheller**

In the CeCoCo sheller, threshed and cleaned peanuts are shelled by a revolving beater mechanism. After being run through the machine, unshelled and shelled peanuts are separated with a fan and screen. Unshelled nuts should go back in the implement until shelling is complete. Breakage of kernels is between 2 and 3 percent. Four model types are available using 1, 2, or 3 h.p. motors and with outputs of 120 to 420 kilograms per hour depending on the model.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

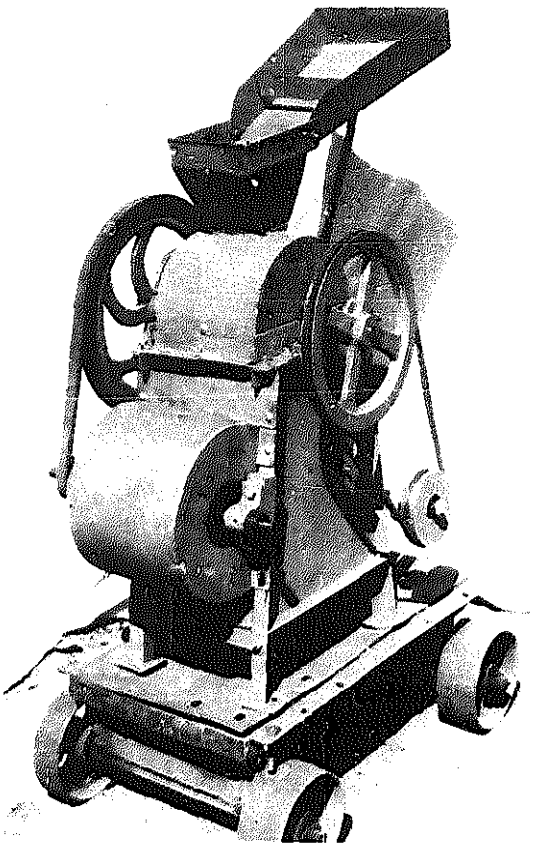
**Harrap Wilkinson, Ltd. Automatic Groundnut Decorticator**

Nuts to be shelled are placed in a hopper at the top of this machine. The nuts pass into a beater chamber by means of a ribbed feed roller; the rate is adjustable. Rotating, flexible beaters break the shells, and a blower mechanism separates the shells so that only the kernels are in the delivery chute. Wilkinson's No. 2 machine has a 1½ h.p. motor and an output of 254 to 406 kilograms per hour.

Harrap Wilkinson, Ltd.
North Phoebe St.
Salford M5 4EA, U.K.

**Dandekar Brothers Groundnut Decorticator**

Dandekar Brothers manufactures four types of power-driven decorticators. Type A needs a 5 h.p. motor and has an output of 80 (180 pound) bags per (12 hour) day. Type B requires a 6 h.p.



*Dandekar Power Groundnut Decorticator*
Dandekar Brothers

motor and will produce up to 100 bags a day. Type C is powered by a 7 h.p. motor and will shell up to 120 bags per day, and Type D uses a 10 h.p. motor for a maximum output of 200 bags per day. The hopper is on the upper part of the machine. Nuts pass from there into an opener cylinder where the shells are broken and separated from the kernels. The shelled nuts fall on the ground to be collected.

Dandekar Brothers
Sangli
Maharashtra, India

## SINGLE NUT NUTCRACKERS

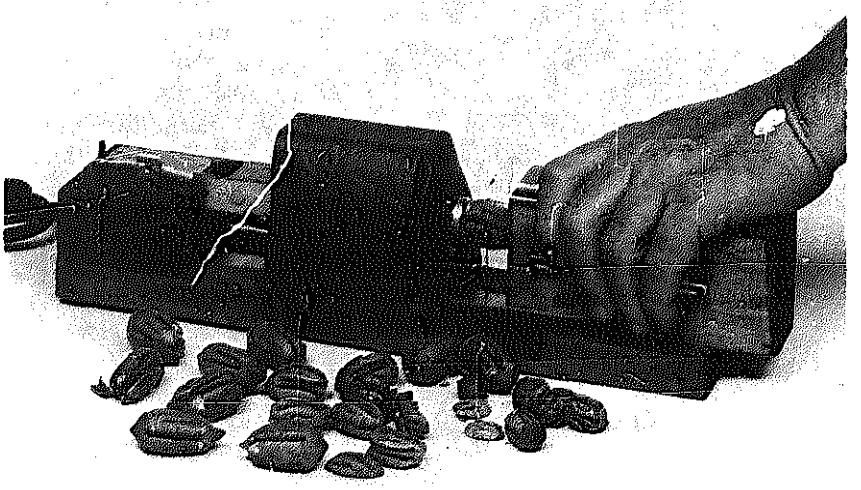
### New Dynamic Nut Cracker

Designed to crack any size nuts except hickory nuts or hard-shell walnuts, this sheller locks and cracks them automatically. Kernels and shells fall out for rapid repeats, and the safety shield protects the operator from flying shell particles. This electrically operated device requires 110 volts and 60 cycle alternating current. The cracker is guaranteed for 1 year, and has an estimated life of 10,000 pounds of nuts.

L.H. Powell
8647 Wingate Drive
Dallas, TX 75209

### Texas Native Inertia Nutcracker

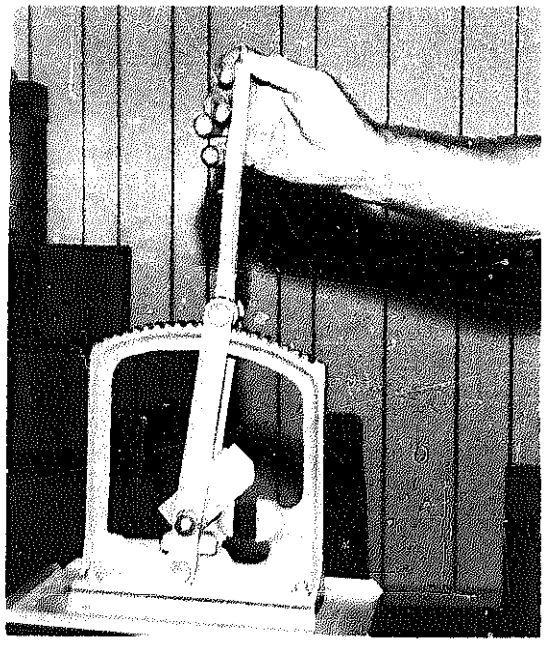
Made of oak and aluminum, this device will



*Texas Inertia Nutcracker*
R.P. Industries, Inc.

crack any type of pecan, Brazil nut, filbert, almond, macadamia, and English or California walnut. The cracker operates by placing the nut between two sockets, pulling the safety shield over the nut, pulling back the knocker stick, and releasing it. The kernel is left in the sockets, and the shell falls away from it. The tool is guaranteed for 1 year, and can crack up to 30 nuts in a minute.

R.P. Industries, Inc.
610 W. Johnson St., P.O. Drawer 10933
Raleigh, NC 27603



*The Potter Walnut Cracker*
**Fred Klingensmith, Inc.**

**Potter Walnut Cracker**

This device cracks walnuts one at a time. Heavy-duty crackers are also available.

Fred Klingensmith, Inc.
Sapulpa, OK 74066

# RICE HULLING

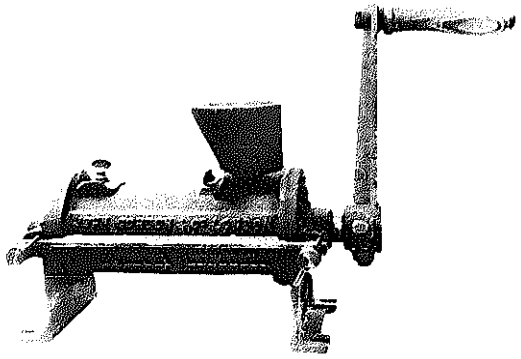
Similar to wheat, rice grows with a bran layer and an outer hull covering the kernel. For the grain to be edible, the hull must be removed in the hulling process. An unnecessary second step, polishing, removes the bran and the germ, and along with them, much of the grain's B-vitamin content. Rice that is hulled but unpolished is called brown rice. Both the hulling and polishing processes require a milling action, often by two rollers rubbing the kernel between them. Most hullers are designed for power operation, but a few hand-operated models are still being made.

## SOURCES OF RICE HULLERS

**Java Hand-Powered Rice Huller**

This is a small machine intended for the grower of small quantities of rice paddy, and for domestic use. It replaces a model called the Paddy Pounder. Paddy can be shelled at a maximum rate of about 30 pounds (14 kilograms) an hour, but the capacity may vary considerably depending on the type of rice and its condition. The machine has three adjustments controlling the feed, the discharge, and the hulling knife. A perforated plate allows dust to escape, and the machine can be opened easily for cleaning. Strongly made, its net weight is 23 pounds (10.5 kilograms), and it is provided with holding-down screws and spanners.

John Gordon & Co. (Engineers, Ltd.)
196a High St.
Epping, Essex CM16 4AQ, U.K.

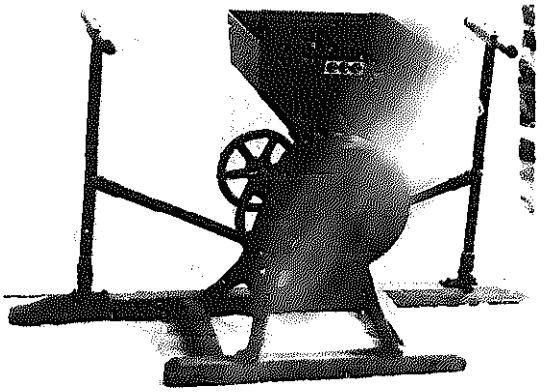


*Java Hand-Powered Rice Huller*
**John Gordon**

**CeCoCo Two-Man Rice Huller**

Two men operating the hand levers will rotate this huller at 3,500 to 4,000 rpm, hulling

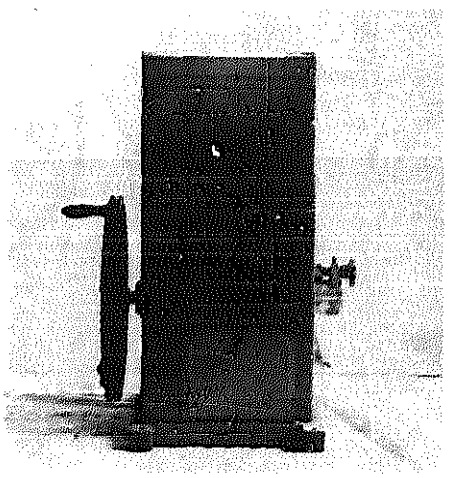
250 kilograms per hour with 90 percent hulling efficiency. Net weight: 60 kilograms.



*CeCoCo Two-Man Rice Huller*

**CeCoCo Hand Rice Polisher Type E**

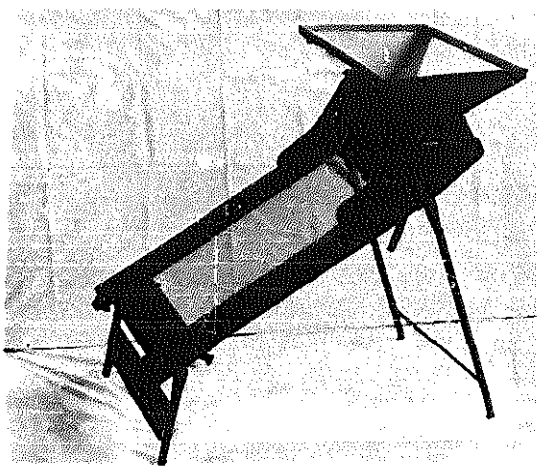
Operated either by hand or by a ¼ h.p. motor, the Type E Polisher will polish unhulled rice that has already been dried and winnowed. Capacity is 10 to 15 kilograms per hour by hand, and 30 kilograms with a motor. Weight: 22 kilograms.



*CeCoCo Hand Rice Polisher Type E*

**CeCoCo Hand-Hulled Rice Separator and Sorter**

Constructed of steel and easily dismantled for storage, the four models of this sorter have capacities ranging from 20 to 32 bushels per hour. Hulled rice is fed into a hopper, and while sliding across the surface of the piano-wire screen, it will separate into whole hulled rice, unhulled rice, unhulled paddy rice and immature rice, mud, and sand. It may also be used to sort polished rice for grading.



*CeCoCo Hand-Hulled Rice Separator and Sorter*

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

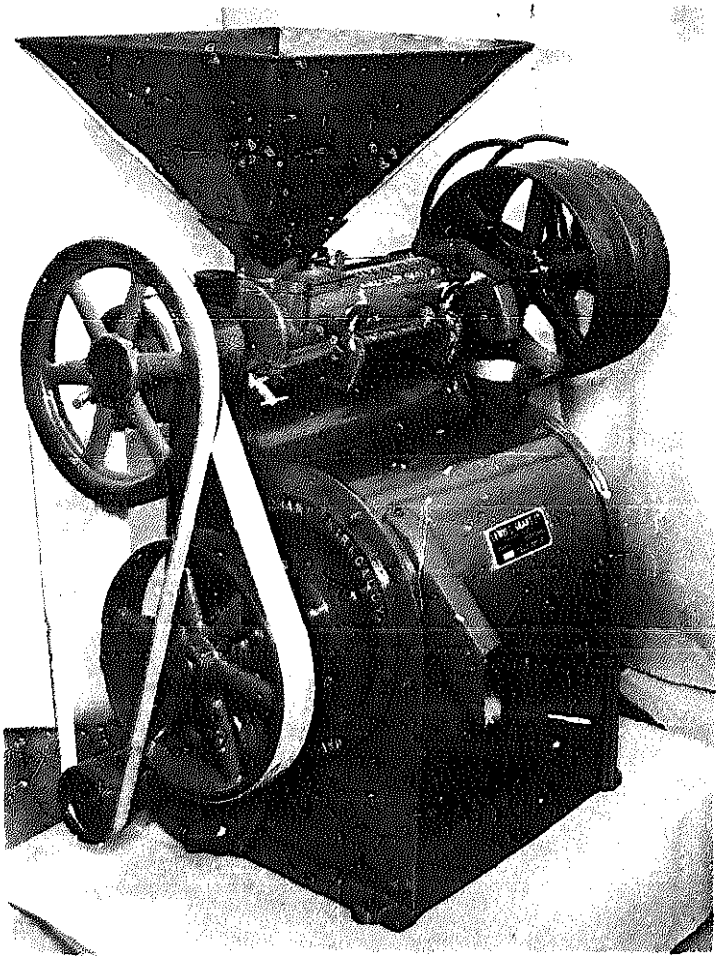
**Amuda Rice Hullers**

These power-driven machines can be used as hullers alone or supplied with polishing attachments. Three models are available, requiring 5, 12, or 15 h.p. They will hull rice from the paddy or shelled rice. From the paddy, the smallest huller will produce 36 to 45 pounds of cleaned rice; the middle, 136 to 204 pounds; the largest, 250 to 295 pounds per hour. When using shelled rice, production capacity is a little less than double those amounts per hour.

Rajan Trading Co.
P.O. Box 250
Madras 600 001, India

**Grantex Rice Hullers**

Three sizes of Grantex hullers are made. The smallest, requiring 5 h.p., produces 80 to 100 pounds of polished rice per hour. The amount is doubled if shelled rice is being polished. The two larger models utilize 12 and 15 h.p., respectively; they produce 300 to 450 and 500 to 650 pounds per hour. The two larger models can



*Grantex Rice Huller*
Lewis C. Grant, Ltd.

produce five separate products directly from the paddy: white rice, coarse meal, fine flour, bran, and husk. Optional extras include polishers, aspirators, fans, drive units, and reciprocating sieves.

Lewis C. Grant, Ltd.
East Quality St., Dysart
Kirkcaldy, Fife, KYI 2UA U.K.

**Iseki Rice Polishers**

The Iseki Model JE25 is an automatic, cabinet body machine. Horsepower required to operate the polisher is 4 to 5, and 300 to 350 kilograms of rice can be polished per hour. The manufacturers recommend combined use with a rice huller, but state that it can also be used as a rice-hulling and -polishing machine. Three larger models are available, either in cabinet or strip enclosures. Efficiency ranges from 300 to 1,000 kilograms per hour. None of the Iseki models include their own power units.

Iseki Agricultural Machinery Mfg. Co., Ltd.
1-3, Nihonbashi 2-chome, Chuo-ku
Tokyo, 103 Japan

**CeCoCo Automatic Rice Hullers and Combinations**

CeCoCo, with its wide variety of all types of machines, offers seven automatic rice processors, with many sizes of each type. Their automatic hullers feature rubber rollers, which they claim will increase output recovery of hulled rice 15 to 20 percent. They also recommend that rubber-rolled rice be stored and shipped as brown rice,

with any polishing to be done at the destination of the shipment to avoid deterioration of the product.

1. Rubber Roll Rice Huller: The original model consists of a hulling head and installation bed. Separation of brown rice and husks is necessary. Seven models are available, ultilizing 1 to 10 h.p. or V-belt drive: capacities range from 500 to 4,000 kilograms per hour in paddy.
2. Combination: Three models, with or without suction husk exhaust, are offered. The basic unit includes a huller and husk winnower. The suction exhaust model is recommended for use in buildings. The three sizes utilize from 2 to 5 h.p., with capacities ranging from 500 to 2,000 kilograms per hour.
3. Automatic KL-A: This self-contained unit includes hulling head, winnower, double elevator, separator, and rice elevator. The smaller model requires 4 to 5 h.p. and produces 600 to 700 kilograms per hour; the larger requires 5 to 6 h.p. and produces 1,000 to 1,200 kilograms per hour.
4. Automatic AM and ME: These are miniaturized versions of the complete unit, suitable for a single farmer or a group of farmers. The one-body construction includes huller, winnower, and separator.

Three larger rubber roller units, having hourly capacities of 1,200 to 4,000 kilograms, are also available.

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

**Nogueira Rural Rice Mill**

The Nogueira Rice Mill husks and polishes rice, then separates polished rice, husks, rice bran, and broken rice. It will utilize a 3 h.p. electric motor, a 6 to 9 h.p. gasoline motor or a 5 to 8 h.p. diesel-oil motor. Production capacity is approximately 2 sacks (60 kilos or 132 pounds) per hour. The cabinet is metal and weighs 236 kilograms.

CIMAG: Comercio e Industria de Maquinas Agricolas Ltda.
Rua Padre Roque no.° 1,840, Mogi-Mirim S.P.
Brazil

**Genuine Engelberg Combined Rice Huller and Polisher Number 3**

Powered by flat belt-drive pulley, this 3 h.p. machine will, in a single operation, hull, scour, and polish rice as it is received from the thresher. An optional built-on exhauster is available to carry away chaff and dust.

This item is suggested for small mill operators or larger growers. The No. 3 has a capacity of 80 to 100 pounds of rough rice per hour, and two larger models are capable of up to 700 pounds per hour.

**Genuine Engleberg Huller Number 4**

Similar in design to the No. 3 Rice Huller and Polisher, the No. 4 does not contain the polisher attachment. Two larger models of hullers are also available.

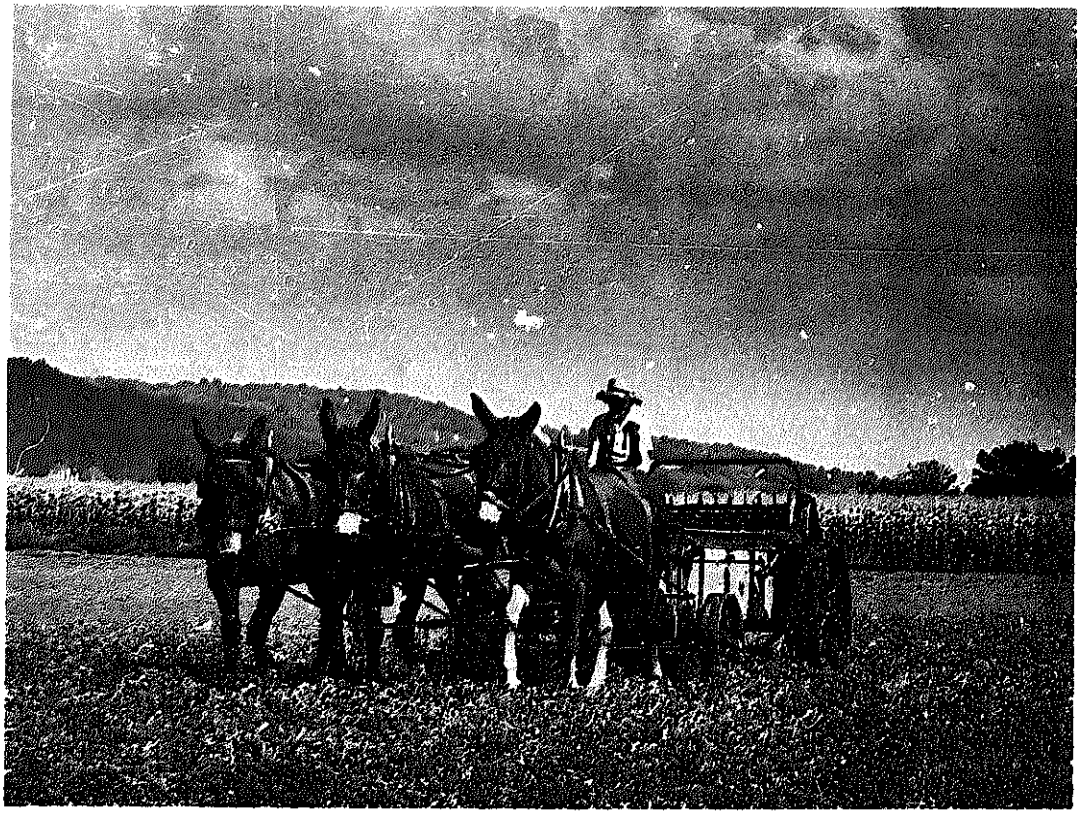
Engleberg Huller Co. Division
P.O. Box 277
Factoryville, PA 18419

# -9- Tools for Adding Organic Matter to the Soil

To the practitioners of today's chemical agriculture, a fertilizer is a substance that has a measurable quantity of at least one of the major nutrients required by growing plants. The most widely used chemical fertilizers are those which contain three primary plant nutrients: nitrogen (N), phosphorus (P), and potassium (K) in varying combinations.

Organic growers, on the other hand, rely on natural fertilizers to maintain and replenish all the elements in their soil that are necessary to plant growth. They view soil fertility as a broader, more complex concept which involves not only specific plant nutrients, but also organic matter, the living organisms present in the soil, and the very structure of the soil itself. To them, humus content and tilth are important aspects of soil fertility. Unlike those farmers who employ chemical fertilizers to supply their crops with specific nutrients in forms that are readily available, organic farmers use a variety of natural materials to maintain and improve overall soil quality. In this way, soil fertility and health are improved even as crop yields increase.

Direct application of livestock manures has been the farmer's traditional approach to return-



*Mule-Drawn Manure Spreader*
*Reading Eagle*, Lancaster County, Pa.

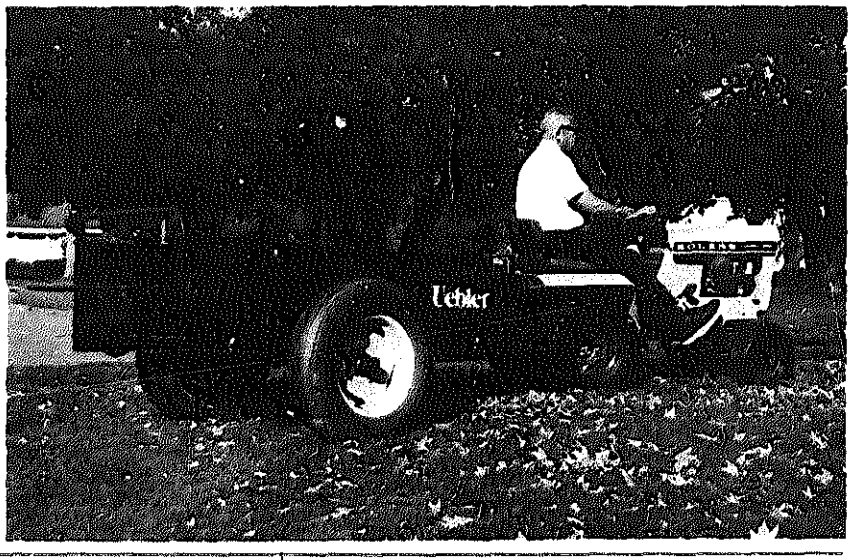
ing organic materials to the soil. Originally, manure was spread over the soil surface from a cart, with a many-tined pitchfork called a manure fork. Then came the development of the manure spreader, a horse-drawn cart with a ground-driven set of chopping blades in the rear. Manure fed into the blades was chopped into small pieces and evenly distributed onto the field.

## SOURCES OF MANURE SPREADERS

Most manure spreaders made today are designed for pulling behind large tractors beyond the scope of this book. They are easy to locate through most agricultural equipment dealers. Farm auctions are the best source for smaller units in North America.

### Uebler Mini

One company to appear with a mini manure spreader, requiring only the power of an 8 to 12 h.p. tractor, is Uebler. Their smallest model has a capacity of 18 bushels which it distributes under power from its own 4 h.p. gasoline engine or a power take-off shaft. Their next size larger has a 50-bushel capacity.



*Uebler Mini Manure Spreader*
Uebler Manufacturing Co.

Uebler Mfg. Co.
Vernon, NY 13476

### New Idea

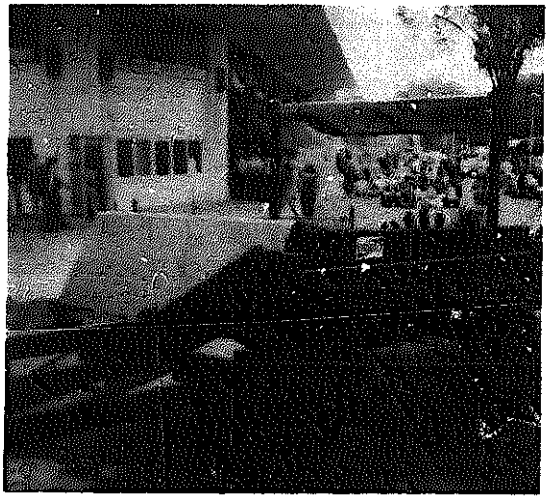
The smallest manure spreaders put out by New Idea are a 138-bushel model with the combined chopping action of a cylinder and paddle, and a 146-bushel, single-beater model.

AVCO. New Idea Corp.,
Farm Equipment Div.
First & Sycamore
Coldwater, OH 45828

### OrBilt Manure Spreader

The main beater of this spreader is made from heavy channel iron. These channels are welded around the beater pipe in two opposing spirals. This beater will tear apart the toughest manure, whether it is from a feedlot or pen, even if it is frozen. Strings don't catch or hang on this beater as they do on others. A lower-splash blade beater has the specific purpose of breaking up and scattering both liquid and clumps. This lower beater is particularly useful if you are spreading on a hay field or some other place where large lumps could smother patches of a crop.

The sliding pusher and false front endgate move as one unit to the rear of the box. The speed is controlled from the tractor seat by a variable flow, hydraulic valve. The pusher, replacing the traditional conveyer apron, is the heart of the entire machine. Part of the hydraulic cylinder is enclosed by the center housing



*OrBilt Manure Spreader*
**O'Reilly Manufacturing**

of the sliding pusher; the other part extends out over the tractor hitch. The entire inside of the box is lined with tough plastic. Manure does not penetrate or stick to the plastic, nor does it freeze to plastic as it does to wood or steel.

O'Reilly Manufacturing
Rt. 3
Goodhue, MN 55027

**Prototype Material Spreader**

Charles E. Fox, of Jonesboro, Louisiana, has invented a spreader wagon that hitches to a tractor and distributes material such as pulverized chicken fertilizer, sawdust, or ground bark. It is a two-wheeled cart with a series of arched platforms in its bed that funnel material onto a conveyor belt, and then through a gauging or measuring device. The gauge limits the amount of material laid per foot. The belt can be disconnected for transport. Mr. Fox is currently seeking a manufacturer for his spreader with the help and guidance of the Raymond Lee Organization. His invention, covered by a patent application pending in the United States Patent Office, is designed primarily for organic farmers.

Charles Fox
Rt. 3, Box 77
Jonesboro, LA 71251

Raymond Lee Organization, Inc.
230 Park Ave.
New York, NY 10017

## COMPOSTING

Manure spreaders are still a necessary tool on the organic farm, but increasingly they are being used to spread composted manures and other organic wastes. Composting is the biological process of decomposition during which wastes are broken down into their basic chemical parts and made ready to be used again in building another plant. The product is called humus.

With the proper microorganisms present in the soil, humus will evolve by simply applying organic wastes to the soil surface. However, composting speeds the process, and by following a basic composting recipe, a more-balanced nutrient fertilizer is produced.

# COMPOSTING AS A MANURE MANAGEMENT SYSTEM

**by Richard Thompson**

Editor's note: Richard Thompson was born and raised on his present farmstead, consisting of 300 acres outside Boone, Iowa. He graduated from Iowa State University with a B.S. in Animal Husbandry and an M.S. in Animal Production.

Composting, in my opinion, is a sensible, practical, economical way to deal with animal waste on the farm. My reasons for starting to compost followed the same pattern as my reasons for changing to organic farming back in 1967, namely—problems.

Back then I was on a continuous corn program, applying chemical N-P-K, herbicides, and insecticides. The fences were removed from between the fields, cattle were brought in and confined to barns and lots.

We live in a low, flat area so the barns and lots needed to be cemented. This situation brought about all kinds of sickness in the cattle. It seemed like it was just one thing after another. I got to the point where, out of frustration, I said, "There has to be something better than this." In the spring of 1968, we stopped using all chemicals and started putting fences back, so the cattle could have limited pasture. The cropping system was changed to a corn-soybean-corn-oats-hay rotation.

Even with all-chemical N-P-K added to the continuous corn program, I had to dispose of all the manure from the cattle and hogs. Note that I say dispose of, not use. The manure was hauled out of sheds and lots during the winter and early spring, and applied to frozen, plowed fields that were often covered with snow. This was a very poor utilization of the nutrients, especially the nitrogen content in manure which would turn into ammonia, dissipate in the air, and be completely lost. Also the raw manure would move with the melted snow and end up in creeks and rivers, polluting our water supply.

After I stopped using the artificial N-P-K, the corn yields stayed at 120 bushels per acre for the next seven years. The corn yields, previously, were about the same, averaging 120 bushels per acre.

My yields, on the organic program, were oats: 70 to 80 bushels, soybeans: 35 to 45 bushels which, I felt, were good and also competitive with the neighbors. The hay fields also seemed to improve each year. After about seven years of organic farming, the field of corn following soybeans dropped to the 80- to 90-bushel range. The cornfield following hay remained in the 120-bushel range. The profit on the 80- to 90-bushel yield would probably be okay, since the expenses per acre were $40 to $50 lower than those of the neighbors on chemical methods. However, I felt with all this manure and only 80 to 90 bushels, something must be wrong. This was where composting came into the picture.

Composting is a way of turning a liability into an asset on the farm.

In the spring of 1975, we decided not to spread the manure on frozen ground during the winter. The manure was pushed up into large piles in the yards during the winter. On June 5, we started to clean out these piles and haul to our compost site on the edge of the hay field. This manure was cold and had large chunks of ice in it.

A bacteria starter was spread on the manure piles in the yard, loaded in the spreader, and taken to the compost site located centrally between our farmstead and the neighbors'.

The spreader needs to be power take-off-operated so it will unload in a stationary position. When the manure builds up to the beaters, the spreader is moved forward about one foot and the rest of the load is unloaded in this fashion. I feel the ideal pile is about eight feet wide at the bottom and four feet high. In two days' time we saw a miracle happen. This cold, frozen manure which had a temperature of about 30 to 40 degrees heated up to 140 degrees, and steam was coming out of the top of the windrows. I feel that, in my situation with all the manure off concrete, I need the added bacteria to get the action started, as little earth was combined with the manure. We tried some windrows without bacteria and the action was very slow.

One of the important keys to good composting is moisture content. This should be in the 40 to 60 percent range. If the manure is wetter than 60 percent, it will take more turnings with the spreader to get it dried down. If the manure is too dry, water needs to be added. Generally, I take some wet manure and mix it with dry manure and this usually comes out about right. Much has been written about carbon-nitrogen ratios in composting; they should be 20 to 30 parts carbon to one part nitrogen. For the farmer, I think this means simply that what creates a good environment for livestock will make good compost. If cattle or hogs are kept clean and dry with bedding, the carbon-nitrogen ratio will be excellent.

My windrows were turned by reloading the spreader and unloading to make a parallel windrow. The windrows need to be turned until the temperature stays below 100 degrees. However, if it is time to spread on fields, incomplete compost that is still steaming can be applied to fields and disked in the same day. We initially applied four tons of compost per acre in fall after the soybeans were combined and bean straw was stacked. The N-P-K analysis of the compost was 2-1-2.

This year I bought an Easy Over compost-turning attachment for my tractor. With this attachment

I can now turn the more than 500 tons of compost I'm making in an hour, as opposed to the two days it took using the stationary manure spreader and loader. I attach the turner to the hydrostatic PTO of a tractor, and use another tractor to slowly move it along through the windrow.

Before getting the turner, we were somewhat lax about turning our piles, since it took so much time. During the growing season it was often impossible to find the time to give two days to turning compost. Now, time is not a problem. If composting had a drawback, it was always because of the amount of time it took to turn. Turning time is no longer a problem for farmers, thanks to the turner.

Although the turner costs five to six thousand dollars, I still think it's a good investment. On a family farm, time is often the critical commodity, and the turner frees a lot of time. I don't think every farmer should own a turner, and as long as there is one in your area, you can hire it for custom work. The turner is easy to transport on the highway, so moving it is no problem. In fact, we now use ours to do our own composting, in the sewage sludge composting operation my son has set up, and a neighbor uses it to compost chicken manure.

As I stated before, we are dealing with raw, wet manure when we start to compost, so we locate our compost site away from farmsteads. When composting starts, the odor changes to a musty smell and isn't noticeable over 40 rods away from windrows. The fly problem is eliminated when the temperature starts to rise, and these temperatures will also kill weed seeds and harmful pathogenic organisms. As I mentioned before, the compost is applied to my field following soybeans. The planting of corn that followed the soybeans was where we were having the yield reduction problem. Last year, we applied 300 tons of finished compost to the fields. The time required to turn 300 tons three times was 30 hours using two people. This year I'll produce more than 500 tons of compost, with not more than eight or ten hours of labor. The yield response from compost was very encouraging, producing a strong 100 bushels per acre in a dry year. This yield was equal to the corn yields of neighbors who used chemical methods.

# SOME SPECIALIZED EQUIPMENT FOR COMPOSTING MANURE

Editor's note: Dennis Demmel of the Small Farm Energy Project in Hartington, Nebraska has supplied much of the information used in this report.

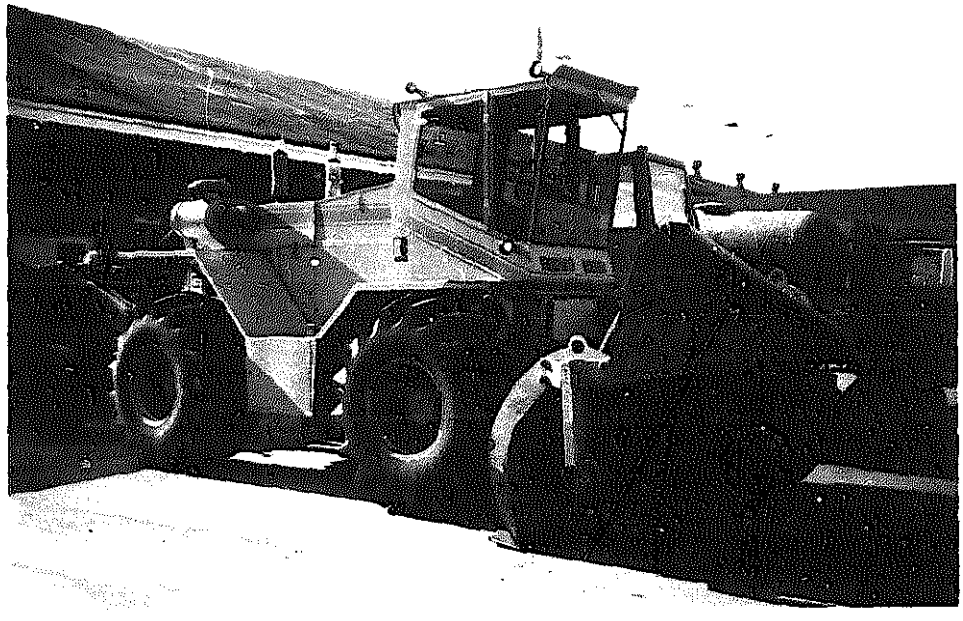
Nebraska is a state that can be said to be blessed—or plagued—with a variety of organic wastes. Its large communities are burdened with paunch manure from slaughterhouses as well as sewage sludge and garbage. Huge piles of dry manure in feedlots or other animal confinement facilities can mean serious dust and odor problems.

In a report in *Farm, Ranch, and Home Quarterly* (Fall, 1977), agronomy professor Leon Chesnin of the University of Nebraska foresees solutions in the near future. His report is entitled "Composting Converts Waste into Valuable Resources," and he writes that "there is a way all of these wastes can be converted into valuable resources—*composting.*" One reason for his optimism is that specialized equipment has been developed to handle large volumes of wastes. Some of this equipment is now in use at the University's Mead Field Station.

The Roscoe Brown Corporation of Lenox, Iowa has supplied a Brown Bear integral auger tractor to the University of Nebraska. The unit is used in composting feedlot manure, paunch manure, sewage sludge, and crop residues.

According to the manufacturer, the Brown Bear can mechanically aerate 3,000 cubic yards per hour—working directly into and parallel with the windrow. In describing the machine's auger speed, the company notes: "By simply changing sprockets, the speed of the auger can be increased to 180 revolutions per minute or more for more aggressive boiling action in the organic waste." The Brown Bear is manufactured by the Roscoe Brown Corporation, P.O. Box 48, Lenox, Iowa 50851.

Edgar Wuebben of Cedar County, Nebraska had a Compost Field Day at his farm last August to demonstrate his home-built compost-turning device. The turner is built from discarded materials,

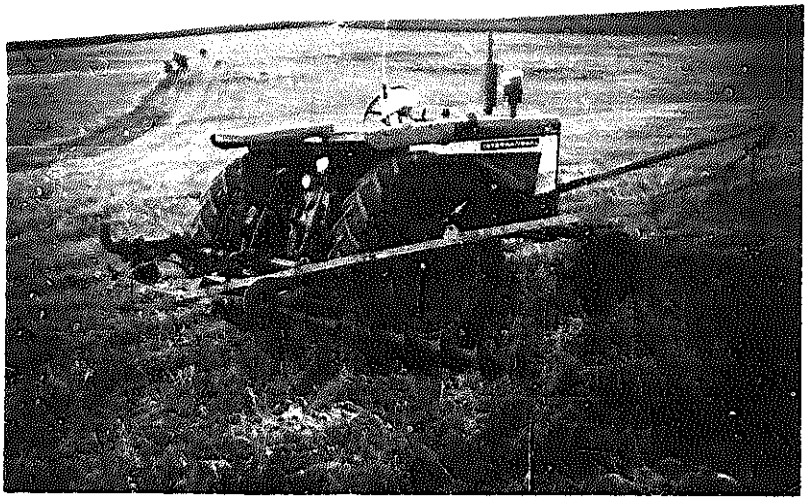


*The Brown Bear Integral Auger Tractor*

*Feedlot manure and crop residues are composted with the aid of the Brown Bear turning machine at the University of Nebraska's Mead Field Station.*

including a gearbox, tool bar, and silage-unloading auger. The auger is used to aerate, break up, and mix the pile. Afterwards, a tractor loader is used to repile the materials.

Wuebben has been keeping daily records of the temperatures within the compost at 50 different points along his 500-foot windrow. The records have indicated that the temperatures of the pile rose substantially after each turning and also following rains that occurred between turnings. The increase in temperature following a rain would indicate that the moisture content of the compost wasn't adequate for optimum bacterial activity.



*Edgar Wuebben's home-built compost turner.*

*Wuebben's compost turner in action.*

A sample of the finished compost was taken to an Omaha laboratory to be analyzed with the following results:

| | |
|---|---|
| Moisture | 34.80% |
| Nitrogen (N) | 0.80% |
| Phosphorous ($P_2O_5$) | 0.62% |
| Potassium ($K_2O$) | 1.17% |
| Organic Matter by Combustion | 14.40% |
| pH | 7.3 |
| Total Organic Carbon | 8.5 % |
| Carbon-Nitrogen Ratio | 10.6 |

A tractor-powered, turning machine built by the Mehlaf Machine and Manufacturing Company of Freeman, South Dakota is used to turn compost at the rate of 400 to 500 tons per hour. This unit is used by Town and Country Park, Inc., in Sioux Falls, South Dakota, which processes sewage sludge, paunch manure, and stockyard pen wastes.

At the McGinley-Schilz feedlot in Brule, Nebraska, a specially designed machine aerates the windrowed manure. The compost is made under contract with the Colorado-Nebraska Compost Corporation owned by Jack E. Martin and Lester R. Kuhlman of Sterling, Colorado. The machine, known as the Scarab, was developed by Fletcher Sims of Canyon, Texas.

"About 20 tons of raw manure to the the acre would have to be applied to equal the benefits derived from two tons of compost," says Martin.

"It's turned our feedlot waste problem around. Instead of manure being a nuisance, it's a valuable asset," Schliz was quoted in an *Omaha World-Herald* article.

## SOURCES OF COMPOSTING EQUIPMENT

### The Cobey Composter

An Ohio feedlot has effectively used the Cobey Composter for processing animal wastes. This unit is a diesel-powered, self-propelled machine which straddles the windrows.

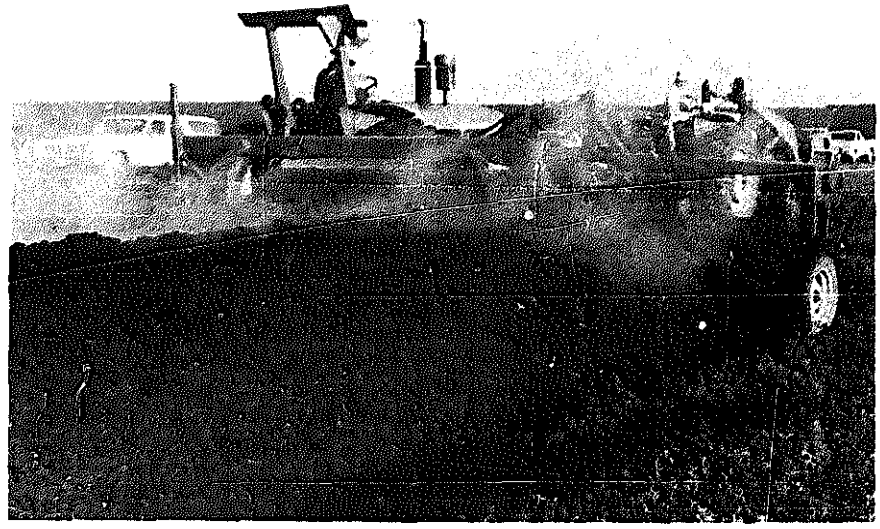
Manufactured by:
Eagle Crusher Co., Inc.
Rt. 2, Box 72
Galion, OH 44833

### The Easy Over Composter

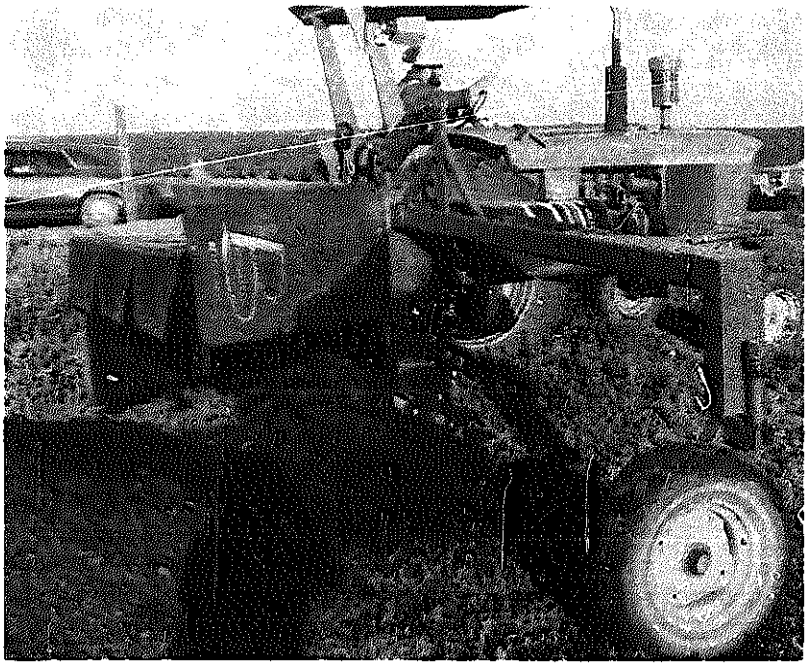
Another composting machine was developed by the late Elton Schaeffer of Menno, South Dakota "out of his own necessity." The machine has knives similar to those of a garden tiller, for lifting material up and back into the windrow. One-half of a compost windrow is taken with each pass of the machine, compared to the full windrow taken by larger machines. The operation, according to Schaeffer, is best accomplished with a hydrostatic-drive tractor for slower ground speed.

Schaeffer's machine now has the commercial name of Easy Over, and is distributed by:

General Corp.
322 S. 16th St.
Philadelphia, PA 19102



*The compost turning machine used on the Elton Schaeffer farm at Menno, S.D., for composting manures brought to the farm from the local livestock sales barn.*



*Schaeffer's composting machine has tines similar to those of a garden tiller, to lift material up and back into the windrow.*

**Accelerator Compost Bin**

This 34 by 36 inch circular bin is made up of green, rigid, polyvinyl chloride interlocking and sliding panels. Waste is added through the top of the bin which has an inflatable cover to repel rain. Ventilating holes in the panels allow for ventilation while helping to hold in heat and insulate.

Rotocrop (U.S.A.) Inc.
P.O. Box 237, 58 Buttonwood St.
New Hope, PA 18938

## SHREDDERS

Today's shredder-grinders are better than they've ever been—thanks largely to 20 years of organic gardening experience contributed and shared by a multitude of backyard growers. They're also more available in greater variety—some larger and more powerful, and some more compact—but all are designed to do a specific gardening job better.

The type of shredder you buy should depend on the kind of gardening operation you run, the size of your place, and the kind of organic materials you're going to feed through it. A good shredder will handle all kinds of garden wastes and residues without clogging, and it should be easy to move around, which means you can take the tool to the work—to the compost pile, the garden row, or the pile of wood chips that were dumped at the end of your driveway.

Today, there are two main types of shredders: the low center of gravity shredder-bagger with its big-mouth hopper, and the classic stand-up shredder-grinder designed to handle a greater volume and variety of materials.

Many combinations of accessories and functions are now available in one machine. The once-reluctant gas engine has been made a lot more dependable and easier to start. You can also find electric-powered shredders which are a lot quieter, easier to start, and also free of fumes. But they have to stay closer to the house and there is always the danger of playing around with electricity outdoors on the damp ground.

Many shredders, both low-profile baggers and the bigger grinders, are equipped with a chipping fixture which is usually a rotating knife that operates through a side slot and can

*To keep a shredder from clogging, it's sometimes best to remove the screen, especially when shredding wet, soggy leaves.*

handle branches up to two or even three inches thick. The MacKissic, Roto-Hoe and Lindig machines are three models with this feature.

Then there are the shredder accessories or attachments that fit onto a small riding tractor or a walking power unit that also functions as a rotary tiller, a mower, a chipper, a snowblower, or even a dozer blade.

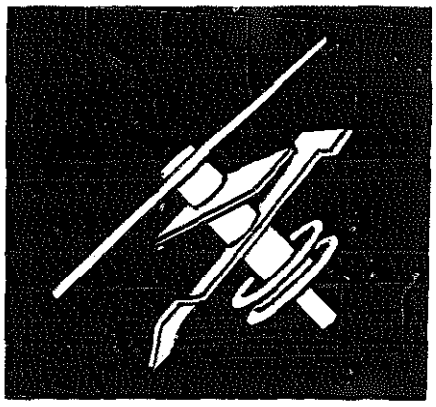
Overloading any machine will result in jamming and stalling it. This especially holds true for the shredder whose job it is to chop up fibrous, damp, or wet materials and then eject them through a screen or grid. We recommend working with as large a screen as possible—the 1¾ inch screen on the Lindig is excellent. Gilson, W-W, and Roto-Hoe offer a grating of rods or square roller bars which seem almost jam-proof. Another solution to the problem is the Winona's "wet mat rack" which encloses only half the shredding chamber.

If you're shredding with very wet, soggy, and rubbery leaves, here's a sure way to eliminate frustration and loss of time—remove the screen. Without it, the action of the cutters chops the leaves into a satisfactory aggregate which can be used either for compost or mulch. If you're working with a shredder-bagger, you may find it speeds up the task to remove the bag. You'll also find it's a good idea to deposit the aggregate immediately in the compost pile or the planting row.

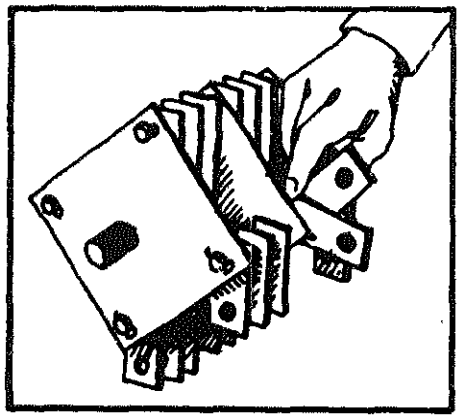
You may also find that a clutch, either centrifugal which depends upon the speed of the motor to actuate it, or one that is manually operated, helps avoid jams. This calls for alert operation of the machine, but it can save a lot of time spent clearing out the inside of your shredder.

Check the wheels on the shredders you are considering. They should have at least a pair, rugged and rubber-tired, and placed so they will comfortably and safely support the machine when you move it. Some of the larger models

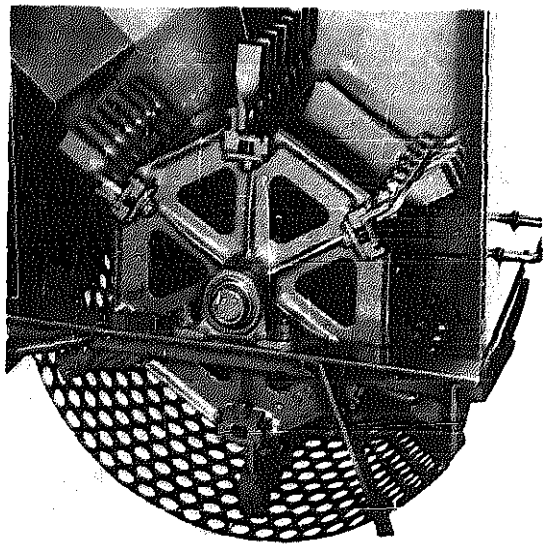
## FOUR TYPES OF CUTTING MECHANISMS



*Three-Cutter Rotary System*

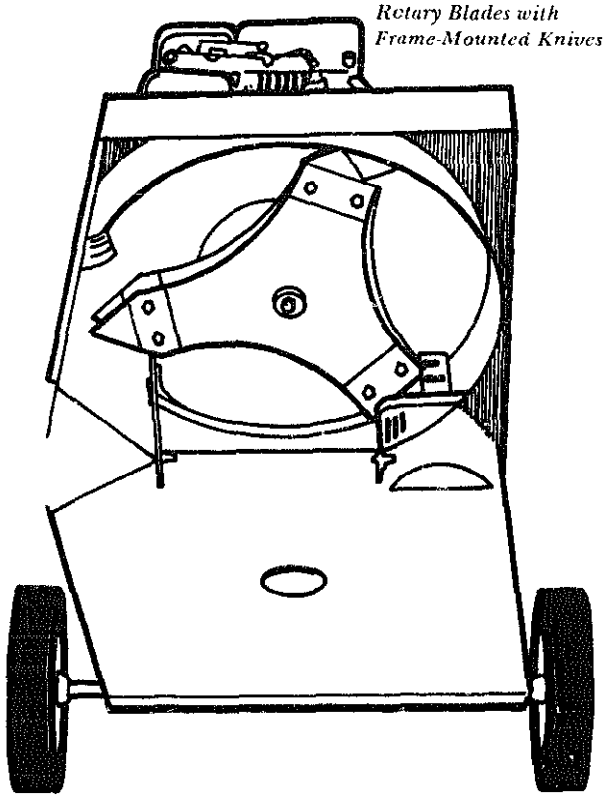


*Hammer mill Unit*



*Rigidly Mounted Knives on Horizontal Shaft*

*Rotary Blades with Frame-Mounted Knives*



*Rotary blades that whirl through stationary knives mounted on the frame chop and fling the mass of particles out the side vent.*

*Another time-tested system is a series of knives rigidly mounted in a revolving horizontal shaft. The fabble plates and a screen tend to hold the material against the cutting action of the blades.*

come with three wheels, and some with four. Make sure the machine you are thinking of buying handles easily and comfortably.

One of the most sensible gardening arrangements we've ever seen was at the Golden Acres Farm in lower Bucks County, Pennsylvania, where a double track of sturdy rails was erected over and along a series of compost bins. A king-sized shredder was mounted on the rails and traveled from bin to bin, depositing its aggregate as it went.

There are three or four basic systems for reducing and mixing your organic wastes. Hammer mill tempered steel flails revolve freely on a rotating shaft, and so have the ability to absorb shocks from hitting stones. There also seems to be a minimum of blockage in the mixing chamber caused by wet materials. Sets of hardened steel teeth or knives, fixed rigidly on a revolving shaft, work in combination with interior baffle plates and the bottom screen, which tend to keep the material in contact with the knives. The smaller shredder-bagger machines work with a series of two or three rotary blades similar to a lawn mower's. In some models, these whirling knives pass between stationary cutters that are part of the frame or chassis to achieve more complete cutting. The turbulence created by the rotary blades also whirls the aggregate out through the vent, which permits you to deposit it right where it is needed—either in the compost pile or in the planting row.

Any matter that is organic and compostable can be reduced to a workable aggregate or mass in your shredder. You will find that there is plenty of material on your home grounds to keep your shredder and you busy for a series of weekends, particularly in the late summer and fall. There are the weeds, the grass clippings, the crop residues, and the leaves. Add to these local benefits the contents of your garbage pail; it combines well with just about anything.

Next, there are the wood chips from the local road department, sawdust from the neighborhood lumberyard, and corncobs from the nearest feedmill (if you can get them ground). All of these varieties of celluiose are fine for mixing with the garbage. Working with unground corn cobs, though, can be tricky. The tough cobs have a habit of flying back up out of the hopper, right at your head. Some gardeners have reported that a thorough soaking (up to a week) of the cobs softens them and makes shredding easier.

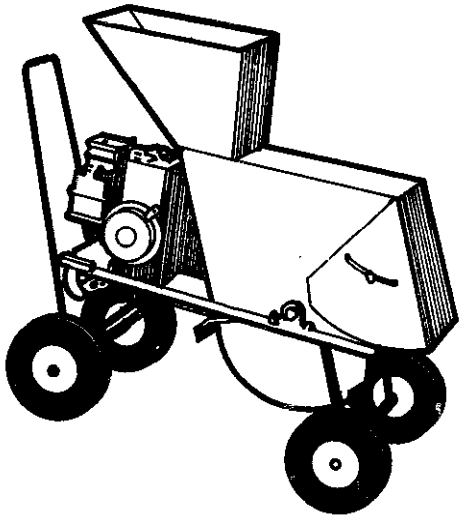
No garden chore is easier or pleasanter than shredding dry, autumn leaves. But if your leaves have wintered over and are tough, wet, and rubbery, feed them into the shredder in very small handfulls which are followed by dry sawdust, and again, be prepared to work without a screen.

## TYPES OF SHREDDERS AVAILABLE

Think over your shredding needs carefully before you begin to shop for a machine. There are many different shredders on the market today, and rather than trying to list them all, we've decided to describe the basic types available and give some examples of each type. Keep in mind that models change from year to year, and be sure to investigate all the features of the models you're considering.

### Large Shredder-Grinders

Most of the shredders in this group comprise the classics of the industry—the Amerind-MacKissic, Gilson, Lindig, and W-W. To them should be added the Royer, the Ariens, the Roto-Hoe, the Hahn-Eclipse and the Winona, all of which feature the larger machine in their wide-ranging lines.



*Four-Wheel Shredder-Grinder*

In general, these shredder-grinders are designed for the 1- to 5-acre place in the country, although you may be perfectly happy with one of these bigger machines on your suburban ½ acre. You'll find that they can handle a greater diversity of materials than the shredder-baggers and also a greater volume. And, thanks to their rugged framework and wheels, it's a lot easier than you would think to roll them out into the garden or up to the compost pile. It's also good to be able to report that shredders last for years with very minor repairs (made easily by the local dealer), so their cost can be amortized over quite a period.

Amerind-MacKissic Model 12-P is a 6 h.p. combination log chipper and shredder-grinder. In addition to handling conventional organic composting materials including corncobs, it reduces logs up to 3 inches to wood chips. Model 9-P is powered by a 4 or 5 h.p. engine and works through a series of 24 free-swinging knives. Power take-off units are available for many popular small estate tractors.

The 6 h.p. Gilson Chopper features nine, square, rotating cutter bars instead of a screen, which are ideal when you're grinding wet, soggy, fibrous materials. Cutting action comes from three sets of rotating double-edged knives—12 cutting surfaces. The gravity-feed hopper is king-sized—almost 17 by 17. The Chopper is belt-driven with an idler clutch.

The Lindig Concho is also available with an electric motor or a 5 or 7 h.p. engine. It offers a wide range of grinding screens from ¼ inch to 1¾ inch. A side-vented brush and wood chopper feed directly into the mixing chamber. The cutting and shredding unit is a series of free-swinging hammers. The steel frame is supported by three wheels, one up front which pivots plus two in the rear.

The 8 h.p. Roto-Hoe Cut'n Shred heavy-duty shredder-mulcher includes a side-feed which leads directly to three knives passing by a hardened block. We have used this feature to shred long, tough corn stalks, and found it did a good job. Built of 12-gauge steel, the frame sits on four wheels and has a long tow handle for easy mobility. The steel bar grate is wide-spaced to reduce jamming.

The Royer 8 is a specially designed machine whose endless shredding belt is lined with tempered steel cleats mounted in rows. Models 8, 10, and 12 are electric or gas powered with a capacity that ranges from 5 to 12 cubic yards per hour of soil, peat, and other organic materials. Many municipalities use the larger models for shredding prior to composting them. This is a well-made machine designed for blending, potting, and soil compost mixes.

In addition to a conventional screen, the W-W Model 62-G offers a grating of six rods and rollers for use when shredding wet materials.

*The Royer Shredder*

Powered by a 5 h.p. engine, it works through a series of tempered, hammer mill flails and can handle all conventional organic materials up to 1½ inch tree trimmings, small bones, phosphate rock, tin cans, and bottles. Optional grinding screens handle corn, wheat, or milo.

The Winona Model JR-AW comes mounted on four wheels, but Model JR-S can be mounted on a garden tractor or over the compost pit. The Winonas are electric or gas driven and have changeable racks including a wet mat rack for gummy materials which is a short screen covering only half the mixing chamber. Powered by a 2 h.p. engine, it works through a cutting unit comprising 16 hinged knives.

**Lickity Chipster**

The Chipster has an 8 h.p. gasoline-powered feed roll, a clutch to disengage the feed roll, a hammer mill-type rotor, shredding screen, and chip direction head. There are two wheels for convenience in moving, but the Chipster is not to be hauled as a trailer. The brush feed chute is 16 inches wide and 13 inches long with an opening to the rotor that permits feeding branches up to 2 inches in diameter. The self-feeding roller, located at the end of the chute, feeds the branch into the hammer mill-type rotor where it is shredded, screened, and dropped on the ground in front of the Chipster. If the dynamically balanced, hammer mill rotor should become overloaded, the powered feed roll will automatically stop until the overload has been cleared and then will automatically start again. Weight: 215 pounds.

**Lickity Chipper Model PTO-5**

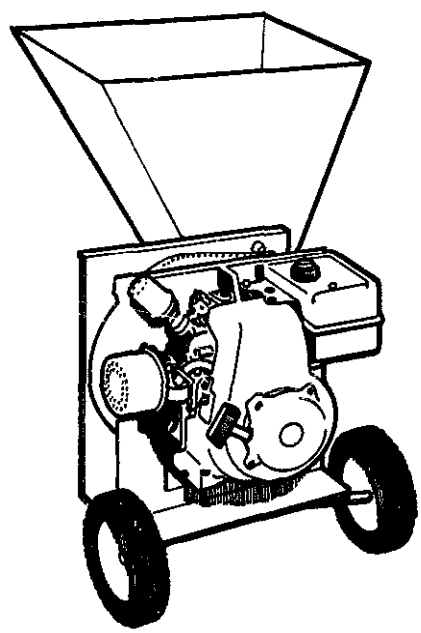
The Brush Chipper utilizes the power take-off of a tractor. The PTO model is equipped with wheels, tires, and tubes as standard equipment. It can be towed to the job at normal highway speeds behind any vehicle. The feed chute can be folded up and the blower discharge chute adjusted to make towing easier. The PTO model is equipped with a pin-type hitch coupler. The hammer mill rotor handles limbs up to 5 inches in diameter at a rate of 50 feet per minute.

A.M. Leonard & Son, Inc.
P.O. Box 816
Piqua, OH 45356

**Diadem Brush Chipper**

The Diadem Chipper will handle up to 3 inch diameter limbs. Brush self-feeds through the chipper and is converted into small chips in just a few seconds. Small brush can be processed in bundles at a time. It is constructed of heavy-duty plate steel with a 6 gauge (5 mm.) engine deck and a solid cylinder rotor. Imbedded in the solid rotor are two 0.4 inch thick cutting knives of specially hardened chrome vanadium steel. The wheeled Diadem is 30 inches wide; it can be taken anywhere for on-the-job brush disposal. All tires are fully pneumatic. You can choose from a three-point hitch PTO and 8, 10, and 12 h.p. models.

Vandermolen Corp.
119 Dorsa Ave.
Livingston, NJ 07039



*Top-Vented Shredder-Bagger*

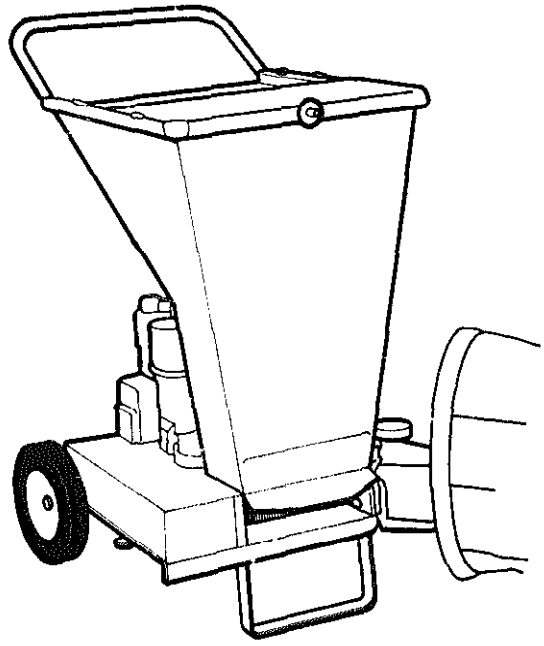
**Top-Vented Shredder-Baggers**

A top-vented, compact shredder-bagger will throw a stream of chopped aggregate into the garden or compost pile. The Hahn 3½ h.p. Mighty Compact and International Harvester 35P are in many ways identical. They are low-

profile, with wide-mouth, gravity-feed hoppers and a pair of wide-set, rubber-tired wheels for extra stability plus mobility. Both models feature hammer mill cutters and optional baggers.

Free-swinging, hardened steel hammers, a large feed hopper, and an adjustable discharge chute are built into the low center of gravity-feed McDonough Snapper. Model 30-S has been designed to handle leaves, bush trimmings, tree prunings up to ½ inch thick, and cornstalks. It is powered by a 3 h.p. engine with centrifugal clutch and belt drive.

A large (22 inches wide) drop chute for raking in leaves and other lawn debris plus a side-mounted chipping opening for branches are features of three top-vented shredder-baggers that are almost identical in design. They are the Columbia Model 654-4, the Jacobsen No. 50080, and the MTD No. 244-650. Powered by a 5 h.p. engine, each machine features a three-stage cutting action consisting of a single, flat reversible blade, nine flail knives, and four cutting fingers. In addition to the novel drop chute, these shredders each have extra-wide hoppers.



*Bottom-Vented Shredder-Bagger*

**Bottom-Vented Shredder-Baggers**

The Atlas, Cross, Kees, Roper, and Sensation models, while more or less identical in appearance—wide, low-set hoppers, each with a set of sturdy wheels, and engines mounted directly over the cutting units—are somewhat different in the features they offer.

The 5 h.p. Atlas does its cutting with three steel blades plus eight shear bars which permit it to cut wood up to 1 inch thick. Blade drive is direct from the engine. A poker rod has been built into the hopper for breaking up twigs and vines.

Cross shredders come in two models, the 3½ h.p. 4365, and the 5 h.p. 4650. Both shredders deposit chopped material in a bag and feature a sweep-in hopper that makes lawn cleanup easy. Power goes direct from the engines into the double-bladed rotary cutters.

The Kees Kom-Pak also has a rake-in hopper, an optional extra. Its steel cutting blades will handle wood up to 1 inch on the 5 h.p. model or ¾ inch for the 3½ h.p. Three bags are packed with each machine.

The 3½ h.p. Roper works with two high-speed blades to chop up leaves, twigs, and vines. It is worth noting that the accompanying Roper photos show it handling corncobs. The 6 h.p. model depends on triple cutting blades plus breaker bars in the chopping chamber. There is a fixed steel deflector on the discharge chute for directional control of the shredded matter. Bags are also available.

Power in the Sensation Eager Beaver goes directly from the engine to the double set of reversible blades without belts or chains; a safety clutch has been designed to protect the engine against shocks. The Eager Beaver dismantles easily for transport by car, thanks to large-diameter hand knobs.

The Sears 8 h.p. Super-Shredder resembles a rotary mower with its engine mounted directly over the three high-speed cutting blades. Shredded particles—leaves, vines, twigs, and garden debris—are vented at the bottom in a bag. The wide-mouthed but shallow hopper may be lowered for raking and sweeping in of lawn debris. Five bags are included.

The Toro comes in two models, 3½ and 5 h.p. Each features a big, slanting, gravity-feed

hopper with a pusher rod to handle the material. The engine sits directly over the cutter blades--two in the smaller model and three in the larger—which work in conjunction with the shredding bars at the bottom vent. An optional bagging kit is available.

# MULCHING

Mulching is an important technique employed by the organic farmer for maintaining weed control, retaining of soil moisture, and increasing the amount of organic matter or humus present, hence improving the soil's tilth. Specially adapted lawn mowers are good for chopping grasses and weeds for mulch on a small scale. But we know of only one source of equipment for applying mulch on a serious scale.

## SOURCES OF MULCHING EQUIPMENT

**Rotary Mulching Mower**

Manufactured by:
FMC Corp., Outdoor Power Equipment Div.
215 S. Park St.
Port Washington, WI 53074

**Rotary Mulching Mower Conversion Plans**

Plans for converting a lawn mower are available from:
Dorsay Poor Man's Catalog 3
240 Kinderkamack Rd.
Oradell, NJ 07649

Wayne Peters
Rt 2
Meadville, PA 16335

**Rotary Mulching Mower Conversion Parts**

The parts needed to convert a lawn mower are available from:
Better Life Enterprises, Inc.
1462 John St.
Whiting, IN 46394

**Friday Straw Spreader**

Originally designed for strawberry culture, the Friday Straw Spreader has the potential of being an important tool for the organic farm. Lack of mechanization for the mulch-spreading process has discouraged many organic farmers from utilizing mulch to its fullest potential. The 36 by 100 inch straw spreader mounts on a trailer or wagon and is powered by a crank start, 18 h.p., two-cycle engine (electric start optional). It can be adjusted to mulch on or between rows at a rate of about 1 acre per hour, governed by tractor speed. A hydraulic drive option utilizing a tractor hydraulic system or PTO pump can be provided. Shipping weight: 640 pounds.

Friday Tractor Co., Inc.
Hartford, MI 49057

## SLUDGE

*While supplying the farmer with a source* of plant food, applying organic wastes to the soil in the form of sludge offers a solution to the problem of finding an outlet for human waste products. Special equipment to pump, store, transport, and apply sludge to farm lands is in the early stages of development as the technique slowly gains credibility as a multipurpose solution to land fertility and waste disposal problems.

# EQUIPMENT FOR INCORPORATING SEWAGE SLUDGE AND ANIMAL MANURES INTO THE SOIL

by Charles H. Reed

Professor of Agricultural Engineering, Rutgers University, New Brunswick, New Jersey

For centuries, man has applied animal manures and human sewage to the soil to improve crop production. The principal technique was to spread it on the land and then work it into the soil.

With the expanding population, depletion of our natural resources, and intolerable pollution of the atmosphere and hydrosphere, there is an urgent need for techniques to recycle biodegradable wastes into the upper horizon of the soil where they are degraded and utilized, resulting in a beneficial effect upon the environment.[1] Bohn and Cauthorn state, "In summary, compared to air and water, the soil has a vastly greater potential for waste disposal and transformation . . . and it has the capacity to absorb far more material than it can produce or than is added to it."[2]

The incorporation of wastes directly into the soil is superior to surface spreading because there are no odors, no opportunity for flies or other pests to feed or breed, no runoff or surface erosion of wastes, and the wastes are placed in the best possible media for immediate degradation to plant nutrients and utilization by plants. These techniques conform to the concept of land treatment as defined by Stevens et al.:[3]

> Land treatment is any of several methods of waste water treatment and sludge application which consider the qualities of land, waste water, and sludge in the design of facilities. Land treatment conveys the reciprocal, beneficial relationship between the land and the waste. Most such facilities are designed to produce valuable end products, such as green crops and pure effluent as a result of the treatment processes.
>
> Land treatment differs from land disposal, a term used to describe any method which applies sewage, raw or treated, to the earth; and land application, a term used by EPA [Environmental Protection Agency] to describe all methods of waste water disposal associated with the ground, that is, sewage farms, land treatment, septic systems, and underground disposal.

The design of an effective land treatment system and the selection of appropriate equipment necessitates the consideration of many factors, some of which are outlined below:

1. Wastes to be incorporated into soil:
   - Kind and previous treatments.
   - Physical and chemical properties, i.e., percent solids (wet basis) and rate of production (daily, weekly).
2. Storage available or required. Transportation.
   - Distance to sites.
   - Mode of.
3. Site characteristics or limitations.
   - Acreage.
   - Topography.
   - Existing vegetation.
   - Soil characteristics.
   - Ground water. (Depth, quality).
   - Location of human habitation. Distance. Prevailing wind.

4. Climatic limitations.
   - Temperature. Duration of frozen soil.
   - Rainfall. Seasonal, normal, and extreme variations.
   - End product desired. Crops to be raised, use of land, etc.

Irrigation of sewage sludge and effluent is receiving considerable attention at this time.[4,5] Only thin slurries with low-solid contents can be irrigated. Because of the high water content (more than 95 percent as it comes from the digesters), conveyance to disposal sites by pipeline may be the only practical transportation system. Storage structures at the sites will be required during periods of sub-freezing temperatures, frozen impervious soil, saturated soil, and other periods of shutdown. Unless thoroughly digested, surface applications of sewage sludge may generate odors and attract flies. Any surface applications are susceptible to surface runoff. There is a possibility of soil clogging and water-logging when sewage sludge is irrigated.[3,6] Also, there may be damage to foliage when large quantities of sludge are repeatedly sprinkled on plants. There will be large power requirements. The aerosol effect may limit high-pressure irrigation on some sites.

Irrigation of effluent containing only dissolved solids can be managed without many of the above disadvantages of sewage sludge, and may be considered for irrigation of crops or ground water recharge when needed. The limiting factor usually is the amount of water which can be added to the soil at different seasons of the year; that is, ice buildup or saturated soil.

Composting is an ancient technique of recycling biodegradable wastes. Modern techniques and equipment have been developed to compost balanced mixtures of biodegradable wastes including sewage sludge, animal manure, and solid wastes. See *Compost Science*, Vol. 13, No. 3, May-June 1972, for information on General Motors' Terex-Cobey Composter. These techniques are relatively expensive and may generate some localized odor. Well-cured compost can be spread on the land without attracting flies, is not as susceptible to surface runoff as is noncomposted waste, and is an excellent soil conditioner. An outstanding advantage of compost is that it can be readily stored in piles at low cost without nuisance until an appropriate time for application in the soil.

Land spreading is the most ancient method of utilizing both human and animal excreta. When plowed or disked immediately after application, it is an effective method of incorporating it into the soil. When large quantities are involved, this may be the most economical, but if not properly treated, it will not be the most sanitary technique.

The ridge-and-furrow technique might be considered a surface method of application unless covered immediately. The furrows can be made on the contour or slightly sloping to permit the water to filter into the soil. Ridge-and-furrows on the contour have been used experimentally at the New Jersey Agricultural Experiment Station as a low-cost winter storage. Aerobic conditions should be maintained in and at the bottom of the furrow.

Equipment has been developed which will incorporate wastes directly into the soil, either in one or two operations by Sub-Sod-Injection or Plow-Furrow-Cover.

Sub-Sod-Injection (SSI) equipment is available which will inject any slurries that will flow by gravity or under pressure through a six inch diameter hose two feet long. Animal manures with up to 20 percent solids and sewage sludge with up to 10 percent solids can be injected by gravity into the soil at the rate of 400 gallons per minute in a band up to two inches thick and 28 inches wide and from six to eight inches beneath the surface without turning over the soil. The injector has a standard category two, three-point hitch with a spring-trip release for passing over subsurface objects. It is comparable to a two-bottom plow in weight and durability. This equipment is not yet available commercially, but can be assembled from existing components.

The Plow-Furrow-Cover (PFC) method is the most adaptable of any of the previously mentioned techniques. Equipment is available, or can be assembled from manufactured components, to incorporate directly into the upper eight inches of the soil up to 300 tons per acre of biodegradable wastes, ranging from thin slurries (septic tank pumpouts) to semisolids (sewage cake). PFC leaves the soil plowed and

ready for disking and seeding. Two types of equipment will be described for PFC: one for 25 percent solids or less, and the other for greater than 25 percent solids.

One of the two recently developed pieces of equipment was assembled by Agway, Inc., of Syracuse, New York. The first one was used at the University of Connecticut in a research demonstration project to study the effect of incorporating septic tank pumpouts into the soil. In this project more than 100,000 gallons of slurry were incorporated into the soil in two months. The capacity of the tank is 800 gallons. A nine inch auger with ample hydraulic power from an auxiliary hydraulic pump on the tractor, and 12 inch as well as six inch valve openings will unload much heavier solids than would the previous prototypes. The highest limit of solids content which it will unload has not yet been determined. This equipment will not unload low-moisture sewage cake, semisolid animal manures with bedding, or caked poultry manure reinforced with feathers. A gooseneck tongue is built permanently into the tank to provide easy maneuverability of either a 16 inch single-bottom moldboard plow or a sub-sod-injector which is mounted on the three-point hitch of the tractor.

A second unit, constructed in 1973, is identical, except that it has a capacity of 1,500 gallons, a nine inch ribbon auger, and a slurry spreader on the rear. This unit has not yet been field-tested. The augers, valves, and spreader are powered by the hydraulic system on the tractor.

To plow-furrow-cover, a 16 inch single-bottom moldboard plow is mounted on the three-point hitch of a standard farm tractor. A slurry with up to 25 percent solids can be deposited into a six to eight inch deep plowed furrow. Immediately after deposition, and in the same operation, the plow covers the waste and opens the next furrow. With properly adjusted equipment, one and one-half to two inches of slurry can be completely covered. This is approximately 170 to 225 tons of slurry per acre. A well-formed furrow, 16 inches wide, seven to eight inches deep and 400 feet long with one and one-half inches of slurry, contains 500 gallons, or approximately two tons. PFC leaves the soil well plowed and ready for disking and seeding. The equipment has been designed to operate at three miles per hour and unload up to 200 gallons of slurry per minute. The axle of the trailer is adjustable so that the trailer is offset, permitting the right rear trailer wheel to travel in the newly formed clean furrow.

A combination transport and field unit was assembled by a tank on a four-wheel-drive, 1½-ton truck chassis with flotation tires. It is equipped with a hydraulic pump, controls, and a category two, three-point hitch. The tank has a capacity of 500 gallons. With a 12 inch ribbon auger in the bottom of the tank and a 12 inch diameter valve, semisolid animal manures with up to 30 percent solids, and sewage sludge with up to 20 percent solids have been unloaded. Because the hydraulic power is limited, the full performance capabilities of the 12 inch auger have not been determined. A spreader can be installed on the rear for land spreading.

A ridge-and-furrow opener can be mounted on the three-point hitch of the tractor or mounted on the tongue of the trailer. This consists of right-hand and left-hand moldboard plows bolted together on the same trip-release beam. The 12 inch opening in the center of the trailer tank permits a high-capacity application of semisolids into the furrow. Presently the furrows are closed or covered in a second operation.

The best equipment field-tested to date at the New Jersey Experiment Station, for unloading semisolids and cake with more than 25 percent solids, is a New Idea Flail Spreader. It can be adjusted for a wide range of surface applications, which are plowed under in a second operation. A conveyor similar to the one on a forage wagon is being adapted to this spreader to convey the waste into a furrow for PFC.

International Harvester sells an attachment to convert one of their heavy-duty manure spreaders into a self-unloading forage wagon. At this time it has not been demonstrated for unloading a gummy, sticky semisolid into a furrow.

There should be no difficulty to adapt either of these pieces of equipment to PFC for either one or two operations. Plans are underway at the New Jersey Agricultural Experiment Station to make these adaptations.

There are outstanding advantages in handling dewatered sludge with a solids content of 15 percent or greater.

1. As solids content increases, volume and weight decrease. For example, to inject one ton of solids in a 5 percent solution, 20 tons of slurry must be handled; for one ton of solids in a 15 percent solution, 6⅔ tons; and only 3⅓ tons if a semisolid with 30 percent solids, dry-weight basis.
2. It can be stored in contoured furrows or piles on well-drained sites to be incorporated into the soil when weather and soil conditions are optimum.
3. It can be transported in regular dump trucks without leakage on the highway.
4. Sludge with a solids content of 15 percent represents the minimum solids content which can be incorporated into the soil by PFC at the rate of 40 tons dry-weight equivalent per acre in one application: that is, 2.27 inches of depth in the furrow can be completely covered. Greater rates of application can be achieved in one operation if the sludge contains less moisture and more solids, and also because greater depths can be covered in the furrow. This rate of application represents the performance capabilities of the equipment and not necessarily the optimum or safe amount which the soil can tie up, degrade, and recycle. Smaller quantities can be applied.

In order to utilize the continuous output of sewage treatment plants, daily PFC applications at the desired annual rate may be made in contiguous strips or furrows, resulting in the entire plot receiving the total annual treatment. At any time when there is sufficient area of contiguous strips of plowed ground, it may be disked and seeded to the crop appropriate for that particular season. After some forage crops, that is, hybrid Bermuda grass, have been established, one or two applications can be made annually by PFC or SSI without replanting. For maximum recycling and utilization of nutrients from the sludge, crops should be raised on and harvested from the treated sites when mature or at the end of the period of their maximum assimilation. Numerous crop management plans and rotations are possible, depending upon the sites and the end product desired.

## SOURCES OF EQUIPMENT TO ADD ORGANIC MATERIAL TO THE SOIL

### Big Wheels

Big Wheels is a 1,600-gallon tank truck used for distributing sludge in either surface or subsurface applications. It is not built for road transport; it must be used in conjunction with sludge transport systems. For surface application, sludge is sprayed from the rear of the truck. For subsurface application, soil-slicing coulters precede chisel-plowing tines to cut a narrow path for application hoses. Injection is possible at adjustable depths usually between 6 and 9 inches. Furrow coverers are available but are usually unnecessary.

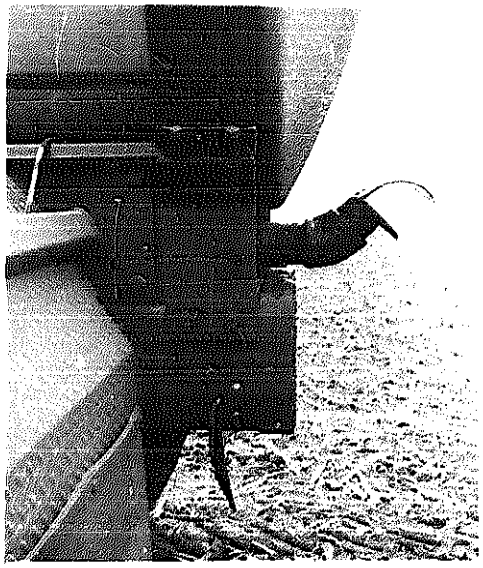
*Sludge leaving the outlet under pressure hits the deflecting cover . . .*



*. . . and sprays a wide pattern behind the truck for surface application.*

**DTS-100 Stationary Manure Pump Unit**

This is a stationary unit comprising the HSP-100 electrically driven screw pump as well as the delivery pipe with three-way valve and mixing nozzle. It is mounted on a supporting rail made of channel sections which should be fixed permanently at the place of pump installation. It is possible to mix the manure in tanks, to pump it over from initial tanks to main tanks, to pump over from the tank to the water cars, and to deliver from the tank directly to the sprinkling system, when the area to be sprinkled is nearby the farm. The unit can be used with even very dense liquids for which no other pump can find application. The stationary unit is best suited for large pumping jobs.

# -10- Woodlot and Orchard Management

## TOOLS FOR THE WOODLOT*

by Jim Ritchie

For most homestead timbering purposes, you will need to make a small investment in tools: a lightweight chain saw or bow saw, an axe, at least two steel wedges for splitting logs and rails, and a sledge to drive the wedges. You may prefer a splitting hammer: a sledge with a hammer face on one side and a wedge-shaped splitting blade on the other; once you get the hang of using it, this tool can speed up timber chores.

You may also find a use for a machete, brush hook, grub hoe, mattock, power circular saw, and bucksaw. Other, more specialized tools and equipment are occasionally called in for particular jobs around the homestead, but unless you use a specialized piece of equipment enough to justify the investment, you may want to borrow or rent, rather than buy.

*Handling wood with a peavy.*

* Reprinted from *Trees for the Yard, Orchard, and Woodlot,* edited by Roger B. Yepsen, Jr. Rodale Press, 1976.

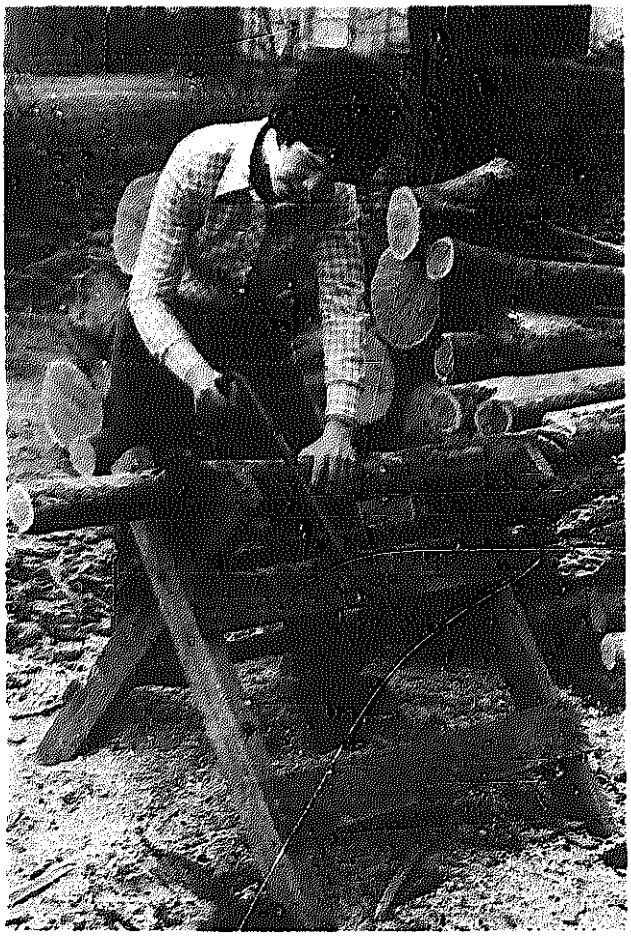
All woodcutting tools should be kept sharp and out of the rain. Well-maintained equipment is not only easier to work with, but safer as well. A sledge or axe that is loose on the handle is a hazard both to the operator and to fellow workers or bystanders. A dull axe blade may bounce or glance off the log and into a human limb.

## SAWS

For most homestead work a lightweight chain saw with a 14 or 16 inch cutter bar is sufficient. You can buy heavier, more powerful models if you need to do a lot of heavy work. But by notching and undercutting with smaller saws, you can fell trees up to three feet in diameter. If you've never operated a chain saw, try out two or three different models and sizes. Also, consider the availability of parts and service before you buy.

Chain saws aren't for everybody. Many people object to the cash investment, the stink or the noise, or the gas and oil consumed. You may prefer to work with a crosscut saw—either the two-man variety (if you have a steady helper) or a one-man saw. The rhythmic sound of a crosscut has a soothing quality, something that certainly cannot be said of a chain saw.

Two-man saws are typically six to seven feet long and have cutting teeth alternated with drag teeth to remove sawdust from the saw kerf (or slot). These saws are made of high-quality steel and are too limber and springy for handy operation by one man. However, it is possible to use a two-man saw by



*The proper stance at a sawhorse.*

yourself if you remove the handle from one end and support that end of the saw with a slender, limber stick cut to just the right length. Poke the stick into the ground at the midpoint of the saw's travel, on the opposite side of the log (or tree) from the sawyer, and tie the upper end of the stick to the saw where the handle was removed. The stick then supports the saw so the blade doesn't flop and wobble. It's not as handy as a sawing partner, but it works.

One-man crosscut saws are shorter, about five feet in length, and are made of heavier metal than two-man crosscuts. They are not as likely to buckle when pushed and pulled from one end.

Because of the chain saws's great popularity, manual crosscut saws have all but disappeared from some areas—even in regions of heavy timbering. And, as with most steel products, prices have climbed rapidly in the past few years. To find a used saw, check classified ads in local newspapers and visit a few farm sales. (Often you can also find reasonably priced axes, sledges, wedges, files, and other timber equipment at these sales.)

For lighter work, a bow saw or bucksaw is more convenient than a crosscut. These have two- or three-foot saw blades stretched in a metal or wooden frame, hacksaw fashion. They're ideal for bucking off cordwood cuts, limbing, and other light timber work and can be used to fell smaller trees. They also come in handy for pruning fruit and ornamentals.

With all saws, power or manual, the condition of the cutting teeth has a big influence on the condition of the sawyer at the end of a day's work. There's an art to filing and setting saw teeth, and no two timbermen file a saw the same way. You'll need a good, clean file—about a number ten bastard flat file for crosscut saws. Chainsaw chains have teeth of various sizes, so you'll need to buy a file to fit your particular saw. Bow saw blades can be easily replaced.

You'll also need gauges to show the length and set of the saw teeth. (Turn the saw teeth up and sight lengthwise along the blade or chain; the angle of the cutting teeth from the plane of the saw blade is called the set.) For cutting fibrous wood, such as green oak or hickory, you'll need to set a greater angle than normal into the saw's teeth.

*Older circular saws, like this PTO-run model, often appear at farm sales and auctions.*

For clearing brush and small trees from land to be cultivated, a wheel-mounted circular power saw can come in handy, particularly if you're clearing large areas. These saws are fast and effective in cutting top growth. Some models are self-propelled but shouldn't be used on steep slopes.

## AXES

A good single- or double-bitted axe is a necessary homestead tool. Keep the blade sharp on the job with a small pocket whetstone.

Some woodsmen prefer to use a double-bitted axe, with one blade honed sharp and the other allowed to dull slightly; the dull blade serves well for grubbing out roots and cutting off sprouts below ground level, while the sharp blade is never used for such rough work.

Leaving one blade slightly dulled gives a measure of protection when chopping among limbs that might catch the axe and divert your swing. If the axe glances into your leg or foot (an occurrence to be avoided at all costs) at least you have an even chance that the dull blade will make contact.

# HOMESTEAD USES OF TIMBER

A homestead woodlot can provide shelter, fuel, tools, equipment, and outbuildings—depending on the size of the woods, the kind of trees grown, and the imagination and skill of the landowner.

## FIREWOOD

Trees are most often cut for burning. Even if you cut timber for other purposes, you'll find that much of your firewood supply—perhaps all of it—can come from the leftover portions of the harvested trees.

Wood varies in heating value with species used and the degree of seasoning. Wood that has been allowed to air-dry for a year or more after cutting has a moisture content of 20 to 25 percent and will burn better and produce more heat per unit of wood than freshly cut, green wood. Also, dried wood does not deposit as much creosote on flue walls, lessening the chance of a chimney fire.

*The best firewood burns steadily but not too quickly, produces a lot of heat for the amount of* wood used, and burns cleanly with little creosote deposit and little ash. The table below gives the heat equivalents of the most common firewood species (based on air-dried wood) as compared with fuel oil. The heat values are given in millions of Btu's (British thermal unit—the amount of heat required to raise the temperature of one pound of water by one degree Fahrenheit) per cord of wood.

Softwoods generally make poor firewood. They burn too quickly, produce relatively little heat, and often give off unpleasant odors. For example, air-dried red pine has but 12.8 million Btu's per cord as compared with 24 million Btu's per cord of white oak.

### HEAT EQUIVALENTS OF WOOD, BY SPECIES

| Wood (1 standard cord) | Available heat of 1 cord of wood (Btu's) | No. 2 fuel oil (gallons) |

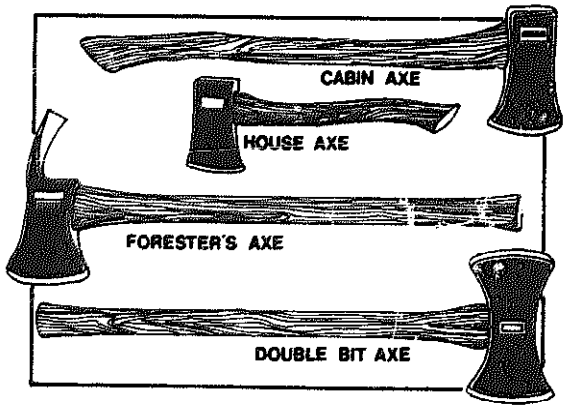
# WHAT TO LOOK FOR IN AN AXE

by Ken Bernsohn

1) Head weight. This varies from a pound and a half on some Hudson Bay or Tomahawk models to over six pounds. Traditional wisdom suggests that the heavier the head, the more effective the axe. There's more weight behind the cutting edge, so gravity can help it on its way. The theory proves out when felling trees, splitting wood, or chopping logs so they'll fit your fireplace. Too light an axe can make you feel ineffective. But that heavy head can also be a hindrance when you're limbing trees, grubbing out saplings, or just turning dead branches into firewood for a campfire. For these uses a 2½ pound head works better, letting you control exactly how the head lands while it's on the way down.



The other obvious aspect of weight is that gravity can help your axe down only after you've hoisted it up against gravity. A six pound axe is a quick way, at first, to hurt yourself more than you hurt the log. If you're going to be using an axe for a living, or intend to build a log home, you might consider one. If you're using your axe, like most of us, as an adjunct to a chain saw, or for both limbing and felling, you'll find a four pound head is far more comfortable to live with, providing enough wallop to go through a log without harming you and enough control to make limbing easy.

2) Head shape. Double-bitted axes reek with the romance of the North Woods. They're also practical because one edge can be razor-sharp for fine work, while the other can be blunter and stand an occasional nick when used for splitting logs or grubbing. However, you do not want one when starting out with an axe. I live in an area where the main industry is logging, and almost every home has an axe, yet I've seen only

three experts use double-edged blades. The droop-nosed Tomahawk is even less popular because of its excessively curved face and bantam weight.

If you're interested only in felling, a very narrow blade is right. An axe intended for a bit of felling, splitting, limbing, and grubbing will probably be best with an edge about 4½ inches from top to bottom.

3) Steel. Some axes have steel so soft you'll have to almost continually sharpen them, touching up in the midst of each tree or log. Others are so tough that you need a grindstone to sharpen them, pausing every minute or less to plunge the axe head into cold water to make sure it keeps its temper. The ideal axe head is between these extremes, soft enough to let you manicure it in the field when it gets a little dull, hard enough that this won't be necessary too often. If your choice is between the two extremes, get the soft one and take along a file and stone.

4) Handle length and style. A handle less than two feet long will cramp you, forcing you to prop up whatever you're chopping on a high platform. You'll also find that the short handle means less power behind each swing. A straight handle makes sense only on a double-bitted axe.

These are the only sure things about length and style. When people made their own handles, each man worked out for himself what was best for him. I find an axe with a 2½ foot handle is usable, and a model that's a yard long is best. But that's probably influenced by the fact that I'm six feet, five inches tall. I also would prefer to have more of a ball end on the bottom of the handle (the foot) to help stop any tendency to slip or twist. But that's me, not you. To find out what suits you, you've got to take each axe off the rack, hold it across your body for feel, and make a few practice swings. Sure, it's a good way to feel a little foolish, swinging at invisible trees in a crowded store on a Saturday. But it's better to feel a little foolish on a Saturday than feel a lot foolish when you go back to get a different axe a few Saturdays later.

## HOW TO SHARPEN YOUR AXE

The odds are that when you buy your axe it will need sharpening. Step 1: Immobilize the head by putting it in a padded vise. If you're outdoors or don't run a workshop, you have two options. One is to lean the head against a stump or something else far more solid and stable than your knee. This is the traditional way, with the blade up, which I used until Gary Champagne saw me using it. He pointed out that, since you file into the edge of the axe, there was nothing to stop me from running my fingers into the edge. Gary's method is to lay the axe flat on a stump or table with just a quarter-inch of edge showing over the side. Now when you file into the blade, your fingers will hit the side of the stump or table before the steel, thanks to the angle you'll be filing at. Step 2: Use a full-size metal file, preferably with a wooden handle,

*When sharpening the axe, use a full-size metal file. Make sure you do not sharpen the edge only, but work back one inch.*

working back from the cutting edge. Make sure you do not just sharpen the edge itself, or you'll end up with a wide V that gets wider with time, making your axe less and less effective. Instead, sharpen a full inch back from the edge so the taper is gradual. Wear gloves. Step 3: Finish off with a whetstone. Trying to do the whole job with a stone will wear your patience thin long before the edge gets that way.

## HOW TO CHOP DOWN A TREE

Put your axe in a safe place and walk around the tree, studying it. Are there any large branches that will cause problems? How thick is the tree? If it's more than 1½ feet in diameter, chopping with an axe will be a workout. Consider borrowing or renting a chain saw if you have several large trees to be removed. Does the tree lean? Most do. The easiest way to fell a tree is to chop so it'll follow its natural bent. If the tree shouldn't fall in the direction it's leaning, you'll have to do extra work.

The best way to change the direction of the fall is to tie a weight to a rope and throw it toward the top of the tree, snagging some branches before the rope falls back to earth. Bring the weighted end around the tree, so you're holding both ends with the tree in the middle of the loop. (This will take a few tries; if the tree is firmly rooted and easy to climb, like most apple trees, consider using your feet instead of your pitching arm to get the rope in place.) Now tie one end of the rope around the base of another tree that's roughly in the direction you want your tree to fall.

Haul on the rope, and you'll find it's easy to sway the tree. Have someone else tie your end onto another tree base so the three trees and the rope make a V, with the point being the one you're cutting. If it's hard to sway the tree, or if the tree's rough, have a few friends help. Do *not* tie the second rope to a truck and use it to pull the treetop! The tree will probably either snap in the middle or pull out by the roots, falling on the truck or on you.

Another, less sure way is recommended only for trees with moderate lean when you want to change the angle of fall less than 45 degrees. Let's assume the tree is leaning south. Chop your first notch, the one that determines the fall, on the west. Make the second cut, the one that actually topples the tree, from the northeast. The tree will twist as you make this cut and fall more toward the west. How much more will depend, of course, on how much it was leaning in the first place. This is faster than the rope trick, but far less precise, as our phone and power companies will attest.

When you go back for your axe, pick it up so your hand is on the handle right against the base of the head. Now you can control it, which you can't if you carry it over your shoulder or swing it by your side. This way there can't be a problem if your dog rushes up or if you trip.

Remember: an axe is more dangerous than a gun. You can unload a gun, but an axe, even one with a leather sheath, is always ready to do damage.

That's why you should look about carefully when you get to where you'll stand while cutting. If there's anything around that might deflect the blade, like low bushes or low branches, clear away the obstruction. Make sure children, advice-giving adults, and animals are well beyond the place where the tree might hit if it falls where you don't want it to. Stand at a right angle to the side where you'll make your first cut, with the axe going in on the east if you want the tree to fall that way (unless you're correcting a twist).

With your right hand at the base of the head, thumb against the metal, left hand at the bottom of the handle, make your first swing, letting your right hand slide as you swing. It should go straight in, waist high. Your second swing goes in higher, cutting down toward the first. How much higher? It depends on how thick the tree is. If you make your blows right on top of each other, as though driving in a nail, your axe will soon get stuck.

By making a wide kerf, as the notch is called, this problem is eliminated. And even when the kerf is six inches wide, a slight twist with your right hand as the axe lands will pop out a broad, flat chip each time to clear a space clean down to your bottom cut. Alternating blows, straight in and down, continue until you're about two-thirds of the way through. This will again vary, depending on the tree. Do not go more than three-fourths of the way

through. You may have a winner of a tree that leans a lot and needs only a one-third cut before the shifting of the top or the sound of a creak tells you you've done more than enough.

Listening for the sounds of the tree and glancing up to see what the top is doing every few swings will help you pace yourself, instead of chopping as though each minute costs you money. High speed only costs you energy.

On a wide tree, work your way across the full diameter, cutting a chip from the far side, then one from the near, then as many as necessary in between to keep your line straight.

When you feel "just a couple more whacks will be enough," stop, walk to the opposite side, looking up while doing so, and start your second cut. On a narrow (six-inch-wide) tree this can be about four inches higher. On one a foot in diameter it should be about eight inches higher. Unless you're cutting sequoias, 1½ feet would be maximum.

The tree will fall before you chop all the way through. So watch and listen as you chop. Pause, lean on the tree a little, long before you've cut enough, just to see if the tree agrees with your judgment.

## HOW TO LIMB A TREE AND LOG IT

When the tree falls, a lot of it will still be in the air. Stand with the tree between you and the first branches you'll be cutting, working from the bottom to the top.

Some people do both felling and limbing holding the axe like a baseball bat. I don't like this method for felling, but for limbing, the baseball or golf club grip works fine. Cut away from your body, working only on the far side of the tree. Then go around to the other side and limb the one you were standing on first.

If you're working with a large tree, you'll reach a point where branches hold the trunk five feet or so into the air. To log into approximate eight-foot lengths, go back to the base.

About eight feet from the bottom step onto the trunk, plant your feet at least 2½ feet apart. Have someone hand you the axe and chop from the side, with the axe going between your legs that are safely out of the way. If you had stayed on the ground chopping from the top down, the tree would eventually bend, making further chopping impossible. Make a deep notch on one side, then turn around and work from the other side. Once again, you should stop before chopping through. Standing with one foot on each half of the trunk when the ends break and the log shifts is not a good idea. After you're two-thirds of the way through, you can continue from the ground with the wide kerfs you've cut, giving your axe room even when the trunk bends at the hinge you've been making. When the tree has had a few of these eight-foot lengths cut out, you'll find the limbs are now easier to reach, and the eight-foot sections you've cut can be moved around to let you get at any branches holding up trunk sections.

## HOW TO SPLIT A LOG INTO FIREWOOD

Wait until you feel tense and frustrated. Then go out and prop up an eight-footer across another, or even across a few so that a two-foot section sticks over the end. Cut it off. A bow saw is the best hand tool for this, since it'll leave you a flat end that's important later. If using an axe, make that first cut straight in and chop toward it, gradually turning the log so each piece you cut has one flat end. Then move the log you cut farther along and do it again and again, until you have a stack of two-foot lengths.

In cutting hardwoods—trees that once had leaves—you'll find the going a lot easier if you cut while the logs are still green. This isn't as important with softwoods, but again it makes the work a little less.

To split the wood, look for cracks in the log. Stand one up on a stump and drive your axe into the biggest crack. Some people pick up the axe and log together at this point. But the log will twist on the axe. The log may fall off the axe onto you. The log may come back with your axe and keep going, as though propelled with a throwing stick on your backswing. Instead, I pry the axe loose, reset the log, and whack into the same spot. Three or four whacks and you'll have most logs in half. Depending on the diameter, you may want to split it again, and possibly again.

If the log is as big around as the potbelly stove, the method you've just read doesn't always work. You may find it best to drive a wedge (which can be a genuine wedge or a battered axe

head you picked up at a junk shop) into the top of the log, using a sledge. Using the back of your good axe for this can stop it from being your good axe, so use the sledge. Then lay the log on its side and use your axe to drive toward the crack the wedge started.

## HOW TO DAISY A LOG

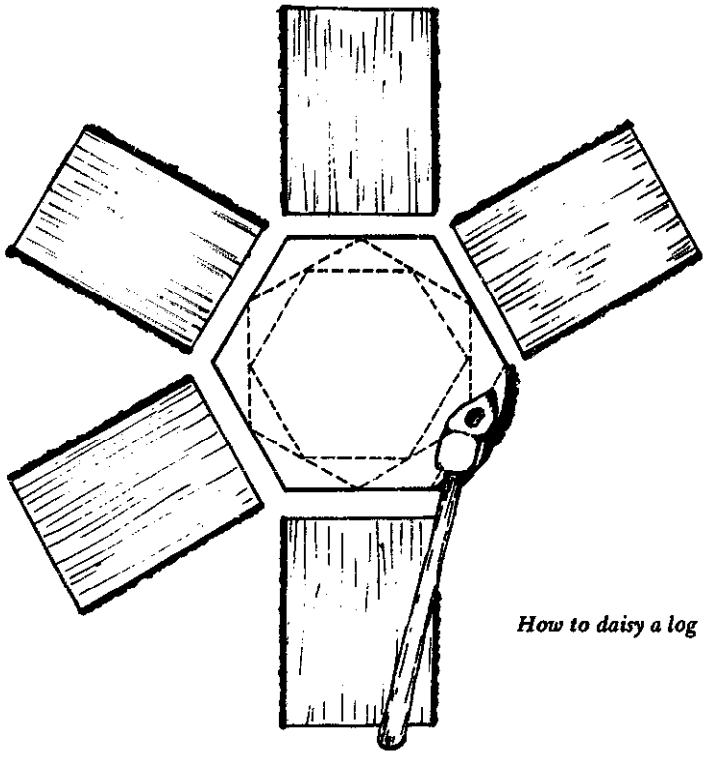
### by Lewis Weeks

When a piece of wood is too large to be halved or quartered with an axe, daisying is called for. To daisy a big hunk of wood efficiently is a pleasing experience both mechanically and aesthetically. As you move around the chunk, backing away from the last cut, you split off a three- or four-inch deep piece from the outside of the chunk. If your cuts are clean, each piece will fall away from the center of the chunk and lie flat on the ground. When a complete circuit has been made, there will be the petals of your daisy, facing out from the center. Pile the petals, and go around again and again until you have reduced your big piece to half or a quarter of its original size.

## STORING YOUR AXE

When you are done using your axe, take a hefty swing at your chopping block and leave the axe imbedded, assuming you'll return the next day. If you won't be chopping for a few days, bring the axe inside, wipe it off with an oily rag, and put it away. Storing it behind a bookcase or workbench will make sure it doesn't cause problems.

This sounds as though using an axe is a lot of work. It is, especially at first, when you forget to wear gloves and raise blisters. But it's satisfying work that you will enjoy in several ways. It removes you from the majority of folks who rely on store-bought logs to fuel their stoves, since in many areas the state forest services have areas open for those who want to cut their own firewood. It gives you a justified sense of self-sufficiency as you gain skill. And it makes your evening fire a matter of pride, something far more enjoyable than it would otherwise be.



*How to daisy a log*

## WOODLOT EQUIPMENT

The following manufacturers and suppliers deal in forestry equipment of all types and sizes. If you are looking for peaveys, cant hooks, grapples, axes, shears, or machetes, try the following:

### Snow and Nealley

Manufacturers of "Our Best" line of forged tools for loggers and lumbermen (pulp hooks, cant dogs, pickaroons, etc.) along with some real specialties—bush hooks, grab hooks, and tell-tale rods.

Snow and Nealley
155 Perry Rd.
Bangor, ME 04401

### Glen-Bel

The Glen-Bel catalog features a full line of hand tools for woods work, including shears (Wiss, Belknap, Cyclone, and Blue Grass), pruning saws, bow saws, pike poles, timber carriers, and all types of axes and hatchets.

Glen-Bel Enterprises
Rt. 5
Crossville, TN 38555

### Tree-Trimming Tools

Stanley offers a good variety of hydraulically operated tree-trimming tools, from pole chain saws and tree pruners to circular saws and weed eaters.

Stanley Hydraulic Tools
13770 S.E. Ambler Rd.
Clackmas, OR 97015

### Friend

The Friend catalog features a full line of hand and power pruning equipment—shears, anvil pruners, lopping shears, pole tree pruners, telescoping saws, and more.

Friend Mfg. Co.
Gasport, NY 14067

### Bartlett

A comprehensive line of tree-trimming equipment is offered by this company.

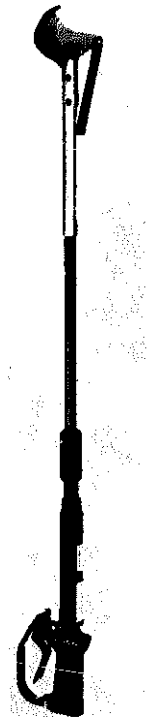
Bartlett Mfg. Co.
3003 E. Grand Blvd.
Detroit, MI 48202

### Sandvik

This firm offers a complete line of pruning saws, bow saws, and hand saws.

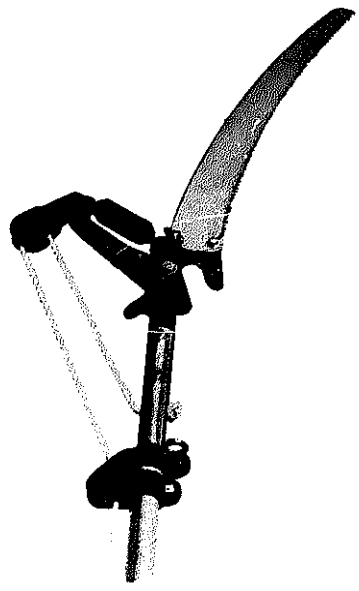
Sandvik, Inc.
Saws & Tools Division
1702 Nevins Rd.
Fair Lawn, NJ 07410

### An Assortment of Woodlot Tools



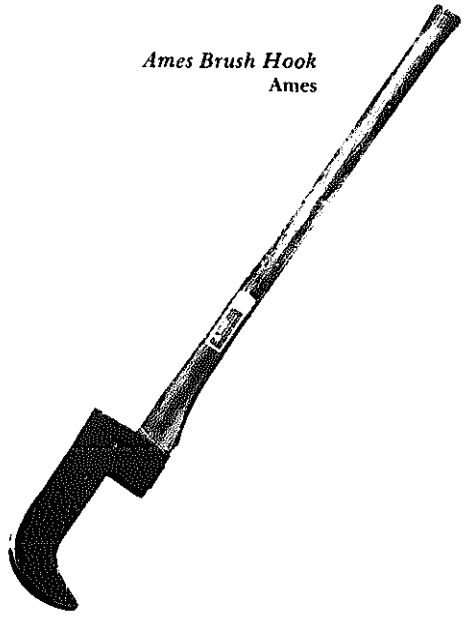
*Stanley Agricultural Power Pruner (3, 4, and 5 foot lengths)*
Stanley Hydraulic Tools

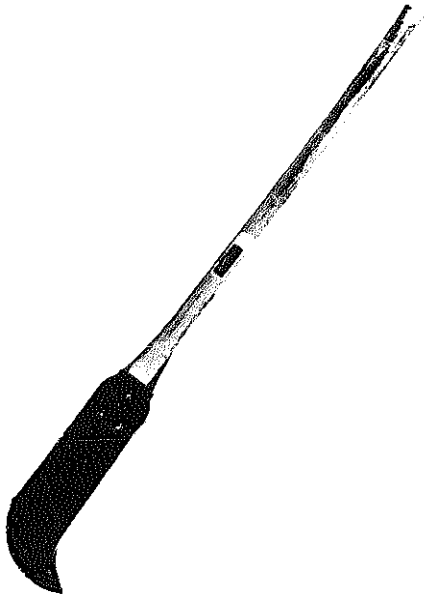
*Ames Pole Tree Trimmer*
Ames



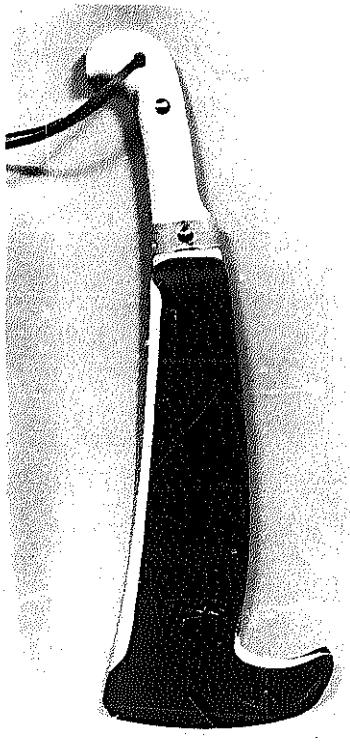
*Stanley Agricultural Long-Reach Circular Saw (overall length, 5 feet)*
Stanley Hydraulic Tools

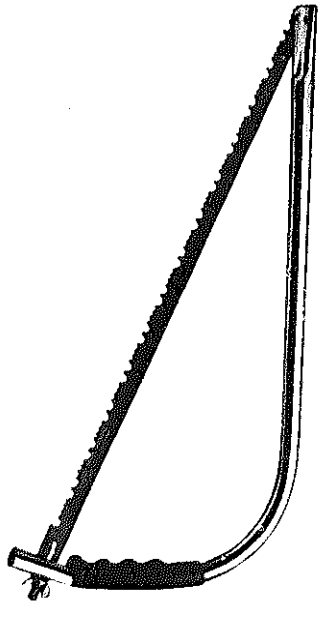
*Ames Brush Hook*
Ames





*Ames Ditch Bank Blade*
Ames





*Ames Bow Saw*
Ames

*Woodsman's Pal Brush-Clearing Knife. Note the two cutting surfaces.*
Oley Tooling, Inc.

**Survival Equipment Co.**

This company manufactures an especially helpful lightweight, machete-type tool for efficient land-clearing with minimum fatigue. It features a concave design with a blunt toe at the end of the cutting edge to minimize the risk of injury from a missed stroke.

Woodsman's Pal Brush-Clearing Knife
Survival Equipment Co.
Oley Tooling, Inc.
Oley, PA 19547

**Cumberland**

Pruning knives and saws, lopping shears, and budding and grafting knives are among the forestry-related equipment of various manufacturers listed in the Cumberland catalog.

Cumberland General Store
Rt. 3, Box 479
Crossville, TN 38555

**Leonard**

This firm markets pole saws, pruner poles and pruning saws, timber carriers, peaveys, cant hooks and other logging tools.

A. M. Leonard & Son, Inc.
Piqua, OH 45356

**Anchor Tools**

William Day at Anchor makes and sells some of the more primitive woodworking tools like adzes, broadaxes, and drawknives.

Anchor Tools & Woodstoves
618 N.W. Davis
Portland, OR 97209

**Dixie**

A complete line of logging equipment, replacement parts, specialty forgings, and wood turnings is available here.

Dixie Industries, Inc.
1210 Greenwood Ave.
Chattanooga, TN 37404

**Meadows**

The Meadows catalog contains 500 pages of forestry and engineering equipment of every description. They carry many specialty items found nowhere else.

Ben Meadows Co.
3589 Broad St.
Atlanta, GA 30366

**Forestry Suppliers**

They are among the world's largest forestry supply houses. If you can't find it in the FSI catalog, you might be in trouble. A sampling: skidding grapples, bowsaws, crosscut saws, pruning saws, timber carriers, pike poles, tree climbing gear, horticultural knives, and much more.

Forestry Suppliers, Inc.
205 W. Rankin St., Box 8397
Jackson, MS 39204

**A German Supplier**

Wolf and Bankert produce high-quality cutlery, including machetes and land-clearing knives for every purpose.

Wolf & Bankert
Werkzeug Fabrik
563 Remschied, W. Germany

**Fiskars**

Manufacturers of a wide range of quality equipment for professional foresters in Europe and North America. A few highlights in the Fiskars catalog are their log hooks, timber stacking claw, skidding grapple, and forest hoe for planting bare-rooted and rolled plants.

Fiskars
Mannerheimintie 14A
Helsinki, Finland

**Belknap**

This distributor carries a good variety of wood-handling tools, as well as pruners, shears, and machetes.

Belknap, Inc.
P.O. Box 28
Louisville, KY 40201

## WHAT TO LOOK FOR IN A CHAIN SAW

The first important rule in chain saw shopping is: look for a nationally known brand and don't spend too much money. You can buy a good saw for under $150 for work around the homestead or farm woodlot. It should last for years if cared for properly.

You'll find models where the chain runs when the motor does, and models that have a centrifugal clutch so you can run the motor without running the cutting chain. The latter kind provides a measure of safety.

Some models have self-oiling features, which keep the chain oiled automatically. They don't seem to offer much advantage over the hand operated oilers that squirt the chain when you push the plunger.

Some manufacturers make a saw with a rotating tip set in the end of the blade. These are supposed to reduce wear on the chain, and this feature is a plus, although not necessary to good operation. You'll also find models with self-sharpeners, but these tend to wear the chain down too fast and require an unusual chain design that may not be as efficient as the standard chain.

Try starting the saw you intend to buy. If it is hard to start in the showroom, it'll probably be hard to start in the woodlot.

An 18-inch blade should be fully adequate for use on the homestead or farm, so don't pay extra for blade length you can't use.

Chain saws have to be sharpened precisely. If you do it yourself, invest a couple of dollars for a saw-sharpening guide. Otherwise, entrust the job to a professional or a friend who does craftsmanlike sharpening. The chain must also be kept at the right tension, and you'll need a wrench and screwdriver for this.

Remember to keep the gas-oil mixture balanced. Too lean on the oil means a burned-out engine. Too heavy on the oil means a fouled motor and a hard start.

Be very careful of secondhand saws. You're more than likely to be buying someone's problem. Since a properly kept new saw lasts for many years, the initial investment is very often worth it.

And finally, use some discretion with the saw. A chain saw is noisy and dirty and doesn't offer the rhythmic harmony of hand sawing or felling trees with an axe. However, it can increase your sawing power ten times over what you can do by hand, and the little bit of gasoline involved can be put to hard, practical use freeing you from what could be a back-breaking chore.

## HANDLING YOUR CHAIN SAW

### by Walter Hall

If, like me, you are a lover of solitude, chances are you'll pass much of your time in the woods alone. That is why it's important to carry a whistle, a good loud one. If you ever get pinned by a tree or cut yourself, you can give it a good blast. Along with the whistle, when you're preparing to go out for a load of logs, take along all the tools you're likely to need. Take extra fuel and all the extra maintenance parts, such as air filters, spark plugs, and an extra chain and sprocket. Start with a sharp chain and a clean saw. After every hour of work, stop and service your saw. This means you fill the fuel and oil tanks, clean or change the air filter, touch up the chain, and wipe off the saw. If you discover or suspect any problem with your chain saw, stop working until the problem is diagnosed and corrected.

Take frequent breaks. Listen to the living trees around you and don't cut them off for firewood. They are sentient creatures—the tongues of the wind and the earth.

### FELLING SMALL TREES

There are two basic cutting operations involved with felling any tree. These operations may be altered or complicated by the size of the tree, the lay of the land, and the required direction of fall. These two operations, the notch, or directional cut, and the felling out, or back cut, are done somewhat differently with a chain saw than with an axe. The notch determines

*Notching a small tree.*
Allis-Chalmers

and controls the direction of the tree's fall. The notch and the back cut must always be made so as to form a hinge of uncut wood. As the tree falls, it pivots on this hinge, breaking it.

First, you make a notch. The basic notch for a small tree is made with two cuts. Make the upper of the two cuts first, to avoid pinching the bar. It's a lot of work to dig a saw out of a tree with the tree's full weight pressing down on it.

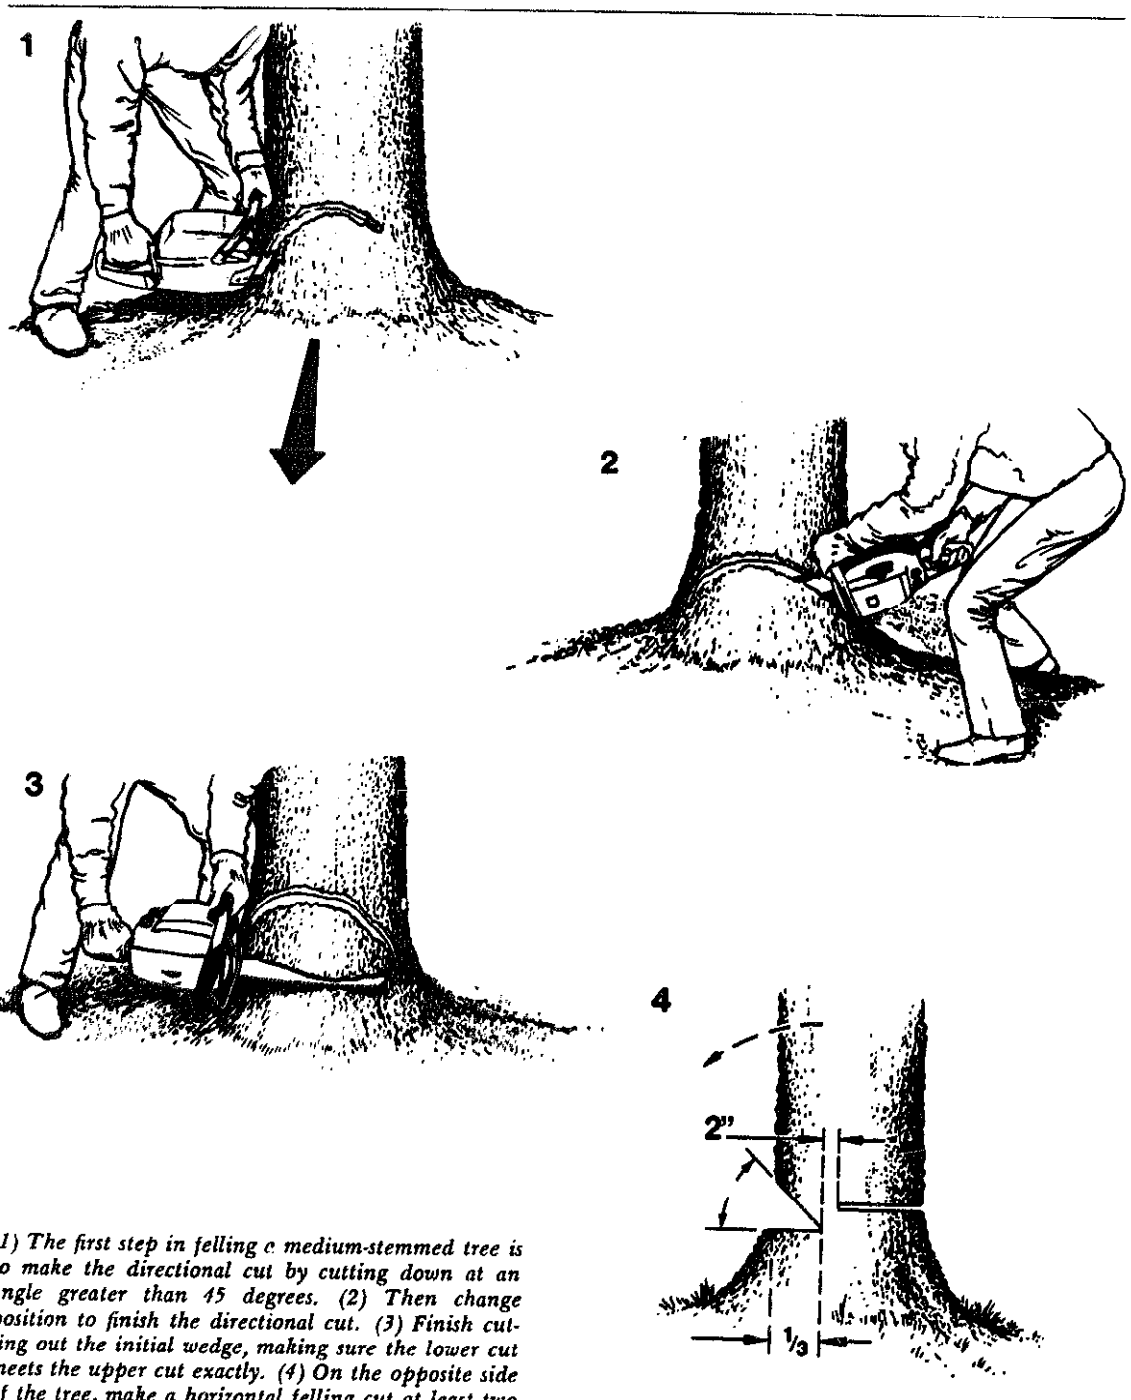
Move to one side of the tree, facing the planned direction of the fall. Aim across the top of your saw, along your front handle or falling sights, at exactly the place where you want the tree to fall. This will correctly line up your guide bar with the trunk of the tree.

Now make the upper cut of your notch, cutting down at an angle. Cut at least a third of the way into the tree, but not as much as halfway. Then make the lower cut. With a small, straight tree on level ground, make this second cut straight in to meet the first. Make the cut horizontal, and cut clear back to remove the whole notch. The hinge will be formed by uncut wood at least two inches thick between the back of the notch end and the felling cut.

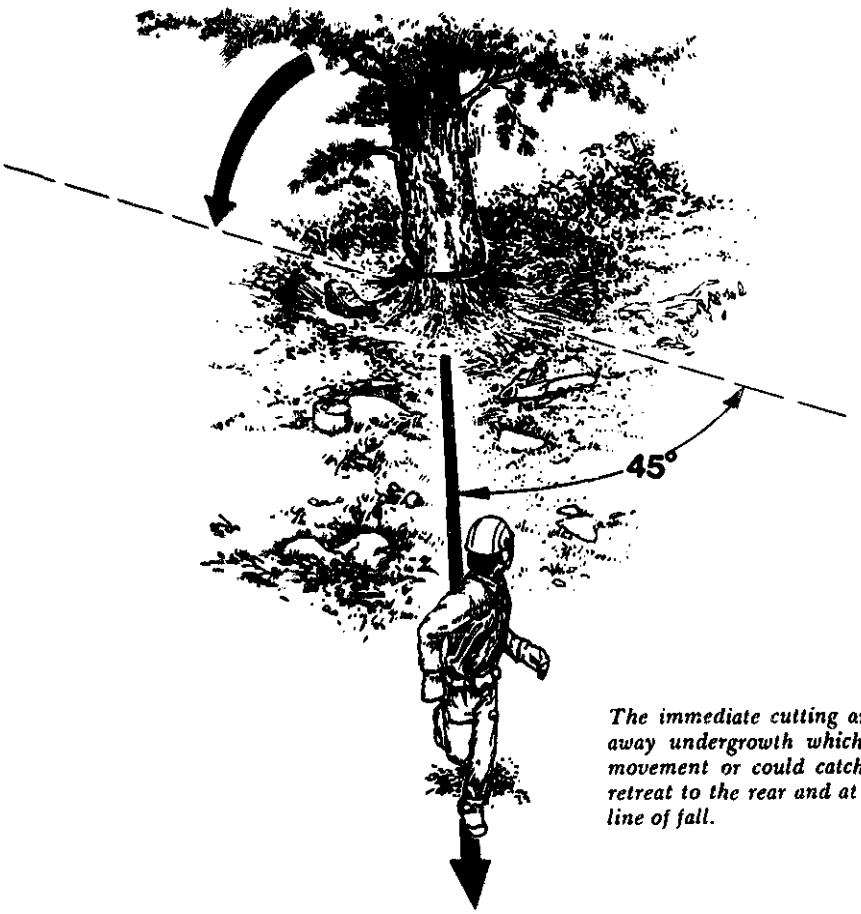
Now go behind the tree and make another horizontal cut, two inches or more above the lower, or horizontal cut of the notch. It is extremely important not to make this second cut so it will meet the horizontal notch cut. It must be an inch or two higher. It is also important not to cut through the hinge wood.

When enough of your felling cut is complete, stop your saw and leave it in the cut. Insert a wedge in the cut to prevent it from closing on your saw and to help control the direction of the fall toward the notch. Then start your saw again and continue until the cut is complete, leaving only the hinge. At this time the tree should fall. If not, give it a little push, or use a felling lever. As the tree starts to move, leave your saw on the ground and retreat quickly along your planned escape route (see page 443). Remember that the butt end of the tree may kick backwards as the tree falls and that unseen dead branches may fall straight down, or in any direction, as the tree topples. Take no chances. Retreat quickly and without hesitation along your escape route.

That's how you cut down a tree when its



*(1) The first step in felling a medium-stemmed tree is to make the directional cut by cutting down at an angle greater than 45 degrees. (2) Then change position to finish the directional cut. (3) Finish cutting out the initial wedge, making sure the lower cut meets the upper cut exactly. (4) On the opposite side of the tree, make a horizontal felling cut at least two inches above the lower (horizontal) cut of the notch. When only a narrow hinge remains (about one-tenth of the tree's diameter) you're ready to insert your wedges or felling lever and topple the tree.*



*The immediate cutting area is prepared by cleaning away undergrowth which could interfere with free movement or could catch fire. Plan a path or safe retreat to the rear and at a 45-degree diagonal to the line of fall.*

diameter is less than the length of your guide bar. But we're also going to be cutting down trees equal to or larger than the length of our guide bars. These situations require a specific sequence of cuts.

## FELLING LARGER TREES

To cut a tree with a diameter larger than the length of your guide bar but not twice its size, proceed as follows: Make a notch, as before. Each cut of the notch may require as many as two cuts to complete. You can do this by making one half of the upper notch cut on one side and then moving to the other side of the tree to complete the upper notch cut. Do the same with the horizontal notch cut.

After the notch is formed, make a plunge cut about an inch or two above the notch and on the opposite side of the wood that will form the hinge. Start the plunge cut with the underside of the tip. When the bar has cut a few inches into the tree, straighten the saw to begin sawing straight inward from the tip of the bar.

When your plunge cut is about halfway into the tree and about twice the width of your guide bar, proceed to make the felling cut by sawing around the tree. Make a pivot with the tip of the guide bar in the center of the tree. Be careful not to cut into the hinge wood, and be sure to insert your wedge or felling lever in plenty of time to force the tree in the right direction. If you use a felling lever, be careful not to hit it with your saw. If you use wedges, be sure to use plastic ones, or make your own from wood.

To fell a tree with a diameter equal to or greater than twice the length of your guide bar, only one additional cut is necessary. This time the additional cut is in the notching operation

and, in effect, cuts the hinge itself in half.

Make the notch, as before. Now make a plunge cut at the back of the notch, right in the center of the tree. The plunge cut should be at least twice the width of the guide bar.

Cutting a plunge at the back of the notch in this manner actually creates two hinges. Make another plunge cut at one side of the trunk and on the felling-cut side of the hinge. The cut meets the plunge cut that comes through the center of the notch. Continue the felling cut by sawing around the tree with the tip of the bar in the center of the trunk. Place your wedges or felling lever in plenty of time, and be careful not to cut through the hinge.

Note that if you fell a large tree on a slope, you should make the bottom notch cut at an upward angle. This provides more control during a longer fall.

## ORGANIZED FELLING

We're going out into the woods to fell a good number of beetle-killed Ponderosa pine trees. The trees are standing dead and are grouped pretty much together, on the side of a slope facing the road but a good distance away.

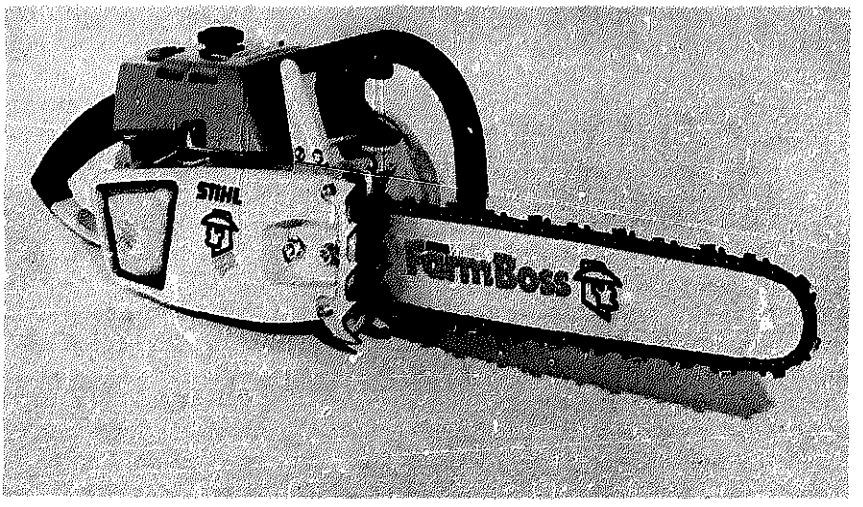
We want to move the trees as little as possible, and we want to fell them so they'll be easy to limb and buck into loading-sized logs. We'll start cutting at the edge of the trees closest to the road, and we'll use one or more of the trees as a workbench for limbing all the trees that come later.

For a workbench, fell a tree diagonally across the center of your start of operation. Then fell tree number one so that it falls across the workbench. This lifts the trunk up off the ground and makes limbing and bucking easier. Limb the whole tree, from trunk to top. It helps to mark the tree for bucking while you're limbing it. With the tree limbed, it's easy to roll or see-saw the tree across the workbench to one side. Then you can buck it into lengths to be rolled downhill to the road. This method quickly leads to piles of bucked logs, ready for loading.

When you follow an organized felling procedure like this, save the side trees for last. You can use your accumulated piles of timber for workbenches for these trees.

Demanding as it is, working with a chain saw is incomplete exercise. It may add some strength to your arms, but will do little for your overall physical condition. My own formula for unwinding after a long session with the chain saw is to devote some time to meditation and yoga. It's the best cure, for me, though a walk in the woods works almost as well.

Sleeping under the trees on a warm afternoon is another ideal way to counter the negative effects of running a gasoline-powered engine. Sitting by a river dipping your toes isn't bad, either. When working in the woods, the natural woodsperson takes long and frequent breaks. It's the only way to remember who you are, where you fit, and why you're there. For safety's



*Manufacturers recognize the many uses a chain saw can have on a farm or homestead.*
Stihl, Inc.

sake, you should work with a partner whenever you can. For nature's sake, you should each take your breaks in solitude.

## ATTACHMENTS FOR A CHAIN SAW

Individuals who haven't had a great deal of experience with chain saws may feel that tree felling and trimming may be the limit of a saw's usefulness. However, with the number of attachments becoming available, the power unit on a chain saw can be a very valuable addition to a tool collection.

The Stihl 08's, a 14-pound unit driven by a single cylinder, two-cycle gasoline engine, is capable of running a cut-off saw, a brush cutter, and one- and two-man earth augers. On many models, power heads can drive hedge trimmers, lumber-making attachments, mills, and drills.

Not all chain saws will drive all the possible attachments, so carefully check into accessories before buying a chain saw. A single power unit running several tools can be much less expensive than buying each tool separately for your woodlot.

## SOURCES OF CHAIN SAW ACCESSORIES

**Atom**

They are manufacturers of chain saw drill attachments.

Atom Industries
15 Reynolds St.
Balmain, N.S.W., Australia 2041

**Bailey**

Mail-order suppliers of chain saws, tools, and accessories, they also have a logger's job service.

Bailey's
P.O. Box 550
Laytonville, CA 95454

**Bell**

Formerly known as Nielson, they are manufacturers of home and shop electric saw chain grinders, carb-cutter attachments, and chain saw related machines.

Bell Industries, Saw and Machine Div.
3390 W. 11th Ave., P.O. Box 2510
Eugene, OR 97402

**Brookstone**

This company markets a chain saw sharpening jig.

Brookstone's Hard-to-Find Tools
125 Vose Rd.
Petersborough, NH 03458

**Carlton**

They are manufacturers of a saw chain.

Carlton Co., Saw Chain Division
3901 S.E. Naef Rd.
Portland, OR 97222

**Defiance**

They are manufacturers of the Little Logger chain saw accessory.

The Defiance Co.
Hancock, MI 48830

**Davis**

They are manufacturers of chain saw testing equipment for mechanics.

Perry Davis Equipment
21353 Endsley Ave.
Rocky River, OH 44116

**Granberg**

They manufacture chain saw tools, and assorted accessories; ripping chain, Alaskan Mill, Break-N-Mend, and File-N-Joint.

Granberg Industries, Inc.
200 S. Garrard Blvd.
Richmond, CA 94804

**Haddon**

They are manufacturers of chain saw accessories; the Lumber/Maker attachment.

Haddon Tool
4719 W. Route 120
McHenry, IL 60050

**Heli-Coil**

They manufacture thread repair kits.

Heli-Coil Products
Shelter Rock Lane
Danbury, CT 06810

**Kwik-Way**

They manufacture machines and tools for small-engine mechanics.

Kwik-Way Mfg. Co.
500 Fifty-seventh St.
Marion, IA 52302

**Lewis**

This firm makes chain saw winch attachments.

*Fred A. Lewis Co.*
40 Belknap Rd.
Medford, OR 97501

**Loctite**

They are manufacturers of thread-locking compounds.

Loctite Corp.
705 N. Mountain Rd.
Newington, CT 06111

**Merc-O-Tronic**

They manufacture chain saw ignition-testing equipment.

Merc-O-Tronic Instruments
215 Branch St.
Almont, MI 48003

**Omark**

This company markets saw chain, tools, and accessories.

Oregon Saw Chain Div., Omark Industries
9701 S.E. McLoughlin Blvd.
Portland, OR 97222

**Permatex**

They manufacture gasket sealers.

Permatex Co., Inc.
P.O. Box 1350
West Palm Beach, FL 33402

**Phelon**

They manufacture ignition parts for chain saws.

R.E. Phelon Co.
East Longmeadow, MA 01028

**Sandvik**

They are manufacturers of forestry tools, guide bars, chain saw tools and accessories. "Swedish Forestry Method."

Sandvik, Inc.
1702 Nevins Rd.
Fair Lawn, NJ 07410

**Sears**

You'll find accessories, a lumber maker attachment, and sharpeners in the catalog.

Sears, Roebuck & Co.
Farm and Ranch Catalog

***Skil Corp.***

This company manufactures professional air and electric impact wrenches, and shop tools for chain saw mechanics.

Skil Corp.
5033 Elston Ave.
Chicago, IL 60630

**Spencer**

They manufacture logger's tape, felling and bucking wedges, and chain saw and logger accessories.

Spencer Production Co.
P.O. Box 224
Pullman, WA 99163

**U.S. General Supply**

This is a large mail-order tool supply company, with various chain saw accessories for sale.

U.S. General Supply
100 General Place
Jericho, NY 11753

**V.I.P.**

They manufacture portable, electric, saw chain grinders.

V.I.P. Industries
300 S. Richardson Rd.
Ashland, VA 23005

**Walbro**

This firm manufactures chain saw carburetors.

Walbro Corp.
Cass City, MI 48726

**Whitney**

This is another large, well-known, mail-order tool supply company.

J.C. Whitney Co.
1917-19 Archer Ave., P.O. Box 8410
Chicago, IL 60680

**Windsor**

They manufacture saw chain, guide bars (Timber King), tools, and accessories.

Windsor Machine Co.
3147 Thunderbird Crescent
Burnaby, British Columbia, Canada

**Zip Penn**

They are mail-order suppliers of saw chain, tools, and accessories.

Zip Penn, Inc.
2008 E. 33rd St., P.O. Box 179
Erie, PA 16512

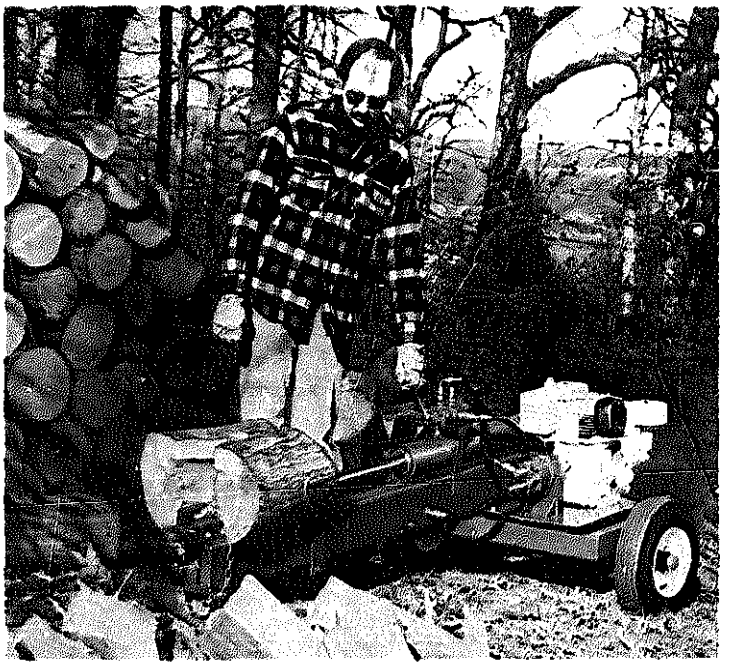
# WHEN AN AXE IS NOT ENOUGH

**by Steve Smyser**

Log splitters have been on the market for years, but until recently they've been a rather specialized tool used exclusively by professionals. When the energy crunch pushed oil prices up and wood stove sales spiraled, many homeowners started looking seriously at commercial splitters. Certainly nobody is about to predict the demise of the axe, sledge, and wedge. Many folks still cut their entire year's supply of fuel wood by hand, enjoy it immensely, and have no interest whatsoever in mechanical alternatives. The commercial splitter has yet to be invented that can simulate the pure joy of chopping wood on a crisp October afternoon and stacking it away in warm anticipation of winter's worst.

On the other hand, sales figures and a proliferation of new manufacturers in the field bear witness to the steadily increasing number of people who heat with wood and prefer to cut it themselves, but who lack the time or inclination to do it all by hand. For this group, which often includes neighbors making a joint purchase, or individuals interested in starting a part-time cordwood business, the mechanical splitters have been a real boon. It takes most of us the better part of a day to cut, split, and stack a cord of poplar or apple with a chain saw and wedge. With a power splitter, the job takes about half that time.

Wood-splitting devices being sold today are principally of either the hydraulic wedge type or the screw type. The latter variety comes as either a self-powered unit or a bolt-on type that attaches to a tractor PTO shaft or to the rear wheels of a car or truck.



*The larger hydraulic units like this go through a cord of wood an hour with ease. Their heavy-duty rams (10 tons of splitting force) make them the choice for frequent splitting of exceptionally dense, stringy wood.*

The hydraulic wedge-type splitter used by most professionals is basically a hydraulic cylinder forcing a log through a splitting wedge. The better models generate about ten tons of splitting force from heavy-duty cylinders and gas engines ranging from four to eight horsepower. Most manufacturers offer two sizes of bed (the I-beam or square tubing on which the log rests), one for logs up to 19 inches and another for logs to 26 inches. Cycle times (the time required for the ram to travel to the wedge and return) for various models range from 12 to 30 seconds, a difference that would be important if you are in the cordwood business. Most hydraulic splitters can get through a cord of wood in an hour with no trouble.

As logs are split, they will shift around a bit to follow the grain of the wood. For this reason, the forward speed of the hydraulic ram should be slow enough to give the operator time to avoid a mishap. Some makers offer two-stage hydraulic pumps with this in mind: the two-stage pump provides fast speed with low force for normal operation, then shifts automatically to low speed/high force when additional pressure is needed to split tough or gnarled logs.

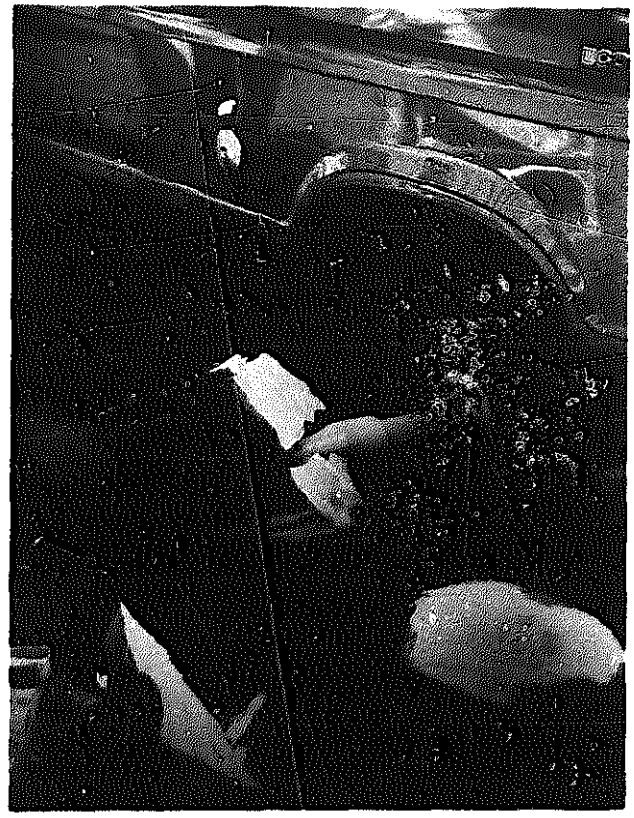
The cost of these hydraulic units ranges from $600 for most of the popular four and five horsepower models up to $1,200 and more for some of the more sophisticated professional versions.

A real breakthrough in the design of commercial wood splitters occurred three years ago with the debut of the auger screw-type splitter. Designed largely in response to the burgeoning farm and home market, the screw-type splitters are made to penetrate logs up to 28 inches in diameter and literally screw them apart. In addition to portable, self-powered units, the screw-type splitters come in models that bolt onto auto and truck wheels and tractor PTO shafts. The bolt-on models cost less than the self-powered splitters ($200 as contrasted wih $400 and up), but require an adapter if you switch to a vehicle with different size lug holes on the wheels.

While quite rugged and satisfactory for almost all home-scale splitting requirements, these eight- and nine-horsepower units must take a back seat to the more powerful hydraulic models when it comes to continual cutting of dense, stringy woods like locust, elm, and willow.

To use the bolt-on type of screw splitter, you press the log into the turning screw, making sure each log is offset so that its lower end butts against the ground and prevents the log from spinning. The threads simply pull the log onto the widening screw and split it open, usually in about 10 to

*The screw-type log splitter: as a separate unit (left), and as a truck-mounted model (below). Each has advantages and disadvantages.*



12 seconds. A safety switch is attached to the engine, allowing the splitter to be turned off from the work area.

Along with the advantage of operating independently of problem-prone small engines and hydraulic systems, the bolt-on screw permits the operator to split large, heavy logs without lifting them off the ground. The self-powered screw units, on the other hand, do not require jacking up your car or truck every time you need to do some splitting.

How do you determine which type is right for you? It depends largely on what kind of wood you work with most often. If you're splitting nonstringy wood like ash, beech, maple, birch, apple, or any wood that splits cleanly with a wedge or an axe, you should probably lean toward the screw-type splitters, which are generally faster and less expensive than the hydraulic units. If you're splitting heavy, dense, and stringy wood like black gum, elm, locust, yellow birch, hackberry, oak or any wood that does not split cleanly with a wedge—any wood that requires an axe to cleave off stubborn strings or strands that prevent a clean split—then you need a hydraulic unit. If you try to split dense, stringy wood on a screw-type splitter, you will spend as much time trying to pull the wood on the screw as you spend on splitting.

What size machine should you buy? Again, it depends on your objective. If you're splitting logs 12 inches wide by 16 inches long, there's no reason to buy a ten-ton hydraulic ram with a 24-inch bed.

Conversely, don't count on a small screw-type unit to routinely split oak logs three feet long by 30 inches across.

In general, if you're splitting logs under 19 inches in length or 20 inches in width, you can buy what most manufacturers call their homeowner models and be fully confident that the machine will do your work. You can, on occasion, split larger logs if you follow the instructions that come with the machine; but if you're going to split larger logs on a regular basis, you should look at professional models. Buying a homeowner model to split logs 30 inches long by 30 inches wide is like buying a half-ton pickup to deliver ten tons of coal every day—you're going to destroy the machine by forcing it to do more than it was designed for.

*Mounted on a three-point hitch, this hydraulic attachment for the Power King Tractor splits logs up to 26 inches in a 15-second cycle.*
**Engineering Products Co.**

*An increasing interest in woodlot harvesting has encouraged manufacturers to develop tractor-run equipment. The Wheel Horse D-Series demonstrates both log splitter and saw.*

How much should you pay for a splitter? Don't be fooled by price—the least expensive machine you can buy is the unit that fits the requirements of your work. Buy a machine that's smaller than you need, and you're going to spend your savings in repairs. Buying a unit that's larger than you need is wasteful in that you're spending more than you have to in order to get the job done.

When shopping, beware the dealer who stocks one or two models and tells you that his machines will do anything. How does he know? Has he ever split wood? If you're going to buy a splitter, find a dealer who has paid his dues, someone who has split and burned a lot of wood, and who knows the difference between a sledgehammer and a splitting maul.

There is no one machine that will do everything. The inexperienced dealer or manufacturer may try to persuade you that his equipment will handle whatever you're splitting. A good dealer will demonstrate his product thoroughly, and perhaps even let you use it for a week. Who knows, you may discover you prefer swinging that axe after all!

## SOURCES OF COMMERCIAL WOOD SPLITTERS

### *Hydraulic Wedge Types*

**Mighty Mac**
This unit comes in 5 and 7 h.p. models.

Amerind-MacKissic, Inc.
Box 111
Parkerford, PA 19547

**Hydra-Splitter**
Available in a 4 h.p. unit, the Model 26 TM hooks to tractor hydraulics.

Didier Mfg. Co.
Box 163, 8630 Industrial Dr.
Franksville, WI 53126

**Lickity Splitter**

This model is available from:
Piqua Engineering, Inc.
Box 605
Piqua, OH 45856

Futura Enterprises
West Bend, WI 53095

Huss Sales & Service
Toledo, OH 43601

**Lindig Splitters**
These splitters come in a 3 h.p. compact size, and 5 h.p. two-stage model; both have a tractor-mount option.

Lindig Splitters
1875 W. County Rd.
St. Paul, MN 55112

**Power King Tractors**
This firm markets tractor-mounted hydraulic splitters.

Engineering Products Co.
1525 E. Ellis St.
Waukesha, WI 53186

**Farnum Log Splitter**
Farnum Companies, Inc.
Box 12068
Omaha, NE 68112

**Futura**
Futura Master Corp.
5069 Highway 45 South
West Bend, WI 53095

**Woodsman**
G.S.I. Corp.
Box 39
Jackson, WI 53037

Household Wood-Splitter
Box 143
Jeffersonville, VT 05464

### *Screw Types*

**Stickler**
This splitter can be wheel-mounted or run from a tractor PTO.

Taos Equipment Manufacturers
Box 1565
Taos, NM 87571

**Bark Buster**
This is a self-powered screw-type splitter.

FW and Associates, Inc.
1855 Airport Rd.
Mansfield, OH 44903

**Quick Split**

This self-powered splitter comes in 5 and 8 h.p. models.

Trans America Power Equipment, Inc.
8308 Washington St.
Chagrin Falls, OH 44022

**Derby Splitter**

This self-powered portable splitter is available as an 8 h.p. model or a tractor PTO-driven unit.

Derby Splitter
Box 21
Rumson, NJ 07760

**The Unicorn**

This is a wheel-mounted or bolt-on splitter.

Thackery Co.
Columbus, OH 43216

**Nortech Splitter**

This company offers a self-powered 8 h.p. splitter.

Nortech Corp.
Midland Park, NJ 07432

**Knotty Wood Splitter**

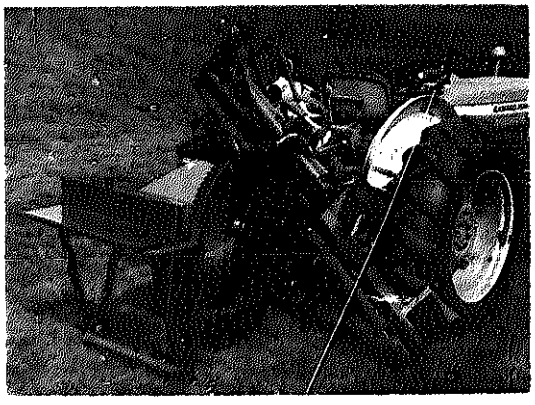
This unit is driven by a tractor PTO.

Knotty Wood Splitter Co.
Route 66
Hebron, CT 06248

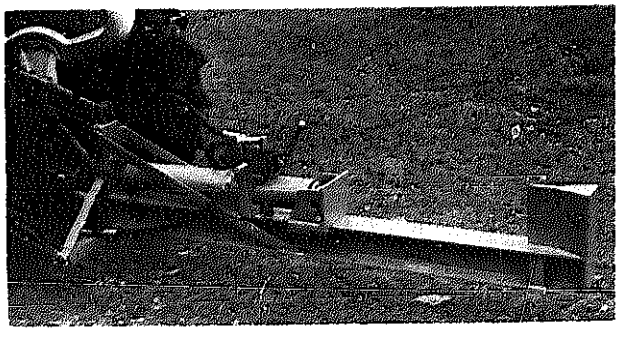
***Other Splitters***

**Pokrandt Splitter**

This is a tractor-mounted combination cordwood saw and wood splitter.



*Pokrandt's tractor-mounted cordwood saw and wood splitter. Units may be purchased and mounted separately, like the hydraulic wedge splitter.*
**Richard Pokrandt Manufacturing**



## MATCHING THE SPLITTER WITH THE WOOD

**Clean and Easy-to-Split Woods**
Hemlock, ash, beech, poplar, hickory, hornbeam, maple, cherry, apple, aspen, white birch, spruce, basswood, oak.

For logs up to 19 inches long by 20 inches wide, use a homeowner screw type splitter.

On logs 19 to 36 inches long by 20 to 30 inches wide, use professional hydraulic or professional screw-type unit with a minimum of 8 h.p.

**Stringy, Hard-to-Split Woods**
Elm, black gum, hackberry, eucalyptus, pinyon, locust, willow, yellow birch.

On logs up to 19 inches long by 18 inches wide, use a homeowner hydraulic splitter. (Screw-type units are often inadequate for these woods).

On logs 19 to 36 inches long by 18 to 30 inches wide, use a professional hydraulic splitter. (Screw-type units not recommended for these woods).

Richard Pokrandt Manufacturing
RD. 3, Box 182
Tamaqua, PA 18252

**Jiffy Woodsplitter**

This is an upright, guided-wedge-type splitter.

C & D Distributors, Inc.
Dept. O, Box 766
Old Saybrook, CT 06475

**Thrust Log Splitter**

This is a nonhydraulic horizontal wedge.

Thrust Mfg., Inc.
6901 S. Yosemite
Englewood, CO 80110

**Knotty Wood**

They offer a tractor-driven cordwood saw.

Knotty Wood Splitter Co.
Route 66
Hebron, CT 06248

Woodland Splitters
P.O. Box 976
Oak Brook, IL 60521

**Hand-Operated Hydraulic Splitter**

Woodland Splitters
P.O. Box 976
Oak Brook, IL 60521

**Tractor-Mounted Log Splitter**

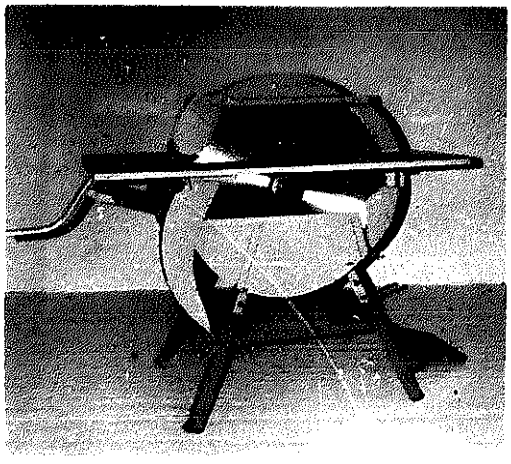
SI Mac Design
9 Vista Verde
Portola Valley, CA 94025

## SAWMILL EQUIPMENT

**Gaubert Saws**

Gaubert makes a series of electric circular saws with 500 or 600 millimeter blades for both sawing logs and rough-cutting lumber. Tractor PTO and three-point-hitch adaptations are also available.

A. Gaubert 16700
16700 Ruffec
Bordeaux, France



*Gaubert Circular Saw* Gaubert

**Speedy Cord Saw**

This saw will cut hardwood slabs or logs to 8 inches in diameter at the rate of 120 cubic feet (about a pickup load full) in 30 minutes time. Three models are available; one trailer, one three-point-hitch mount, and one on skids.

Speedy Cord Saw
Winona Attrition Mill Co.
1009 W. 5th St.
Winona, MN 55987

**Mini-Mite**

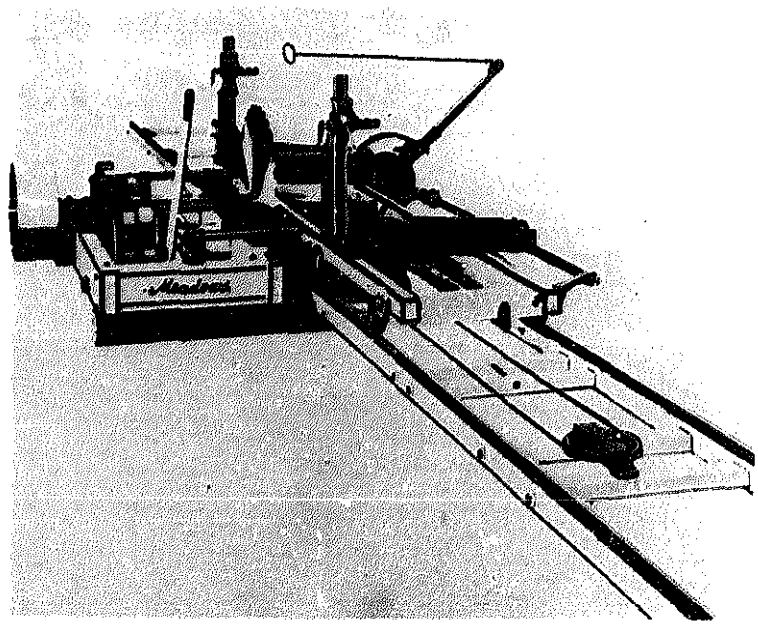
The Mini-Mite can handle logs up to 18 feet in length. Equipped with hydrostatic carriage drive, the unit can produce true dimension lumber with a maximum cut of 4½ inches by 12½ inches. The saw is designed to be towed with a pickup and can be set up on the site in 45 minutes.

Mini-Mite Transportable Sawmill
International Enterprises of America, Inc.
3931 N.E. Columbia Blvd., P.O. Box 20427
Portland, OR 97220

**Meadows Portable Mill**

Easily moved and set up, the Meadows No. 1 mill features a 15 foot carriage on four sets of roller bearing travelers, 6 inch wheels, and a 48 inch blade.

Meadows Portable Sawmill
North Wilkesboro, NC 28659



*Meadows No. 1 Standard Saw Mill*
Meadows Mills Co.

**Pokrandt**

Pokrandt manufactures a tractor-mounted combination cordwood saw and wood splitter. The saw is driven off a tractor PTO; the wood-splitter is powered by the tractor's hydraulic system. Units may be purchased separately.

Richard Pokrandt Mfg.
RD 3, Box 182
Tamaqua, PA 18252

**Belsaw**

Belsaw offers a variety of power sawmill equipment, including two sizes of sawmills, a self-feed rip saw, and a chain saw grinder. The smaller mill handles logs up to 18 inches in diameter, 14 feet in length, while the large mill will take a 36 inch diameter, 24 foot log.

Belsaw Power Tools
4103 Field Bldg.
Kansas City, MO 64111

Glen-Bel's Country Store
Rt. 5
Crossville, TN 38555

**Laredo**

The Saw and Emery Laredo Model SEL-005 requires 3 to 5 h.p., and is available in two models: with stationary engine or three-point tractor PTO. The saw (14 inches in diameter) and the emery (12 inches diameter) will reach a maximum 2,200 rpm.

Laredo, S.A. Industria e Comercio
Rua 1 de Agosto, 11-67
17.100 Bauru (SP), Brazil

## WINCHES

**Fulton 900**

Fulton's 900 Series winches are available with rated load capacities of 1,000, 1,500, and 2,500 pounds. Special features include a Load-Lok automatic brake system and large drum diameters for use with steel cable.

Fulton Mfg. Co.
1912 S. Eighty-second St.
Milwaukee, WI 53219

**Lug All**

Lug All makes cable ratchet lever winch-hoists in ½ to 3 ton capacities. Designed to lift, pull, lower, bend, or stretch in any position and at any angle, Lug All winch-hoists are available with all types of hooks and with cable lengths up to 50 feet.

Lug All
538 Lancaster Ave.
Haverford, PA 19041

Forestry Suppliers, Inc.
Box 8397
Jackson, MS 39204

**Superwinch**

These 12-volt electric winches come in 12 different models. The winches bolt on to a vehicle's bumper and draw power from the battery.

Superwinch, Inc.
Connecticut Route 2
Putnam, CT 06260

**Trewhella Monkey Winch**

Designed for pulling up trees and hedges, and for land clearing, the Monkey Winch is strong and light and has two speeds and a reverse gear. A lightweight model, the Spacemaker, is recommended for pulling, lifting, and clearing small trees. The Monkey Wire Strainer for mending broken fences or stretching new wire is also available.

Trewhella Monkey Winch
Trewhella Bros., Ltd.
Rolfe Street, Smethwick
Warley, West Midlands, B66 2BA, U.K.

**Sasgen**

Sasgen makes all-purpose winches in 2, 5, and 15 ton capacities. An automatic safety brake handle holds the load in any position.

Sasgen Derrick Co.
3101 W. Grand Ave.
Chicago, IL 60622

**Tirfor**

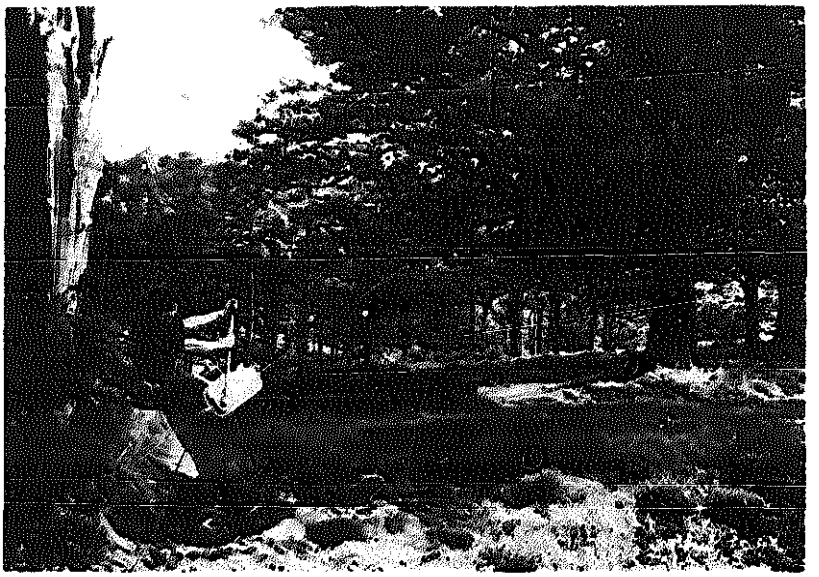
The Tirfor is a fully portable pulling-lifting or lowering machine that can be used for many purposes, including tree felling. It can increase the human effort by up to 85 times.

Tirfor Lifting & Pulling Machines
Tirfor, Ltd.
Halfway, Sheffield S19 5GZ, U.K.

**Fulton General Purpose Winches**

Fulton winches come in load capacities ranging from 900 to 1,500 pounds; all feature a one-piece reinforced frame, two-way ratchets, and gears of high carbon steel. Also listed in these catalogs are free-spooling winches, come-alongs, a variety of hoists, and screw and mine-type jacks.

Cumberland General Store
Box 479, Rt. 3
Crossville, TN 38555



*Tirfor Lifting Machine*

Glen-Bel's Country Store
Rt. 5
Crossville, TN 38555

Belknap, Inc.
P.O. Box 28
Louisville, KY 40201

**Airborne**

Airborne, a government surplus store, offers a wide variety of hand and electric winches. Maximum capacities of the hand winches range from 1,200 to 2,000 pounds; the larger electric winches, designed for more rugged use, have 4,000 to 8,000 pound pull ratings.

Also available are hand-operated rope pulls, which combine hoist, winch, and puller for smaller jobs around the home or farm.

Airborne Sales Co.
8501 Steller Dr., P.O. Box 2727
Culver City, CA 90230

**More-Power Puller**

The More-Power Puller is a portable, two-ton block and tackle unit with 5/16 inch wire cable in 20, 30, or 40 foot lengths.

Wyeth-Scott Co.
85 Dayton Rd., Rt. 16 East
Newark, OH 43055

Forestry Suppliers
P.O. Box 8397
Jackson, MS 39204

**VITA Overhead Hoist**

VITA is an international service agency that functions as a clearinghouse for information on village-scale technology and low-energy agricultural methods. Among the voluminous plans they have developed for international distribution (primarily to developing countries) is this easily constructed tripod-type hoist that can be either electrically powered or hand operated. VITA also has a plan for a jack-type post puller made of angle iron and a clevis and chain.

Volunteers in Technical Assistance
3706 Rhode Island Ave.
Mt. Rainier, MD 20822

**Levalift**

Levalift 117 Pull Hoist, a general-purpose pulling machine, can be used for large jobs, such as extracting trees. It is available in 3/4, 1 1/2, 3, and 4 1/2 ton sizes.

Herbert Morris, Ltd.
P.O. Box 7
Loughborough LE11 1RL, U.K.

**Wire Strainers**

Wire Strainers/Stretchers, useful for mending broken fences or stretching new wire around posts, vary in their pulling and holding capabilities. Certain models are for smaller tasks and utilize conventional chain; others require heavy-duty chain and can be used on many types of wire.

G.V. Donald Africa (Pty), Ltd.

Cannock, Staffs WS1 3JP, U.K.

Hans Nicolaisen
Box 18
Plainfield, NH 03781

**Banana Conveyor**

A winch-powered conveyor has been developed by the Overseas Department of NIAE to meet the needs of banana producers for a simple, mechanical carrying system to transport bananas from the field to the boxing plant. The conveyor, the department feels, may possibly be used in other field transport situations.

Powered either by hand or electric winch, it includes branch lines, ravine crossings, transfer rails, and switch points. A booklet describing the whole system and its components is available from the Overseas Department of the NIAE.

Tropical Agricultural Engineering Information
Overseas Department
National Institute of Agricultural Engineering
Silsoe, Bedfordshire, U.K.

**Heavy-Duty Shrub Puller**

Anchoring this tool to the ground by foot, the operator grasps the shrub, cotton stalk, thistle, sorghum or maize roots, or young tree in the jaws of this tool, and removes the stem by pulling back on the tall handle. No bending is involved. The maximum jaw opening is two inches.

Project Equipment, Ltd.
Rednal Ind. Estate
Oswestry, Salop, UK

Hans Nicolaisen
Box 18
Plainfield, NH 03781

## POWER SCYTHES

**Echo SRM**

This is a shoulder-type brush cutter with a two-cycle engine integrated into the operating rod. It features a safety guard, muffler, and vibration-damping cushions, with a total weight of 6.8 kilograms.

Echo SRM, Echo Chain Saw Div.
Kiorita Corp. of America
350 Wainwright
Northbrook, IL 60062

**CeCoCo Power Scythe**

Shoulder- or knapsack-mounted scythe features a 1.2 h.p., two-cycle engine that is independently suspended for minimum vibration and heat. Circular blade automatically stops rotating when it comes in contact with a stone or other obstacle. Weight: 11 kilograms.

CeCoCo Power Scythe
P.O. Box 8, Ibaraki City
Osaka Pref 567 Japan

**Stihl Brush Cutters**

Stihl produces a complete line of power brush cutters ranging from the very light FS150 to the professional FS202. Larger models are available with either two-cycle or electric engines. The variety of available cutting tools includes brush knives, grass trimmers, chipper tooth blades, and scratcher tooth blades.

## ORCHARD HARVESTING EQUIPMENT

**Friend Orchard Equipment**

Their canvas bags and buckets are durable harvesting bags for all kinds of fruit, including special designs for peaches and easily bruised apples. Picking straps and picking harness are also available separately.

Orchardkraft wood ladders are designed especially for fruit harvesting; they have a wide flare bottom and are well balanced. Available in open top style, pointed top style and three-point step ladders. Also have extra-strong aluminum ladders. Other harvesting equipment is also available.

Friend Mfg. Corp.
Gasport, NY 14067

***Maktefot Picker***

This is a lightweight pole-and-sleeve-type picker designed to cut stems at exactly the proper length, and thus minimize spoilage. The aluminum rod telescopes to 12 millimeters, with the woven linen chute having internal baffles to cushion the fruit fall.

Maktefot, Ltd.
12 Hadekalim St.
Hod Hasharon, Israel

***Pflucki Fruit Gatherer***

The Pflucki Fruit Gatherer, a small pole-mounted unit appropriate for cherries and plums, snags the fruit stem in a set of metal tines and drops the fruit into a small plastic box.

Metallwarenfabrik Naegeli AG
P.O. Box CH-8594
Guettingen, Switzerland

**Pole Picker**

This pole-mounted avocado picker, equipped with a nylon bag to catch fruit, can be mounted on any size pole. A collapsible aluminum pole that extends for several meters for tall trees, as

well as grape shears and pruners, are also available.

Tachsir Ltd. Metal Works
25 Hamlacha St.
Holojn Industrial Center, Israel

**Pinza Cogliolive (Olive Pluckers)**

These pliers have a patented rolling device which allows them to slide along branches to harvest olives without damage to the branches or fruit.

Felli Deidone
Villafranca Verone
Via A. Messedaglia, 20, Italy

**Cumberland Fruit Picker**

Made from galvanized wire, this fruit picker attaches to any round-ended pole.

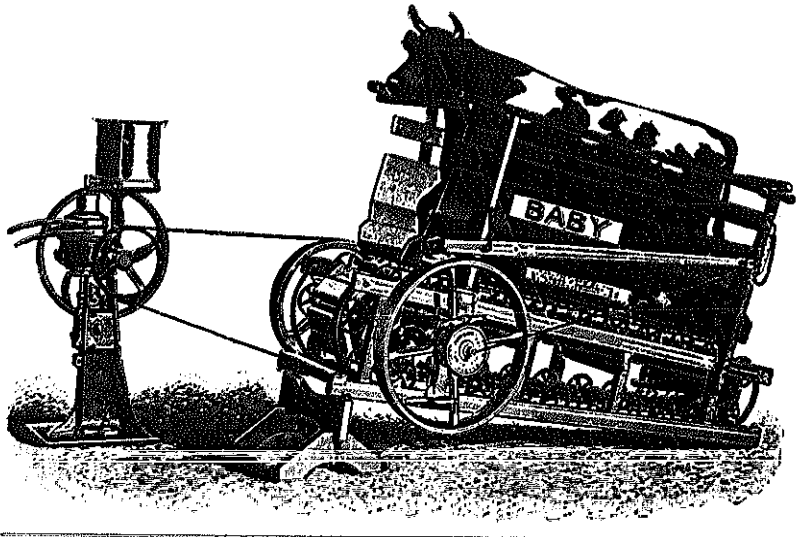
# -11- Livestock Equipment

Depending on the type of livestock and the actual number of animals or birds a farmer raises, equipment may be a large expenditure or a relatively small one. A handy farmer can build his own pens, coops, fences, feeders, and small buildings.

The following sources carry most of the equipment in which you might be interested for raising poultry, rabbits, pigs, cows, or horses. Other local raisers, the cooperative extension agent, and magazines devoted to a specific animal or breed can also be helpful in locating information on equipment.

## GENERAL SOURCES OF LIVESTOCK EQUIPMENT

Brower Mfg. Co.
640 S. Fifth St.
Quincy, IL 62301



*Her work is never done! In an old advertisement, we see the family cow separating her own cream with treadle power—illustrating the true meaning of self-sufficiency.*
*The Farm Implement News*, 1894

Nasco Agricultural Sciences
901 Janesville Ave.
Fort Atkinson, WI 53538

A variety of feeders, waterers, hog equipment, nursing equipment, and poultry equipment is offered.

The Pearson Bros. Co.
P.O. Box 192
Galva, IL 61434

They offer a wide variety of specific equipment for most farm animals, a large assortment of veterinary supplies, feeders, waterers, transporting equipment, and related agricultural supplies.

Feeders, waterers, stalls, and farrowing crates are available.

Quinn Machinery Division of Zeidlers, Inc.
Box 130
Boone, IA 50036

This company manufactures Daisy gravity and pressure waterers.

Shenandoah Mfg. Co.
Box 839
Harrisonburg, VA 22801

A variety of feeders and waterers, brooders, and metal nests can be found.

Southeast Mfg. Co., Inc.
Route 2 Box 275
Joplin, MO 64801

They carry stock racks for transporting small animals in pickup trucks and large portable hay feeders.

Tomsicek Mfg. Co.
1419 Adams Blvd.
Ithaca, NE 68033

They manufacture portable hay feeders.

Wadler Mfg. Co., Inc.
Route 2 Box 76
Galena, KS 66739

They carry oilers, livestock scales, hay feeders, assorted chutes, and crates.

WLC Co., Inc.
Sedlia, IN 56067

They have a wide variety of feeders, farrowing crates, stock tanks, and gates.

## INTERNATIONAL SOURCES OF GENERAL LIVESTOCK EQUIPMENT

Ets Louis Tellier
Athies-Sous-Laon
02000 Laon, France

Large transport equipment for livestock and feeders are available.

SKA s.a.s.
36066 Sandrigo (VI)
Italy

This company offers equipment for small- to large-scale livestock raising, including poultry, rabbits, cattle, and swine.

## NORTH AMERICAN SOURCES OF RABBIT SUPPLIES

Bass Equipment Co.
Box 352
Monett, MO 65708

They handle a full line of rabbit-raising equipment.

Maple Grove Rabbit Farm
Chadsey Rd.
Pownal, ME 04069

A wide range of rabbit-raising equipment, rabbits, and books are offered.

Mother's General Store
Box 506
Flat Rock, NC 28730

They stock metal hutches and drinking tubes.

Nasco Agricultural Sciences
901 Janesville Ave.
Fort Atkinson, WI 53538

Feeders are available.

WLC Co., Inc.
Sedalia, IN 46067

Nest boxes, feeders, waterers, and hutches are available.

## INTERNATIONAL SOURCES OF RABBIT SUPPLIES

Self-Sufficiency and Small-Holding Supplies
The Old Palace, Priory Road
Wells, Somerset BA 5 1SY, U.K.

Waterers; cage-size hay racks.

## NORTH AMERICAN SOURCES OF SUPPLIES FOR COWS, CALVES, AND DAIRYING

American Village Institute
440 Meyers St.
Kettle Falls, WA 99141

They offer a butter churn, butter molds, and a butter paddle.

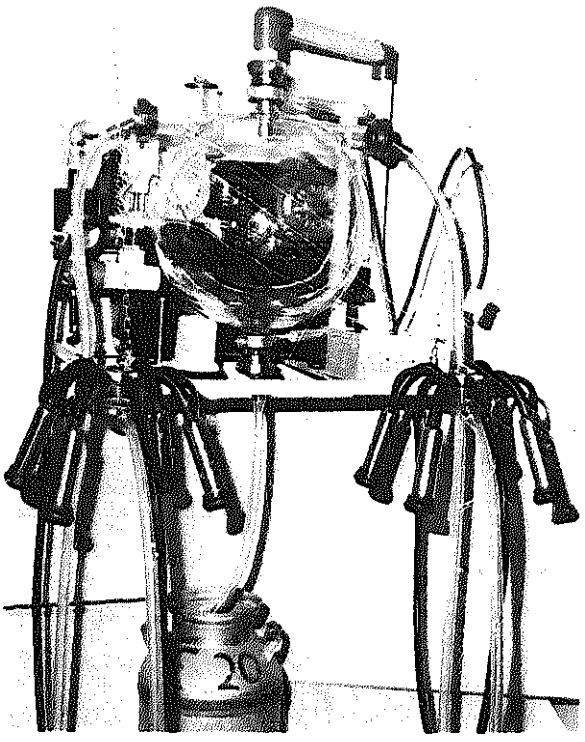
Belknap, Inc.
Box 28
Louisville, KY 40201

This company manufactures halters, leaders, feeders, weaners, kickers, dehorners, and bells.

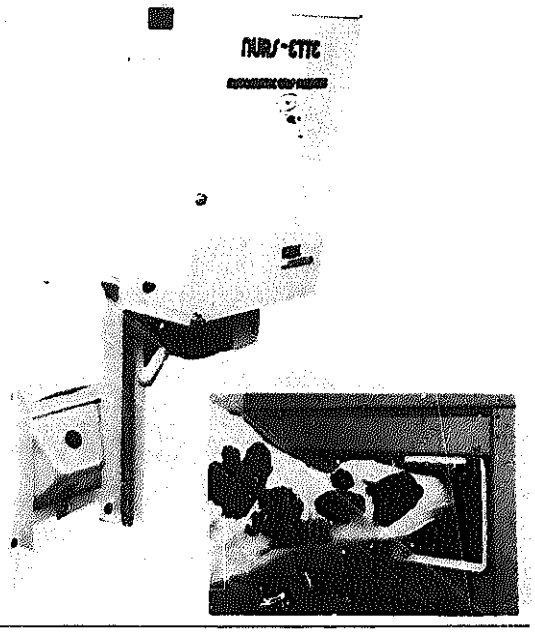
Chore-Boy Division
Gloay and Co. Inc.
Cambridge City, IN 47327

They carry milking systems.

Countryside Catalog
Route 1, Box 239
Waterloo, WI 53594



*The Chore-Boy Milking System: a two-unit pipeline system that can be installed and in use in an hour.*
Gloay and Co.



*K & K Nurs-Ette Automatic Calf Feeder*
K & K Mfg.

Milking pails are available.

Cumberland General Store
Rt. 3, Box 479
Crossville, TN 38555

They have nursery items including nipples, calf weaner, cow kicker, bull rings, horn weights, dehorner, bells, halters, and health care accessories.

Glen-Bel Country Store
Rt. 5
Crossville, TN 38555

They offer cattle leaders, dairy halters, bull rings, bells, calf weaners, cow kickers, and grooming aids.

K & K Mfg., Inc.
Rogers, MN 55374

They have Nursette feeders for calves, bottle feeders, and dry automatic feeders.

K-W Mfg. Co., Inc.
800 Marion Rd.
Sioux Falls, SD 57106

They have pole syringes and calfers.

Marting Mfg.
Washington Court House, OH 43160

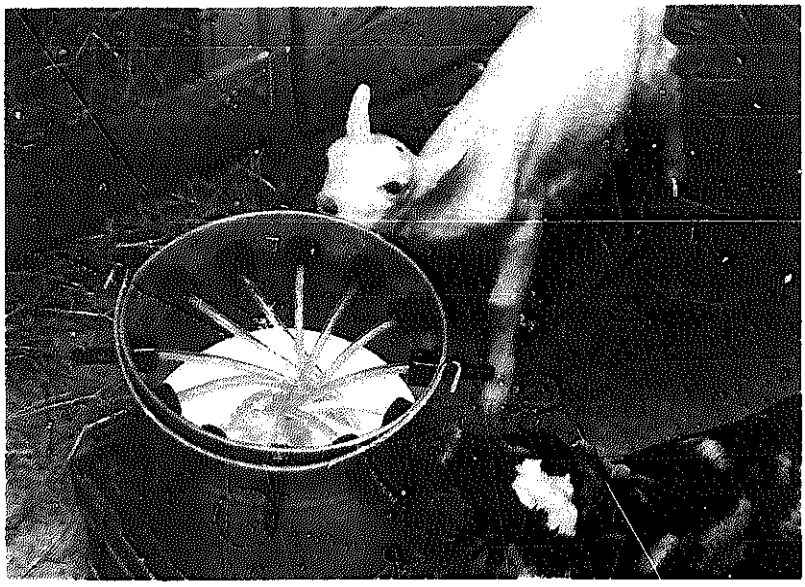
Feeders, waterers, scales, chutes, shelters, and oilers are available.

Montgomery Ward (catalog)
1000 S. Monroe St.
Baltimore, MD 21232

There are stock tanks, feeders, waterers, tagging guns, home pasteurizers, and milk filters.

Mother's General Store
Box 506
Flat Rock, NC 28731

Halters and bells are available.



*Parts are available for making your own feeder.*

Nasco Agricultural Sciences
901 Janesville Ave.
Fort Atkinson, WI 53538

There is a wide variety of halters and leads, grooming accessories, hoof and horn equipment, blankets, home pasteurizers, and a wide assortment of dairying equipment including testing supplies.

Sears, Roebuck & Co.
Farm and Ranch Catalog

They have feeders, milk pasteurizers and butter churns.

Schoessow, Inc.
Rt. 2
Pulaski, WI 54162

They have large wagon feeders and gates.

## NORTH AMERICAN SOURCES OF GOAT SUPPLIES

Countryside Catalog
Rt. 1, Box 239
Waterloo, WI 53594

They have harnesses and dairying supplies.

Hoegger Supply Co.
Box 490099
College Park, GA 30349

***This peculiar-looking device is an aid to keeping those pesky, sometimes dangerous, flies and other insects off your cows. It is a canvas roll which is filled with any absorbent material like cotton rags. The roll is then saturated with rotenone and lubricating oil and suspended between two poles slightly lower than the back height of an average cow. The animals, after an introduction by walking them under the roll once or twice, will return to it on their own, says Gayle Treadwell of Beeville, Texas; it keeps insects under control.***

New Delphos Mfg. Co.
Delphos, OH 45833

They have a variety of feeders, waterers, metal nests, and vent accessories.

Ronson Farms
P.O. Box 12565
Columbus, OH 43212

They offer feeders, incubators, brooders, cages, poultry pickers, chicks, pigeons, pheasants, waterfowl, quail, doves, books, and aviary accessories.

Sears, Roebuck & Co.
Farm and Ranch Catalog

They list feeders, waterers, steel poultry nests, cartons, chickens, ducklings, goslings, and mallards.

Stromberg's Pets Unlimited
50 Lakes Route
Pine River, MN 56474

They carry feeders, waterers, incubators, chicken pluckers, chicks, bantams, ducklings, goslings, and books.

Productions Master S.A.
Apartado Postal 74-057
Calzada de Tlalpan 1606
Mexico 13, D.F.

Feeders, waterers, and brooders are available.

## INTERNATIONAL SOURCES OF POULTRY SUPPLIES

CeCoCo
P.O. Box 8, Ibaraki City
Osaka Pref. 567, Japan

They have egg washers and sorters.

Dalton Supplies, Ltd.
Nettlebed, Henley on Thames
Oxon, U.K.

They carry marking equipment.

PAL, Ets. P. Lecieux & Cie
rue du Riez
59112 Annoeullin, France

Feeders and brooders can be ordered.

Self-Sufficiency and Small-Holding Supplies
The Old Palace, Priory Road
Wells, Somerset BA 5 1SY, U.K.

Feeders, poultry houses, and identification equipment can be found here.

## NORTH AMERICAN SOURCES OF SHEEP SUPPLIES

Belknap, Inc.
P.O. Box 28
Louisville, KY 40201

They carry shears.

Columbia Cutlery Co.
P.O. Box 123
Reading, PA 19603

They have a variety of sheep shears.

Countryside Catalog
Rt. L, Box 239
Waterloo, WI 53594

They have shears and wool cards.

K & K Mfg., Inc.
Rogers, MN 55374

They carry Nursette lamb feeders, nipples, and tube assembly parts.

Nasco Agricultural Sciences
901 Janesville Ave.
Fort Atkinson, WI 53538

They offer marking equipment, cards, halters, blankets, nursing supplies, castrators, lambing instruments, and a variety of shears.

## INTERNATIONAL SOURCES OF SHEEP SUPPLIES

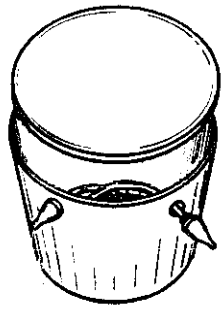
Dalton Supplies, Ltd.
Nettlebed, Henley on Thames
Oxon, U.K.

They have lamb-bar feeders, lambing instruments, ram harnesses, ewe-bearing retainers, and castration rings.

Kumaon Nursery
Ramnagar
Nainital, U.P. India

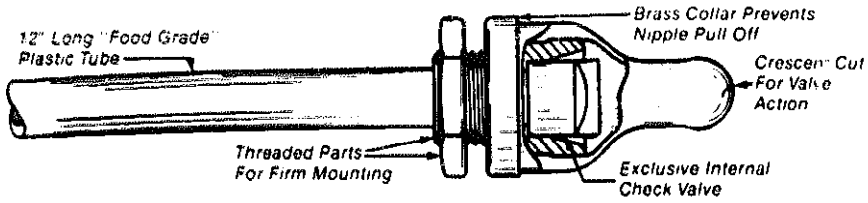
**Custom Build Your Own Feeder**

*Many companies offer the parts for fabricating a feeder at home. . .*
K & K Mfg.

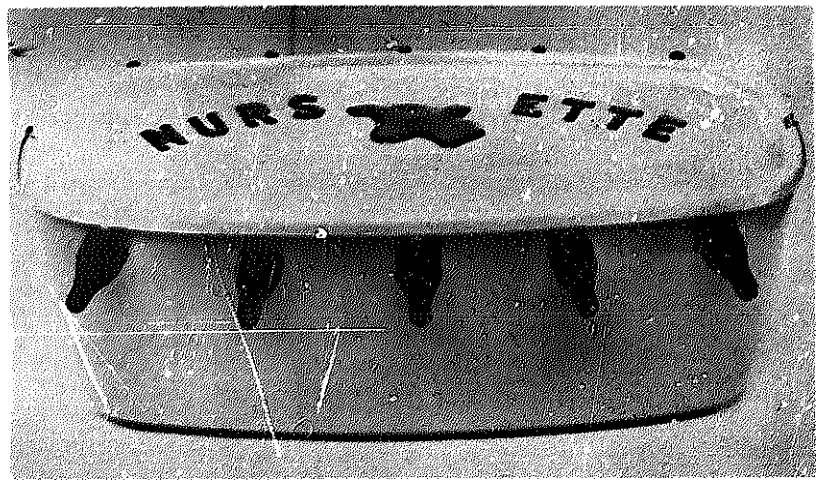


Cut a 7/8" hole in a suitable container and install the nipple and tube assembly best suited to your needs.

**ASSEMBLY FEATURES:**



*. . . or as a preassembled unit.*
K & K Mfg.



They carry shears.

R.A. Lister Agricultural, Ltd.
Dursley
Gloucestershire GL 11 4HS, U.K.

Electric- or engine-powered sheep shears are available.

Self-Sufficiency and Small-Holding Supplies
The Old Palace, Priory Road
Wells, Somerset BA5 ISY, U.K.

Shears and shepherd's crooks are available.

Ubungo Farm Implements Mfg. Co.
P.O. Box 2669
Dar-Es-Salaam, Tanzania

They carry shears.

## NORTH AMERICAN SOURCES OF HOG SUPPLIES

Belknap, Inc.
P.O. Box 28
Louisville, KY 40201

They have feeders, holders, and marking equipment.

Brower Mfg. Co.
640 S. Fifth St.
Quincy, IL 62301

Hog-holding crates, farrowing pens, and pig brooders are available.

Countryside Catalog
Rt. 1, Box 239
Waterloo, WI 53594

They handle harnesses.

Cumberland General Store
Rt. 3, Box 479
Crossville, TN 38555

They offer holders, feeders, waterers, and marking equipment.

Glen-Bel Enterprises
Rt. 5
Crossville, TN 38555

They carry feeders.

K & K Mfg., Inc.
Rogers, MN 55374

They have a nurse-ette piglet feeder.

Marting Mfg.
Washington Court House, OH 43160

They carry a large variety of feeders, waterers, hog houses, holders, oilers, and scales.

Montgomery Ward
1000 S. Monroe St.
Baltimore, MD 21232

They handle feeders, waterers, holding crates, and farrowing stalls.

Nasco Agricultural Science
901 Janesville Ave.
Fort Atkinson, WI 53538

Marking equipment, castrators, holders, feeders, waterers, and scales are available.

New Delphos Mfg. Co.
Delphos, OH 45833

Feeders are available.

Winona Attrition Mill Co.
1009 W. Fifth St.
Winona, MN 55987

They have creep feeders.

## INTERNATIONAL SOURCES OF HOG SUPPLIES

Agromet Motoimport
00-950 Warszawa, ul.
Przemyslowa 26, Poland

Waterers and farrowing cages are available.

Dalton Supplies, Ltd.
Nettlebed, Henley on Thames

# -12- Tools for Fish Farming

edited by Nancy J. Moore

The uses of a farm pond are as varied as its owners. For some, ponds perform the vital function of providing water for home and livestock. To many people, the pond is a great source of recreation and relaxation—swimming, boating, and fishing in summer, and skating in winter. The pond serves as a catch basin for pasture runoff during rainstorms and is often the only water source for a range area in the event of fire. Insurance companies have been known to lower premium costs for owners of farm ponds.

Pond water is particularly rich in organic material when it contains fish and algae. Resourceful farmers can use this nutrient-rich water for crop irrigation, and benefit from the fertilizer boost as well. The extra bit of work and planning necessary for a successful farm pond is easily offset by these benefits.

## AN INTRODUCTION TO AQUACULTURE

by William O. McLarney, Ph.D.

The best argument for aquaculture is based on the ever-increasing need for protein foods. Fish and aquatic invertebrates are efficient food converters, capable of producing more protein per unit area from the same amount of food than their warm-blooded counterparts. The quality of protein is the highest available from animals and is the lowest in fat content.

The farm pond is usually stocked with largemouth bass and bluegills, and is designed to provide sport fishing with food as a fringe benefit. Even when managed with recreation in mind, the farm pond has been shown to produce a substantial amount of edible fish and, it is my belief that, properly managed, it could become a really significant factor in the nourishment of many families.

More than a few American farmers have made the logical transition from eating pond fish to fish culture for the express purpose of food production, often on a commercial scale. They are usually encouraged to go into farming rainbow trout or channel catfish. The former species has produced fantastic yields but requires a large and dependable supply of water at a constant temperature—a condition which can be met by only a few landowners. Catfish farming is more amenable to most farmers as it can profitably be carried out in warm, still water.

Almost all trout farmers use antibiotics, not only in disease treatment, but as a prophylactic measure in their stock's diet. Use of antibiotic feeds is increasing in catfish culture, and many farmers also apply chlorinated hydrocarbon herbicides as a matter of course. Researchers at the New Alchemy Institute in Falmouth, Massachusetts, and at Rodale Resources Incorporated in Emmaus, Pennsylvania, are seeking alternatives, however.

Trout and catfish farming in the United States is further characterized by monoculture and heavy feeding. The latter will almost always increase production and may be necessary in large-scale commercial fish culture, but it certainly is not necessary to produce yields appropriate for personal, family, or community use. Asian fish culturists produce thousands of pounds of food fish which derive their nutrients essentially through organic pond fertilization or enrichment from surrounding farmland, through cut grass, vegetable tops, or other such inexpensive feeds. Similar systems are beginning to evolve in Africa, where considerable success has been achieved with community fish ponds stocked chiefly with herbivorous tilapia.

The direct or indirect utilization of organic wastes by fishes is by no means the only way in which fish ponds can contribute to the recycling capacity of a farm's ecosystem. Excess fish or fish too small for human consumption may be com-

posted or fed to other livestock such as hogs or chickens. Under certain conditions, metabolic wastes from fish and shellfish may be applied beneficially to vegetable crops without harvesting the fish.

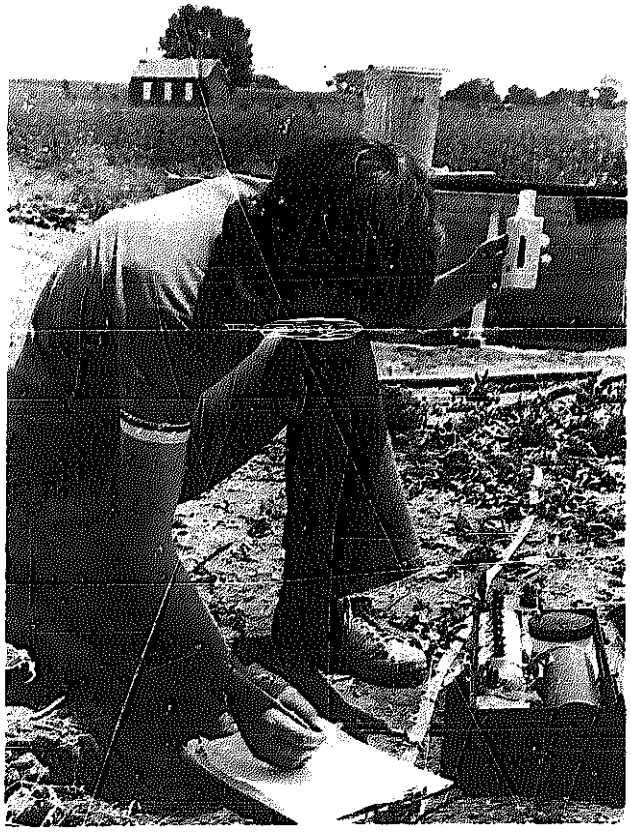
Polyculture is a widely applicable technique, with high yields being its most obvious benefit. The Chinese employ a highly refined polyculture technique which supplies them with a substantial supply of fish as it recycles their waste products and fertilizes their gardens. They build their latrines and animal shelters with slatted floors over the pond for organic wastes to fall through and supply the pond with a nutrient source. The pond becomes rich with algae feeding on the manure and provides a foundation for a complicated food chain to build upon. Algae- and manure-rich water is syphoned off to irrigate the garden and fertilize it at the same time.

A further benefit of polyculture includes providing the farmer with greater economic stability. (If one crop fails; there's always something else.) It also reduces the likelihood of a disease or pest destroying the entire crop, with the consequent temptation to use chemical poisons.

It would seem, then, that American food growers at all levels of the economy should not only consider taking up aquaculture, but should also be busy developing modern American analogs of the traditional Oriental pond polyculture systems. When integrated with similar practices on the land, such systems have the potential to revolutionize American agriculture—organically.

## WATER QUALITY

When employing intensive fish culture techniques, it is advisable to monitor the water quality. A thermometer is a must for all pond owners, but the intensive aquaculturist must also worry about dissolved oxygen and ammonia content in water. Too much ammonia or too little



*Frequent testing of water quality for excesses of ammonia or any oxygen deficiency will warn the fish farmer of problems before they become critical.*

oxygen quite often will result in fish kills. And with intensive fish culture, small deficiencies or excesses can rapidly reach dangerous proportions.

There are several companies which manufacture chemical testing kits for under $50, and one company manufactures a meter for measuring dissolved oxygen for a bit over $100.

Several companies manufacture water test equipment, but it is generally designed for precise research work, so prices tend to be high. For example, laboratory-quality oxygen meters, accurate to tenths of a part per million, start at $500. However, the Garcia is designed for fishermen, is less accurate but accurate enough, and costs a little over $100 (1977 price).

The other option for farm pond water testing is to use chemical kits. They require more time, to mix solutions and add chemicals to water samples, but they are much less expensive. The chemicals are premeasured in little packets called pillows to make the procedure as expedient and simple as possible. Chemical test kits are available to measure dissolved oxygen, pH, nitrogen ammonia, hardness, $CO_2$, and many other factors.

**Garcia D.O. Meter**

## AERATION

Most fish deaths occur because of an oxygen deficiency. Excessive algae and weed growth may rob ponds of oxygen, and the ammonia produced by fish waste products seriously affects water quality. Decomposing plant and animal materials may also contribute to oxygen loss and ammonia buildup. Aeration equipment offers relief from oxygen deficiency and excess ammonia problems.

Aerators can be divided into two main categories, mechanical aerators and agitators which transfer atmospheric oxygen into water, and diffusers, which are tubes that introduce oxygen bubbles into the water under its surface. Anyone who has seen an aquarium filter in operation knows how this type of aerator works.

Floating mechanical aerators use a pump to spray sheets of water above the pond's surface. This spraying action causes the water to absorb oxygen, aids in the removal of carbon dioxide and ammonia, and also may slightly lower water temperatures. Agitators are usually equipped with paddles which stir the water, causing it to oxygenate at the surface.

These positive features are clouded by a few disadvantages as well. Floating aerators and agitators should not be in operation while anyone is boating or fishing because they present an electrical hazard. They also obstruct the natural look of the pond. Some companies have manufactured aerators with decorative spray patterns in an effort to turn this negative feature into an attribute.

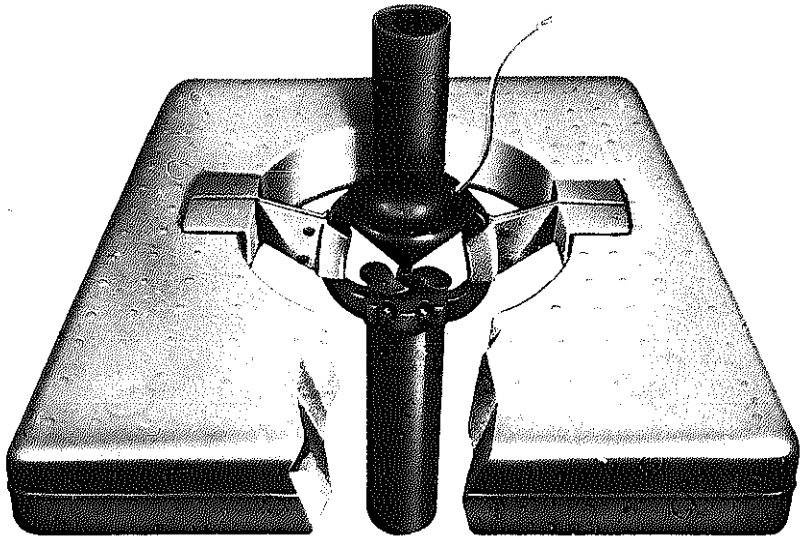
Diffusers, on the other hand, oxygenate the water while submerged, so they don't interrupt the aesthetics of the landscape or prohibit swimming or boating. Because of the equipment necessary for installation, such as air compressors and air pumps, diffusers are generally a more-expensive enterprise. Operation costs are generally higher because of a higher power requirement.

## SOURCES OF AERATORS

**Air-o-Lator**

A floating mechanical aerator, the Model AF-14 has a totally submersible 1/3 h.p. (115 volts, 7 amps under full load), stainless steel, electric motor which moves 350 gallons of water per minute, and comes with a 50-foot cord. Shipping weight: 35 pounds.

Air-o-Lator (Div. of Roycraft Industries)
8100 Paseo St.
Kansas City, MO 64131



*A cross section of the Air-o-Lator illustrates the position of the pump and impeller within the supportive float of a mechanical aerator.*
Air-o-Lator

**Aquacharger**

This unit is a ceramic diffuser-aerator. The manufacturer states that a single unit is sufficient to aerate a 1- to 2-acre lake 10 to 25 feet deep. The diffusing cylinder is 2.25 inches in diameter and 9.5 inches long. It will circulate water to a radius of 20 to 30 feet at the pond surface. Additional equipment needed for operation are a buried electric line with an outlet socket, a waterproof pump house on a concrete slab, an air pump, and copper tubing. Overall life of the unit is estimated at 10 years.

Environmental Management & Design, Inc.
P.O. Box 493
Ann Arbor, MI 48107

*Aquacharger Ceramic Diffuser-Aerator*
Environmental Management & Design, Inc.

**Aqua Puss**

The Aqua Puss is an air diffuser-aerator. Air is released from the diffuser in sufficient volume to maintain turbulent uplift at a rate at which oxygen transfer can take place. The water jet propels water enough to carry it above the water surface, making a rise in the pond. The water then flows back upon itself and is converted to a horizontal flow 360 degrees around the rising column.

Schramm, Inc.
901 E. Virginia
West Chester, PA 19380

**Boatcycle Company**

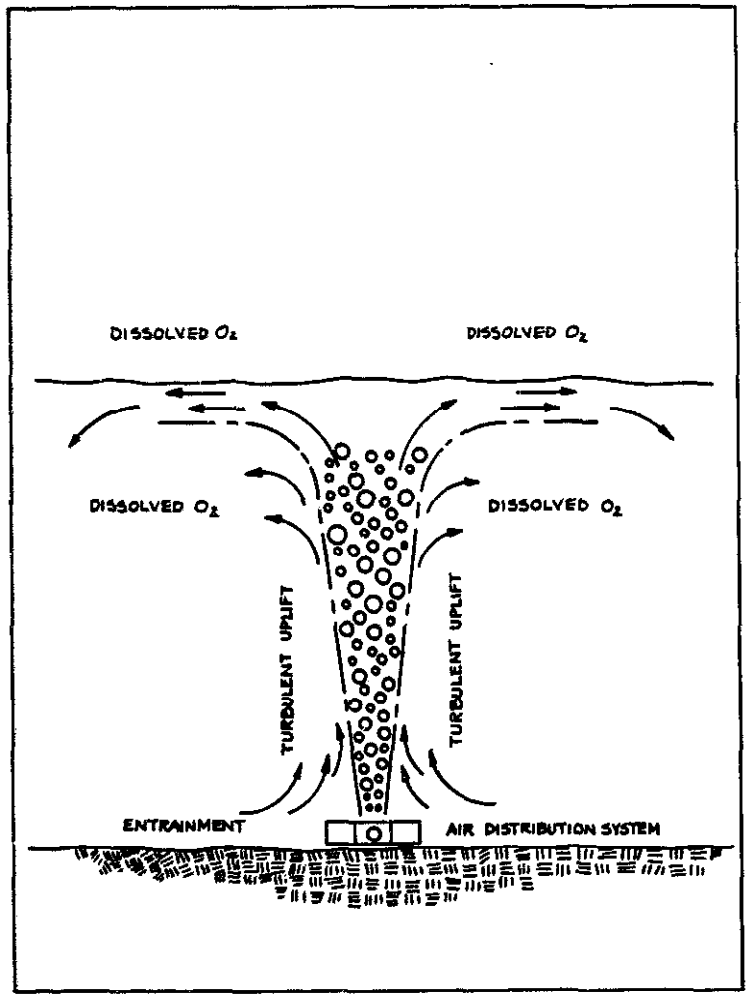
They are agitation equipment manufacturers. The Big Bull agitator has a 110-volt, ⅓ h.p. motor with a one-year warranty against defective materials and workmanship, provided all repairs have been done by the manufacturer.

Boatcycle Co.
P.O. Box 494
Henderson, TX 75652

**Crescent Agitators**

Crescent manufactures agitators in a variety of sizes for everything from small hauling and holding tanks to outdoor ponds. Both indoor and outdoor models are available.

Crescent Mfg. Co.
P.O. Box 3303
Fort Worth, TX 76105



*Air distribution system of a diffusing aerator.*

**Air Jet Aerator**

The makers of the Air Jet manufacture various kinds of agitation equipment. In this aerator, air is drawn down through a tube to a propeller and broken up into tiny bubbles. The water level will not alter the effectiveness of the unit. Models for both transport and pond aeration are powered by 110-volt, ⅓ h.p., fan-cooled, continuous-duty ball bearing motors.

Commerce Welding & Mfg. Co., Inc.
2200 Evanston St.
Dallas, TX 75208

**Fresh-Flo**

In this centrifugal action aerator, a propeller-impeller draws water into the unit and initiates a tremendous force. Water is passed through slots above the water line, and sheets of water are sandwiched with open air. This aerator is mounted on pipes, floats, or overhead installations and provides a continuous circulation process.

Fresh-Flo Corp.
Rt. 1
Adell, WI 53001

**GenAIRator**

This diffuser-aerator will aerate and circulate 6,000 gallons of water per hour (100 gallons per minute), and add 50 pounds of oxygen to the water per day. The ¼ h.p. motor has a thermo protector which shuts the motor off

temporarily during periods of low voltage or current shortages. There is no float, standpipe, or overhead support; it needs no adjustment to different lake levels. This model poses no hazard to boaters or swimmers, and it has a one-year guarantee.

Kembro, Inc.
P.O. Box 205
Meguon, WI 53092

**McDonald Oxidator**

Unlike many hanging aerators, water level is not critical with this agitating oxidator. It operates effectively when immersed in 8 to 12 inches of water. Aeration occurs at the surface by an agitating blade and at the bottom of the oxidator by an air rotor. The unit is engineered to aerate more with less agitation.

McDonald Bait Co.
Rt. 2, Box 300
Erin, TN 37061

**Micro-por**

This air diffuser-aerator consists of ABS thermoplastic tubing containing approximately 1,000 microscopic holes per linear foot. As air is introduced through the tubing at low pressure, it seeps out through these tiny pores along the entire length of the Micro-por pipe. Available in 100-foot coils or in 5-foot straight lengths with ½ inch male thread adapters.

Micro-por, Inc.
P.O. Box 278
Colwich, KS 67030

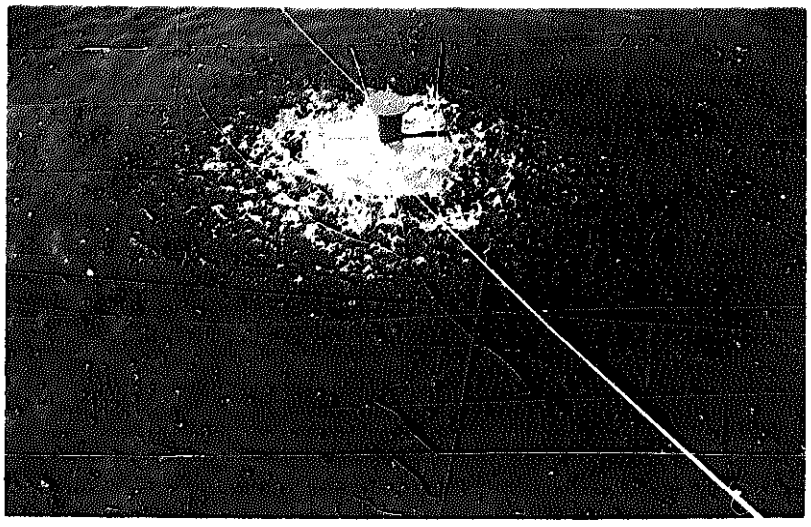
**P.J. Minneau**

Floating and submersible aerators are available from this company in the following sizes:

1. A 5 inch unit with a ⅓ h.p. electric motor which aerates 100 gallons per minute at ½ cent per hour;
2. A 5 inch unit with a ½ h.p. electric motor which aerates 200 gallons per minute at 1 cent per hour;
3. A 5 inch unit with a 1 h.p. electric motor which aerates 400 gallons per minute at 2 cents per hour; and
4. A 5 inch unit with a 2½ h.p. gasoline motor which aerates 500 gallons per minute at 10 cents per hour.

A 1½ inch pipe is needed for installation, its length depending upon the water depth and the depth it must be driven into the bottom to be firmly situated (submersible type). (Electrical costs were calculated in 1977).

P.J. Minneau Machine Co.
Lime Kiln Rd., Rt. 6
Green Bay, WI 54301



*Floating mechanical aerators, like this Otterbine Mechanical Aerator, may need to be held in place by mooring cables.*

**Otterbine® Aeration Systems**

These compact 1, 2, 3 and 5 horsepower floating mechanical aerators are designed to improve water quality in fish ponds by increasing the supply of dissolved oxygen available to the fish and by mixing the water to distribute dissolved oxygen to various depths.

With aeration, fish can be stocked more heavily, reach eating size faster, and are less vulnerable to diseases and parasites.

Otterbine aerators are installed by floating them into position in the pond, and mooring or anchoring them in place. An underwater power cable leads to on-shore electrical service. The 1 and 2 horsepower models require either 115 or 230 volt single-phase power; the 3 and 5 horsepower models require 230 or 460 volt three-phase power.

All Otterbine aerators are warranted conditionally against defects in materials and labor for one full year from date of delivery.

Rodale Resources Inc.
576 North St.
Emmaus, PA 18049

**Vulcan Aerator Company**

Vulcan's model No. 12 has a 12-volt, ball bearing, totally enclosed motor, with continuous-duty, replaceable brushes. Domes are available for splash-free operation, and it requires 3½ amps at half-paddle. Model No. 10 has a 1.5-amp, alternating current motor which operates at a slower speed.

Vulcan Aerator Co.
N. 113, W. 18830 Carnegie Dr.
Germantown, WI 53022

**Xodar Corporation**

Xodar's Model 360 is a submersed aeration diffuser. The air flow volume is very low in order to achieve sufficient discharge pressure to produce an effective bubble swarm for the desired maximum oxygen-to-water transfer.

Xodar Corp.
Powder Hill Dr.
Lincoln, RI 02865

## FEEDING

Two conditions encourage the use of supplemental feeding of farm pond fish: when the stocking density is higher than what would occur naturally and thus exceeds the natural food supply, and when an increased growth rate is desired. High-protein, pelleted commercial feeds satisfy both conditions and are available at most local feed stores.

Feed pellets are in either floating or sinking form. Floating pellets permit the farmer to watch his fish feeding. He can check growth as well as gauge what amount to feed. The activity with which fish feed is indicative of their health; healthy fish feed actively.

Sinking pellets insure that smaller, more timid fish are fed also. Every fish will eat, not only the big, aggressive fish cruising the water surface. Often pond owners use a combination of floating and sinking feed to reap the benefits of both. Feeding habits are species-specific. Thus, fish farmers should select feed according to recommendations for the variety they are raising.

Fish feeds come with different protein ratios; selection depends upon how extensive the feeding program is. If commercial feed is used only to supplement the fishes' natural diet, a lower protein ratio (25 to 30 percent) is used. If it is the major portion of the diet, then a higher protein ratio (30 to 40 percent) is recommended.

Many pond owners feed their fish by hand. This method is economical, but requires that the owner always be present at feeding time. Purchasing an automatic commercial feeder can easily involve an investment of $100 or more. The simplest feeder is a floating ring which merely confines food to one spot rather than having it float all over the pond. A design carrying the floating ring idea one step further is described in the following build-it-yourself plan. If you have decided to feed by hand, this feeder can make the venture easier while utilizing feed more effectively.

## BUILD-IT-YOURSELF FEEDER

This feeder can be used with both sinking and floating feeds. While sinking pellets drop into a sloped screen tray, floating feed remains

*A simple feeder will cut down on waste by preventing scattering.*

## FISH FEEDER

**Materials Required**

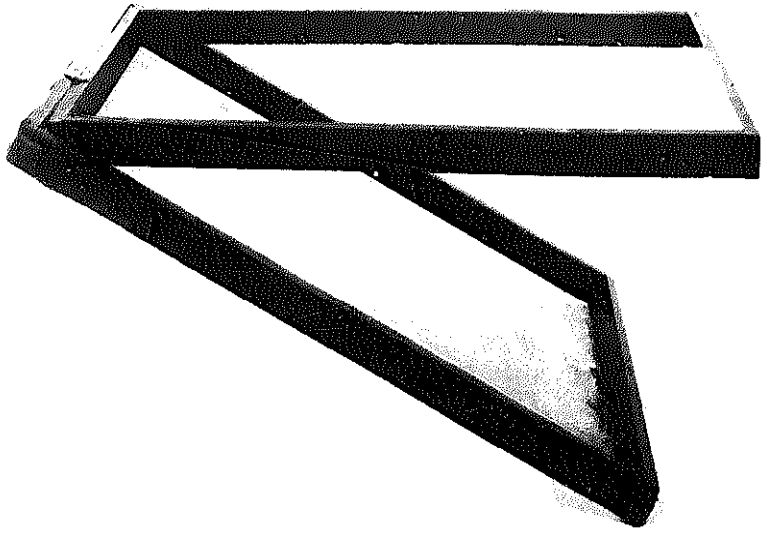
| QTY | SIZE & DESCRIPTION | PURPOSE |
|---|---|---|
| 2 | ¾" x 24" x 2¼" Pine | Frame |
| 2 | ¾" x 38" x 2¼" Pine | Frame |
| 2 | ¾" x 21" x 2¼" Pine | Floating |
| 2 | ¾" x 37" x 2¼" Pine | Frame |
| 1 | 44" x 28" Aluminum or Plastic Screening | Tray Bottom |
| 1 | 8" Strap Hinge | |
| 14 | 2"–#8 Wood Screws | |
| | Staples or Tacks | |
| | Marine Varnish | |

confined within a floating wooden square. Surface-feeding fish 'boil' the water as they scramble for food; fish occupying different feeding niches are satisfied with food distributed at different depths on the screen. It is necessary to weight the screened frame with a brick to keep it submerged.

Marine varnish or paint on the frame prevents the wood from rotting, and placing chicken wire over the floating frame keeps birds and other animals from stealing feed. Training fish to feed at one spot will allow you to watch them as they feed. Also, with fish congregated in one spot, harvesting procedures may be simplified.

Pretreat wooden frames with marine varnish before using wood screws in assembling the two frames. One frame will be 21 by 37 inches, the other 24 by 40 inches. The larger frame has screening stretched beneath it, stapled or tacked in place. Use the strap hinge to join the two frames so that the smaller of the two is inside the larger.

For turbulent water, you may wish to make the floating bracket smaller so water currents don't carry feed outside the screen.



*Build-It-Yourself Feeder*

## SOURCES OF COMMERCIAL FEEDERS

A number of commercial feeders are available which automatically dispense feed at timed intervals, while others feed by demand.

### E-Z Feed

The E-Z Feed is an automatic feeder with a time-controlled dispensing apparatus. Any type of dry food can be used, and the hopper will hold 40 to 50 pounds. This amount should be sufficient for 6 to 8 weeks for a 1- to 2-acre pond. Suggested installation is over the deepest water up to but not exceeding a depth of 10 feet. Larger or smaller hoppers are available upon request. If no electricity is available at the pond

*E-Z Feed Feeder*
E-Z Feed Co.

site. E-Z Feed offers a direct current model equipped with a 12-volt battery.

E-Z Feed Co.
P.O. Box 97
Morrisville, NC 27560

**Nielsen Model 5-0101**

This is an automatic feeder with a 100-pound capacity hopper which has an adjustable gate to control food flow. It is electrically powered by a 115-volt, 60-cycle, alternating current motor which normally draws 3.6 amps. Adjustable mounting brackets are available for installation. Feed dispersion patterns can easily be adjusted manually.

Nielsen Metal Industries
8501 Portland Rd. NE
Salem, OR 97303

**Poirot Farm Industries**

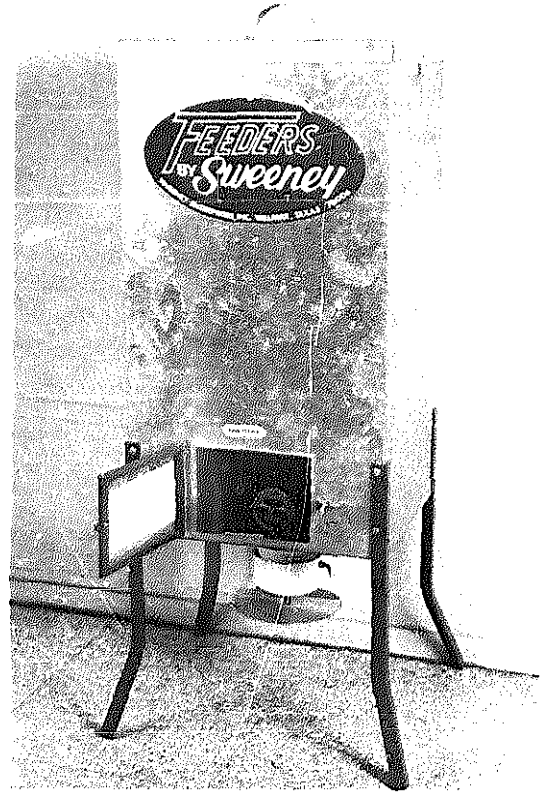
This company markets an automatic, floating, gravity-operated fish feeder which does not require electricity to operate. It is available with or without a float, and in 100- and 200-pound hopper sizes. The unit is lightweight and can easily be moved to any section of the pond, as it does not require an electrical outlet.

Poirot Farm Industries
Golden City, MO 64748

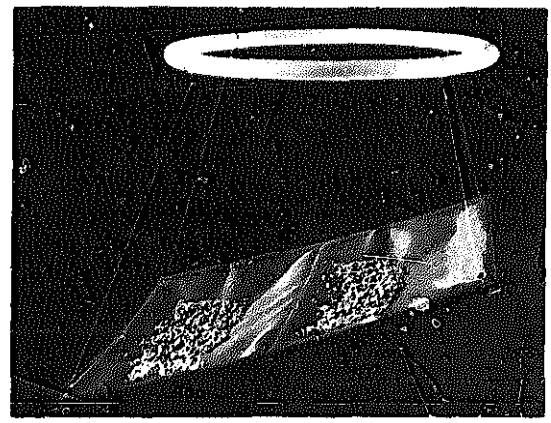
**Sweeney Enterprises, Inc.**

Automatic feeding systems are offered here with either 100- or 200-pound hopper capacities and adjustable feed dispersion patterns and flow rates. One model is a front-drop feeder (HF 1). All feeders are battery powered and equipped with a rechargeable dry battery and a DFT-1 Timer. Possible methods of installation include: standing the feeder on its short legs or purchasing extension legs, hanging it from cables and cross arms, or mounting it on a float.

Sweeney Enterprises, Inc.
Rt. 2, Box 145G
Boerne, TX 78006



*Sweeney Feeder*
Sweeney Enterprises, Inc.



*Farm Pond Harvest Feeder*
*Farm Pond Harvest*

**Farm Pond Harvest Bluegill Feeder**

This feeder utilizes both floating and sinking fish feeds. A floating ring contains floating

feed, and a plastic feeding tray suspended under this floating ring holds the sinking feed. This tray prevents the sinking feed from falling to the bottom of the pond. Bluegill may teach bass to eat from the feeder, helping with the harvest of bass. This feeder and feed are available from your local Purina dealer. If they do not have feeders contact:

*Farm Pond Harvest*
P.O. Box AA
Momence, IL 60954

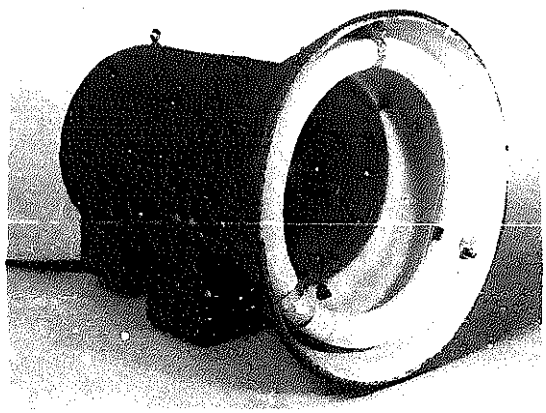
## BUG LIGHTS

Another type of feeder is the bug light, a device which attracts insects by fluorescent lighting. A fan pulls bugs into the water, or a blade cripples their wings, causing them to fall into the water. But depending upon your location, bug lights are often effective only during summer months when insects are prevalent.

## SOURCES OF BUG LIGHTS

### Will-o'-the-Wisp

This model is an adaptation of the yard bug light; it's an ultraviolet light which attracts insects and is equipped with a fan to blow them down into the water. The shell is made of fiberglass, and the black light is a 32-watt circular fluorescent tube connected to a small electric motor with a fan blade. The only maintenance needed is occasional cleaning and, possibly, replacement of the light bulb. Operating costs (in 1977) are less than 10 cents per day.



*Will-o'-the-Wisp Bug Light*
Hedlunds of Medford, Inc.

Hedlunds of Medford, Inc.
P.O. Box 305
Medford, WI 54451

### Bug-Eater and Security Light

This model is controlled by a photo cell which turns it on at dusk and off at dawn. It is easily plugged into any standard 110-volt outlet, and a direct current operating unit will permit operation where alternating current is not available. A specially designed wire blade rotates rapidly and cripples insects attracted to the light, scattering them into the water below. The unit causes no insect buildup or odor, and operating costs are less than 1 cent per day (in 1977).

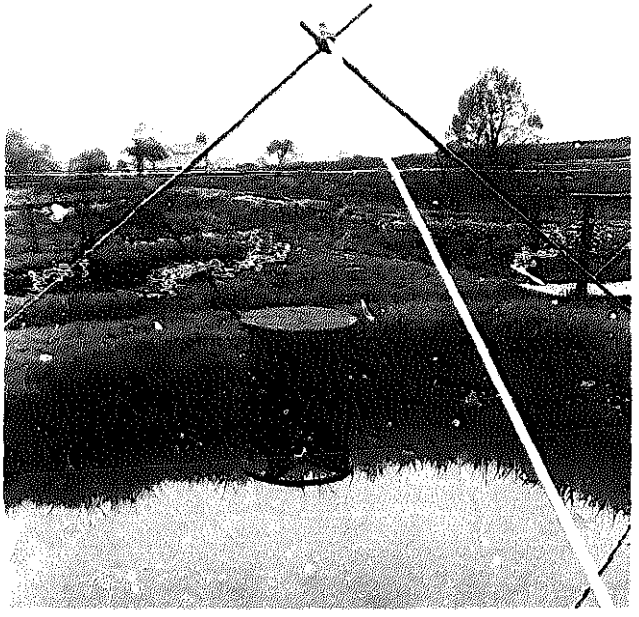
Southeast Equipment Co.
P.O. Box 6
Enigma, GA 31749

# INSECTS . . . AN UNTAPPED RESOURCE

by Andy Merkowsky

Insects are a natural resource man has yet to utilize to full potential. For most people, bugs are bothersome pests, but viewed differently, they are an excellent source of protein. The protein content of insects is high; some contain more than 60-percent protein. They live almost everywhere and have tremendous reproductive ability.

The squeamishness of most Western societies prohibits human consumption of insects. A more easily accepted method of utilizing insects is to recycle them through other animals. They can be incorporated into pelleted fish feeds or dropped directly into the pond with the aid of a bug light suspended over the pond. Fish congregate under these traps to feed. The high protein content of the



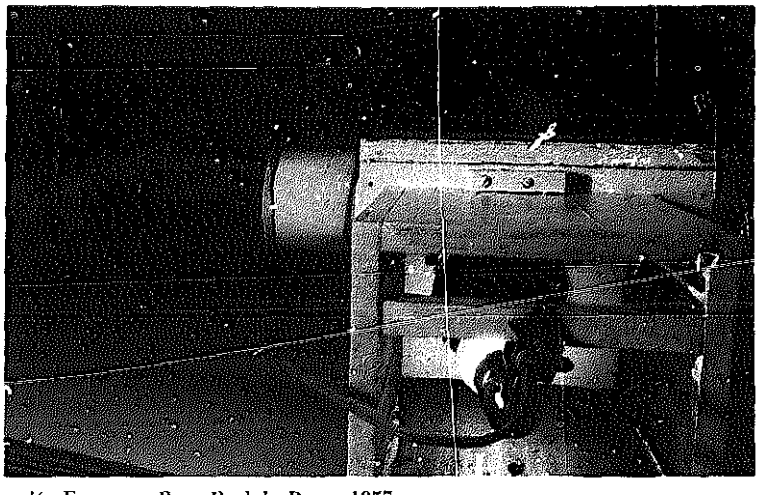
*Suspending an easily constructed insect trap over a pond transforms insect pests into fish food.*

insects makes for better growth rates in the fish, and as an added benefit, the fish will be easier to catch because they are congregated in one area.

Several types of insect traps have been developed, and companies are now marketing them. Although commercial traps work well, they are very expensive. Homemade traps are cheaper to build and work about as well as commercial models.

# DICK'S BUG MACHINE*

Originally designed by Dick Geddes of Winsted, Connecticut, this insect trap was used to supplement his chickens' diet. With only minor alterations, this insect trap can be suspended over a pond to effectively feed fish.



*Dick's Bug Machine*

* Reprinted from *Build It Better Yourself*. Emmaus, Pa.: Rodale Press, 1977.

## MATERIALS

Wood

1–2′ x 4′ sheet, ¾″ exterior plywood or

Sides: 4 pcs. 12″ sq.
End: 1 pc. 12″ x 13½″
Sides: 4 pcs. 8″ sq.

1 pc. 1″ x 1″ x 2″ or

Brace: 1 pc. 1″ x 1″ x 8″
Mounting block: 1 pc. 1″ x 1″ x 4″

Hardware

6d nails

3–½″ #6 screws

1 light bulb clamp and waterproof socket

1–10-watt light bulb

4–1″ #6 screws

Miscellaneous

1 electric fan, approx. 4½″ intake

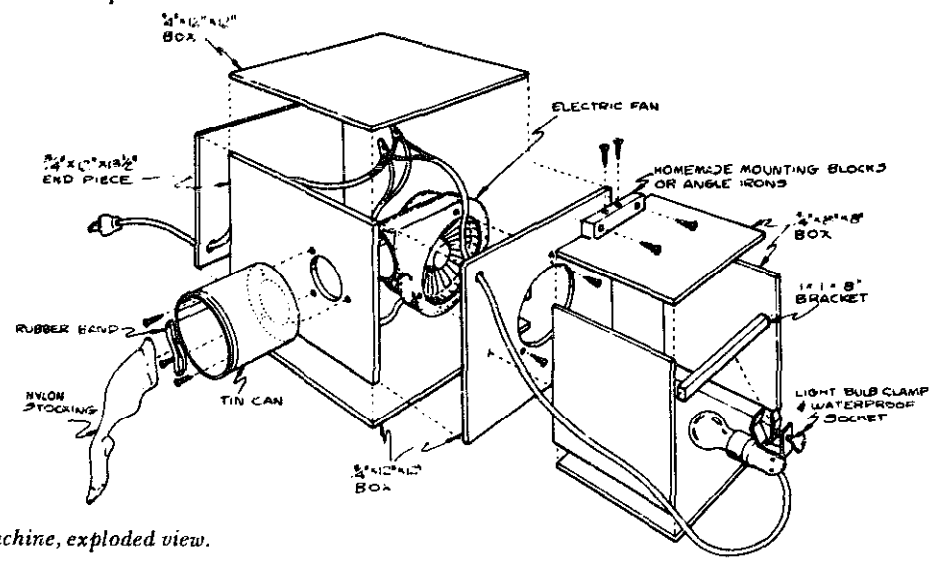
1 tin can

1 nylon stocking

1 heavy rubber band *OR* 1 elbow tube

## CONSTRUCTION

1. From ¾ inch plywood, cut four 12 inch square pieces and a piece 12 inches by 13½ inches. Nail the square pieces together, forming an open-ended box, using 6d nails.
2. Measure the diameter of the fan intake and cut a hole that size in the center of one side of the box. Mount the fan in the box, the intake against the hole cut for it, the exhaust directed out one of the open ends of the box.
3. Place the remaining piece of plywood against the open end through which the fan exhausts. Mark the location and size of the exhaust on the plywood, then remove the plywood and cut out the exhaust hole. Next, cut a similar-sized hole in the bottom of the tin can and secure it over the exhaust hole with three ½ inch #6 screws. Finally, nail the plywood to the box, using 6d nails.
4. Cut four 8 inch square pieces of ¾ inch plywood. Nail them together forming another open-ended box. Cut an 8 inch length of 1 by 1. Nail it across one open end of this box, so the light socket can be clamped to it, with the bulb inside the box.
5. Secure the light box to the fan box, using small corner irons or a homemade mounting, as shown in the photo.



*Dick's Bug Machine, exploded view.*

6. To trap and collect insects, slip a nylon stocking over the exhaust pipe and secure it with a stout rubber band.
7. For an automatic feed of insects into your pond, replace the stocking trap with an elbow tube directed toward the water.
8. Plug in the light and fan. A 40-watt bulb will provide adequate light.

## CAGE CULTURE

There are many advantages to raising fish in cages. Cage confinement means fish can be grown in streams and rapidly moving water without any fear of losing them to the natural environment. Feed waste is greatly reduced since the feeding is concentrated in a very small area. Because the movement of the fish is restricted, they do not need much feed to survive. They just eat and grow! Monitoring fish growth and health is greatly simplified, and the threat of predators is reduced. For a 100-percent harvest, the cages are simply lifted from the water—no fishing, draining, or seining (harvesting with a drag net) is necessary.

*Cage culture makes use of bodies of water that are otherwise unsuitable.*

# CAGES: A NEW APPROACH TO FISH CULTURE

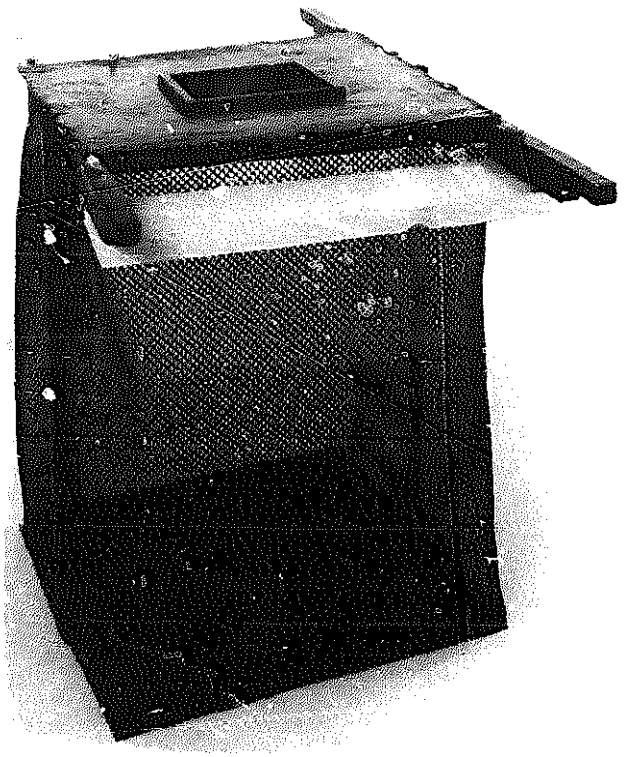
**by Andy Merkowsky**

Fish culture is an ancient art, but several new approaches have been developed in recent years. One of the more interesting developments is cage culture. Using this approach, the great numbers of farm ponds that would otherwise lay idle because they are without drains or contain stumps that make them impossible to seine, can now be utilized. Floating cages in these ponds can produce fish at a cost much lower than store prices for fresh fish. Cage culture does not interfere with the other pond uses; the pond can still be used for watering cattle, irrigating crops, or recreation.

Stocking rates in cages are amazingly high. For a cage measuring one cubic meter it is recommended that at least 150 fingerlings be stocked. Any less than this and fish may become territorial, resulting in fighting. Some researchers have successfully raised 500 fish per cubic meter, but a stocking density of 200 to 250 fish per cubic meter is generally suggested for most efficient use of cage space.

Cage culture is perhaps the cheapest method of raising fish because pond construction costs can be

avoided by using a farm pond already in existence. The movement of fish in cages is restricted so fish do not use as much energy, making feed costs much lower. Fish obviously are much easier to harvest, too.



*An easily constructed, durable fish cage.*

## HARVESTING

Any farm pond venture is only as successful as its harvesting methods. Getting the fish from the pond to the table can be approached in a variety of ways. For the sports-minded harvester, there is always the angler's approach. If the fish don't bite or if you want faster results, there are a variety of techniques which employ nets. Seining the pond and using gill nets are two efficient methods of harvesting fish all at once. Dip nets are effective for small harvests and will not injure fish.

## SOURCES OF HARVESTING MATERIALS

**Commerce Welding and Manufacturing Company**

This company manufactures 3/16 inch, nylon mesh, double-frame dip nets with two handle sizes. The nets have 15 inch widths. Handles are available in either 12 or 24 inch lengths.

Commerce Welding & Mfg. Co., Inc.
2200 Evanston St.
Dallas, TX 75208

**Crescent Manufacturing Company**

Crescent manufactures small dip nets for fingerlings and minnows. The nets have 6 to 9 inch bags of 3/16 inch nylon netting or 3/8 inch net. Nets are available in widths of 10, 12, 14, 18, 20, and 24 inches with handles 10 to 20 inches long. Small-mesh nylon seines are manufactured in depths of 4 to 12 feet and mesh sizes of 1/8, 3/16 and 1/4 inch. Larger mesh seines are offered in sizes of 1/2, 3/4, 1, 1 1/2, and 2 inches and in depths of 6 to 12 feet. Seines are tarred with black net bond for added strength.

Crescent Mfg. Co.
P.O. Box 3303
Fort Worth, TX 76105

**Duraframe Dipnet**

Dip nets come in three shapes, lengths of 3 1/2, 5, and 6 feet, and mesh sizes of 1/16, 1/4, 3/4, and 1 inch. Seines are made to the purchaser's specifications. Nets and seines are guaranteed for a period of one year: frames are handmade, and those used in cement runways have a second metal rim to keep the net lacing from rubbing and wearing against cement walls.

Duraframe Dipnet
Rt. 2, Box 166
Viola, WI 54664

**Nylon Net Company**

This firm manufactures a wide variety of nets, seines, and lead sinkers.

*The protective outer rim of the Duraframe Dipnet prevents the net from being damaged if rubbed against the pond wall.*
**DuraFrame Dipnet**

Nylon Net Co.
P.O. Box 592
Memphis, TN 38103

**Poirot Farm Industries**

The PFI Automatic Fish Harvester models 1-A and 1-B are made of ¾ inch nylon netting tied to three 6-foot pieces of aluminum tubing. When combined with a feeding apparatus, the net will be released when almost all of the feed has been eaten. A 12-volt battery is all that is needed to power the device. Model 2-B is available for minnows and small fish. If a customer is dissatisfied with the units after three weeks, a full refund is given if the system is returned washed. The automatic lift and sensor are guaranteed for 1 year against failure.

Poirot Farm Industries
Golden City, MO 64748

**Gill Nets**

Gill nets are very large, lightweight nets with mesh averaging about 3 inches. They have little application in fish farming because they catch only very large fish and the fish die shortly after being caught. Particularly useful for commercial fisherman and game and fish associations, they can be manipulated by one person and set up in about an hour. The nets are dropped into a lake or river and left for perhaps 24 hours. Fish are not able to see the fine strands of netting; so they swim right into the net. By the time they realize their peril, they have gone too far and their gills are caught in the net—like a fly in a spider web. Fish are often scarred or marked, and on the threshhold of death when finally pulled from the water. With an immediate market outlet for their catch, commercial fishermen find this technique quite satisfactory, but most people involved in aquaculture prefer to seine.

**Seine Nets**

Seine nets are used for harvesting all the fish from a pond at one time. Their mesh is much finer and made of a heavier fiber than gill nets in order to hold a whole catch without breaking. Lead weights attached to the bottom ropes prevent any fish from escaping the net as it is pulled across the pond. Floats attached to the top ropes complete the enclosure. To make the catch, the net is drawn across the pond and hauled out of the water at the other end. This is one task which requires a number of helpers.

**Catfish Nets**

Spines on the dorsal fins of catfish have a

*Special netting material must be used for harvesting catfish to prevent snagging and injuring their spines.*

tendency to get caught in nylon mesh netting. This can be harmful to the fish and to you if you attempt to free them without gloves, and can create a potential bottleneck in your harvesting project. Special nets coated with tar are available to help you avoid this problem.

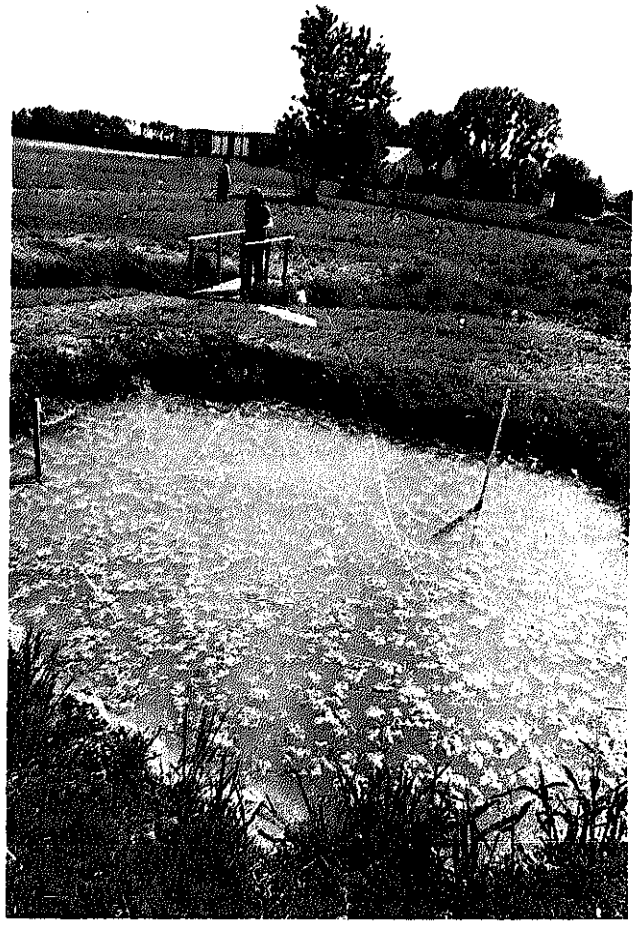
## AQUATIC PLANTS

The control of aquatic weeds is a problem which plagues everyone involved with fish farming. If allowed to grow unchecked, water weeds will overrun ponds and lakes, reducing their water storage capacity, restricting water flow, and possibly harboring disease-carrying insects.

There is no permanent solution to this problem, but the longer weeds are left to flourish, the greater will be the expense of their eradication. Several methods are employed to remove weeds: mechanical devices, biological controls, chemical treatments, and cultural methods. For ecological reasons, we do not recommend chemicals, especially since sound alternatives are available.

Cultural and biological controls are still in the experimental stages. Certain species of fish, like the white amur and tilapia, feed on aquatic plants. They are illegal in most states because the effects of their introduction into a new environment are unknown. Researchers experimenting with biological control are stocking weed-laden ponds with only male fish to control the population of the species.

Such uncertainties bring us to mechanical devices as the most practical and ecologically



*Algae blooms can rob fish of needed oxygen and cause massive fish kills.*

sound means of aquatic weed control. Various cutting and dislodging tools are commercially available or can easily be made. Floating and submerged weeds can be controlled by manually picking or cutting them. A number of cutting devices can be used to harvest weeds from the bottom of a pond. It is important to remove cut aquatic vegetation from the water, as many of these plants reproduce through fragmentation (simple cell division) and would soon fill the pond again. Harvesting them for their contribution to the compost pile alone would be worth the effort.

Another effective weed control technique is lining the pond bottom with plastic to prevent plants from rooting. This method is quite expensive, and in larger ponds, is generally used only in the swimming area.

## SOURCES OF WEED CUTTERS

### Kee Underwater Weed Cutter

This weed cutter is designed to control underwater plant growth. It is comprised of two serrated blades which pivot forward and backward whenever the direction of movement is changed. The cutter comes with a 5-foot handle; an extra extension is also available. The cutter has a 3-month guarantee.

Kee Mfg. Co., Inc.
P.O. Box 2195
Bradenton, FL 33505

### Joe Morreale and Son's Pond Sweeper

Plans for building your own pond sweeper are available by sending $3.00 to Joe Morreale. The unit is inexpensive to make, lightweight (12 pounds), and parts should be easy to find. It is operated by two people and is designed to gather weeds as they are cut, considerably simplifying disposal.

Joe Morreale
6805 Pioneer
Richmond, IL 60071

## SOURCES OF FISH

### Hatchery Listings

A list of all federal, state, and private hatcheries is available from:

National Marine Fisheries Service–National Oceanic and Atmospheric Administration
One Union Plaza, Suite 1160
Little Rock, AR 72201

When purchasing fish it is best to contact the closest hatchery. Transportation costs are high and stress to fish in transport may cause death.

### Commercial Fish Farmers Buyers' Guide

The *Buyers' Guide* is published annually and contains a list of distributors and manufacturers of everything the fish farmer may need. The list is comprised of the magazine's advertisers' and subscribers' products.

Commercial Fish Farmer Subscription Service
P.O. Box 4992
Manchester, NH 03105

## GOVERNMENT AGENCIES

There are a number of government agencies which provide literature and services for the pond owner. These services vary regionally, as some parts of the country are far more involved with fish farming than others. The best procedure is to contact a local office and ask specifically what information and services are available.

### United States Fish and Wildlife Service–Division of Fisheries

The assistance offered by this agency varies in different parts of the country based upon the availability of fish in the area. In the southeastern United States, pond owners can apply to have their ponds inspected and stocked by the Service and receive the assistance of a staff fisheries biologist.

For those fortunate enough to have one of these offices nearby, there is a very important service offered. Each office has a disease control center where pond owners can send samples of dead fish to be analyzed. A staff member will identify the problem and advise what action should be taken. This resource is a comfort when fish appear floating belly up and the cause of death remains a mystery.

**Soil Conservation Service**

Again, the services offered vary regionally, but in all states the Soil Conservation Service will provide information about the suitability of soil for pond construction, design criteria, and stocking advice. Some states require a formal written request for assistance and will send agents prior to construction, while in other states, agents may stay during the entire construction and may stock the pond for free.

**State Fish and Game Commission**

In states where this agency is funded by revenue from fishing permits, this commission is forbidden by law to service private ponds. In the South, where fish farming is widespread, services may include free stocking, removal of trash fish, and assistance in restocking ponds. The Fish and Game Commission may also test to see what fish are already in your pond, and advise what should be done with them.

**State Cooperative Extension Service**

This service generally provides a wealth of information about pond design and management, balance of fish population, and methods of plant control. They can also advise of applicable United States Department of Agriculture publications.

Most extension services have agricultural engineers and/or wildlife experts on staff to advise about fish culture, and in some states, agents will run water-quality tests and assist with pond and stocking management.

**United States Department of Agriculture Publications**

The following publications are available free of charge (as long as the supply lasts) by writing to:

Publications Division
Office of Communication
U.S. Department of Agriculture
Washington, DC 20250

Write your name and address plainly on your order, and be sure to include your zip code. In general, not more than one copy each of 10 publications is allowed.

| +F 2256 | Building a Pond |

## INTERNATIONAL DEVELOPMENT OF FISH FARMING

Most countries have government offices specifically geared towards international aquaculture development which are responsible for all project coordination. Often these agencies will contact other countries more actively involved with aquaculture for technical assistance. The United States Agency for International Development (USAID) and the Food and Agriculture Organization (FAO) are the two largest organizations involved with international aquaculture development. Both agencies have staff personnel trained to give technical assistance. Countries can apply to the World Bank for loans to finance their aquaculture projects. Generally, the World Bank will contact aquaculture experts for feasibility studies for a given country.

**Addresses of International Offices**

World Bank, International Bank for Reconstruction & Development

## RECOMMENDED PUBLICATIONS

**Magazines**

*Farm Pond Harvest*

Published quarterly, this magazine includes such features as Aquaculture News, Questions

and Answers, Let's Go Farmpond Fishing, various articles about pond species and problems, tips for fish farmers, and advertising for many different types of small-scale equipment. The magazine is geared toward the small farm pond situation.

*Farm Pond Harvest*
Department M76
P.O. Box AA
Momence, IL 60954

*Commercial Fish Farmer and Aquaculture News*

Published bimonthly, this magazine features aquaculture news, columns, and sections about all species of cultured aquatic animals, organization news and meetings schedules, new developments both national and international, regular columns by various aquaculture experts, and a new products section. Advertisers are national distributors and manufacturers of aquaculture products and species.

*Commercial Fish Farmer*
Subscription Department
P.O. Box 631
Penacook, NH 03301

Fish Culture Section/American Fisheries Society Newsletter

You must be a member of the American Fisheries Society to receive this newsletter. Summaries of aquaculture events, conferences, legislation, new publications, workshops and symposiums, lists and directories, and pertinent aquaculture information are presented in this publication.

American Fisheries Society
5410 Grosvenor Lane
Bethesda, MD 20014

**Books**

The following books will provide fundamental understanding of pond ownership and management. Some are more technical and scientific than others, but all will provide valuable background information.

Hickling, C.F. *The Farming of Fish.* Elmsford, New York: Pergamon Press, Ltd., 1968.

This book provides the reader with an introduction to fish culture and offers an international perspective. It presents information which is basic to understanding pond ecology and productivity—water supply and quality, energy production and consumption within the pond, how the food chain applies to pond life, and the biology of and life cycles within the pond. It also compares aquaculture techniques of various countries.

Bardach, John E.; Ryther, John H.; and McLarney, William O. *Aquaculture: The Farming and Husbandry of Freshwater and Marine Organisms.* New York: John Wiley & Son, Inc., 1972.

The introductory chapter of this book discusses the general principles and economics of aquaculture. The following chapters deal with individual species, describing both commercial and small-scale culture, environmental and biological requirements, breeding information and population controls, and what a particular species has to offer for the fish farmer. It is a must for anyone involved in aquaculture because it provides specific requirements and information about all fish and shellfish commonly cultured.

Bennett, George W. *Management of Lakes and Ponds.* 2nd ed. New York: Van Nostrand Reinhold Co., 1971.

Bennett's book is geared to the professional fisheries biologist or the recreation expert designated to develop a body of water for sports fishing. It provides considerable general information about fish culture and discusses the history and theory of fish management. Other topics covered include water quality, carrying capacity and productivity of a given body of water, behavioral patterns of fish, production and growth potentials, and detailed information about angling.

Chakroff, Marilyn. *Freshwater Fish Pond Culture and Management.* VITA: Manual Series Number 36E, 1976.

This manual is a complete how-to for the aspiring pond owner. It is designed to provide basic information for the Peace Corps worker in Third World countries; so it is not technical or highly scientific. It details pond siting and construction, management and harvesting techniques, and control of diseases, parasites, and predators. The manual is also full of plans, recipes, and homemade treatments.

Scott, W.B., and Crossman, E.J. *Freshwater Fishes of Canada*. Ottawa: Fisheries Research Board of Canada, 1973. Bulletin 184.

Many of the species of freshwater fish found in Canada can also be found in the United States. This book provides detailed information on many species of fish including anatomical sketches, descriptions, distribution, biological requirements, nomenclature, and relation to man. It also has an extensive glossary, many suggested readings, and a lengthy reference section. It is a valuable tool in providing the reader with the means of finding a wealth of material about many species of fish.

Podems, Marc, and Ruttle, Jack. *A Guide to Small-Scale Fish Culture*. Emmaus, Pennsylvania: Rodale Press, 1978.

This primer is a must for any would-be fish farmer. It describes how to raise fish in a pond or a pool or even in your basement in simple, easy-to-understand language. Its chapters include discussions on selecting the right species for given circumstances, caring for the fish, managing the water, estimating costs, and water ecology. In addition, sources for supplies, fish, and references to expert advice are listed in the appendix. It is illustrated with drawings of fish and is available without charge from *Organic Gardening* Readers' Service, Rodale Press, 33 E. Minor Street, Emmaus, PA 18049.

Logsdon, Gene. *Getting Food from Water: A Guide to Backyard Aquaculture*. Emmaus, Pennsylvania: Rodale Press, 1978.

This book, published in fall of 1978, is geared for the hobbyist interested in raising his own food and possibly making a small profit. It covers a wide range of topics from edible water plants to raising ducks to ice and ice houses. This book is not limited to procuring food from a farm pond only, but also tells how to get food from the wild. The first section of the book deals with naturally occurring bodies of water, and the second section deals with constructed ponds, tanks, and raceways.

Hale, P.R., and Williams, B.D., eds. *Liklik Buk*. Lae, Papua, New Guinea: Liklik Buk Information Center, 1977.

This handbook of intermediate technology in Papua, New Guinea has a brief section devoted to the local fish culture project. Dealing with tilapia, its chapters describe the economics, processing, and marketing of the fish.

Liklik Buk Information Center
P.O. Box 1920
Lae, Papua, New Guinea

# Appendix C: CONVERSION FACTORS: U.S. AND METRIC UNITS

These conversion tables will come in handy if you're interested in any pieces of foreign equipment. They were supplied by Seedburo Equipment Co.

## METRIC TO U.S.

| | | | |
|---|---|---|---|
| **LENGTH** | | | |
| 1 millimeter | = | 0.04 | inch |
| 1 meter | = | 3.3 | feet |
| 1 meter | = | 1.1 | yards |
| 1 kilometer | = | 0.6 | mile |
| **AREA** | | | |
| 1 sq. centimeter | = | 0.16 | sq. inch |
| 1 sq. meter | = | 11.0 | sq. feet |
| 1 sq. meter | = | 1.2 | sq. yards |
| 1 hectare | = | 2.5 | acres |
| 1 sq. kilometer | = | 0.39 | sq. mile |
| **VOLUME** | | | |
| 1 cubic centimeter | = | 0.06 | cubic inch |
| 1 cubic meter | = | 35.0 | cubic feet |
| 1 cubic meter | = | 1.3 | cubic yards |
| 1 milliliter | = | 0.2 | teaspoon |
| 1 milliliter | = | 0.07 | tablespoon |
| 1 milliliter | = | 0.03 | ounce |
| 1 liter | = | 4.2 | cups |
| 1 liter | = | 2.1 | pints (liq) |
| 1 liter | = | 1.1 | quarts (liq) |
| 1 cubic meter | = | 264.0 | gallons (liq) |
| 1 cubic meter | = | 113.0 | pecks |
| 1 cubic meter | = | 28.0 | bushels |
| **MASS** | | | |
| 1 milligram | = | 0.015 | grain |
| 1 gram | = | 0.035 | ounce (dry) |
| 1 kilogram | = | 2.2 | pounds |
| 1 metric ton | = | 1.102 | tons (short) |

Temperature °C Celsius x 9/5 and add 32° = °F.

## U.S. TO METRIC

| | | | |
|---|---|---|---|
| **LENGTH** | | | |
| 1 inch | = | 25.4 | millimeters |
| 1 foot | = | 0.3 | meter |
| 1 yard | = | 0.9 | meter |
| 1 mile | = | 1.6 | kilometers |
| **AREA** | | | |
| 1 sq. inch | = | 6.5 | sq. centimeters |
| 1 sq. foot | = | 0.09 | sq. meter |
| 1 sq. yard | = | 0.8 | sq. meter |
| 1 acre | = | 0.4 | hectare |
| 1 sq. mile | = | 2.6 | sq. kilometers |
| **VOLUME** | | | |
| 1 cubic inch | = | 16.4 | cubic centimeters |
| 1 cubic foot | = | 0.03 | cubic meters |
| 1 cubic yard | = | 0.76 | cubic meters |
| 1 teaspoon | = | 5.0 | milliliters |
| 1 tablespoon | = | 15.0 | milliliters |
| 1 fl. ounce | = | 29.6 | milliliters |
| 1 cup | = | 0.24 | liter |
| 1 pint (liq) | = | 0.47 | liter |
| 1 quart (liq) | = | 0.95 | liter |
| 1 gallon (liq) | = | 0.004 | cubic meter |
| 1 peck | = | 0.009 | cubic meter |
| 1 bushel | = | 0.04 | cubic meter |
| **MASS** | | | |
| 1 grain | = | 64.8 | milligrams |
| 1 ounce (dry) | = | 28.3 | grams |
| 1 pound | = | 0.45 | kilogram |
| 1 short ton | = | 9.072 | kilograms |

Temperature of Fahrenheit x 5/9 after Subtracting 32° = °C.

## TONS TO BUSHELS CONVERSION

**Conversion factors by grain:**

| Grain | Short | Metric | Long |
|---|---|---|---|
| Wheat | 33.333 | 36.743 | 37.333 |
| Corn | 35.714 | 39.368 | 40.000 |
| Soybeans | 33.333 | 36.743 | 37.333 |
| Barley | 41.667 | 45.929 | 46.667 |
| Oats | 62.500 | 68.894 | 70.000 |

| | |
|---|---|
| Wheat | 60 lbs. per bu. |
| Soybeans | 60 lbs. per bu. |
| Corn | 56 lbs. per bu. |
| Barley | 48 lbs. per bu. |
| Oats | 32 lbs. per bu. |

A Short Ton is 2,000 pounds.
A Metric Ton is 2,204.6 lbs.
A Long Ton is 2,240 pounds.

# Garden Glossary

Learning gardening terms and definitions.

We've gathered a list of common edible gardening terms and their definitions. Browse the garden glossary and learn. To quickly find the word you're looking for, click on the appropriate letter below.

()A | B | C | D | E | F | G | H | I | J | K | L | M | N | O | P | Q | R | S | T | U | V | W | X | Y | Z
()

**()Acidic Soil**
soil with pH lower than 7.0; adding garden lime (calcium carbonate) to the soil is a common practice used by gardeners to raise the pH level of soils that are too acid; the ideal pH for most vegetables is between 6.2 and 6.8, while herbs prefer a pH near neutral 7.0

**Newsletter Sign-Up**

### ()Aeration
refers to the amount of air space available in soil; roots need air to thrive, and air spaces also provide drainage and passages for insects and worms in the soil-food web; sandy soils have greatest aeration; heavy clay soils have the least; well-aerated soils are key to growing healthy plants so that roots can breathe; many root crops, such as carrot or sweet potato, love well-aerated sandy soil, which is also referred to as “light” soil

### ()Alkaline Soil
soil with pH between 7.1 and 14; alkaline soil is also referred to as “sweet” soil; adding sulfur to the soil can lower the pH level of soil that is too alkaline; the ideal pH for most vegetables is between 6.2 and 6.8, while herbs prefer a pH near neutral 7.0

### ()All-America Selection (AAS)
AAS varieties have been awarded distinction by a panel of judges for exceptional performance for disease or pest resistance, novel forms, earliness to bloom, great harvest yields and other desirable qualities; winners have performed well in trial gardens throughout the United States and the program has been giving awards annually since 1932

### ()Amendment
a material added to soil, usually to improve its ability to grow plants; it may improve fertility, drainage, or ability to retain water, or change pH; an amendment is most often worked into existing soil, as opposed to mulch, which is placed on top of soil; amendments include rotted or aged manure, cottonseed meal, compost, sand, peat moss, garden lime, and garden sulfur; nitrogen-rich amendments include many fertilizers, blood meal, cottonseed meal, and composted manure

### ()Annual
a plant that completes its life cycle in one growing season; roots, stems, and leaves die annually; many vegetables are annuals, including bean, cucumber, and squash

back to top
()

### ()Banding
a method of placing fertilizer in a narrow strip either on the soil surface or below it, typically near the root zone of plants (normal recommendations suggest 4-6 inches away from plants); banding is often done at or prior to planting time as a starter fertilizer for young transplants; it is commonly practiced in cool, wet regions and when growing using a no-till system of raised beds

### ()Beefsteak
a type of tomato that is very large (up to 1 pound), often irregularly shaped, and has a good solid flesh; beefsteak tomatoes are juicy and frequently grown for slicing; examples include ‘Better Boy‘, ‘Goliath‘, and ‘Mr. Stripey‘

### ()Beneficial Insects
insects that are considered friendly inhabitants in the garden, largely because they are predators of harmful pests; ladybugs and praying mantis are widely recognized as beneficial insects and sometimes released into gardens as a natural pest control

### Biennial

a plant that blooms in its second year and then dies; parsley is a biennial plant; onion is botanically biennial when grown from seed, but because our onion transplants are so far along when planted, they are grown like an annual and will often bloom the first year

### ()Bird Netting
a lightweight, usually plastic net that's used to protect ripening crops, such as strawberries, from foraging birds, rodents, and other critters; you can also toss netting over plants like beans to prevent deer and rabbits from feasting on foliage

### ()Black Gold
a gardening term often used to describe ideal loam soil, or a finished form of compost; loamy soil rich in organic matter

### ()Black Plastic Mulch
a type of inorganic mulch made from sheets of black plastic laid on the ground; used to smother weeds or warm soil; especially in cooler climates, black plastic is used to warm the soil for heat-loving crops and extend the growing season

### ()Blanching
1) during growing, blanching is a technique used to shade plant parts from sunlight to prevent greening; it's used when growing cauliflower to keep heads white (the process involves using a clothespin or twine to hold leaves over maturing heads); it's also used with leeks (in this case, soil is heaped against stems to produce the classic white form)
2) in food preservation, blanching is a process by which vegetables are partially cooked by placing into boiling water for a prescribed time and then quickly cooled to stop the cooking process; done prior to freezing, blanching helps vegetables retain color, crispness, and flavor; it also neutralizes enzymes and bacteria that can cause items to spoil

### ()Blossom Drop
common name when flowers form then drop without forming fruit or form small fruit that drop; most tomatoes, peppers, and eggplant will drop blossoms when daytime temperatures are above 90 degrees F and/or nighttime temperatures are above 75 degrees F; blossoms will also drop when night temperatures drop below 55 degrees F

### ()Blossom-End Rot
a blemish that causes rot (most often in tomatoes and peppers) on the blossom-end of the fruit, (opposite the stem end); blossom-end rot is usually the result of lack of calcium available in the soil or inconsistent water levels

### ()Bolt
a process that occurs when leafy vegetables flower and go to seed; when bolting occurs, plants grow taller and leaves lose flavor and become bitter; bolting is typically triggered by longer days and warmer weather; crops prone to bolt prematurely because of improper temperature or other stress include cilantro, lettuce, onion, spinach, and members of the cabbage family, such as kale, cabbage, and broccoli

### ()Breaker Stage
refers to a stage of ripening in tomatoes when the fruit is first starting to show hints of mature color (beyond green); tomatoes picked at the breaker stage will continue to color and ripen after picking if placed in a cool, dry place out of direct sun

**Newsletter Sign-Up**

### ()Browns
a compost ingredient that is rich in carbon; sometimes abbreviated “C”; typically, browns are dry materials, such as fallen leaves, pine needles, hay, straw, sawdust, shredded paper, newspaper, cardboard; good compost contains a ratio of 3 parts browns to 1 part greens

### ()Bt
short for Bacillus thuringiensis, a naturally occurring soil bacterium used to kill certain insect pests; Bt produces proteins that react with cells in the guts of certain insects, paralyzing the insect digestive system so that it stops feeding and dies of starvation; Bt doesn’t kill beneficial insects; different strains of Bt affect specific insects, including caterpillars, fungus gnats, and Colorado potato beetles; insects must eat the Bt to be affected, so the insects will still be active for a short while after applying, as it does not kill instantly after spraying; Bt comes in a liquid or powder that’s mixed with water and sprayed onto plants; sunlight breaks it down in about 7 days, although residual effect varies by strain

### ()Bush Variety
a compact form of a plant that yields full-size fruit, but typically less fruit than the full-size plant over the course of the growing season; bush varieties are ideal for growing in small gardens or containers; bush tomatoes are typically determinate

back to top
()

### ()Cole Crop
any plant belonging to the mustard (cabbage) family, including cabbage, Brussels sprouts, cauliflower, collards, kale, kohlrabi, mustard, and turnip; cole crops thrive in cool seasons

### ()Cold-Tender Annual
a plant that is typically killed by freezing temperatures

### ()Compost
an organic soil amendment that results from decomposing organic matter, such as leaves and vegetable scraps; compost enhances soil fertility, improves clay soil’s ability to drain, and improves sandy soil’s ability to retain water; some gardeners refer to compost as “Black Gold“

### ()Composting
the technique of recycling organic material such as leaves and vegetable scraps so that they decompose into a rich soil amendment that gardeners fondly nickname “Black Gold“

### ()Container Garden
planting vegetables, herbs, or flowers in individual containers or pots rather than in-ground or in raised beds

### ()Cool-Weather Or Cool-Season Crops
vegetables and herbs that flourish in the cooler seasons of early spring and fall; they usually become bitter or bolt in the warmer temperatures of summer

### ()Cracking
when the skins of fruits, such as tomatoes, split or crack from a large fluctuation in water intake; often due to inconsistent watering or after rainy spells.

**Newsletter Sign-Up**

### ()Crack-Resistant
a vegetable or fruit whose skin isn't prone to crack easily; cracking typically happens following a quick supply of lots of rain or watering, because the plant is stressed from taking up water faster than the skin can expand; it's most often used in reference to tomatoes; cabbages are referred to as split-resistant

### ()Cucurbit
a plant belonging to the plant family Cucurbitaceae, or gourd family; includes squashes, watermelons, cantaloupe, gourds, pumpkins, and cucumbers.

### ()Culinary (As In Herbs)
referring to plant crops used in cooking

### ()Cut-And-Come Again Harvest
a harvest method used with leafy crops where you cut off the entire plant, when plants reach 3 to 6 inches tall, leaving a half-inch stub; plants re-sprout to yield more harvests later; with most greens, you can anticipate three to four harvests with this method; good crops for this method include leaf lettuce, arugula, cilantro, parsley, and turnip and mustard greens

### ()Cutworm Collar
a barrier, such as a strip of aluminum foil, placed around the base of a seedling at the soil to prevent cutworms from reaching and injuring young stems

back to top
()

### ()Day-Length
the measure of daylight hours within one day; day-length is longer in the summer and shorter in fall and winter in the North Hemisphere

### ()Day-Neutral
refers to plants that mature or flower regardless of the length day; some plants, like onions, need either short days or long days to trigger maturity, but day-neutral plants don't differentiate

### ()Days To Maturity
the number of days from planting to the first harvest

### ()Determinate
a type of tomato that stops growing when it reaches a certain height; the majority of fruits mature within a small window of time and are formed on the edges of plants; ideal for canning or preserving; examples include 'Better Bush', and 'Rutgers'

### ()Digging Fork
a digging tool with four tines used to lift and aerate soil, blend amendments into soil, or harvest potatoes, onions, or leeks; sometimes called a spading or garden fork

### ()Drip Irrigation
a highly efficient method of watering that delivers water very slowly, literally a drop at a time, from a tube placed near the base of the plant; the tube ends in an emitter, which allows water to pass through drop by

Newsletter Sign-Up

drop; drip irrigation produces little waste and is an excellent choice for watering plants to conserve water and insure a steady, consistent supply

### ()Drought Tolerant
a popular term used to describe plants that withstand periods without regular, consistent watering

back to top
()

### ()Early Variety
a plant that matures earlier than typical for its type and delivers an early harvest; early varieties are ideal for planting in late summer to yield a fall crop; early tomato varieties include 'Better Bush', 'Bush Early Girl,' 'Big Beef,' and 'Early Girl'

### ()Edging Plant
refers to a plant that is low growing and can be used along the edges of planting beds or containers; because it has a short stature, an edging plant won't hide mid-size and taller plants that are planted behind it; sweet marjoram and thyme make good edging plants

### ()Female Flower
a flower that has only female parts; many vegetables have flowers that contain both male and female parts within the same flower, but cucurbits such as squash, cucumber, cantaloupe, and watermelon have separate male and female flowers, and pollen must be transferred from the male flower to female flowers by a pollinator such as a bee in order to make fruit; botanically, a female flower is also called a pistillate flower, it contains a pistil (female part made of stigma, style, and ovary) but no functioning pistil (male part including anthers)

back to top
()

### ()Fertilizer
a material that adds nutrients to the soil and is essential to support the healthy growth of plants; fertilizer may be natural, such as manure, or synthetic; fertilizers typically contain nitrogen (N), phosphorus (P), and potassium (K), and often other nutrients

### ()Fish Emulsion
a liquid fertilizer created from byproducts of the fish oil and fish meal industry; it comes as a concentrate that you dilute with water and apply to foliage; fish emulsion has a high nitrogen content, which makes it a good choice for leafy greens, like broccoli or Swiss chard, but all plants respond to it; it can have a fishy smell, but you can purchase types with less odor

### ()Floating Row Cover
a light- and water-transmitting polypropylene fabric that's placed over plants (either directly or using a structure) to shield them from cold, birds, and insects or diseases spread by insects; row cover fabrics protect plants from cold and wind in early spring to allow for earlier planting, and the provide shade for plants and soil in hot regions; row covers come in different thicknesses for use in different seasons; lightweight fabrics work well in summer heat; heavier fabrics can protect plants against varying levels of cold; also called row cover or garden fabric

**Newsletter Sign-Up**

### ()Frost Date
the dates designated by geographic location to determine the average first and last frost dates an area experiences; used as a guideline to determine a “safe” target planting date after the last frost of spring or before the first frost of fall; plants susceptible to frost damage are best transplanted within this window of time with enough days to mature before danger of frost

### ()Fruit Set (Or Setting Fruit)
initiation of fruit growth; pollination by wind or pollinators is required for fruit set

### ()Full Sun
at least six hours of direct sunlight; most vegetables thrive with six hours of direct sunlight in order to properly set fruit and produce expected harvests

### ()Fungicide
a chemical or natural compound that kills or inhibits fungi and/or fungal spores; fungicides are applied to plants to protect them from disease

### ()Furrow
a narrow groove or row made in soil for planting seed or bulbs, including onions

back to top
()

### ()Globe-Shaped
a round shape, usually in reference to a fruit or vegetable description; examples include ‘Summer Set’ tomato, ‘Green Globe’ artichoke, and ‘Candy’ onion

### ()GMO And Genetically Engineered
the term “genetically modified organism,” or GMO, refers to plants produced through genetic engineering; genetic engineering uses molecular biology techniques to introduce new genes, or to eliminate or rearrange specific genes, in a plant (or any organism) to achieve desired traits; in short, it describes a biologically altered and cross-bred organism, usually by insertion (from another organism) of a gene that carries the desired traits via the process of genetic engineering, which is different from traditional crossing, or hybridization; Bonnie Plants does not sell plants grown from GMO seeds

### ()Greens
a compost ingredient that is rich in nitrogen (sometimes abbreviated “N”); typically greens are fresh, moist materials, such as grass clippings, fresh green plant parts, fruit and vegetable scraps from the kitchen, coffee grounds, manure, organic fertilizers; good compost contains a ratio of 3 parts browns to 1 part greens

### ()Growth Habit
used to describe a plant’s characteristic shape, height, fullness or appearance such as upright or vining

back to top
()

### ()Half-Hardy Perennial

refers to a perennial plant that is tolerant of some frost and whose roots come back the next growing season in a moderate climate, but that is not tolerant of severe cold weather; an example is Mexican tarragon

### ()Hard Freeze
what occurs when the air temperature drops below 25 degrees Fahrenheit for four or more consecutive hours; many plants, even cool weather ones, have a hard time surviving a hard freeze and need to be protected via a row cover or cold frame

### ()Hardened-Off
a term used to describe seedlings or plants that have experienced gradual exposure to outdoor growing conditions and as a result can withstand ambient temperature or sunlight; in spring, it's vital to harden off indoor-raised seedlings to outdoor conditions; in fall, plants that have experienced the gradual cool-down are better able to withstand frosts when they arrive than if the weather were to drop from 80 degrees to 20 degrees overnight

### ()Hardiness Zone
zones denoted on a U.S. map to highlight areas of similar temperature ranges, specifically the average annual lowest temperature; zone hardiness of plants describes an area where a plant is most likely to thrive and tolerate the duration of the lowest freezing temperatures

### ()Hardy
describes a plant's ability to thrive or survive undamaged in specified lowest minimum temperatures; the most cold hardy vegetables are spinach and kale

### ()Heirloom
generally, a plant that has been passed down through generations due to valued characteristics such as flavor and color; more specifically, a plant that is at least fifty years old, is not a hybrid, and is open-pollinated; the widely accepted categories of heirlooms are:

1. commercial origin heirlooms, including open-pollinated varieties introduced before 1940, such as 'Rutgers', and those in circulation for more than 50 years, such as 'Bradley' and 'Homestead';
2. family origin heirlooms, passed down through generations, such as 'Cherokee Purple' and 'Arkansas Traveler';
3. heirlooms created by crossing two heirlooms or an heirloom and hybrid;
4. natural or mystery heirlooms, which are believed to be the result of natural cross pollination between two heirlooms

### ()Hormone
a plant hormone is a chemical messenger made inside the plant that influences growth, either stimulating or inhibiting it; hormones govern plant processes such as fruit set or ripening, seed germination, and stem elongation; some hormones can be synthesized in a lab and sold for home garden purposes, such as blossom set spray, which stimulates blossoming or fruit set in tomatoes is one example

### ()Hybrid
a plant produced as the result of a cross between two plants of different genotypes (plants that are different from each other genetically, such as a variety); in vegetables, hybrids are usually plants that are bred by crossing varieties; hybrids typically offer better disease resistance, higher yield, and other improved traits; our hybrids are not genetically engineered

**Newsletter Sign-Up**

back to top

()

### ()Indeterminate

a type of tomato that grows and produces fruits during the entire growing season; sometimes called a vine tomato; fruits mature all season long and appear along the length of the vine; examples include 'Big Boy', 'Early Girl', and 'Super Sweet 100'

### ()Inoculant

a product containing Rhizobium bacteria, which helps legume crops (peas, beans) to fix or add nitrogen to soil; inoculant improves yield of legumes; inoculant typically comes in a powder form that you add to soil at planting time; bacteria establish in soil; once established, you don't need to add more

### ()Insecticidal Soap

a soap formulated specifically to control insect pests; known for its insecticidal properties, thanks to the potassium salt in the fatty acids the soap contains; insecticidal soaps don't typically harm plants (unlike household soaps, which often have perfumes and other additives); soaps are most effective against soft-bodied insects such as aphids, young scales, mealybugs, and whiteflies; except for predatory mites, most beneficial insects aren't hurt by insecticidal soap as long as they are not wet by the spray

### ()Intensive Gardening Or Intensive Spacing

planting crops closer together than the recommended spacing (found on plant tags and labels) to maximize available garden space; reducing wasted space to interplant complementary crops, thereby increasing yields and reducing the need to weed

### ()Invasive

often used to describe the characteristic of a plant to thrive and readily re-seed, spread or multiply easily outside of natural range

### ()IRT Film

infrared transmitting plastic (IRT) is laid as a mulch on the surface of soil to transmit infrared radiation, while blocking most light (similar to black plastic mulch); it is used to warm the soil in spring, especially in cold climates; IRT film is usually translucent brown or green

back to top

()

### ()June-Bearing

a description used for strawberries that produce fruit once mid-season, around June in the North, rather than multiple times (seeming continuous) throughout summer (i.e. everbearing)

back to top

()

### ()K (Potassium)

the abbreviation for potassium; the last of three letters (N-P-K) used on packaged fertilizers to denote the percentage (by weight) of potassium contained; potassium contributes to a plant's overall health

back to top

()

### ()Lanky
too-long stems often a result of not enough light; these stems are weak and tend to fall over

### ()Layering
a method of propagating or rooting a plant in which you lay a stem that's alive and growing against soil, holding it in place with a stone, brick, or landscape staple; the stem produces roots where it touches soil; eventually, when roots are in place, you can cut the rooted seedling free from the main or mother plant to plant as a seedling; plants that layer easily include mosquito plant and tomato

### ()Light Frost
what occurs when the temperature drops below 32 degrees Fahrenheit and ice crystals begin to form; many cool weather vegetables (such as kale and collards) can not only survive a light frost, but even have their flavor improved by it

### ()Lime
calcium carbonate, or garden lime, is a type of soil amendment used to raise soil pH; it comes in different forms; some forms are fast-acting, other takes months to shift pH; some types are pelletized, others are fine and dusty; read product labels to buy the right type for your situation

### ()Liming
adding lime (calcium carbonate) to soil to raise its pH and make it less acidic

### ()Long-Day Onions
the term given to onion varieties that require a minimum number of days with long periods of sunlight to form proper bulbs; describes growing conditions where daylight lasts at least 14 hours, and nights are, of course, shorter; long-day onions are typically grown in the North

back to top

()

### ()Macronutrients
the elements used in largest quantity by plants that are essential to growth and health; they are nitrogen (N), phosphorous (P), and potassium (K), calcium (Ca), magnesium (Mg), and sulfur (S); also called major elements; three macronutrients (nitrogen, phosphorous, and potassium) are always listed on fertilizer labels by percentage (ex. 8-4-4 is the percentage of N-P-K in Bonnie Herb, Vegetable & Flower Plant Food)

### ()Male Flower
a flower that has only male parts; many vegetables have flowers that contain both male and female parts within the same flower, but cucurbits such as squash, cucumber, cantaloupe, and watermelon have separate male and female flowers, and pollen must be transferred from the male to female flowers by a pollinator such as a bee in order to make fruit; botanically, a male flower is also called a staminate flower, and it contains a stamen (male part including the pollen-bearing anthers) but no functioning pistil (female part made of stigma, style, and ovary)

### ()Micronutrients

**Newsletter Sign-Up**

the elements used in small but crucial quantities by plants that are essential to plant growth and health; these include sulfur (S), manganese (Mn), boron (B), copper (Cu), iron (Fe), chlorine (Cl), molybdemum (Mb), and zinc (Zn); also called minor or trace elements

### ()Mulch
a layer of organic or inorganic material placed on the surface of the soil; mulch helps soil retain moisture, suppress weeds, and maintain even soil temperature; mulch also helps keep leaves clean on greens and fruit clean on strawberries by keeping soil from splashing on the plants; mulch materials include grass clippings, shredded or ground bark, pine straw, aged manure, straw, rocks, and plastic sheeting

back to top

()

### ()N (Nitrogen)
a macronutrient that fuels new growth and the element that is used in largest quantities by plants, which is why is it always present in packaged fertilizers

### ()Neem Oil
a horticultural oil used as an organic insecticide and fungicide; made from the fruits and seeds of the neem tree, native to India; doesn't harm beneficial insects as long as it isn't sprayed directly on their habitat or food source

back to top

()

### ()Open-Pollinated
plants that are naturally pollinated by insects or wind without human intervention; an open-pollinated plant is not an F-1 hybrid; seeds from open-pollinated varieties yield plants and fruit that are the same or similar to the parent; being open-pollinated is one requirement for calling a plant an heirloom; all heirloom varieties are open-pollinated, but not all open-pollinated varieties are heirlooms

### ()Organic
in gardening, organic refers to anything relating to, or derived from living organisms; soil contains organic matter such as decaying plants and living organisms (worms, fungi, microbes); organic is also a labeling term for food and other products that are regulated by the United States Department of Agriculture and other entities to be grown or made using practices approved as organic

### ()Organic Gardening
using gardening techniques and products that promote or do the least disturbance to ecological health, including biodiversity and soil health; organic gardening practices minimize or eliminate the use of synthetic fertilizers and many conventional pesticides, instead relying on natural products and practices thought to promote the best overall environment; GMOs are not allowed in organic gardening

back to top

()

### ()P (Phosphorous)

**Newsletter Sign-Up**

a macronutrient that promotes root development, which strengthens plants, and increases blooms; often present in packaged fertilizers

### ()Part Sun (Or Part Shade)
plants labeled either part sun or part shade don't like a long exposure to full sun; because the sun's intensity varies according to season and geography, observation is the best way to gauge a site's suitability for your plant's needs; generally, figure four to six hours of direct sun daily for plants labeled part sun or part shade

### ()Perennial
a plant that lives from one year to the next; often, its leaves will die back to the ground at the end of the season, allowing new growth to emerge in the spring; perennial vegetables include artichoke, asparagus, and rhubarb; many herbs are perennial, including bee balm, chives, oregano, and mint

### ()PH
the letters "pH" are a technical terms that represent a measure of acidity; in soil, pH determines whether nutrients are available to plants or anchored tightly in soil; most vegetables need a soil pH between 6.2 and 6.8; herbs thrive when pH is near 7.0 (neutral); soil pH may change over time and should be tested every year or two

### ()Pollination
pollination is the transfer of pollen from male to female flowers, which often results in the flower producing a fruit or seed; pollen grains are transferred from the anthers (male flower part that produces pollen) to the stigma (female part that receives pollen) by wind or by pollinators such as bees; types of pollination include self-pollination (male and female parts on the same flower, such as a tomato plant) and cross-pollination (male and female parts on separate flowers), namely on cucumbers, squash, cantaloupe, and watermelons)

### ()Pollinator
an agent of pollen transfer including insects, such as bees, as well as wind

### ()Potting Mix
a growing medium made from materials such as composted bark, peat moss, perlite, and other ingredients, but not including true soil; potting mix is used in containers instead of garden soil because it provides a good balance of air, moisture, and nutrition for the container growing environment

### ()Potash Fertilizer
a fertilizer that's high in potassium, which promotes high vegetable yields; all plants need some potassium but some crops, such as artichoke, need more than others and benefit from a high-potassium fertilizer

()

back to top

()

### ()Rain Barrel
a barrel used to catch rainwater, often from a rooftop and gutter, and store the rainwater for use in the garden; rain barrels can be purchased ready-made or fashioned out of 50-gallon plastic barrels, trash cans, whiskey barrels, or other vessels

**Newsletter Sign-Up**

### ()Rain Gauge
a device that measures how much water a garden gets, either by rainfall or watering; keeping one in the garden can help you to determine if and how much to water plants

### ()Raised Bed
a garden bed built above the soil surface and typically framed with either wood or stone; raised bed kits and building plans are readily available; raised beds filled with potting mix, bagged garden soil, or a mixture of compost and garden soil help eliminate problems with poor native soil

### ()Reseed
also known as self-seeding or self-sowing; plants reseed when they produce mature seed that falls to the ground and germinates to produce new seedlings; examples of plants that frequently reseed include Mexican tarragon, dill, cilantro, and heirloom tomatoes; new crops may sprout in the same growing season or seeds may linger in soil through winter and sprout the following spring

### ()Rotate
to plant crops in a different place each growing season; many experts specify using a 3-year rotation, which means in one spot in the garden, you plant a different crop three years in a row before repeating the same crop in that spot again; this planting practice helps minimize pests and diseases

back to top

()

### ()Scoville Scale
the first lab approach to measure heat in peppers, devised by Wilbur L. Scoville in 1912; in this method, human subjects taste a pepper sample and record the heat level; the samples are then diluted in the lab until heat is no longer detected by the tasters; this dilution is called the Scoville Heat Unit; while the method is still subjective, as it depends on the taster's palate and sensitivity, it's the most accepted, scientific measurement of heat in peppers

### ()Semi-Hardy Vegetables
tolerate light frosts (usually 29 to 32 degrees F) late into fall and through winter in mild climates; good for spring and fall gardens; includes cauliflower, lettuce, radicchio, rutabaga, and Swiss chard

### ()Short-Day Onions
onion varieties that need short days (10 to 12 hours of daylight) to form bulbs; they take approximately 110 days to mature in the South if planted in the fall, and just 75 days in the North where they may be planted in early spring; the earlier you plant short-day onions, the larger they get, but they won't get very big in the northern states; short-day onion varieties include Georgia Sweet (Yellow Granex), Sweet Red, Texas Super Sweet (1015Y), Texas Sweet White

### ()Soaker Hose
a type of hose that applies water directly to soil, typically by sweating or seeping water through its porous surface; frequently made from recycled rubber; work best on a flat surface; good for conserving water

### ()Soil
the earthen ground that serves as a natural growing medium for the growth of plants; soil is made of minerals, air, water, and organic matter; the mineral component of soil is measured by size, including (largest to

smallest): sand, silt, and clay

### ()Soil Food Web
a community of organisms that live in the soil; as organisms move through the food chain, energy and nutrients are exchanged; the soil food web features a diversity of creatures, from microscopic bacteria, fungi, and algae, to mites and nematodes, to earthworms, ants, spiders, and plant roots.

### ()Split-Resistant
used to described cabbage varieties that resist splitting when they take up a lot of water, especially after a dry period; ‘Early Jersey Wakefield‘ and ‘Stonehead‘ are split-resistant cabbage varieties

### ()Strawberry Jar
a planter with pocketed openings in the sides into which small plants can be inserted for growing; used for growing strawberries as well as flowers and herbs

### ()Support
anything used to hold up a plant, such as a trellis, cage, or stake; support is often recommended for keeping tomato and cucumber plants upright and keeping fruit off the ground

back to top
()

### ()Transplant
young seedling plant especially grown in a container instead of starting directly from seed in the ground; the name “trans-plant” comes from the fact that it moves from its container into the ground; transplants give the garden a big head start; Bonnie Plants transplants are grown in greenhouses around the country and are ready for sale at the appropriate planting season

()

back to top
()

### ()Vermiculite
a natural, mica-like mineral that expands when heated; used as a soil conditioner to aerate heavy or sticky soil; included in many nursery mixes used for seed germination and potting to provide a growing medium that holds water but allows good drainage

back to top
()

### ()Warm Season Crops
plants that require warm soil and warm air temperatures to grow and produce these plants do not tolerate frost; they thrive in summer; setting out warm-weather crops when nights are cool or soil is cool can cause roots to rot; nights below 50 F can cause warm-season crops to stall, blossoms to drop, leaves to wilt, or fruit to fail to set; examples include basil, tomato, pepper, eggplant, okra, beans, cucumber, and melon

**Newsletter Sign-Up**

back to top

### ()Well-Drained Soil

soil that allows water to pass through it easily; a few minutes after watering or rainfall, soil that is well-drained will show no puddle of water remaining on the soil surface; all vegetables and herbs need soil that has good drainage

All plants native to

California

**6986 all plants** native to California

1

**Big Berry Manzanita** Arctostaphylos glauca

Add to plant list

Arctostaphylos glauca is a species of manzanita known by the common name bigberry manzanita. It is native to California and Baja California, where it grows in the chaparral and woodland of coastal and inland hills. This is a large shrub to small tree varying in size from >>

2

**Blueblossom Ceanothus** Ceanothus thyrsiflorus

Add to plant list

Blueblossom or Blue blossom Ceanothus is one of the most popular species of Ceanothus in landscaping applications. It varies dramatically in form and size over its natural range, with some plants growing fairly upright to 30 feet and others growing in a mounding form to only 2- >>

3

**Redbud** Cercis occidentalis

Add to plant list

The Western Redbud is a small deciduous tree or shrub found in the foothills and mountains of California. In the northern, rainier part of its range, it grows more often on dry slopes in mountain foothills. In the southern and drier part of its range, it grows most often near near >>

4

**Maritime Ceanothus** Ceanothus maritimus

Add to plant list

Ceanothus maritimus is a rare, narrow endemic species of shrub in the Buckthorn family (Rhamnaceae) known by the common name Maritime Ceanothus. It is endemic to San Luis Obispo County, California, where it is known from only a few occurrences in the vicinity of >>

5

**Blue Eyed Grass** Sisyrinchium bellum

Add to plant list

Blue Eyed Grass is a 1 foot tall perennial herb that grows throughout California, usually in open places where there is some moisture, particularly grassy areas. It can also be found in woodlands and at altitudes up to almost 8000 feet. The stems can grow as long as 24 in, >>

6

**Flannel Bush** Fremontodendron californicum

Add to plant list

Fremontodendron californicum, or California Flannelbush is one of the most spectacular of the native California shrubs. It is a fast growing evergreen shrub with fuzzy, flannel-like leaves and abundant, large yellow blossoms that bloom in the spring. Under ideal conditions, it can >>

7

**Hummingbird Sage** Salvia spathacea

Add to plant list

Hummingbird sage is a herbaceous plant species with woody bases and a somewhat sprawling habit with upright flowering stems. Its a member of the large Salvia or sage genus in Lamiaceae, or the mint family. This fruity scented Salvia blooms in March to May with >>

8

**Nevin's Barberry** Berberis nevinii

Add to plant list

Berberis nevinii (syn. Mahonia nevinii) is an evergreen species of flowering shrub in the Berberidaceae (barberry) family known by the common name Nevin ' s barberry. This plant is

endemic to southern California, where it is known from very few occurrences in the chaparral >>

9 **Coast Live Oak** Quercus agrifolia

Add to plant list

The Coast Live Oak is a beautiful evergreen oak that grows predominantly west of the central valleys, as far north as Mendocino County, and as far south as northern Baja California in Mexico. This tree typically has a much-branched trunk and reaches a mature height of 10-25 >>

10 **Mission Manzanita** Xylococcus bicolor

Add to plant list

Mission Manzanita is a shrub that grows up to 20 feet tall, and 20 feet in diameter. Its native range is very limited, comprising Southwestern and Pacific coastal California from San Diego county through north-central Pacific coastal Baja California, a small area in the foothills >>

11 **Santa Cruz Island Buckwheat** Eriogonum arborescens

Add to plant list

Eriogonum arborescens is a species of wild buckwheat known by the common name Santa Cruz Island buckwheat. This shrub is endemic to the Channel Islands of California. It may be anywhere from one half to two meters in height and sprawl from one half to three meters in >>

12 **California Fuchsia** Epilobium canum

Add to plant list

Epilobium canum is beautiful species of willowherb, native to the California foothills and coastal areas. It is a perennial plant, notable for the profusion of bright scarlet flowers in summer and autumn - it's usually the only native California plant in an area flowering at the >>

13 **Common Manzanita** Arctostaphylos manzanita

Add to plant list

Artostaphylos manzanita is a tall, beautiful species of manzanita with an often dramatic and winding branch structure. It has the common names of Whiteleaf Manzanita and Common Manzanita. It is native to California, where it can be found primarily in the North Coast Range, >>

14 **Chalk Dudleya** Dudleya pulverulenta

Add to plant list

Chalk Dudleya is a succulent plant known by the common names chalk lettuce and chalk liveforever. It is in the Subgenus Dudleya in which the flowers are tubular and pollination is primarily by hummingbirds or bumblebees. This dudleya is native to the southwestern United >>

15 **Showy Penstemon** Penstemon spectabilis

Add to plant list

Showy Penstemon is native to southern California and Baja California, where it grows primarily in the chaparral, scrub, and woodlands of the Peninsular and Transverse ranges, and to central California, where it grows in the northeastern part of the South Coast Range. It >>

16 **Deergrass** Muhlenbergia rigens

Add to plant list

Deergrass is a large perennial bunchgrass found in sandy or well drained soils below 7000 feet in elevation in the southwestern United States and parts of Mexico. In California, it grows primarily in the coast ranges of central and southern California, the Sierra and Cascade >>

17 **Douglas Iris** Iris douglasiana

Add to plant list

The Douglas Iris is a common and attractive wildflower of the coastal regions of Northern and Central California and southern Oregon, with scattered locations inland. The Douglas Iris grows mainly at lower elevations, below 100 meters (330 feet), though it is occasionally found >>

18

**Oregon Grape** Berberis aquifolium

Add to plant list

Berberis aquifolium is a species of flowering plant in the family Berberidaceae, native to western North America. It is the state flower of Oregon. In California, it grows throughout the mountains and foothills of northern and central California, and in Southern California, it grows >>

19

**Fremont Cottonwood** Populus fremontii

Add to plant list

The Fremont Cottonwood is a cottonwood native to North America, growing in riparian areas near streams, rivers, and wetlands in the southwestern part of the United States, and downwards into Mexico. It is a large tree growing from 12-35 meters in height, with a trunk up >>

20

**Carmel Ceanothus** Ceanothus thyrsiflorus var. griseus

Add to plant list

Ceanothus thyrsiflorus var. griseus is a variety of flowering shrub known by the common name Carmel ceanothus. It formerly called Ceanothus griseus and considered a separate species and some sources may still use this terminology. This Ceanothus is endemic to >>

21

**California Aster** Corethrogyne filaginifolia

Add to plant list

Corethrogyne filaginifolia (syn. Lessingia filaginifolia) is a species of flowering plant in the daisy family known by the common names common sandaster and California aster. The taxonomy of this plant and certain relatives is currently changing; recently the Corethrogynes >>

22

**Toyon** Heteromeles arbutifolia

Add to plant list

Toyon is a beautiful perennial shrub native throughout the western part of California and the Sierra foothills. It is a prominent component of the coastal sage scrub plant community, and is a part of drought-adapted chaparral and mixed oak woodland habitats. It is also known by the >>

23

**Little Sur Manzanita** Arctostaphylos edmundsii

Add to plant list

A species of manzanita known by the common name Little Sur manzanita. This shrub is endemic to California where it grows on the coastal bluffs of Monterey County. This is a petite, low-lying manzanita which forms mounds and patchy mats in sandy soil. The leathery leaves >>

24

**Blue Oak** Quercus douglasii

Add to plant list

The Blue Oak is endemic to California and is found in foothills surrounding the Central Valley of California, the South Coast Range, North Coast Range and San Francisco Bay Area. It is also sometimes known as the Mountain Oak, and occasionally the Iron Oak. Blue Oaks are >>

25

**Western Columbine** Aquilegia formosa

Add to plant list

Names include Crimson Columbine, Western Columbine or (ambiguously) "Red Columbine". It is a common and attractive wildflower native to western North America, from Alaska to Baja California, and eastward to Montana and Wyoming. It is very often known as the "Red >>

26

**Black Oak** Quercus kelloggii

Add to plant list

California Black Oak (Quercus kelloggii), also known as simply Black Oak, or Kellogg Oak, is an oak in the red oak section (Quercus sect. Lobatae), native to western North America. It is a close relative of the Black Oak (Quercus velutina) found in eastern and central North America. >>

**Creek Dogwood** Cornus sericea ssp. sericea

Add to plant list

27

Creek Dogwood (Cornus sericea ssp. sericea) is a native shrub that grows in northern, southern and central California. It was formerly known as Cornus stolonifera and is still referred to by that name in some sources. It is moderately fast growing and moderately long- >>

28

**Channel Islands Tree Poppy** Dendromecon harfordii

Add to plant list

A species of flowering plant in the poppy family known by the common names Channel Islands tree poppy and Harford's tree poppy. It is sometimes treated as subspecies harfordii of its relative, Dendromecon rigida. This is a shrub or small tree reaching heights between 2 and >>

29

**Western Sycamore** Platanus racemosa

Add to plant list

Western Sycamore is a species of plane tree known by several other common names, including California sycamore, California plane, and Aliso. It is native to California and Baja California, where it grows in canyons, floodplains, and along streams in several types of >>

30

**Hooker's Manzanita** Arctostaphylos hookeri

Add to plant list

Arctostaphylos hookeri is a species of manzanita known by the common name Hooker's manzanita. This shrub is endemic to California where its native range extends from the coastal San Francisco Bay Area to the Central Coast. This is a low shrub which is variable in >>

31

**San Diego Ceanothus** Ceanothus cyaneus

Add to plant list

Ceanothus cyaneus is a rare species of flowering shrub known by the common names San Diego Ceanothus and Lakeside Ceanothus. This Ceanothus is found in the mountains of San Diego County, California, and its range probably extends just into Baja California. Most of the >>

32

**Summer Holly** Comarostaphylis diversifolia

Add to plant list

Comarostaphylis diversifolia is a rare shrub in the heath family known by the common name Summer Holly. It is slow growing in an upright form up to a height of 20 feet or more, with striking white flowers in the spring, an incredible summer display of holly-like red berries , and >>

33

**Catalina Cherry** Prunus ilicifolia ssp. lyonii

Add to plant list

Catalina Cherry (Prunus ilicifolia ssp. lyonii) is a native tree that grows in Southern and Central California, primarily in the Channel Islands region. though with some specimens in the coastal Southern California mainland. It is fast growing once established, and moderately >>

34

**Island Snapdragon** Gambelia speciosa

Add to plant list

Island Snapdragon is a somewhat vine-like perennial plant native to the Channel Islands of California and Guadalupe Island, Mexico. It has trumpet-shaped red flowers which attract birds, especially hummingbirds. Under the right conditions it can bloom almost year >>

35

**Blue Elderberry** Sambucus nigra ssp. caerulea

Add to plant list

Blue Elderberry, Mexican Elderberry, or Tapiro is a deciduous shrub or small tree, growing up to as tall as 30 feet. It is native from Oregon to Baja all the way to western Texas. It has cream or yellow flowers in the spring and purple berries in the fall. It's berries are one of the most >>

36

**Engelmann Oak** Quercus engelmannii

Add to plant list

The Engelmann Oak, also called the Mesa Oak, is a beautiful rare oak native to Southern California. Suburban sprawl has eliminated these oaks from the majority of its native range. Most remaining trees are located in San Diego County, with small remnant populations in >>

37

**Sugar Sumac** Rhus ovata

Add to plant list

Rhus ovata, also known as Sugar Bush or Sugar Sumac, is an evergreen shrub to small tree that grows in chaparral in dry canyons and slopes below 1300 meter in Southern California, Arizona and Baja California. In the southern part of it's range (in Los Angeles, Orange and >>

38

**Bush Anemone** Carpenteria californica

Add to plant list

The sole species in the genus Carpenteria in the Hydrangea family, is an evergreen shrub native to California. It is closely related to the genus mock-orange genus. Common names include Tree-anemone and Bush-anemone. It is a rare species, endemic to only seven sites in >>

39

**Hoaryleaf Ceanothus** Ceanothus crassifolius

Add to plant list

Ceanothus crassifolius is a species of flowering shrub known by the common name hoaryleaf ceanothus. This Ceanothus is found throughout the coastal mountain ranges of the southern half of California below 3,500 ft., and its range extends into Baja California. It is an erect, >>

40

**Conejo Buckwheat** Eriogonum crocatum

Add to plant list

Eriogonum crocatum (Conejo Buckwheat or Saffron Buckwheat) is a rare species of wild Buckwheat that is endemic to the Conejo Valley and surrounding regions in Ventura County, California. It grows on open, dry hillsides, often in crags in rock faces. Conejo Buckwheat is a >>

41

**White Sage** Salvia apiana

Add to plant list

White sage, bee sage, or sacred sage, is one of the cornerstone species of the coastal sage scrub habitat of Southern California and Baja California. It grows rapidly to 3 or 4 feet tall, with white flower spikes shooting up sometimes 8 feet or more. The leaves (about 1.5-3 inches >>

42

**Southern Kinnikinnick** Arctostaphylos uva-ursi

Add to plant list

Arctostaphylos uva-ursi is a species of Arctostaphylos, one of several related species referred to as bearberry. Names for this species include kinnikinnick and pinemat manzanita. It is a small procumbent woody shrub 5-30 centimeter high. The leaves are evergreen, remaining >>

43

**Desert Lavender** Condea emoryi

Add to plant list

Hyptis emoryi (Desert Lavender) is a fragrant, multi-stemmed shrub species of flowering plant in the Lamiaceae (mint family). The genus Condea (formerly Hyptis) is commonly known as the bushmints. Desert Lavender is a medium to large perennial shrub found in the deserts of >>

44

**Lemonade Sumac** Rhus integrifolia

Add to plant list

Lemonade Berry is a shrub or small tree, with a variable form. They tend to grow upright (up to 30 feet tall) when somewhat inland, and low and sprawling (3 feet tall by up to 30 feet wide) when close to the ocean. It is native to Southwestern and Pacific coastal California from >>

45

**Royal Penstemon** Penstemon speciosus

Add to plant list

Royal Penstemon is native to the western United States where it can be found in many types of habitat, including plateau and foothill scrub and sub-alpine mountain forests. It is a perennial herb growing erect to a maximum height near 60 centimeters. The leaves are >>

**Woolly Bluecurls** Trichostema lanatum

Add to plant list

46 Trichostema lanatum (Romero or Woolly Blue Curls) is a highly fragrant, small evergreen shrub or sub-shrub, with curly and woolly blue flowers that give the plant its common name. It is native to oak woodlands, chaparral and coastal sage scrub communities in the southern >>

47 **Hearst's Ceanothus** Ceanothus hearstiorum

Add to plant list

Ceanothus hearstiorum is a species of flowering shrub known by the common names Hearst Ranch Buckbrush and Hearst's Ceanothus. This Ceanothus is endemic to California, where it grows wild only on the hilly coastline of San Luis Obispo County. This shrub is generally wider >>

48 **Foothill Penstemon** Penstemon heterophyllus

Add to plant list

Penstemon heterophyllus is a species of penstemon known by the common names bunchleaf penstemon and foothill beardtongue. It is endemic to California, where it can be found in all of the major coastal mountain ranges and the northern Sierra Nevada foothills. It is a member of >>

49 **Golden Currant** Ribes aureum

Add to plant list

Known by the common names Golden Currant, Buffalo Currant, Clove Currant and Missouri Currant, it is a species of small to medium-sized deciduous shrubs 6-10 feet tall. It blooms in spring with golden yellow flowers, often with a pronounced fragrance similar to that of cloves >>

50 **Sierra Redwood** Sequoiadendron giganteum

Add to plant list

Giant sequoias are the world's largest single trees by volume. Record trees have been measured to be 94.8 m (311 ft) in height and over 17 m (56 ft) in diameter. The oldest known giant sequoia based on ring count is 3,500 years old. Sequoia bark is fibrous, furrowed, and >>

51 **California Wax Myrtle** Morella californica

Add to plant list

California Wax Myrtle (Morella californica) is a native shrub in the Myracaceae (Myrtle) family that is found primarily along the coast in northern and central California, although it does occur as far south as Los Angeles County and as far north as British Columbia. It is >>

52 **San Diego Mountain Mahogany** Cercocarpus minutiflorus

Add to plant list

San Diego Mountain Mahogany is a beautiful native shrub that grows in Southern California, primarily in coastal Orange and San Diego counties, and in the western side of the Peninsular Range region, mostly at elevations from 0-4300 feet. It grows quickly to 8 feet, and then fairly >>

53 **Silver Lupine** Lupinus albifrons

Add to plant list

Silver lupine, white-leaf bush lupine, or evergreen lupine, is a perennial species native to California, Oregon, and northern Baja. It grows along the coast, foothills of the Sierras and into the mountains, in dry and open meadows, prairies and forest clearings. It is a member of >>

54 **Coffee Berry** Frangula californica

Add to plant list

The California Buckthorn is also called coffeeberry because its berries contain seeds which look like coffee beans. It is a fairly common plant native to California and southwestern Oregon. It is a dense evergreen shrub growing to 6-15 feet tall, with dark red branches. The >>

55 **Farewell To Spring** Clarkia amoena

Add to plant list

Clarkia amoena (Farewell to Spring or Godetia; syn. Godetia amoena) is a flowering plant native to western North America, found in coastal hills and mountains from British Columbia south to the San Francisco Bay Area. The common name derives from its bloom time of late >>

56

**Wavyleaf Silktassel** Garrya elliptica

Add to plant list

Garrya elliptica (Coast silk-tassel) is a common evergreen shrub native to the coastal ranges of California and southern Oregon, south to Los Angeles County. It reaches a height of two to five meters. It is one of a small biological family of approximately twenty known species in the >>

57

**Desert Willow** Chilopsis linearis

Add to plant list

It is a small tree native to the southwestern United States and Mexico. Despite the common name Desert-willow, given because of its willow-like leaves, it is actually a member of the bignonia family, Bignoniaceae. It is commonly seen in washes and along riverbanks at >>

58

**Giant Wildrye** Elymus condensatus

Add to plant list

Elymus condensatus (syn. Leymus condensatus) is a wild rye grass native to California and northern Mexico. Its common name is giant wildrye. It grows in bunches or clumps, stays green all year, and has a distinctive silver blue foliage. It is drought tolerant, growing in coastal >>

59

**St. Catherine's Lace** Eriogonum giganteum

Add to plant list

St. Catherine's lace is a species of wild buckwheat endemic to the Channel Islands of California. It is variable in size, from a thin half a meter in height and width to a sprawling or rounded bush over three meters high and wide. The leathery, woolly, oval-shaped leaves are >>

60

**Scarlet Monkeyflower** Mimulus cardinalis

Add to plant list

Scarlet monkeyflower is a herbacious perennial in the lopseed family. It is an attractive plant which bears red or orange-red flowers and toothed, downy leaves. It is native to the southwestern United States and Baja California. It is typically found in wetlands or moist >>

61

**Mexican Flannelbush** Fremontodendron mexicanum

Add to plant list

Fremontodendron mexicanum is a rare species of shrub in the mallow family known by the common name Mexican flannelbush. It is known from about ten occurrences in northern Baja California and adjacent San Diego County, California, but it has most recently been confirmed >>

62

**Del Norte County Iris** Iris innominata

Add to plant list

Del Norte County Iris is a perennial herb that is native to southern Oregon, and California along the north coast and Klamath Ranges in Del Norte County, California. It is a very small iris. It tends to grow in slopes, at elevations from 3300-4600 feet. The leaves are dense and >>

63

**Gumweed** Grindelia stricta var. platyphylla

Add to plant list

Gumweed (Grindelia stricta var. platyphylla) is a native perennial herb that grows in Southern and Central California, primarily in the Central Coast region. It is a member of the Asteraceae and has typical sunflower floral structure with yellow disk flowers and ray flowers. It tends to >>

64

**Cleveland Sage** Salvia clevelandii

Add to plant list

Cleveland Sage is a beautiful, fast growing and highly aromatic species of sage native to the coast of southern California and northern Baja California. Its common names include Blue sage, Fragrant sage, and Cleveland sage. This is a small, hairy, grey-green shrub native to >>

65

**White Coast Ceanothus** Ceanothus verrucosus

Add to plant list

Ceanothus verrucosus is a rare species of shrub in the Buckthorn family (Rhamnaceae) known by the common names wart-stem ceanothus, barranca brush, and white coast ceanothus. It is endemic to Baja California and San Diego County, where it grows in coastal >>

66

**Pajaro Manzanita** Arctostaphylos pajaroensis

Add to plant list

Arctostaphylos pajaroensis is a species of manzanita known by the common name Pajaro manzanita. It is endemic to California, where it is known mainly from Monterey County. Historical occurrences have been noted in Santa Cruz and far western San Benito Counties; >>

67

**Coulter's Matilija Poppy** Romneya coulteri

Add to plant list

Romneya coulteri (Coulter's Matilija poppy) is species of flowering plant in the poppy family. This poppy is native to southern California and Baja California, where it grows in dry canyons in chaparral and coastal sage scrub plant communities, sometimes in areas recently burned.It >>

68

**Deerbrush** Ceanothus integerrimus

Add to plant list

Ceanothus integerrimus (Deer Brush) is a woody shrub in the Rhamnaceae (Buckthorn) family native to the western United States, in Arizona, New Mexico, California, Oregon, and Washington. It grows in a wide range of habitats including chaparral mountain shrub regions, >>

69

**Island Alum Root** Heuchera maxima

Add to plant list

A species of flowering plant in the saxifrage family known by the common names island alumroot and Jill-of-the-Rocks. It is endemic to three of the eight Channel Islands of California, where it grows on cliffs. It is rare in the wild due to its limited distribution. It is also >>

70

**Mountain Mahogany** Cercocarpus betuloides

Add to plant list

California Mountain Mahogany typically grows in dry areas in the foothills and mountains of California, often in chaparral communities, and in other parts of the southwestern United States and Baja California. This shrub has a typical size of three to five meters in height. The >>

71

**Island Ceanothus** Ceanothus arboreus

Add to plant list

Ceanothus arboreus is a species of shrub endemic to California, especially to the Channel Islands. It is known commonly as feltleaf ceanothus. It is a species of what are sometimes called California lilacs, and may be referred to as the California mountain lilac or island >>

72

**Early Onion** Allium praecox

Add to plant list

Allium praecox is a species of wild onion known by the common name early onion. It is native to the coastal hills and mountains of southern California and Baja California, including the Channel Islands, where it grows in shady areas in clay soils. This onion grows from a >>

73

**Eastwood Manzanita** Arctostaphylos glandulosa

Add to plant list

Eastwood's manzanita is a shrub native to the coastal slopes of western North America from Oregon to Baja California. It can be seen in southern California among granite peaks. This is an erect shrub reaching up to 2.5 meters in height. It is bristly and sometimes hairy, secreting >>

**Big Saltbush** Atriplex lentiformis

Add to plant list

Atriplex lentiformis is a species in the Chenopodiaceae (Goosefoot) family known by the

74
common names Big Saltbush and Quail Bush. It is native to the southwestern United States and northern Mexico, where it grows in habitats with saline or alkaline soils, such as salt flats >>

75
**Coyote Bush** Baccharis pilularis

Add to plant list

Names include Coyote Brush (or Bush), Chaparral Broom, and Bush Baccharis. It is a common shrub in the Asteraceae that grows in California, Oregon, and Baja California. There are two subspecies. Ssp. pilularis is more common along the central coast. Ssp. >>

76
**Black Sage** Salvia mellifera

Add to plant list

Black sage is the most common sage in California, and one of the keystone species of the coastal sage scrub plant community in the southern half of the state. Black sages grows quickly up to 3 feet in height, but mature specimens can reach up to 6 feet in height and 10 >>

77
**Big Leaf Maple** Acer macrophyllum

Add to plant list

Acer macrophyllum (Bigleaf Maple or Oregon Maple) is a large deciduous tree. It grows to be up to 35 meters tall, but more commonly 15-20 meters tall. The trunk can get up to a meter in diameter. It is native to western North America, mostly near the Pacific coast, from >>

78
**Vine Hill Manzanita** Arctostaphylos densiflora

Add to plant list

Arctostaphylos densiflora is a very rare species of manzanita known by the common name Vine Hill manzanita. It is endemic to Sonoma County, California, where it is known from only one extant population of 20 to 30 individuals. These last wild members of the species are on >>

79
**Mock Orange** Philadelphus lewisii

Add to plant list

Lewis's Mock-orange is a deciduous shrub in the Hydrangeaceae (Hydrangea) family native to western North America, from northwestern California in the Sierra Nevada, north to southern British Columbia, and east to Idaho and Montana. It is widespread but not terribly >>

80
**Sulphur Buckwheat** Eriogonum umbellatum

Add to plant list

A species of wild buckwheat known by the common name sulphurflower buckwheat, or simply sulphur flower. It is native to western North America from California to Colorado to central Canada, where it is abundant and found in many habitats. This is an extremely variable plant >>

81
**Desert Ceanothus** Ceanothus greggii

Add to plant list

Known by the common names Mountain Buckbrush or Desert Ceanothus, it is native to the southwestern United States and northern Mexico where it grows in desert scrub, sagebrush, chaparral, and other dry habitat. This shrub grows erect to nearly 2 meters in maximum >>

82
**Box Elder** Acer negundo

Add to plant list

Acer negundo is a species in the Sapindaceae (Soapberry) family native to North America known by the common names Box Elder, Boxelder Maple, and Maple Ash. In California it is found in the coastal mountain ranges from Mendocino County to San Diego County and in the >>

83
**Giant Coreopsis** Leptosyne gigantea

Add to plant list

Giant Coreopsis is a woody perennial plant native to California and Baja California. The stem is a trunk 1-2 meters tall, 4-10 centimeters in diameter, occasionally branching. Bright green leaves and flowers are on the top of the trunk, the rest of the trunk is bare. The flowers are >>

84

**Point Reyes Ceanothus** Ceanothus gloriosus

Add to plant list

Ceanothus gloriosus is a species of shrub in the Buckthorn family (Rhamnaceae) known by the common name Point Reyes ceanothus. It is endemic to California, where it is known from the coastline of the San Francisco Bay Area and areas north and south. It grows on seaside >>

85

**Sand Dune Sedge** Carex pansa

Add to plant list

Dune sedge is a member of the Cyperaceae (Sedge) family native to the coast of western North America from British Columbia to California, where it grows in scattered locations on dunes and other sandy habitats. It tends to grow in wetlands or moist places. This grass-like >>

86

**Catalina Currant** Ribes viburnifolium

Add to plant list

The shrub is known by the common names Catalina Perfume, Island Gooseberry and Evergreen Currant. It is found in southern California in the United States, especially on Santa Catalina Island, and into northern Baja California in Mexico. It is a rare member of the >>

87

**Bristly Matilija Poppy** Romneya trichocalyx

Add to plant list

Romneya trichocalyx is species of flowering plant in the poppy family. This poppy is native to southern California and Baja California, where it grows in dry canyons in chaparral and coastal sage scrub plant communities, sometimes in areas recently burned.It is a popular >>

88

**Del Mar Manzanita** Arctostaphylos glandulosa ssp. crassifolia

Add to plant list

Del Mar or Costa Baja Manzanita (Arctostaphylos glandulosa ssp. crassifolia) is a rare native shrub that grows in Southern California, primarily in the South Coast region. Depending on the time of year, leaves can be pinkish, slivery, blue green or dark green. It tends to grow in >>

89

**Thickleaf Yerba Santa** Eriodictyon crassifolium

Add to plant list

Eriodictyon crassifolium, or thick-leaved Yerba Santa, is a shrub in the Borage family (formerly in the Hydropyllaceae or Waterleaf family). It is endemic to California, where it grows in several types of habitats in the coastal and inland hills and mountains below 6,000 ft., mainly >>

90

**California Copperleaf** Acalypha californica

Add to plant list

The flowering shrub Acalypha californica is known as the California copperleaf, and sometimes by the older name Pringle three-seeded mercury. It is the only Acalypha species native to California, where it is found from the Peninsular range foothills hills into the lower >>

91

**California Buckwheat** Eriogonum fasciculatum

Add to plant list

Known by the common name California buckwheat. This common shrub is native to the southwestern United States and northwestern Mexico, where it grows on scrubby slopes and in chaparral and dry washes in a number of habitats. It is variable in appearance, forming a >>

92

**Hollyleaf Redberry** Rhamnus ilicifolia

Add to plant list

Hollyleaf Redberry (Rhamnus ilicifolia) is a native shrub that grows in the foothills and mountains of southern and central California, the Sierra foothills, and in the foothills west of the Sacremento valley. It primarily grows at elevations from 500 - 6600 feet. It was formerly >>

**Valley Oak** Quercus lobata

Add to plant list

93

The Valley Oak grows into the largest of North American oaks. It ranges over the hot interior valleys of California where there is a water table within reach of the roots. Valley Oaks grow quickly, reaching 20 feet in 5 years, and 40 feet in 10 years, and up to 60 feet in 20 years. >>

94

**Bladder Pod** Peritoma arborea

Add to plant list

Bladder Pod is a species of the Caper family also known by the common names burrofat, and California Cleome. It is native to California (primarily southern) and Baja California where it grows in a variety of habitats from coastal bluffs to desert arroyos. It is a densely branching >>

95

**White Alder** Alnus rhombifolia

Add to plant list

White Alder is a member of the Birch family (Betulaceae) native to western North America, from Washington east to western Montana and south to San Diego County, occurring at altitudes of 100-2400 meters. It has not been reported from northern Baja California but has >>

96

**California Goldenrod** Solidago velutina ssp. californica

Add to plant list

California Goldenrod is a native perennial herb that grows in northern, southern and central California. It tends to grow in open grassy places, at elevations from 0-7500 feet. It produces masses of yellow flowers when many other plants are dormant. Birds and pollinating insects >>

97

**Fuchsiaflower Gooseberry** Ribes speciosum

Add to plant list

Fuchsiaflower Gooseberry (Ribes speciosum) is one of the most spectacularly blooming native California shrubs during the wet season, with beautiful fuchsia red flowers hanging down in abundance from the branches throughout the bush. The tube shaped flowers with >>

98

**California Grape** Vitis californica

Add to plant list

Vitis californica, or California Wild Grape, is a species of wild grape that grows throughout central and northern California, and occasionally in southern California. Specifically, it grows as far south as the foothills of the Transverse Range, over the entire range of Sequoia and >>

99

**Madrone** Arbutus menziesii

Add to plant list

The Pacific Madrone (Arbutus menziesii), is a species of arbutus found on the west coast of North America, from British Columbia (chiefly Vancouver Island and the Gulf Islands) to California (mainly in the Puget Sound, Oregon Coast Range and California Coast Ranges but >>

100

**Yerba Mansa** Anemopsis californica

Add to plant list

Yerba mansa or lizard tail, is a perennial flowering plant within the family Saururaceae. It is the only species in the monotypic genus Anemopsis. It is native to southwestern North America. In early spring numerous tiny white flowers are borne on a cone which is surrounded >>

## Lewisia

(*Lewisia cotyledon*)

**Native to:** California and southern Oregon

To about 1 ft. high, 10 in. wide. Rosettes of narrow, fleshy, evergreen leaves bear 10-in. stems topped by large, extremely showy clusters of 1-in. white or pink flowers often striped with rose or red. Blooms from spring to early summer. Lewisia cotyledon howellii is similar but has wavy-edged leaves and somewhat larger flowers. Prune out side growth to maintain air circulation around root crown. Can be grown in pots of fast-draining sterilized soil or growing mixes.

## *Penstemon* 'Margarita BOP'

**Native to:** California

These deep blue beauties have purple throats.

Advertisement

***3 of 23*** Kimberley Navabpour

## Common thrift

(*Armeria maritima*)

**Native to:** California, Oregon, Washington, and B.C.

Tufted mounds spread to 1 ft.; leaves are 6 in. long. White to rose pink flowers in tight clusters atop 6–10-in. stalks. Bloom is profuse in spring (goes on almost all year in mildest climates). Sturdy, dependable plants for edging walks or borders and for tidy mounds in rock gardens or raised beds. Attractive in containers. Good drainage is essential and permits regular watering, but safest tactic is to water moderately in dry climates, sparingly in moister regions. Tolerate seaside conditions, infertile soil. Clumps spread slowly and need dividing only when bare centers show.

Advertisement

## Yarrow

(*Achillea*)

Makes a flat, spreading mat (about 1 1/2 ft. wide) of fernlike, hairy leaves. Golden flower heads in flat clusters top 6-10-in. stems. A good edging and a neat ground cover for small areas; useful in rock gardens. Shear off dead flowers to leave attractive gray-green mat.

## Apricot mallow

(*Sphaeralcea ambigua*)

**Native to:** California

Downy stems bear flowers in summer. Grows 3 to 4 feet tall.

Advertisement

***6 of 23*** Marion Brenner

## Pink checkerbloom

(*Sidalcea malviflora*)

**Native to:** Oregon, California, and Baja California

Grown for clusters of five-petaled flowers like little hollyhocks May grow erect to 2 ft. high and wide; or may sprawl and spread more widely by rooting at the nodes. Pink or purplish pink, 2-in. flowers in early spring.

Advertisement

***7 of 23*** Marion Brenner

## Blue-eyed grass

(*Sisyrinchium idahoense bellum*)

**Native to:** Coastal California and Oregon

Grows 4 in. to 2 ft. high, 6 in. to 2 ft. wide. Green or bluish green leaves. Purple to bluish purple, 1/2-in. flowers appear in spring. Several named forms, many of them dwarf, are available.

Advertisement

***8 of 23*** John Clark

# Pacific coast iris

(*Iris hybrid*)

**Native to:** Pacific Coast states

Eleven species constitute a homogeneous group within the genus Iris, from which breeders have developed hybrids in a broad range of colors and patterns; flowers may be white, blue shades, pink, copper, brown, maroon, violet—many with elaborate veining or patterning. Foliage is narrow; clumps are like coarse grass. Slender flower stems reach 8 to 24 in., depending on variety. Best conditions are sun to light shade, well-drained soil, moderate to scant water in summer. Intense heat coupled with water and poor drainage can be fatal; in clay soil, grow in raised beds in organically amended soil. Plant from containers any time, though spring and fall are best.

***9 of 23*** Steven Gunther

## Sticky monkey flower

(*Mimulus aurantiacus*)

**Native to:** California

Flowers in shades of red, yellow, and orange in spring and summer.

Advertisement

***10 of 23*** Steven Gunther

## Wild lilac

(*Ceanothus*)

**Native to:** California

Many kinds — groundcovers to tall shrubs. All bear flowers of blue or white in spring. 'Concha' grows 6 to 7 feet tall.

Advertisement

***11 of 23*** D.A. Horchner / Design Workshop

## Rocky Mountain columbine

(Aquilegia coerulea)

Melting snow awakens a riot of hardy high-alpine blooms along the Tundra World Nature Trail, an easy half-mile paved footpath starting from the Rock Cut on Trail Ridge Road. Look for forget-me-nots, sky pilo and alpine sunflower (cheery yellow blossoms that grow only in Rocky Mountain). *nps.gov/romo or 970/586-1206.*

Advertisement

***12 of 23*** Steven Gunther

## Desert beard tongue

(*Penstemon pseudospectabilis*)

**Native to:** California

Upright shrub (to 2 to 4 feet tall) that bears pink to purplish flowers spring into summer.

Advertisement

***13 of 23*** Steven Gunther

## Beach aster

(*Erigeron glaucus* 'Cape Sebastian')

**Native to:** California

Clumping perennial to 1 foot tall with daisy flowers in summer. Native to the coast, it burns in hot sun.

Advertisement

***14 of 23*** Steven Gunther

## Common snowberry

(*Symphoricarpos albus*)

**Native to:** California

Deciduous shrub that bears pink flowers followed by white berries from late summer to winter. Grows 2 to 6 feet tall.

Advertisement

***15 of 23*** Steven Gunther

## *Salvia* 'Celestial Blue'

**Native to:** California

Three lesser goldfinches pause at a birdbath with *Salvia* 'Celestial Blue' growing in the foreground. Evergreen shrub with lavender-blue flowers in early summer and gray-green leaves.

Advertisement

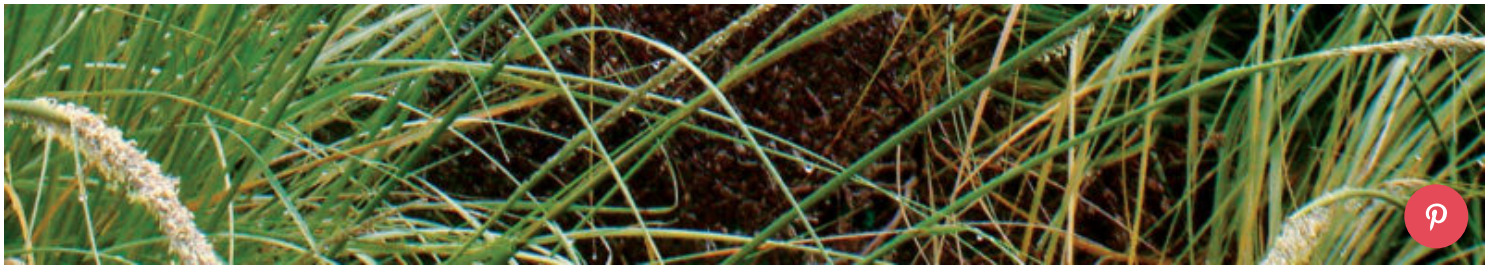
## California poppy

**Native to:** California and Oregon

Free branching from base, with slender, 8–24 in.-long stems and blue-green, finely divided leaves. Single, satiny-petaled flowers about 2 in. wide; color varies from pale yellow to deep orange. Flowers close at night and on overcast days. In mild climates, it blooms from spring to summer and reseeds freely. Naturalized not just in California but also in parts of Hawaii. In cold-winter areas, generally used as a summer annual.

Advertisement



***17 of 23*** Joshua McCullough

## Deer grass

*(Muhlenbergia rigens)*

**Native to:** California to Texas and south into Mexico

Bright green leaves form a dense, tight clump to 4 ft. high and wide. Slender yellow or purplish flower spikes in autumn are erect at first, then leaning; rise 2 ft. above the leaves.

Advertisement

***18 of 23***

## Redtwig dogwood

(*Cornus stolonifera*)

**Native to:** Northern California to Alaska and eastward

Grown for brilliant red fall foliage and winter twigs. Thrives not only in the coldest mountain areas of West but also throughout California—even in intermediate valleys of Southern California if given frequent water. Grows rapidly to form a multi-stemmed shrub 7—9 ft. high; spreads to 12 ft. or wider by creeping underground stems and rooting branches. Oval, 1 1/2—2 1/2-in.-long, fresh deep green leaves. Small, creamy white flowers in 2-in. clusters appear among leaves throughout summer; white or bluish fruits follow.

Advertisement

***19 of 23*** yaquina on Flickr Creative Commons

## Vine maple

(*Acer circinatum*)

**Native to:** Northwest

In the forest shade, plant is crooked, sprawling, and vine-like, with many stems from the base. In the open, it becomes a nearly symmetrical small tree 5–35 ft. high, with one or several trunks. Leaves nearly circular, to 6 in. across, with 5–11 lobes; red tinted when new, light green as they mature, then orange, scarlet, or yellow in fall. Tiny reddish purple spring flowers are followed by winged red seeds. Let it go untrimmed to make natural bowers, ideal setting for ferns and woodland flowers. Use under a canopy of tall conifers where its blazing fall color offers brilliant contrast. Can be espaliered against shady side of a wall. Its contorted leafless branches to make an intricate pattern in winter.

Advertisement

***20 of 23*** Thomas J. Story

## Western sword fern

***(****Polystichum munitum)*

**Native to:** California to Alaska and Montana, Idaho, and South Dakota.

Most common fern of Western forests. To 2–4 ft. high and wide. Leathery, lustrous dark green fronds are erect, then spreading. Each leaflet is dagger shaped, with toothed edges and a base that looks rather like a sword hilt. Old plants may have 75–100 fronds. Long lasting when cut for arrangements. Established plants get by with reduced moisture.

Advertisement

***21 of 23*** Steven A. Gunther

## Baja fairy duster

(*Calliandra californica*)

**Native to:** Baja California

It's a favorite with Southwest gardeners and reaches 5 ft. tall. The shrub attracts hummingbirds with its brilliant red stamens that resemble powder puffs. Use it as an accent in front of a living ocotillo fence or as a backdrop for small blue agaves.

Advertisement

***22 of 23*** Marion Brenner

## Bird’s eyes

(*Gilia tricolor*)

**Native to:** California

Slender plants with finely cut leaves and colorful flowers from late spring to early fall. Useful in wild garden or borders. In fall or early spring, sow seeds in well-drained soil where plants are to grow. Thin seedlings to avoid crowding. Grows to 4–18 in. high, about 9 in. wide. Subtly beautiful flowers, carried singly or in clusters, are 1/2 in. wide or wider, with pale to deep violet with yellow throat spotted purple; blue pollen.

Advertisement

***23 of 23*** Steven Gunther

## Ocotillo

(*Fouquieria splendens)*

**Native to:** Southwest

A decomposed granite path passes through a fence and gate made from ocotillo. The winding walkway invites exploration of more of this casual low-water landscape.

# List of California native plants

California native plants are plants that existed in California prior to the arrival of European explorers and colonists in the late 18th century.[1] California includes parts of at least three phytochoria. The largest is the California Floristic Province, a geographical area that covers most of California, portions of neighboring Oregon, Nevada, and Baja California, and is regarded as a "world hotspot" of biodiversity.[2][3]

## Introduction

In 1993 *The Jepson Manual* estimated that California was home to 4,693 native species and 1,169 native subspecies or varieties, including 1,416 endemic species. A 2001 study by the California Native Plant Society estimated 6,300 native plants. These estimates continue to change over time.[2]

Of California's total plant population, 2,153 species, subspecies, and varieties are endemic and native to California alone, according to the 1993 Jepson Manual study.[4] This botanical diversity stems not only from the size of the state, but also its diverse topographies, climates, and soils (e.g. serpentine outcrops). Numerous plant groupings exist in California, and botanists work to structure them into identifiable ecoregions, plant communities, vegetation types, and habitats, and taxonomies.[4][5]

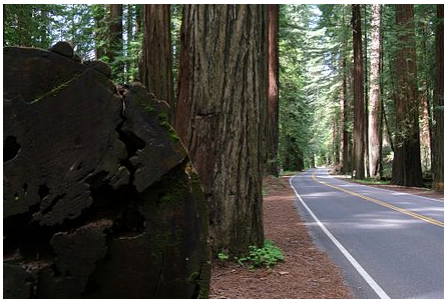
California native plants include some that have widespread horticultural use. Sometimes the appreciation began outside of California—lupines, California fuchsias, and California poppies were first cultivated in British and European gardens for over a century.[6]

# Selected trees

## Coniferous trees

### Sequoias and redwoods

- Coast redwood (*Sequoia sempervirens*) - in the fog-shrouded coast ranges.
- Giant sequoia (*Sequoiadendron giganteum*) - in the Sierra Nevada Mountains.



Coast redwood (*Sequoia sempervirens*)

### Pine trees

- Bishop pine (*Pinus muricata*): coastal species grown in gardens
- Coulter pine (*Pinus coulteri*)
- Gray pine, ghost pine, or digger pine (*Pinus sabiniana*)
- Knobcone pine (*Pinus attenuata*)
- Ponderosa pine (*Pinus ponderosa*): well known in mountains
- Lodgepole pine (*Pinus contorta*): used for early construction of buildings and other structures
- Monterey pine (*Pinus radiata*): naturally limited endemic range; widely planted horticulturally around the world
- Limber pine (*Pinus flexilis*)
- Jeffrey pine (*Pinus jeffreyi*)
- Parry pinyon (*Pinus quadrifolia*)
- Shore pine (*Pinus contorta*)
- Sugar pine (*Pinus lambertiana*)
- Torrey pine (*Pinus torreyana*)
- Western white pine (*Pinus monticola*)
- Single-leaf pinyon pine (*Pinus monophylla*)
- Great Basin bristlecone pine (*Pinus longaeva*): the Methuselah, a 4,700-year-old specimen
- Foxtail pine (*Pinus balfouriana*): endemic to California; 2,000-year-old specimens

*Pinus ponderosa*, Kings Canyon National Park

### Other conifers

- Monterey cypress (*Cupressus macrocarpa*)
- Santa Lucia fir (*Abies bracteata*) and seven other native *Abies* species.
- Douglas-fir (*Pseudotsuga menziesii*)
- Bigcone Douglas-fir (*Pseudotsuga macrocarpa*) - Central Coast and Santa Susana Mountains.
- California nutmeg (*Torreya californica*)
- Incense cedar (*Calocedrus decurrens*)
- Port Orford cedar-Lawson cypress (*Chamaecyparis lawsoniana*)
- White fir (*Abies concolor*) - at high elevations
- Mountain hemlock (*Tsuga mertensiana*)
- Red fir (*Abies magnifica*)
- Pacific yew (*Taxus brevifolia*)

## Oak trees

California is home to many deciduous and evergreen oaks, often occurring in oak woodlands:

Valley oak near Mount Diablo.

- Valley oak (*Quercus lobata*) - the giant.
- Leather oak (*Quercus durata*) - the shrubby one
- Blue oak (*Quercus douglasii*) - in the Central Valley foothills and Coast Ranges
- California black oak (*Quercus kelloggii*) - in the higher hills mountains
- Canyon live oak (*Quercus chrysolepis*) - in the higher hills
- Interior live oak (*Quercus wislizenii*) in the Central Valley region.
- Island oak (*Quercus tomentella*) - endemic with distinctive large evergreen leaves.
- Engelmann oak (*Quercus engelmanni*) - shade giving with a cool blue-gray cast to the foliage.
- Coast live oak (*Quercus agrifolia*) is found in the Coast Ranges, Transverse Ranges, Peninsular Ranges, and along the coast's hills and adjacent interior valleys, and many other habitats and gardens.[7][8]

## Riparian trees

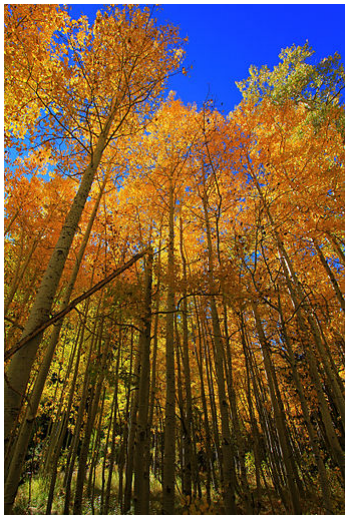
In riparian areas (streamside and moist habitats) some of the trees include:

- California sycamore (*Platanus racemosa*)
- White alder (*Alnus rhombifolia*)
- Quaking aspen (*Populus tremuloides*)
- Fremont cottonwood (*Populus fremontii*)
- Black cottonwood (*Populus trichocarpa*).
- Arroyo willow (*Salix lasiolepis*).[9]

## Other trees and tree-like shrubs

- Tanoak (*Lithocarpus densiflorus*)
- California bay laurel (*Umbellularia californica*)
- Madrone (*Arbutus menziesii*)
- Toyon (*Heteromeles arbutifolia*)
- Bigleaf maple (*Acer macrophyllum*)

- Western blue elderberry (*Sambucus mexicana*) is found throughout the state, an important host for birds, butterflies, pollinators, and beneficial insects (*integrated pest management*).
- California Buckeye (*Aesculus californica*)
- Western redbud (*Cercis occidentalis*)
- California black walnut (*Juglans californica*)
- California hazelnut (*Corylus cornuta*)



Quaking aspen (*Populus tremuloides*) in Lee Vining Canyon

## Selected shrubs

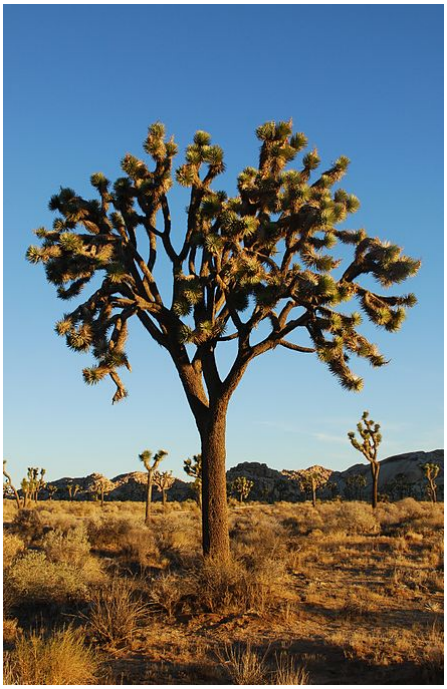
- Chamise or greasewood (*Adenostoma fasciculatum*)
- Service-berry (*Amelanchier alnifolia*)
- Manzanita (*Arctostaphylos* spp.)
- California sagebrush (*Artemisia californica*)
- Coyote brush (*Baccharis pilularis*)
- Calliandra (*Calliandra* spp.)
- California lilacs (*Ceanothus* spp.)
- Desert willow (*Chilopsis linearis*)
- Flannelbush (*Fremontodendron* spp.)
- Creosote bush (*Larrea tridentata*)
- Lupines (*Lupinus* spp.)
- Snowberry (*Symphoricarpos mollis* & spp.),
- Huckleberry (*Vaccinium ovatum* & spp.)
- Coffeeberry (*Rhamnus* spp.)
- Lemonade berry (*Rhus integrifolia*)
- Sugarbush (*Rhus ovata*)
- Gooseberries and currants (*Ribes* spp.)
- Sages (*Salvia* spp.)[10][11]

*Fremontodendron californicum* (California flannelbush)

## Selected desert plants

- California fan palm (*Washingtonia filifera*)
- Joshua tree (*Yucca brevifolia*)
- California juniper (*Juniperus californica*)
- Blue palo verde (*Parkinsonia florida*)
- Yellow foothill palo verde (*Parkinsonia microphylla*)
- Single-leaf pinyon (*Pinus monophylla*)
- Fremont cottonwood (*Populus fremontii*)
- Ocotillo (*Fouquieria splendens*)
- Creosote bush (*Larrea tridentata*)
- Indian mallow (*Abutilon palmeri*)
- Brittlebush (*Encelia farinosa*)
- Desert agave (*Agave deserti*)
- California barrel cactus (*Ferocactus cylindraceus*)
- Banana yucca (*Yucca baccata*)
- Mojave yucca (*Yucca schidigera*)
- Rush milkweed (*Asclepias subulata*)
- Purple desert sand-verbena (*Abronia villosa*)
- Sacred datura (*Datura wrightii*)

# Selected perennials



A Joshua tree in Joshua Tree National Park.

## Sunny habitats

- California poppy (*Eschscholzia californica*) are found in drier places. California poppies are also an annual in many places.
- Douglas iris (*Iris douglasiana*) and 'Pacific Coast' hybrids
- Monkeyflower e.g.: *Mimulus aurantiacus*, *Mimulus guttatus*, *Mimulus cardinalis* and cultivars.
- Columbine (*Aquilegia* spp.)
- Coyote mint (*Monardella* spp.)
- Buckwheats (*Eriogonum fasciculatum*), (*Eriogonum giganteum*), (*Eriogonum umbellatum*)

## Shady habitats

- Western wild ginger (*Asarum caudatum*)
- Pacific bleeding-heart (*Dicentra formosa*)
- Island coral bells (*Heuchera maxima*)
- Canyon coral bells (*Heuchera hirsutissima*)
- Heucherella
- Threeleaf foamflower (*Tiarella trifoliata*)
- Redwood sorrel (*Oxalis oregana*)[12]

Creosote bush (*Larrea tridentata*)

## Ferns

- Polypody ferns (*Polypodium*), e.g.: *Polypodium californicum*
- Native sword ferns (*Polystichum*), e.g.: *Polystichum munitum*
- Giant chain fern (*Woodwardia fimbriata*)
- Goldback ferns (*Pteridium* spp.)
- Wood ferns (*Dryopteris* spp.), e.g.: *Dryopteris arguta*
- Maidenhair ferns (*Adiantum* spp.) e.g.: *Adiantum jordanii*

*Eriogonum fasciculatum* (California buckwheat)

# Selected bulbs

- Ithuriel's spear (*Triteleia* spp.)
- Meadow onion (*Allium monticola*)
- Goldenstars (*Bloomeria crocea*)
- Brodiaeas (*Brodiaea* spp.)
- Blue dicks-ookow (*Dichelostemma capitatum*): one of the most common native bulb species throughout California; found in grassland and dry meadow habitats
- Mariposa lilies (*Calochortus* spp.): available from reputable horticultural sources; taking from the wild is illegal and is resulting in significant declines of some species from over collecting.

# Selected annuals and wildflowers

- Baby blue eyes (*Nemophila menziesii*)
- Blazing star (*Mentzelia lindleyi*)
- California poppy (*Eschscholzia californica*)
- Chinese houses (*Collinsia heterophylla*)
- Elegant clarkia (*Clarkia unguiculata*)
- Farewell-to-spring (*Clarkia amoena*)
- Meadowfoam (*Limnanthes douglasii*)
- Miner's lettuce (*Claytonia perfoliata*)
- Tarweed (*Madia elegans*)
- Wind poppy (*Stylomecon heterophylla*)[13]

*Brodiaea coronaria* (California hyacinth)

## Selected vines

- Dutchman's pipe vine (*Aristolochia* spp.)
- Morning glory (*Calystegia* spp.)
- Chaparral clematis (*Clematis lasiantha*)
- Western virgin's bower (*Clematis ligusticifolia*)
- Calabazilla (*Cucurbita foetidissima*)
- Wild cucumber-manroot (*Marah fabaceus*)
- Cucamonga manroot-bigroot (*Marah macrocarpus*)
- California wild grape (*Vitis californica*)
- Desert wild grape (*Vitis girdiana*)

*Aristolochia californica* (Dutchman's pipe)

## Selected grasses

***Grasses:***[14]

- Purple three-awn (*Aristida purpurea*)
- Blue grama (*Bouteloua gracilis*)
- California fescue (*Festuca californica*)
- Idaho fescue (*Festuca idahoensis*)
- Red fescue (*Festuca rubra*)
- Junegrass (*Koeleria macrantha*)
- Giant wildrye (*Leymus condensatus*)
- California melic (*Melica californica*)
- Deer grass (*Muhlenbergia rigens*)
- Purple needlegrass (*Nassella pulchra*): The state grass of California
- Indian ricegrass (*Oryzopsis hymenoides*)
- Pine bluegrass (*Poa secunda*)

*Festuca californica*, El Cajon

***Grasslike:***[15]

- Sedges — (*Carex* spp.) (taller 'bunch grass' specimens and lower meadow spreaders)
- Rushes — (*Juncus* spp.)
- Western blue-eyed grass (*Sisyrinchium bellum*) *and* yellow-eyed-grass (*Sisyrinchium californicum*).

## Selected succulents

### *Dudleyas*

- Chalk lettuce (*Dudleya pulverulenta*) - garden-plant
- Coast dudleya (*Dudleya caespitosa*) - [CA endemic]
- Canyon live-forever (*Dudleya cymosa*) - garden-plant
- Fingertips (*Dudleya edulis*) - garden-plant
- Giant chalk dudleya, Britton's dudleya (*Dudleya brittonii*) - garden-plant
- Lanceleaf liveforever (*Dudleya lanceolata*) - garden-plant

Coast dudleya (*Dudleya caespitosa*)

### *Sedums*

- Broadleaf stonecrop (*Sedum spathulifolium*) - San Bruno elfin butterfly host plant.
- Coast sedum (*Sedum oreganum*)
- Feather River stonecrop (*Sedum albomarginatum*) - [CA endemic, Sierras]
- Red Mountain stonecrop (*Sedum eastwoodiae*) - [CA endemic, Mendocino]
- Roseflower stonecrop (*Sedum laxum*)
- Sierra stonecrop (*Sedum obtusatum*)

## Environmental challenges

Some California native plants are in rapid decline in their native habitat due to urban sprawl, agriculture, overgrazing, recreational impacts, pollution, and invasive non-native species (invasive exotics) colonization pressures (animals and other kingdoms of life, as well as plants).[16]

California also has 1,023 species of non-native plants, some now problematic invasive species such as yellow starthistle, that were introduced during the Spanish colonization, the California Gold Rush, and subsequent immigrations and import trading of the 18th, 19th and 20th centuries.

# Landscape Plants for California Gardens

An Illustrated Reference of Plants for California Landscapes

Bob Perry, Professor Emeritus
Cal Poly Pomona University

www.landdesignpublishing.com

# Introduction

These pages are contained within the book *Landscape Plants for California Gardens.* They cover information on plant climate zones, estimated water needs of plants, and lists and palettes of plants that are adaptable in meeting water conservation and design needs for a variety of project situations.

The goal is to provide information that can assist in the design and management of landscapes throughout California with an emphasis on water conservation through the use of plant palettes that fit into compatible hydrozones.

*Agave attenuata* 'Boutin Blue'

*Phormium* 'Sunset'

**Introduction**

## Section One - Plant Climate Zones and Water Estimates

California Plant Climate Zones and Maps 10-17
Estimating Water Needs of Plants and Landscapes 18-25
Master Plant Checklist 26-41

## Section Two - Plant Lists

### Aggregated Lists

California Native Plants 44-47
Mediterranean Garden Plants 48-49
Southwestern Garden Plants 50-51
Subtropical Garden Plants 52-53
Woodland Garden Plants 54-55
Asian Garden Plants 56-57
Coastal Garden Plants 58-59
Invasive Plants 60-61

### Plant Types

Flowering Trees 62-62
Flowering Shrubs 64-64
Vines 66-67
Ground Covers 68-69
Flowering Perennials 70-71
Palms, Cycads and Ferns 72
Bamboo, Grasses and Sedges 73
Agave, Aloes, Cacti and Succulents 74-75

### Plant Functions and Aesthetics

Street Trees 76-77
Trees for Parkways and Medians 78
Monumental Scale Trees 79
Courtyard and Patio Trees 80
Plants with Special Interest and Character 81
Hedges and Screening 82-83
Fragrant Flowers and Foliage 84-85
Olive to Silver Foliage Color 86-87
Red to Purple Foliage Color 88
Fall Foliage Color 89
Variegated Foliage 90-91
Bold Foliage 92
Soft Foliage 93
Butterfly Plants 94-95
Hummingbird Plants 96
Bioswale Plants 97
Shade Plants 98-99
Container Plants 100-101

# Section 3 - Plant Palettes

## Irrigation Group 1 - Regular Water

### Woodland Palettes

Crape Myrtle 104-105
Eastern Redbud 106-107
Japanese Black Pine 108-109
Japanese Maple 110-111
Southern Magnolia 112-113
Trees and Turf Grass 114-115

### Subtropical Palettes

Giant Bird of Paradise 116-117
Jacaranda 118-119
Natal Coral Tree 120-121
Queen Palm 122-123
Trumpet Tree 124-125

## Irrigation Group 2 - Reduced Summer Water

### Mediterranean Palettes

Canary Island Palm 126-127
Coast Live Oak 128-129
Italian Cypress and Stone Pine 130-131
Lemon-scented Gum 132-133
New Zealand Christmas Tree 134-135
Oak 136-137
Olive 138-139
Prickly Paperbark 140-141
Pomegranate 142-143
Sugar Gum 133-145
Torrey Pine 146-147
Western Sycamore 148-149

### Southwestern Palettes

California Fan Palm 150-151
Palo Verde 152-153
Southwestern Chaparral 154-155
Thornless Mesquite 156-157

*Phormium* 'Maori Chief'

*Ceanothus* 'Gentian Plume'

# Section One

## Plant Climate Zones and Water Estimates

Section One of *Landscape Plants for California Gardens* provides a summary of information regarding California plant climate zones and estimated water needs of plants and landscapes. A combination of maps, tables, calculations and checklists are provided for use in selecting plants, organizing hydrozones and preparing estimated water budgets. These help create a foundation for successfully designing landscapes and gardens throughout California. Information provided in Section One is visibly woven throughout the book to reinforce the connections between climate, water and plants.

The study of climate is essential for understanding the relationship between plants and the environment. Temperature and moisture conditions dominate growth and survival of plants around the world as well as in local landscapes and gardens. The climate zone maps included in this section illustrate the range and diversity of growing conditions in California. Each zone is described and information on temperature, rainfall and evapotranspiration is provided. By understanding the adaptations of plants to temperature and moisture, it becomes possible to match them to various conditions found throughout the state and within specific planting situations. Such information enables one to make good planting choices when selecting appropriate plants for a given location.

Many people familiar with plants are aware that maps, tables, calculations and checklists used to describe climate zones and water needs are only approximations. Plants are adaptable to many conditions which limits any effort to place them in absolute categories. There will always be exceptions. Maps, tables and calculations are intended to be useful guides that bring attention to the most common needs and adaptations of plants. This information is most helpful when combined with sound horticultural knowledge, regular observation and planting experience. A series of plant palettes are presented in Section Three to provide examples that show how information in this section can be applied.

## Introduction to California

# Plant Climate Zones

### Plants and Climate

The growth and adaptation of plants has occurred over many years in response to a range of environmental conditions. Climate conditions have been among the most important, particularly temperature, precipitation, sun exposure, relative humidity and wind. On balance, cold temperatures most often pose the primary limiting condition on the survival and growth of plants. Plants that cannot tolerate the minimum temperatures of an area can be severely damaged or killed, particularly during record cold cycles. Additionally, the length of the annual growing season that occurs between the last frosts of spring and the early frosts of fall may be too short in some zones for plants to thrive. In these observations, it has been assumed water needs for agricultural and ornamental plantings would be met through irrigation.

In response to this knowledge about the effects of cold temperatures on plants, a number of climate zone maps have been developed over the years to illustrate different growing areas according to temperature. One map prepared by the United States Department of Agriculture illustrates 11 hardiness zones for North America based upon average annual minimum temperature ranges. This map, known as the USDA Plant Hardiness Zone Map, has become a standard reference for the selection and planting of both agricultural and horticultural plants across the country. However, this map illustrates only very broad zones throughout the west coast and has proven to be too general in treatment to be completely useful for the design of landscapes and gardens.

In California, the Cooperative Extension within the Division of Agriculture and Natural Resources of the University of California became involved in developing a plant climate zone map that more accurately represented the climate conditions and zones across the state. This effort was combined with climate maps included in the *Sunset New Western Garden Book* published in 1979 by Lane Publishing Company. The product of this work is the 1989 Generalized Plant Climate Map of California illustrated on the opposite page. This map shows 21 different climate zones occurring in California using annual minimum temperature ranges as the primary basis for delineating each zone. To a large extend, cold temperatures are the greatest limiting constraint on the survival and growth of agricultural and horticultural plants; heat This map has become a standard reference for selecting plants for different areas in California, and continues to be refined and presented in subsequent editions of the *Sunset Western Garden Book*.

The 21 plant climate zones provides a key starting point in identifying and selecting plants that can be grown in different parts of California. However, they are still large zones that often do not have precise boundaries. Many microclimate variations exist within each zone that modify conditions of temperature, sunlight, moisture and wind. This is particularly true in urban areas where the orientation and enclosure of landscape and garden spaces changes the broader climate conditions enough to successfully grow many plants. Once the broader climate conditions are assessed, the next step is to evaluate microclimate conditions to discover additional opportunities or constraints in growing plants.

A number of the key environmental factors that influence Plant climate zones in California are briefly described on this page along with a statewide map illustrating these zones. A more detailed summary of the climate conditions for each Plant Climate Zone is provided on pages 12-17 to further distinguish their similarities and differences.

### California Plant Climate Zones

#### Overview

Plant climate zones identified throughout California are largely defined upon the pattern of cold temperatures. Climate Zones 1, 2 and 3, for example, have the coldest winter conditions in California, including snow and a greatly reduced growing season. Climate Zones 22, 23 and 24 are quite mild by comparison; very few days fall below 32°F each year. Of the 24 plant climate zones mapped across the western United States, 21 are found in California. Many factors and conditions impact the growth of plants and contribute to this rich tapestry of climate zones. Some of these are briefly described below.

#### Cold Temperature

The successful growth of plants strongly reflects their adaptation to seasonal temperatures and moisture. In essence, cold temperatures pose the primary limiting condition on plant survival and the length of the growing season that occurs between frosts. Plants that cannot tolerate the minimum temperatures of an area can be severely damaged or killed, particularly during record cold cycles.

#### Warm Temperature

Plants are also impacted by summer heat and average warm temperature conditions. A large number of plants from arid, Mediterranean and subtropical climate zones are planted in California. Many of these plants grow best in zones where there are 60-70 or more days each year where temperatures are above 90°F. Some of these plants can tolerate a fair amount of cold, but they need to be placed in warm microclimates when grown in cooler climate zones.

#### Pacific Ocean

The existence of the Pacific Ocean along the western edge of California lies at the foundation of regional climate conditions in the state. It is key to the movement of storms into the state during winter months as well as mitigating summer heat and evapotranspiration losses along the coast during summer months. Climate zones located in northern latitudes commonly receive more precipitation and zones closest to the coast have the lowest range of annual evapotranspiration losses.

#### Continental Climate

Climate conditions that occur within the interior areas of the western United States have a dominant impact on temperature and precipitation conditions along the eastern side of California. Continental climate temperatures are colder and place greater limits on the growth of ornamental plants throughout the Great Basin and Mojave Desert regions of the state.

#### Topography

Statewide climate conditions are heavily modified by regional topography, including elevation, slope and orientation. It is the remarkably diverse topography of California that largely defines the boundaries of the 21 climate zones by altering regional temperatures, precipitation and sunlight into different local patterns. There are many examples where two very different plant climate zones occur in close proximity to each other, but are separated by a topographic feature such as a ridgeline or the slope of a valley floor.

#### Reference Evapotranspiration

Reference evapotranspiration is defined as the combined loss of moisture from evaporation and transpiration during the growth of four to seven-inch cool season grass. Reference evapotranspiration is measured by weather stations throughout the state and is summarized on a monthly and annual basis. This data is used in estimating the water needs of plants in different climate zones. The key climatic factors influencing evapotranspiration rates are solar radiation, air temperature, relative humidity and wind speed.

#### Precipitation and Supplemental Irrigation

Similar to temperature, natural precipitation varies greatly across California. Most of the state has a Mediterranean climate pattern that brings the great majority of rain and snow during winter months and very little during summer months. The widespread use of supplemental irrigation in landscapes and gardens helps offset the lack of summer precipitation. However, the increasing demand for water through population growth and recurring drought cycles necessitates mindful conservation and efficiency in the use of supplemental irrigation.

#### Microclimates

The broad plant climate zones of California have proven to be highly successful in helping guide the selection of plants for garden and landscape use across California. At the same time, the exact boundaries of these zones are hard to identify and seasonal conditions change from year to year.

Additionally, the occurrence of buildings and pavement as well as the orientation and enclosure of entries, patios and courtyards create microclimate conditions with significantly modified temperature and sunlight, as well as drainage and soils that are completely different from the broader conditions at large. The greatest success of landscapes and gardens rests upon interpreting the microclimate conditions throughout the different seasons of the year in the process of selecting, planting and caring for plants.

# Plant Climate Zones

## Northern Latitude

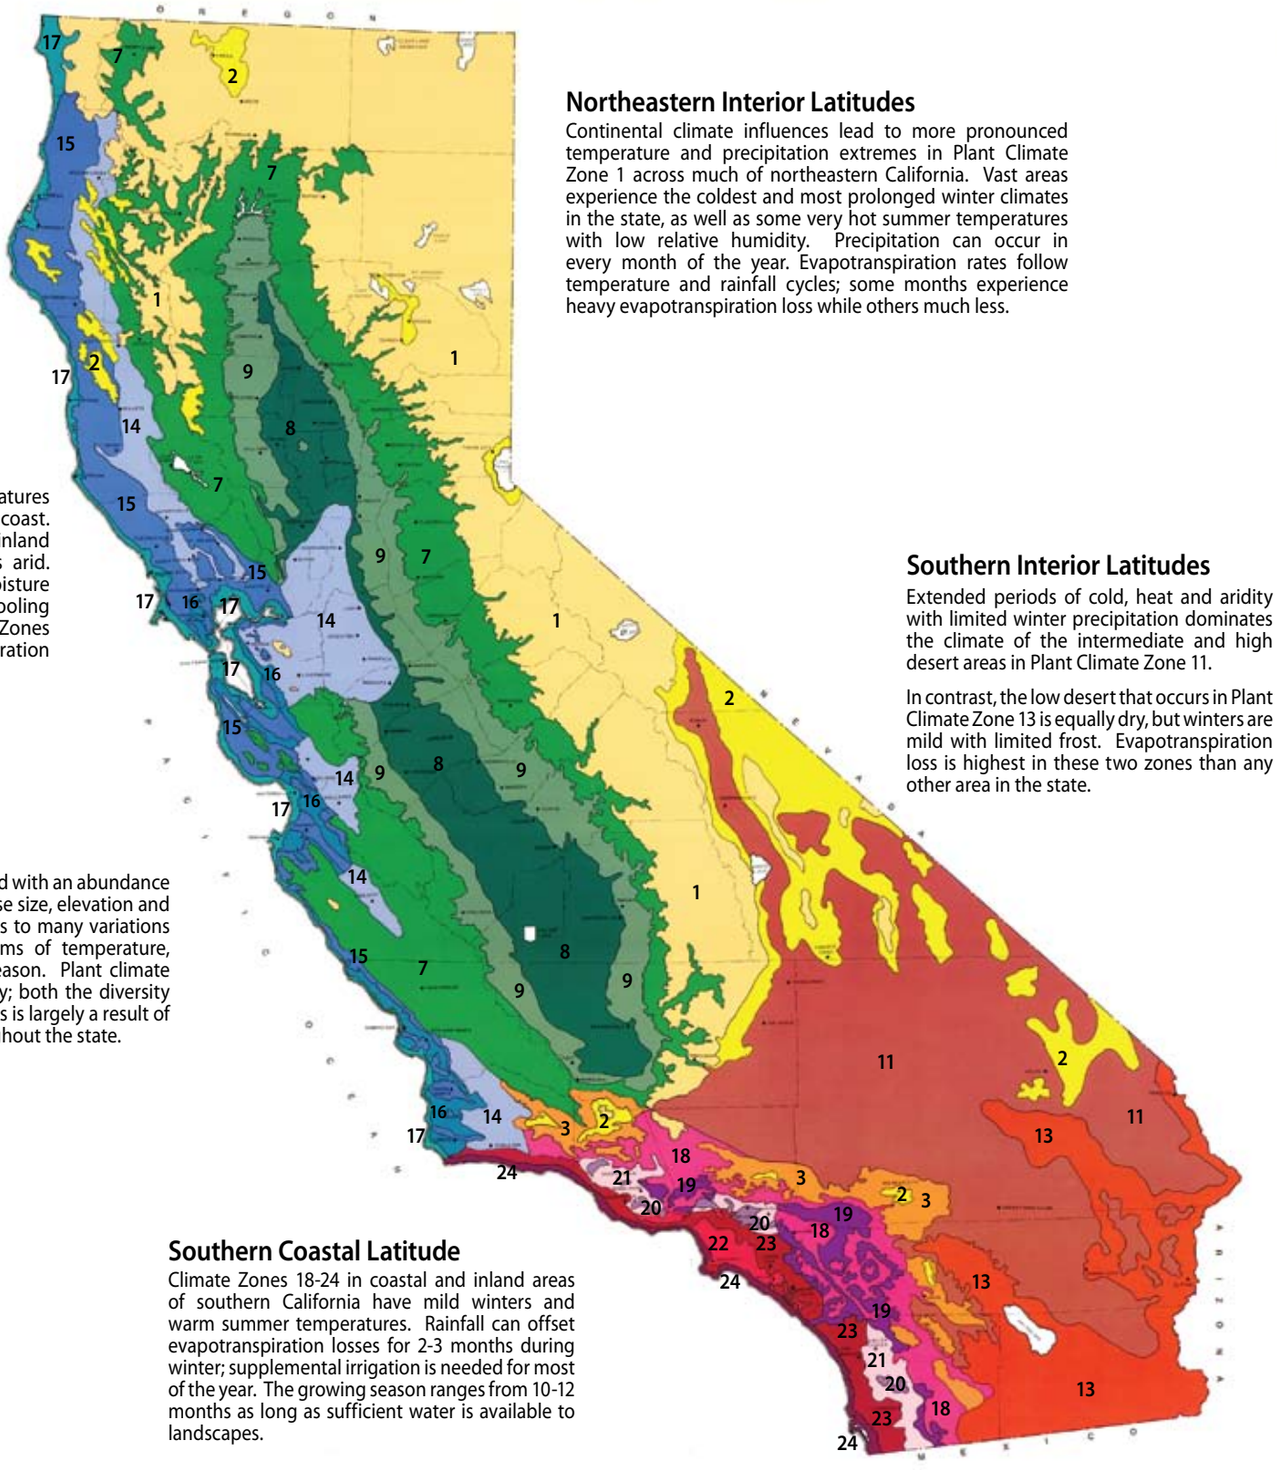
Climate zones of northern latitudes are marked by colder winter temperatures, fewer growing season days and greater levels of annual precipitation in contrast to southern zones of the state. Precipitation exceeds reference evapotranspiration for several winter months of the year. Summers are cool and moist along the coast; inland valleys and foothills are warm and dry with periods of high temperatures and increased moisture stress.

## Pacific Ocean

The Pacific Ocean moderates temperatures along the entire length of California's coast. Winter's cold is less extreme than in inland areas; summer heat is milder and less arid. Relative humidity is increased and moisture stress is reduced by the damp and cooling influence of marine air. Plant Climate Zones 17 and 24 have the lowest evapotranspiration levels in the state.

## Topography

California's topography is filled with an abundance of ranges and valleys of diverse size, elevation and character. This diversity leads to many variations in climate conditions in terms of temperature, precipitation and growing season. Plant climate zones fit into this topography; both the diversity and boundaries of these zones is largely a result of the varied topography throughout the state.



## Northeastern Interior Latitudes

Continental climate influences lead to more pronounced temperature and precipitation extremes in Plant Climate Zone 1 across much of northeastern California. Vast areas experience the coldest and most prolonged winter climates in the state, as well as some very hot summer temperatures with low relative humidity. Precipitation can occur in every month of the year. Evapotranspiration rates follow temperature and rainfall cycles; some months experience heavy evapotranspiration loss while others much less.

## Southern Interior Latitudes

Extended periods of cold, heat and aridity with limited winter precipitation dominates the climate of the intermediate and high desert areas in Plant Climate Zone 11.

In contrast, the low desert that occurs in Plant Climate Zone 13 is equally dry, but winters are mild with limited frost. Evapotranspiration loss is highest in these two zones than any other area in the state.

## Southern Coastal Latitude

Climate Zones 18-24 in coastal and inland areas of southern California have mild winters and warm summer temperatures. Rainfall can offset evapotranspiration losses for 2-3 months during winter; supplemental irrigation is needed for most of the year. The growing season ranges from 10-12 months as long as sufficient water is available to landscapes.

## Plant Climate Zones

# Northern California

### Introduction

Northern California's topography defines a number of north and south oriented ranges and valleys that create many contrasting plant climate zones. Some areas have cold winter temperatures and short growing seasons, others have clearly defined Mediterranean climate conditions. Winter precipitation often exceeds evapotranspiration rates; very little supplemental water is needed for landscapes and gardens for several months of the year. Coastal and high elevation zones have little summer heat in contrast to valley zones that experience high temperatures for extended periods.

**Cold Climate Zones - Zones 1, 2**

These northern climate zones have severely cold winters with heavy snowfall and remarkably short growing seasons. Hardy native and exotic trees and shrubs along with seasonal annuals and tough perennials provide most of the planting palette. Microclimates are key to mitigating harsh conditions to extend the season of exotic plantings.

**Foothill Gray Pine - Zone 7**

The foothill gray pine zone almost forms a continuous ring at middle elevations around the Sacramento and San Joaquin valleys throughout California. This zone is dominated by rugged foothill environments with winter temperatures in the northern part of the state falling below 32°F on a regular basis, limiting the growing season to 5-6 months.

**Sacramento Valley - Zones 8, 9**

The interior of northern California is dominated by the Sacramento Valley. It has two climate zones; both are characterized by cool winters with regular frost and summers with intense sunlight and high temperatures. The lower elevations of this valley comprises a cooler climate zone with more severe winter frosts and a slightly shorter growing season. This climate is ideal for many agricultural crops as well as ornamental plants that thrive in summer heat. Dense wintertime tule fogs occur for many days each year as well as harsh Northern winds. Trees are highly important in these zones to provide shade and protection from hot sun for many flowering shrubs and perennials.

**North Coastal Valley - Zone 14**

A well defined northern coastal valley zone extends from Sonoma to Humboldt Counties and includes such cities as Napa, Sonoma, Petaluma and Santa Rosa. The southern parts of this zone experience milder winter temperatures and warmer summers to produce a highly favorable climate for many ornamental and native California plants. Northern parts of this zone become increasingly cooler and more favorable to temperate climate plants.

**North Coast and Range - Zones 15, 17**

Areas falling within the north coast and range zones experience the mildest temperatures and highest levels of precipitation of any part of California. The Pacific Ocean moderates winter cold and brings abundant rainfall during the winter; summer temperatures are seldom above 90°F and dense fog is common. Fog drip along the immediate coast can measure as much as 10 inches per summer. While temperatures are mild, plants from subtropical and arid climates do not get enough heat to do well, instead, plants from maritime and temperate climate zones do very well in these zones.

## Plant Climate Zones

# Central California

### Introduction

The climate zones of central California are dominated by some of the best known physiographic features in the state, including the San Francisco Bay, central coastal ranges, the San Joaquin Valley and Sierra Nevadas. While all of these areas fall under the broad umbrella of a Mediterranean climate system, the range of seasonal temperatures and moisture conditions among them are distinctly different.

**Sierra Nevada - Zone 1**

Elevations above 2,500 ft. in the Sierra Nevada mountains of central California experience very cold winters and extensive amounts of snow. These conditions limit the growing season to two to three summer months, which can be remarkably warm and dry for weeks at a time. Only the hardiest native and exotic plants do well in this zone; annuals and robust perennials provide spring and summer garden interest.

**Foothill Gray Pine - Zone 7**

The foothill gray pine zone occurs at mid elevations on both sides of San Joaquin Valley of central California. This rugged foothill zone has regular winter frost, but receives far less precipitation with higher evapotranspiration loss in comparison to Zone 7 in the northern part of the state.

**San Joaquin Valley - Zones 8, 9**

From an agricultural perspective, the San Joaquin Valley is one of the most productive growing environments in the world. This is the result of cool moist winters, long warm summers and rich sedimentary soils. These same climate and soil conditions also support the growth of many types of ornamental plants. Winters are too cold for subtropical plants, but many species from temperate, Mediterranean and arid climate zones thrive in this valley. Native and ornamental trees, including the venerable valley oak, grow to monumental sizes in deep soils with regular moisture and summer heat. Hot summer months result in over 45 inches of evapotranspiration loss.

**San Joaquin Delta - Zone 14**

The San Joaquin delta encompasses low elevation areas between the southern part of the Sacramento Valley and northern part of the San Joaquin Valley. Throughout this low lying drainage basin, cooler maritime climate conditions flow through the San Francisco bay area and interfaces with the warmer interior valley climate. The maritime climate keeps winter temperatures warmer than adjacent valley areas and brings more humidity. This zone has a very warm nine month long growing season that can produce robust and diverse ornamental plantings with regular supplemental irrigation in such cities as Davis, Sacramento and Stockton.

**San Francisco Bay Area and Central Coast - Zones 15-17**

The coastal ranges of this part of the state buffers the full impact of fog and wind, and produces conditions in Zones 15 and 16 that are much warmer and drier in such communities as Palo Alto, Saratoga and the foothills of Walnut Creek. The highly diverse topographic character of the bay area produces many sudden variations among these zones.

Many parts of the San Francisco bay area and the coastline that extends through Santa Cruz, Monterey and Carmel to Pismo Beach, comprise Zone 17, and reflect a departure from warm summer temperatures widely associated with Mediterranean climate zones. Few days each year get above 90°F; dense fog and cool maritime breezes are common due to the proximity to the Pacific Ocean.

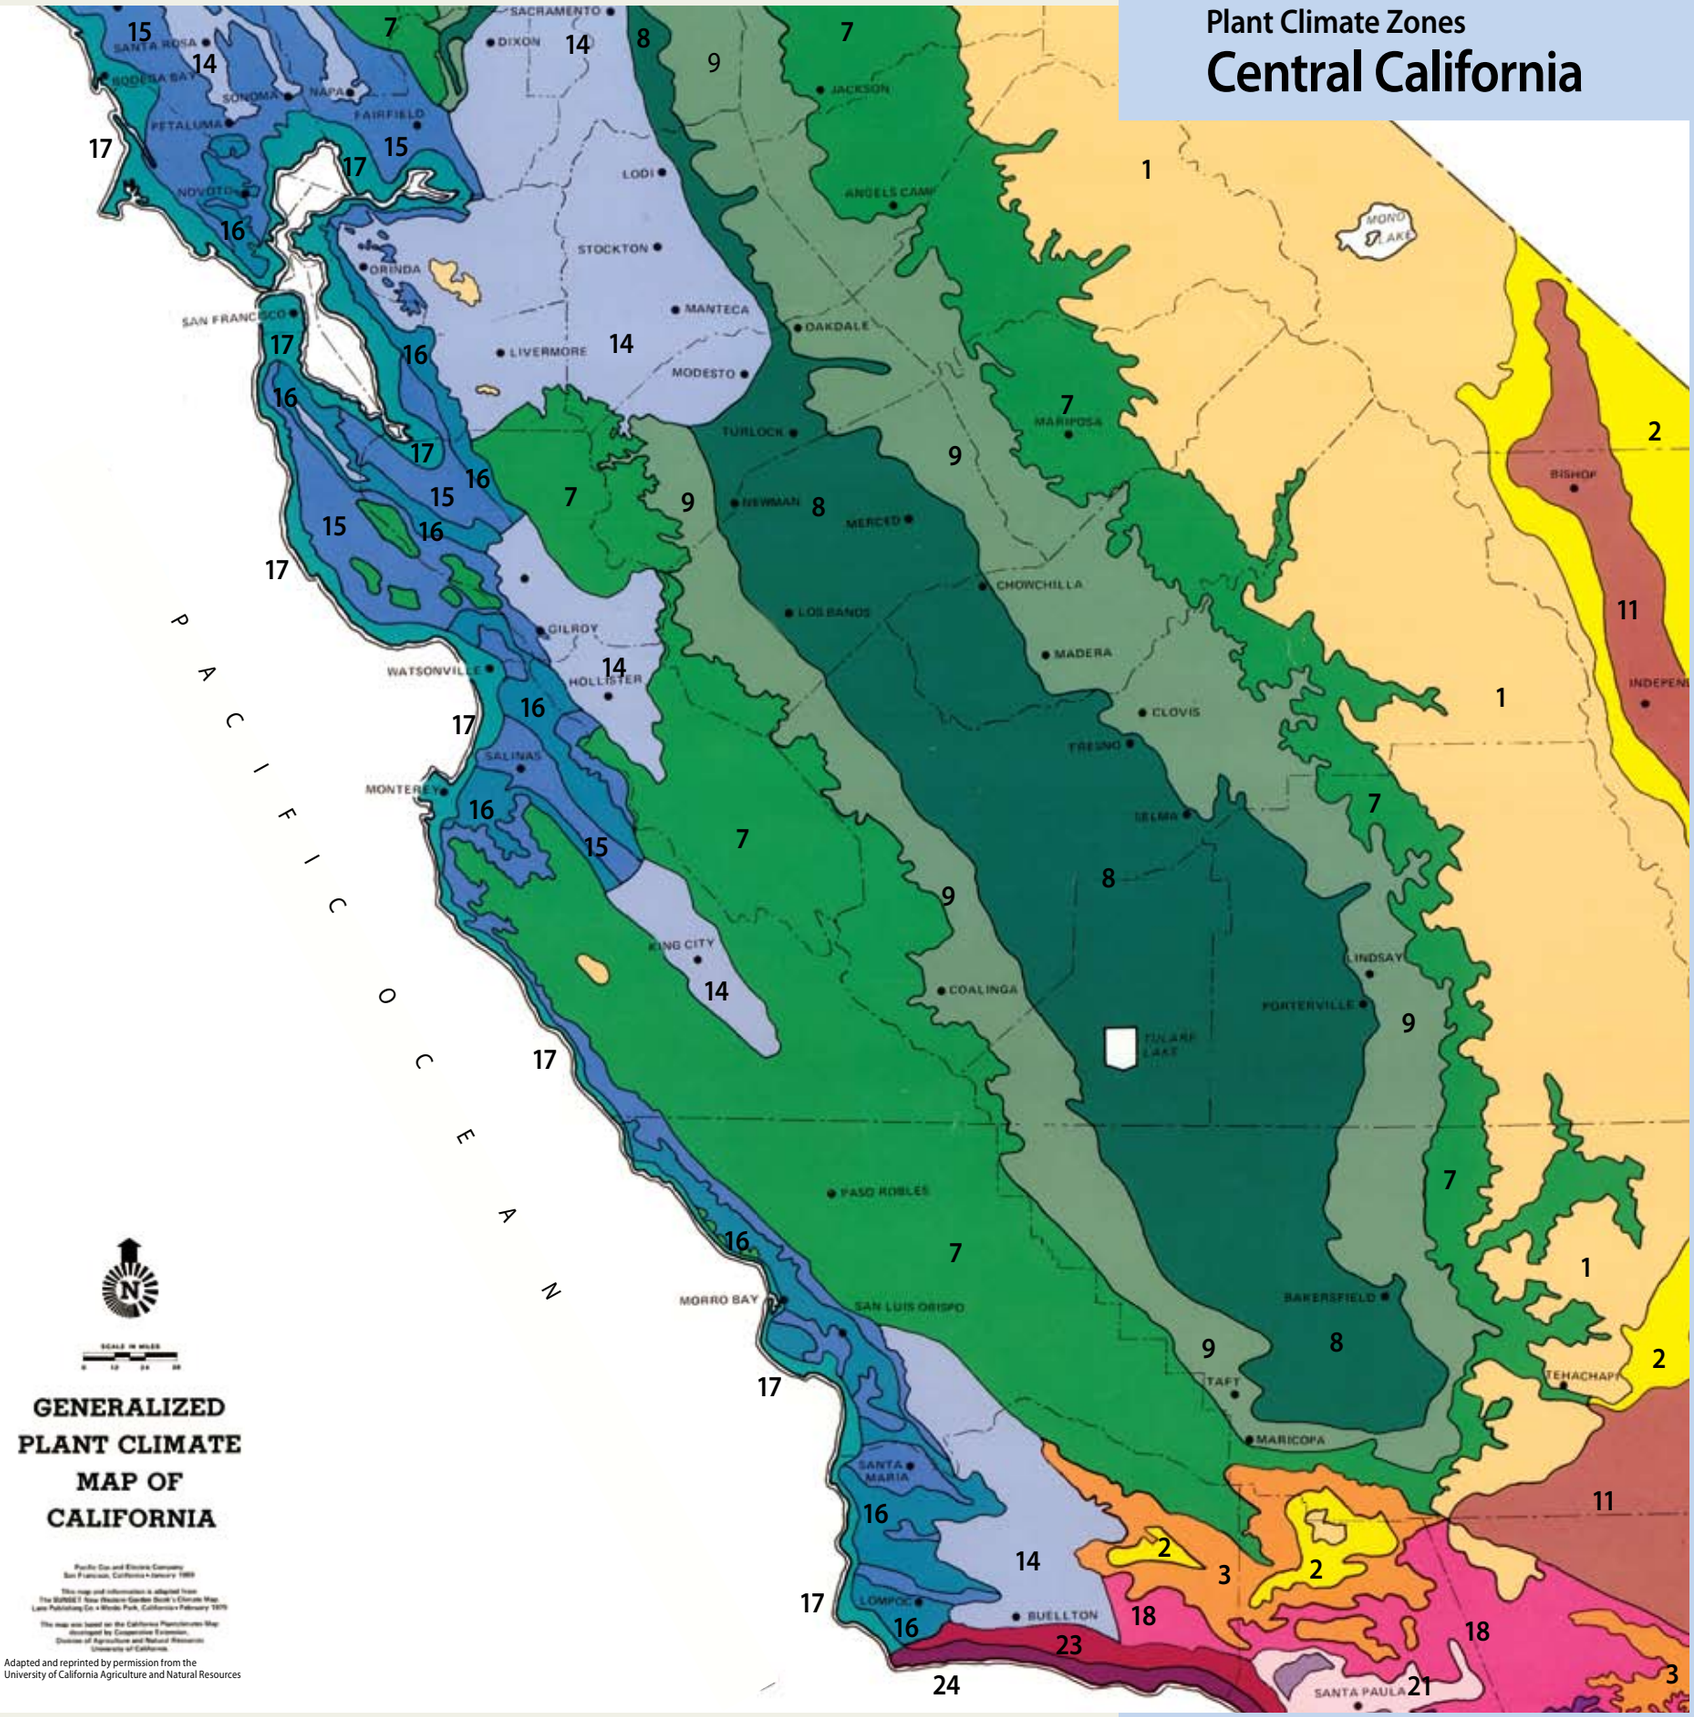
Plant Climate Zones

# Central California



## Plant Climate Zones

# Southern California

### Introduction

The climate of southern California includes some of the warmest and driest parts of the state; both Mediterranean and arid climate conditions occur. More plant climate zones exist in this area than any other comparable part of the entire west coast, as well as some of the finest coastal conditions for growing a remarkably large variety of plants from around the world. These zones reflect the complexity of conditions that occur between climate, topography and the presence of the Pacific Ocean.

#### Cold Climate Zones - Zones 2, 3

The cold climate of southern California zones occur at high elevations in mountains and interior areas of the Mojave Desert. Severe winters and short growing seasons restrict the choice of plants to hardy trees and shrubs and tough perennials and annuals. Microclimates that provide protection from cold, wind and intense summer sun are key to the success of ornamental plantings.

#### Mojave Desert - Zone 11

The Mojave Desert area of southern California is dominated by arid climate conditions that are much harsher and drier than Mediterranean conditions. The combination of cold winters, hot summers, wind, aridity and lack of precipitation greatly restrict both the native flora and survival of exotic plants in such communities as Palmdale, Lancaster and Victorville. Microclimates that buffer these conditions as well as regular supplemental water is critical for landscape success.

#### Sonoran Desert - Zone 13

The arid climate conditions of the Sonoran Desert produces high levels of heat, low rainfall, wind and aridity. However, winter frost is very infrequent and many plants from Mediterranean, subtropical and arid zones are successfully grown throughout such communities as Palm Springs, Palm Desert and Indio as long as there is generous use of supplemental water and some shelter provided from intense sun exposures.

#### Inland Valleys and Foothills - Zones 18 - 21

The Mediterranean climate conditions of the inland valleys and foothills of southern California are characterized by short mild winters and long dry summers. Winter rainfall can meet moisture needs of ornamental plants for a few months, but supplemental irrigation becomes necessary in ornamental landscapes and gardens for much of the rest of the year. Plants from temperate, Mediterranean and arid climate zones grow well throughout this part of the state; hardy subtropicals also grow well, particularly in microclimates that protect them from record cold cycles. These zones experience cooling maritime fog during spring and daily afternoon breezes much of the year.

#### Coastal Edge and Valleys - Zones 22-24

Coastal zones in southern California stretch from Santa Barbara to San Diego under Mediterranean climates dominated by ocean influences most of the year. This results in modest winter precipitation and mild winter and warm summer temperatures. Some areas have growing seasons that last up to 12 months as long as supplemental water is available; only occasional frosts occur. These conditions are ideal for subtropical plants with many microclimates providing enough sun and warmth for plants from arid climates.

## Water Needs of Plants and Landscapes

# Reference Evapotranspiration

### Introduction

All plants and landscapes need water to function and grow. In natural landscapes this water comes from various forms of precipitation, principally rainfall and snow. Native plants adapt and grow in response to this moisture. In ornamental landscapes and gardens, precipitation does not provide all of the moisture plants require and supplemental water is needed. This is particularly true when landscapes and gardens are developed in dry climate zones and include plants that are adapted to cooler and moister habitats. From a horticultural perspective, too little water can lead to poor growth and death. Too much water can lead to excessive growth, increased pest and disease problems as well as death. Additionally, from the perspective of conservation, it is essential to design and manage landscapes with high levels of efficiency and understanding about the limits of regional and local water supplies and natural drought cycles.

In response to these issues, an approach has been developed to estimate the supplemental water needs of ornamental plants in landscapes and gardens. This approach was initially developed and tested in the production of agricultural crops and is now being applied to ornamental plantings. It is based upon an assessment of a number of factors involving weather, plants and irrigation efficiency. These factors are described in the next several pages along with charts, images and example calculations that are helpful in estimating the total applied water use in landscapes and working with water budgets. The goal of this effort is to help estimate water needs of existing and new landscapes and gardens in any location in California for conservation and horticultural purposes.

### Reference Evapotranspiration (ETo)

Plants and landscapes lose water through evaporation and transpiration. Evaporation occurs from the surfaces of foliage and soil; transpiration occurs from plants during the processes of photosynthesis and respiration. The total amount of water lost in these two ways is referred to as evapotranspiration. Understanding evapotranspiration loss of water from plants and landscapes underlies the process of estimating how much water is needed for healthy growth and aesthetic character.

The principal weather factors that affect the amount and rate of evapotranspiration are solar radiation, air temperature, relative humidity and wind speed. Data collected by weather stations is used to estimate the amount of evapotranspiration loss that occurs as plants grow throughout the year. In this process, one plant has proven useful to serve as a reference crop for other plants due to its uniform response to the combined influence of these climate factors. This reference plant is four to seven-inch tall cool season grass that is well irrigated to avoid any moisture stress throughout the year. Evapotranspiration data for this grass is called **Reference Evapotranspiration (ETo)**.

Weather stations have been set up in many areas throughout California to collect local weather data and calculate reference evapotranspiration rates. The results of these measurements and calculations is often summarized in a chart such as the one seen to the right. The ETo of an average year is referred to as normal year ETo. This data is used in the estimation of water needs of plants and landscapes which will be described over the next several pages.

### Reference Evapotranspiration (ETo)

The chart below shows examples of the ETo calculations obtained from different weather stations on a monthly and annual basis. These weather measurements and calculations serve as a reference value to estimate water needs of other plants described on pages 20-21. The annual reference evapotranspiration rates for four different cities are shown to the right.

Reference Evapotranspiration data for many cities across the state are available through the:

# Precipitation and Microclimates

## Precipitation

Some of the monthly and annual water needs of ornamental plants can be met by natural precipitation. A comparison can be made between the historic monthly reference evapotranspiration rates and monthly precipitation during the growing season of a location to address this issue. It is possible to anticipate that little or no irrigation is needed during the growing season when precipitation exceeds reference evapotranspiration. This conclusion can work if rainfall occurs with consistency throughout the month. Even when rainfall does not exceed reference evapotranspiration, it can provide important supplemental water to landscapes and gardens when it occurs. A value of 25% (0.25) of annual rainfall is commonly accepted as the portion of total precipitation that is useful to plants and landscapes. Automatic irrigation systems should be equipped with rain sensor devices that automatically shut off irrigation when rainfall occurs to avoid wasting water.

The growing season for most plants occurs between the last days of frost in the spring and the first days of frost in the fall. In some climate zones across California, particularly at high elevations, the growing season can be as short as two to three months due to the regular occurrence of cold temperatures. Other climate zones closer to the coast experience little or no frost to restrict the growing season. The growing season is the principal time of year when supplemental water is beneficial to active plant growth.

## Microclimates

Weather stations are commonly placed in relatively large and open spaces to collect data on solar radiation, air temperature, relative humidity and wind speed. This provides data that can be applied to other areas having similar conditions. However, many landscapes and gardens near these weather stations can have quite different conditions. A common example of a microclimate is the occurrence of shade on the north side of buildings and under mature trees that greatly reduces solar radiation. Another example is the shape of the topography that influences the drainage of moisture; low areas often collect and absorb more moisture for use by plants while ridges and south and west facing slopes absorb less moisture and dry out more quickly. Reflected light and heat from pavement can increase temperatures and moisture stress. These conditions result in microclimates that have different ETo values from the data provided by weather stations.

The key to successful plant growth, including supplemental moisture needs, is closely linked to microclimates. The best growth and character of plants occurs when they are placed in areas where they are naturally adapted to sunlight, temperature and moisture conditions within specific microclimates. This is particularly evident in warm and dry climate zones where the enclosure and shelter provided by courtyards and walls can create highly successful plantings that are buffered from drying weather conditions, thereby reducing the need for supplemental moisture. From another perspective, plants from subtropical and arid climate zones often require sufficient periods of warmth to grow well when they are planted in cooler climate zones. These plants will grow best in sunny locations and areas sheltered from winter frost.

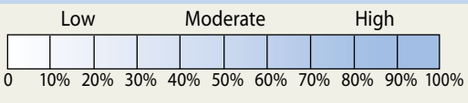
## Water Needs of Plants and Landscapes

# Plant Factors

### Introduction

Reference evapotranspiration calculations derived from weather stations measurements (page 18) provide the necessary foundation for estimating the water needs of other types of plants grown in landscapes and gardens. This is done by assigning a **Plant Factor (PF)** to all other plants that represents the estimated percent or portion of supplemental water needed relative to the ETo value of a particular location.

Two types of plant factors are applied in order to reflect the different physiological and adaptive characteristics of plants in response to their water needs. Plants with a single plant factor (L, M, H) grow best with regular water throughout the year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors reflect both the total amount of moisture needed and the season of need (see page 21). As can be seen in the different plant images to the right, the plant factors vary between tall fescue, Japanese maple, crape myrtle and Allen Chickering sage. These plants have different foliage, stem and rooting characteristics that influence their need for moisture. The assignment of a plant factor to each plant is based mostly upon horticultural judgement, botanical research and experience to sustain healthy growth and positive aesthetic character. The graph shown below illustrates the range of supplemental water needs associated with each plant factor.



By multiplying the reference evapotranspiration value by the plant factor, the relative water need of a particular plant is estimated. The example below illustrates how many inches of supplemental moisture that is needed throughout the year in the landscape area where the plant is growing.

**Individual Plant Water Needs = (ETo) x (PF)**

**Los Angeles ETo** Plant Climate Zone: 22

| J | F | M | A | M | J | J | A | S | O | N | D | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2.2 | 2.7 | 3.7 | 4.7 | 5.5 | 5.8 | 6.2 | 5.9 | 5.0 | 3.9 | 2.6 | 1.9 | 50.1 in. |

Plants with regular water needs throughout the year:

Acer palmatum (H) 50.1 in. x (0.6-0.8) = 30-40 in.
Lagerstroemia indica (M) 50.1 in. x (0.4-0.6) = 20-30 in.

Plants with reduced summer water needs:

Abutilon palmeri (M/L) 50.1 in. x (0.3-0.5) = 15-25 in.
Acacia aneura (L/VL) 50.1 in. x (0.2-0.3) = 10-15 in.

This approach calculates the annual supplemental water needs of plants and landscapes in inches and can be used to schedule irrigation systems. Inches of water can also be converted into gallons of water; this is illustrated in the example calculations on pages 24-25.

It is important to note that plant factors provide a range of moisture needs for the average reference evapotranspiration levels that have occurred for many years. This range provides flexibility to adjust supplemental irrigation to fit microclimate conditions and variations in average weather conditions that can occur in any specific year.

### Plant Factors (PF)

An example list of landscape plants and their plant factors is presented in the chart below. Plant factors indicate the percentage of supplemental water each species needs relative to ETo. Two types of plant factors are shown below. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. Depending upon the type of plant factor, each plant is assigned to an irrigation group explained on the opposite page. A comprehensive listing of plant species and their plant factors is provided on pages 26-41. Similar data on plant factors is also available in the Department of Water Resources 2000 publication:

**Water Use Classification of Landscape Species (WUCOLS)**

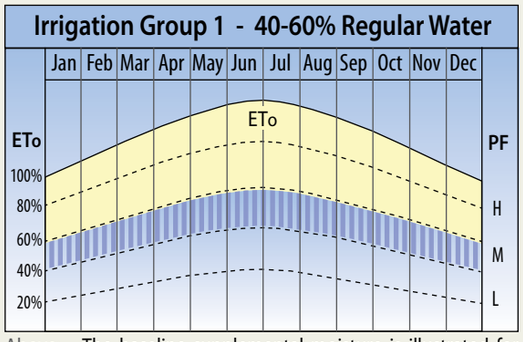
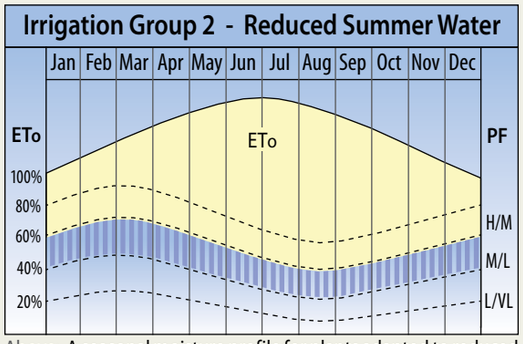
Above: The baseline supplemental moisture range is illustrated for plants with high plant factors (H), based on 60-80% of ETo every month of the year.

Above: A mixed planting of *Jacaranda* and *Agapanthus* with moderate (M) plant factors.

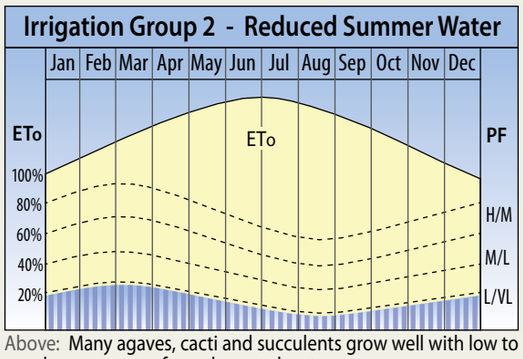


Above: The baseline supplemental moisture is illustrated for plants with moderate plant factors (M), based on 40-60% of ETo every month of the year.

Above/Below: A combination of *Cistus, Rosmarinus* and *Phlomis* that grow well with moderate to low (M/L) supplemental water. *Agave, Opuntia and Yucca* need low to very low (L/VL) water.



Above: A seasonal moisture profile for plants adapted to reduced summer moisture. Supplemental water for plants with moderate to low plant factors (M/L) ranges 40-60% of ETo through fall and winter and 20-40% during summer.



Above: Many agaves, cacti and succulents grow well with low to very low amounts of supplemental water.

## Water Needs of Plants and Landscapes

# Irrigation Groups

### Introduction

The combination of reference evapotranspiration and plant factors helps estimate the amount of annual supplemental water ornamental plants need in landscapes and gardens. Two types of plant factors are used. These types indicate that different plants need different annual amounts of water as well as vary in their need for water at different times of the year. Studying both annual and seasonal moisture needs helps refine the basis to select and combine plants into compatible irrigation groups and hydrozones.

### Irrigation Groups (IG)

Annual water needs of plants should be met as much as possible on a seasonal basis that reflects the adaptations and stages of growth, flowering, fruiting and dormancy of each species. For example, some plants need moderate amounts of water and grow best with regular moisture throughout the year, while others do better with regular water in winter and reduced amounts of water in summer. The basis for these differences in seasonal needs is often found by understanding the climate and habitat conditions of a plants origin. Two baseline **Irrigation Groups (IG)** can be identified to reflect basic differences in the seasonal moisture needs of plants. These groups are described below. Charts to the left illustrate conceptual seasonal moisture ranges and profiles for each group.

#### Irrigation Group 1 - Regular Water

Plants in this group commonly grow best with regular moisture throughout the year. In general, watering will be increased as reference evapotranspiration increases and watering will be decreased when reference evapotranspiration decreases. In essence, irrigation is scheduled to regularly provide water as moisture is lost. This avoids placing moisture stress on plants and enables them to be active during the full growing season. This approach to irrigation management is particularly helpful for cool season turf grasses and plants that come from cool and moist habitat conditions that quickly become stressed under warm and dry conditions.

It is important to note that regular moisture can limit the range and depth of a plant's root systems due to the ease of available moisture. Plants with limited root systems can suffer heavily if the irrigation system fails.

#### Irrigation Group 2 - Reduced Summer Water

The second irrigation group and set of charts shows the moisture distribution curves for plants adapted to Mediterranean climate conditions, including many California native plant species. Such plants have an active winter and spring growing cycle with the occurrence of seasonal rains and mild temperatures. By the end of spring and early summer, many of these plants enter their fruiting stages and become less active under moisture stress. Many species adapted to these moisture variations have evolved hard and leathery leaves to endure summer sun, heat and drought. Others have developed succulent foliage that enables them to store moisture and resist periods of drought.

Plants adapted to reduced summer moisture levels will continue to grow if provided with regular moisture in the summer. However, this commonly results in excessive and non-beneficial growth and increased risk of pest and disease problems.

# Hydrozones

## Hydrozones (H)

One of the best planting strategies from the perspective of managing water use and increasing efficiency is achieved by grouping plants together that have the same level of water needs in combination with similar seasonal water needs. This approach to planning and designing landscapes and gardens can avoid conflicts between plants such as overwatering some plants while underwatering others.

Organizing plantings into hydrozones and irrigation groups goes hand in hand with fitting plants into the microclimate conditions of a landscape or garden. Sun and shade patterns as well as topography alter the broader climate factors of solar radiation, temperature, humidity and wind that further define hydrozone areas. Additionally, slopes often reduce the infiltration of water while low drainage areas can become saturated as a result of moisture runoff that collects in these areas. After all of these factors are studied and weighed, plantings with similar water needs can be organized into spaces and be sustained with dedicated irrigation systems that can provide the appropriate amount of supplemental water.

It is also important to consider the flexibility and adaptability of different types of irrigation systems with regard to the planting design. For example, drip systems comprised of flexible tubing can placed where water is needed and be concentrated around larger trees and shrubs to provide increased amounts of water. This strategy can sustain plants with different water needs on the same irrigation system and in close proximity to each other. In another example, spray systems can be very helpful in washing dust and other pollution from plant leaves as well as provide uniform moisture coverage similar to rainfall. Often, the surface runoff and overspray from these systems can collect and infiltrate into surrounding planting areas for beneficial use. Sometimes two irrigation systems can overlap and complement each other. Trees can be irrigated by one system that provides deep watering cycles while shrubs, vines, ground covers and perennials can be irrigated by another.

From a conceptual perspective, it is often desirable to work with moderate to high water needy plants near entries, in courtyards and border plantings where landscape impact is most beneficial. Lawns should be mostly surrounded by shrub planting areas instead of pavement as a way to have overspray go into planting zones. Low water hydrozones are often best suited to perimeter spaces and edges where mulching and use of adapted trees and shrubs can grow with less supplemental water. An experienced and creative approach to working with hydrozones often saves water and enhances planting success. Good design and water use does not diminish or compromise the quality of landscapes and gardens.

Above/Below: Examples of two different landscapes, each comprised of several hydrozones. The design and layout of various plant species to match exposure conditions and topography produce hydrozones of similar water needs. Irrigation systems suited to each hydrozone can be designed and managed to provide supplemental water as efficiently as possible.

Above: Spray nozzles can achieve 60% irrigation efficiency.

Above: Microspray nozzles can achieve 70% efficiency.

Above: Rotating nozzles can achieve 75% irrigation efficiency.

Above: A close-up view of a rotating nozzle applying water.

Above: Rotors can achieve 75% irrigation efficiency.

Below: A drip system being tested before covering with mulch. These systems can achieve 90% irrigation efficiency.

Above: Bubblers can achieve 85% irrigation efficiency.

Below: The layout of a drip line with emitters providing water at 12 inch intervals along the length of the tubing.

## Water Needs of Plants and Landscapes

# Irrigation Efficiency

### Introduction

The measurement of reference evapotranspiration and study of plant factors and microclimates can provide a sound estimate of the supplemental water needs of plants in a specific hydrozone. However, it is not possible to provide water at 100% efficiency to meet these needs. It is important to estimate the level of efficiency in order to know how much additional water is needed. Efficiency is defined as the amount of water beneficially used in comparison to the total amount of water applied by the irrigation system. The greater the inefficiency, whether from poor management or faulty equipment, the greater the amount of water that must be provided to meet plant needs.

### Irrigation Efficiency (IE)

Every irrigation system is compromised by inefficiency to some degree. **Irrigation Efficiency (IE)** is dependent on both management actions as well as the type of equipment being used. Mismanagement contributes to inefficiency in several ways. Setting irrigation schedules to provide too much water can result in runoff, excessive saturation and infiltration beyond the root zone. Leaving systems on during rains or providing too much out of season water are also common problems. Even bubbler and drip systems that provide water in very efficient ways to the soil are vulnerable to these types of poor management practices. Excessive irrigation of any type is a highly common issue; too much water can result in excessive and non beneficial growth, and is a form of inefficiency. The regular use of reference evapotranspiration data to provide the correct amount of water to each hydrozone is very helpful in guiding management actions.

Irrigation equipment also influences irrigation efficiency and moisture distribution. Systems with spray and rotor nozzles are often the least efficient due to occurrences of overspray, fogging, runoff, blocked heads, evaporation and wind drift. These systems are designed to provide uniform moisture distribution throughout the planting area and are well suited to turf grass and uniform plantings. Bubbler and drip systems that apply water more directly to the ground can experience runoff and over saturation that can compromise efficiency. These systems are less uniform in moisture distribution compared to spray nozzles. However, they are highly adaptable to fit dispersed planting schemes and capable of achieving varying levels of moisture among trees and shrubs.

All irrigation systems need to be well designed with appropriate equipment as well as be regularly inspected and maintained to achieve their potential level of efficiency.

### Guideline Irrigation Efficiency Values

Tests and assessment of different types of irrigation nozzles and emitters for efficiency have resulted in a list of baseline efficiency values. These include:

| | |
|---|---|
| Spray Nozzles | 0.60 |
| Microspray Nozzles | 0.70 |
| Rotating Nozzles | 0.75 |
| Rotors | 0.75 |
| Bubblers | 0.85 |
| Drip | 0.90 |

For example, a properly managed irrigation system with microspray nozzles can achieve 0.70 efficiency; it will require 30% more water to meet the estimated water needs of a landscape. A drip irrigation system with 0.90 efficiency will require 10% more water to offset water loss through the system.

## Maximum Applied Water Allowance

# Annual Water Budgets

### Introduction to MAWA

The State of California as well as many county and local planning departments have embraced a water budget approach to conserve water in ornamental landscapes and gardens. This approach is incorporated into various landscape ordinances to guide the design and use of water in landscapes. Two formulas are commonly used. The first formula establishes the maximum water allowance for a year; the second formula is used to estimate the total annual landscape water use. These formulas combine a number of the factors described on pages 18-23, including reference evapotranspiration, plant factors, irrigation efficiency, rainfall and hydrozones.

Example calculations for a three acre community park are provided to show how such formulas can be applied. These calculations are completed for Los Angeles and San Francisco in order to illustrate the annual water allowance and estimated total water use in cities that have different weather conditions.

### Maximum Applied Water Allowance

**MAWA = (ETo) (0.62) (AF) (LA)**

MAWA = Maximum Applied Water Allowance
ETo = Reference Evapotranspiration in inches per year
0.62 = Conversion factor to gallons
AF = ET Adjustment Factor
LA = Landscape Area

### Maximum Applied Water Allowance (MAWA)

This allowance identifies the upper limit of annual applied water for a landscape project. This budget is based upon the the reference evapotranspiration of a location, a conservation adjustment factor and the size of the landscape area. A conversion factor of 0.62 is included to convert the units of measurement from inches into gallons.

### Reference Evapotranspiration (ETo)

The loss of water through processes of evapotranspiration of a large field of four to seven-inch tall, cool season grass that is well watered. Values for reference evapotranspiration are measured in inches and can be summarized on a daily, monthly and annual basis (See page18).

### Conversion Factor (0.62)

This factor is included in the maximum applied water allowance formula to convert the numeric values from inches of water to gallons of water.

### ET Adjustment Factor (AF)

This factor makes an adjustment to the maximum applied water allowance by reducing the value of the annual evapotranspiration. The 2009 California State Model Water Efficient Landscape Ordinance sets this value at 0.70. This adjustment factor may be viewed as a conservation adjustment to limit water use in landscapes and gardens to 70% of ETo.

### Landscape Area (LA)

The landscape area is a measurement of all planting areas within a project that are to be irrigated. This area is measured in square feet for use in the maximum applied water allowance calculation. The landscape area does not include the area occupied by buildings or structures, sidewalks, driveways, parking lots or patios.

## Three Acre Community Park Case Study

| J | F | M | A | M | J | J | A | S | O | N | D | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2.2 | 2.7 | 3.7 | 4.7 | 5.5 | 5.8 | 6.2 | 5.9 | 5.0 | 3.9 | 2.6 | 1.9 | 50.1 in. |

### Los Angeles Historic Rainfall Profile

| J | F | M | A | M | J | J | A | S | O | N | D | Total |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 3.3 | 3.4 | 2.5 | 1.0 | .25 | .07 | .01 | .05 | .29 | .45 | 1.3 | 2.3 | 14.9 in. |

### Maximum Applied Water Allowance

MAWA = (ETo) (0.62) (AF) (LA)
(50.1) (0.62)(0.7) (130,680) = 2,841,428 Gallons

### Estimated Total Water Use Formula

$$ETWU = \frac{(ETo)\ (0.62)\ (PF)\ (HA)}{(IE)}$$

### Hydrozone Area 1 - 1 Acre
### Tall Fescue Turf Grass Hydrozone - 1 Acre

Estimated Annual Water Need - Irrigation Group 1

$$\frac{(50.1\text{ in.})(0.62)(0.8)(43{,}560\text{ sq. ft.})}{.75} = 1{,}443{,}265\text{ Gallons}$$

### Hydrozone Area 2 - 1 Acre
### Community Garden Hydrozone

Estimated Annual Water Need - Irrigation Group 1

$$\frac{(50.1\text{ in.})(0.62)(0.7)(43{,}560\text{ sq. ft.})}{.90} = 1{,}052{,}381\text{ Gallons}$$

### Hydrozone Area 3 - 1 Acre
### Perimeter Planting Hydrozone

Estimated Annual Water Need - Irrigation Group 2

$$\frac{(50.1\text{ in.})(0.62)(0.3)(43{,}560\text{ sq. ft.})}{.90} = 451{,}020\text{ Gallons}$$

### Gross Estimated Total Annual Water Use:

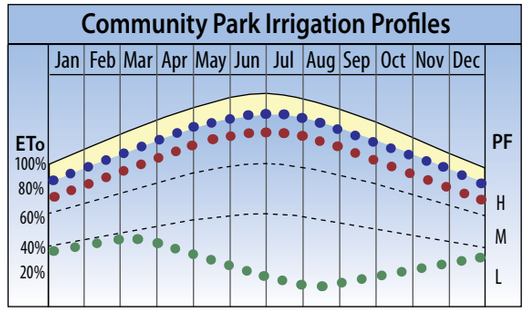
**(1,443,265 + 1,052,381 + 451,020) = 2,946,666 Gallons**

### Rainfall Adjustment

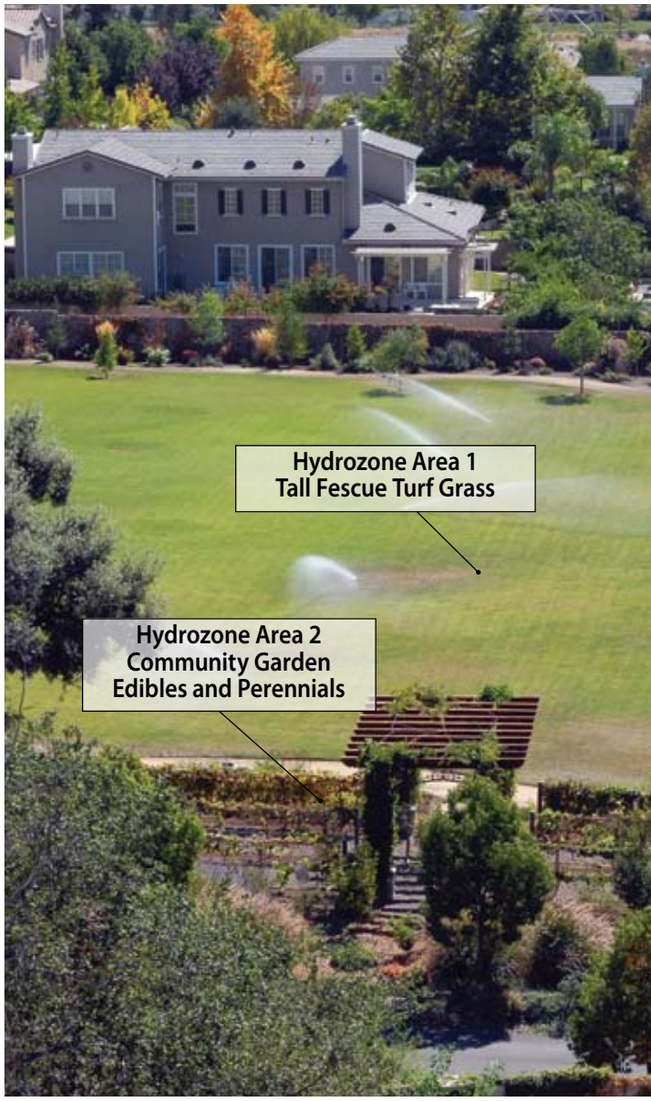
**14.9 in. of annual rainfall x 0.25 = 3.7 in.**
(3.7 in. x .62 x 130,680 sq. ft.) = -299,780 Gallons

### Net Estimated Total Annual Water Use:

(2,946,666 - 299,780) = 2,646,886 Gallons



- Hydrozone 1 - Tall Fescue Turf Grass Hydrozone (H) provided water on a regular basis at 0.8 of ETo.
- Hydrozone 2 - Community Garden Hydrozone (M) provided water on a regular basis at 0.7 of ETo
- Hydrozone 3 - Perimeter Hydrozone (M/L) provided moderate amounts of water in fall and winter and low amounts in summer.



### Plant Factors and Irrigation Efficiency*

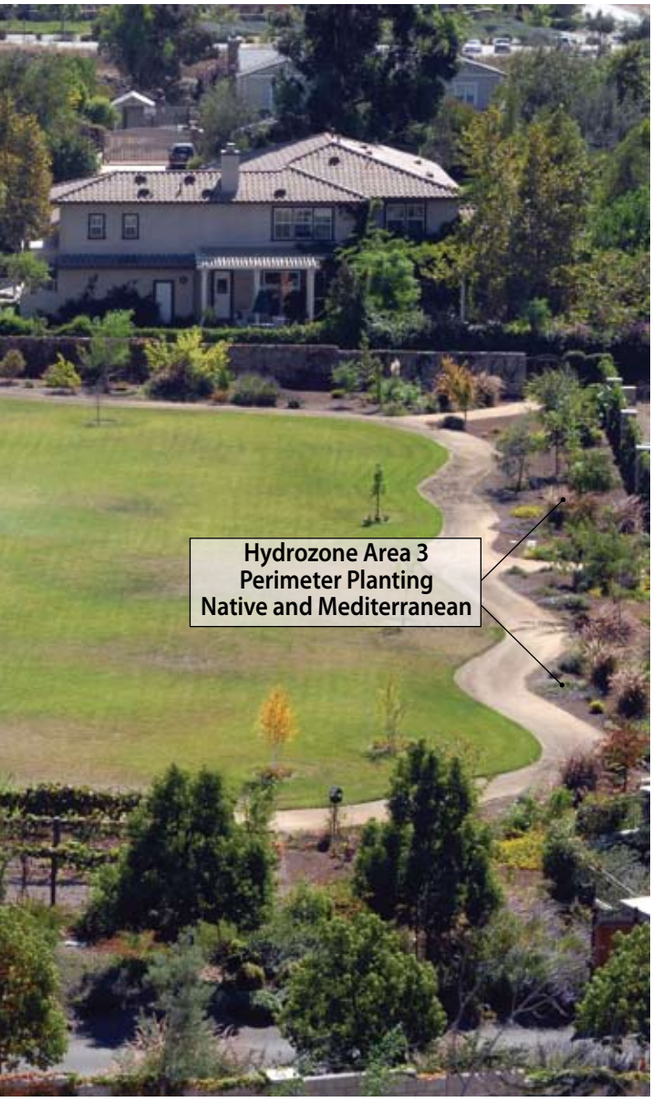
Plant Factors and Irrigation Groups used in these calculations include:

| | | PF | IG |
|---|---|---|---|
| Tall Fescue Turf Grass | = | 0.8 | 1 |
| Community Garden | = | 0.7 | 1 |
| Perimeter Planting | = | 0.3 | 2 |

Irrigation Efficiency values used in these calculations include:

| | | |
|---|---|---|
| Turf Grass Rotor System | = | 0.75 |
| Community Drip System | = | 0.9 |
| Perimeter Drip System | = | 0.9 |

*These values can vary; the appropriate plant factors and irrigation efficiency values for every project and local ordinances need to be reviewed and determined during the planning and design process.



## Three Acre Community Park Case Study
### Example Annual Calculations

**San Francisco ETo** Plant Climate Zone: 17

| J | F | M | A | M | J | J | A | S | O | N | D | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1.5 | 1.3 | 2.4 | 3.0 | 3.7 | 4.6 | 4.9 | 4.8 | 4.1 | 2.8 | 1.3 | 0.7 | Total 35.1 in. |

**San Francisco Historic Rainfall Profile**

| J | F | M | A | M | J | J | A | S | O | N | D | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 6.0 | 2.3 | 2.7 | 1.7 | 1.1 | 0.3 | .03 | 0.2 | 0.1 | 0.6 | 2.5 | 6.5 | Total 24.3 in. |

### Maximum Applied Water Allowance

MAWA = (ETo) (0.62) (AF) (LA)

(35.1)(0.62)(0.7)(130,680) = 1,990,701 Gallons

### Estimated Total Water Use Formula

$$ETWU = \frac{(ETo)\ (0.62)\ (PF)\ (HA)}{(IE)}$$

### Hydrozone Area 1 - 1 Acre
### Tall Fescue Turf Grass Hydrozone - 1 Acre

Estimated Annual Water Need - Irrigation Group 1

$$\frac{(35.1\text{ in.})(0.62)(0.8)(43{,}560\text{ sq. ft.})}{.75} = 1{,}011{,}150\text{ Gallons}$$

### Hydrozone Area 2 - 1 Acre
### Community Garden Hydrozone

Estimated Annual Water Need - Irrigation Group 1

$$\frac{(35.1\text{ in.})(0.62)(0.7)(43{,}560\text{ sq. ft.})}{.90} = 737{,}297\text{ Gallons}$$

### Hydrozone Area 3 - 1 Acre
### Perimeter Planting Hydrozone

Estimated Annual Water Need - Irrigation Group 2

$$\frac{(35.1\text{ in.})(0.62)(0.3)(43{,}560\text{ sq. ft.})}{.90} = 315{,}984\text{ Gallons}$$

### Gross Estimated Total Annual Water Use:

**(315,984 + 1,011,150 + 737,297) = 2,064,431 Gallons**

### Rainfall Adjustment

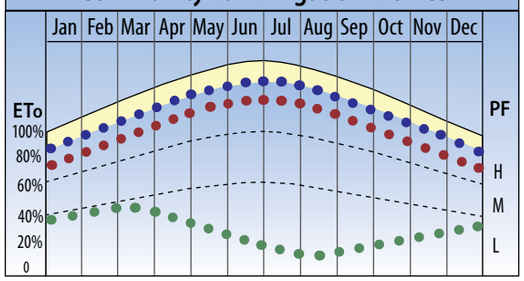
**24.0 in. of annual rainfall x 0.25 = 6.0 in.**

(6.0 in. x .62 x 130,680 sq. ft.) = -486,130 Gallons

### Net Estimated Total Annual Water Use:

(2,064,431 - 486,130) = 1,578,301 Gallons

### Community Park Irrigation Profiles



- Hydrozone 1 - Tall Fescue Turf Grass Hydrozone (H) provided water on a regular basis at 0.8 of ETo.
- Hydrozone 2 - Community Garden Hydrozone (M) provided water on a regular basis at 0.7 of ETo
- Hydrozone 3 - Perimeter Hydrozone (M/L) provided moderate amounts of water in fall and winter and low amounts in summer.

### Conversion Factors and Units of Measurement

Measuring estimated water needs of landscapes uses a combination of inches, square feet and gallons. Common conversion factors and units of measurement include:

1 Acre = 43,560 square feet

1 Acre foot of water = 1 Acre covered by 12 inches of water

1 Acre foot of water = 43,560 cu. ft. of water

1 Cubic foot of water = 7.48 Gallons

1 Acre foot of water = 325,851 Gallons
(43,560 x 7.48 = 325,851 Gallons)

Inches per square foot x 0.62
= Gallons per square foot

## Estimated Total Water Use
# Annual Water Use

### Introduction to ETWU

It is possible to estimate the total amount of water used in landscapes and gardens with the formula presented below. These estimates can be prepared on a monthly, quarterly or annual basis; calculations shown on these pages are for one year. Many landscape ordinances adopted by counties and cites throughout California work with these factors and versions of this formula.

### Estimated Total Water Use Formula

$$ETWU = \frac{(ETo)\ (0.62)\ (PF)\ (HA)}{(IE)} - (\text{Rainfall Adjustment})$$

| | | |
|---|---|---|
| ETWU | = | Estimated Total Water Use in gallons |
| ETo | = | Reference Evapotranspiration in inches |
| 0.62 | = | Conversion factor to gallons |
| PF | = | Plant Factor of relative water needs |
| HA | = | Hydrozone Area measured in square feet |
| IE | = | Irrigation efficiency at a minimum of 0.75 |
| 0.25 | = | Rainfall Adjustment |

### Estimated Total Water Use (ETWU)

The estimated total water use for landscapes and gardens is based upon the local reference evapotranspiration rate, the plant factor value, the area of each hydrozone, and the irrigation efficiency. A conversion factor of 0.62 is included to convert the units of measurement from inches into gallons.

### Reference Evapotranspiration (ETo)

The loss of water through processes of evapotranspiration of a large field of four to seven-inch tall, cool season grass that is well watered. Values for reference evapotranspiration are expressed in inches and commonly measured on a daily, monthly and annual basis (See page18).

### Conversion Factor (0.62)

This value is included in the estimated total water use formula to convert the numeric values from inches of water to gallons of water.

### Plant Factor (PF)

Each plant species is assigned a plant factor that represents its estimated supplemental water needs as a percent of local **ETo** rates. These factors represent a range of water that is needed for healthy growth and aesthetic character (See page 20).

### Rainfall Adjustment

Rainfall can supply some of the annual water needs of plants and landscapes. An adjustment value of 25% (0.25) of the total annual rainfall is most widely applied to reflect the amount of effective water provided by rainfall (See page 19).

### Hydrozone Area (HA)

The hydrozone area is a planting area with plants having the same moisture needs. Each hydrozone area is measured in square feet. When there are several hydrozones in a landscape project, the estimated total water use calculation is completed for each hydrozone and added together for the overall estimated total water use (See page 22).

### Irrigation Efficiency (IE)

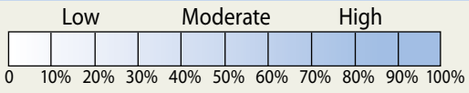
Irrigation efficiency means the measurement of the amount of water beneficially used by landscape plants divided by the amount of water applied. This value represents an assessment of the irrigation system design characteristics and management practices (See page 23).

## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Afrocarpus gracilior* grows well in Plant Climate Zones 8-9 and 13-24. It is placed in Irrigation Group 1 and does best with moderate (M) amounts of moisture throughout the year.

| Botanical Name | Common Name | PF | IG | California Plant Climate Zones | | | | | | | | | | | | | | | | | | | |

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: *Arbutus* 'Marina', as shown in the example below, is adapted to Plant Climate Zones 8-9 and 14-24 with moderate to low (M/L) amounts of supplemental water in Irrigation Group 2. Protection from hot sun is recommended when planted in southern California's Zone 18.

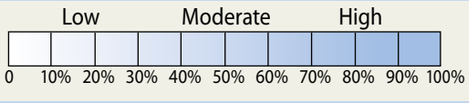
| PF | IG | California Plant Climate Zones | | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | 1 | 2 | 3 | 7 | 8 | 9 | 11 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |
| M/L | 2 | | | | | + | + | | | + | + | + | + | • | + | + | + | + | | + |

## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Bougainvillea* 'San Diego Red' grows in Plant Climate Zones 13-24 where it does well with moderate to low (M/L) amounts of moisture. Reduced moisture during summer often intensifies its flowering cycle.

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: In landscape and garden settings, *Carpenteria californica* grows well with moderate to low (M/L) amounts of supplemental water and is placed in Irrigation Group 2. It is adapted to Plant Climate Zones 7-9 and 14-24. Protection from hot sun is recommended when planted in Zones 8-9 and 18-21.

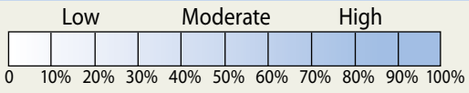
## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Cistus purpurea* grows well in Plant Climate Zones 7-9 and 14-24 with moderate to low (M/L) amounts of moisture. It is placed in Irrigation Group 2 with moderate supplemental water from fall through early spring and low amounts of water during summer.

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: *Agave salmiana* var. *ferox* and *Echinocactus grusonii* grow well with low to very low (L/VL) amounts of supplemental water and are placed in Irrigation Group 2. They perform best in Climate Zones 13-24 and are highly adapted to heat, aridity and drought. Warm exposures are recommended when planted in Zones 14-17.

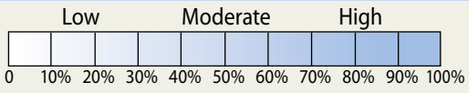
## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Erythrina caffra* grows best in Plant Climate Zones 20-24. It is placed in Irrigation Group 2 and is adapted to reduced amounts of summer water.

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: For best growth, *Ginkgo biloba* requires moderate (M) amounts of moisture throughout the year. It grows well in Plant Climate Zones 1-11 and 14-24. Protection from hot sun in Zone 11 is recommended.

| PF | IG | California Plant Climate Zones 1 | 2 | 3 | 7 | 8 | 9 | 11 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |

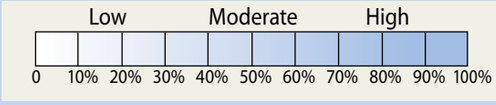
## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Koelreuteria elegans* is adapted to Plant Climate Zones 14-24. It it placed in Irrigation Group 1 and grows well with moderate (M) amounts of moisture on a regular basis throughout the year.

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

- (+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
- (•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
- (o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: The ornamental character of *Magnolia grandiflora* is best when placed in Irrigation Group 1 where it receives moderate (M) amounts of supplemental water throughout the year. It is adapted to Plant Climate Zones 7-9 and 14-24.

| PF | IG | California Plant Climate Zones 1 | 2 | 3 | 7 | 8 | 9 | 11 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |

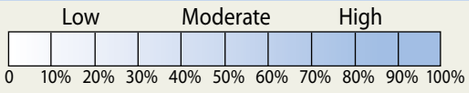
## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Muhlenbergia lindheimeri* grows well in Climate Zones 7-24 in Irrigation Group 2. It is adapted to moderate amounts of moisture through early spring and low amounts during summer.

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: *Parkinsonia* 'Desert Museum' has a Plant Factor of (M/L) and is placed in Irrigation Group 2, requiring moderate amounts of supplemental water during winter and spring, low amounts during summer. It grows best in Climate Zones 11-14 and 18-24.

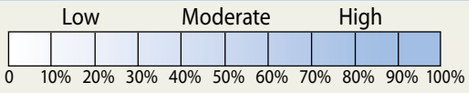
## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Platanus racemosa* is adapted to Plant Climate Zones 7-24. It grows well with high amounts of moisture from winter through spring and moderate amounts during summer.

| Botanical Name | Common Name | PF | IG | California Plant Climate Zones | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: *Rhapis humilis* is placed in Irrigation Group 1 and grows best with moderate (M) amounts of supplemental water throughout the year. It is adapted to Plant Climate Zones 13-24. Planting in partial shade with protection from hot sun in Zones 13 and 18-19 is recommended.

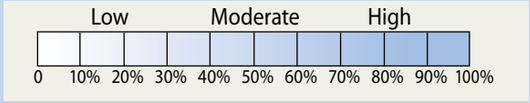
## Master Checklist

# Plant Factors | Climate Zones

### Plant Factors (PF)

Each plant species included in the master checklist is shown with a plant factor to represent its estimated supplemental water needs as a percent of local **ETo** rates. Two types of plant factors are used. Plants with a single plant factor (L, M, H) grow best with regular water all year; plants with two factors (L/VL, M/L, H/M) grow best with regular winter moisture and reduced summer moisture. These factors provide a range for estimating water budgets and adjusting irrigation schedules to sustain healthy growth and positive aesthetic character.



### Irrigation Groups (IG)

Water needs of plants vary throughout the year. This checklist includes a recommended irrigation group for each species listed to help organize plants into hydrozones, reflecting key seasonal moisture needs. Plants are not strictly confined to any one irrigation group, however, these groups indicate baseline preferences.

**IG 1** = Regular Water Schedule
**IG 2** = Reduced Summer Water Schedule

Plant factors and irrigation groups are intended to serve as a guide for addressing water needs of plants in California landscapes and gardens. Additional discussion on estimating water needs of plants can be found on pages 18-23.

Below: *Schinus molle* is well adapted to Plant Climate Zones 8-9 and 13-24 where it grows with low to very low (L/VL) amounts of moisture. It is placed in Irrigation Group 2 to receive low amounts of supplemental water through early spring and very low amounts of water during summer.

| Botanical Name | Common Name | PF | IG | California Plant Climate Zones | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## Master Checklist

# Plant Factors | Climate Zones

### Plant Climate Zone Summary

The California Plant Climate Zones chart indicates the approximate adaptability of plants to the average range of low and high temperatures that occur differently throughout California. Some plants can grow well in all zones, but often they grow best in zones that reflect their natural adaptation to cold and heat. As a result, some plants do better with cooler conditions while others show a clear preference for warmer conditions. Three symbols, as shown and defined below, provide additional insight regarding the relationship between plants and climate zones.

(+) Indicates a high degree of compatibility with the average range of cold and warm temperatures.
(•) Indicates a preference for cooler exposures and microclimate conditions with protection from hot sun.
(o) Indicates a preference for warmer exposures and microclimate conditions.

More information on adaptability of individual plants to California Climate Zones is provided in Section Four - Illustrated Plant Compendium, beginning on page 158. California Plant Climate Zone descriptions and maps can be found on pages 12-17.

Below: The ornamental character of *Wisteria sinensis* is best with moderate (M) amounts of moisture throughout the year. It is adapted to Plant Climate Zones 3-24. Vines can be efficiently irrigated using bubblers when planted in paved areas.

# Section Two
## Plant Lists

This section contains a number of special purpose lists of plants that are designed to provide a range of planting choices for specific needs and interests. Each list is organized into an alphabetical listing of plants and includes information regarding plant factor and irrigation group as described in Section One - Plant Climate Zones and Water Estimates.

Checklists are helpful in providing the names of plants that fit specific needs and situations. Several lists bring attention to plants that grow well together due to their geographic and climatic adaptations. Other lists cover a range of functional uses and aesthetic characteristics of plants. Each list contains a brief summary of comments that can help in plant selection and use.

### Plant List Abbreviations

| | | | |
|---|---|---|---|
| cv/cvs | = | cultivar/cultivars | Indicates a plant of horticultural origin that has been produced and propagated in cultivation. Many plants grown for ornamental used are cultivars. Single quotes is placed around its name. An example of a cultivar is:<br><br>*Abutilon pictum* 'Thompsonii' |
| ssp | = | subspecies | Indicates a plant species with two or more naturally occurring forms that exist in distinctly different areas of geographic distribution. An example of two subspecies:<br><br>*Lyonothamnus floribundus* ssp. *asplenifolius*<br>*Lyonothamnus floribundus* ssp. *floribundus*<br><br>These subspecies occur on different Channel Islands: |
| var/vars | = | variety/varieties | Indicates a plant species with one or more naturally occurring forms that are distinctly different in character, but occur in the same geographic area. The two varieties of wild lilac listed below share the same coastal area of California; the first is a low growing form and the second has an upright habit:<br><br>*Ceanothus thyrsiflorus* var. *horizontalis* (Prostrate habit)<br>*Ceanothus thyrsiflorus* var. *thyrsiflorus* (Upright habit) |
| NCN | = | No Common Name | |
| PF | = | Plant Factor | The relative percentage of moisture needs based upon reference evapotranspiration (See page 18). |
| IG | = | Irrigation Group | A value representing the seasonal water needs group for this plant (See page 21). |

## Plant Lists

# California Native Plants

California's native flora is widely celebrated and renowned for its abundance and diversity which is due to a variety of physiographic and climatic factors. California consists of more than 158,690 square miles of highly varied topographical land features, including mountains, valleys, plains and river courses. Elevations range from over 14,000 ft. to below sea level. The entire western boundary lies adjacent to the Pacific Ocean, resulting in more than 1,340 miles of coastline that is exposed to strong maritime influences. These conditions combine to create many climate zones, geographic units and habitat areas, resulting in a native flora that includes more than 6,400 species that are widely adapted and organized into many plant communities.

This list presented on the next several pages covers a wide range of California native species, subspecies, varieties and cultivars that are included in this book. It is organized to provide a quick overview and design reference. More than 350 native plants are described in Section Four - Illustrated Plant Compendium, which were selected to reflect the range and diversity of plants widely used in ornamental landscapes and gardens throughout the state. Additionally, a number of horticultural plant palettes that include plants from this list are found in Section Three - Plant Palettes which provides examples of compatible species for various design situations.

## Plant Lists

# California Native Plants

Upon review of the California Native Plants list it is important to keep some thoughts in mind.

- It is a common misconception that all native plants are drought tolerant and need little care once established. Many species are adapted to areas with regular moisture and become highly stressed under dry conditions.
- Native plants come from across the state and are adapted to varying habitat conditions, such as coastal, inland, valley and desert. It is desirable to learn about these habitat conditions and associated species during the process of selecting and combining natives into ornamental plantings.
- Emphasize the use of species and cultivars of local origin and organize them into associations to define outdoor spaces, frame pathways, mitigate climate and enhance views.
- Select a diverse plant palette to fit soil and microclimate conditions, attract wildlife and encourage biological balance between beneficial insects and pests.
- Arrange plants into hydrozones and irrigation groups that reflect their moisture needs to avoid excessive and unseasonal irrigation; summer is often a period of reduced moisture availability and inactivity for many natives in cultivation.
- Study and shape the topography to capture and infiltrate rainfall and minimize irrigation runoff.
- Work with organic to help retain moisture, reduce weeds and release nutrients through decomposition.
- Schedule planting to occur from late fall through early winter to benefit from seasonal rains and start the establishment stages without heat and moisture stress.

## Plant Lists

# California Native Plants

A number of California native plants grown in ornamental landscapes and gardens do best with regular moisture throughout the year. These plants often come from riparian habitats or microclimate areas that have ground moisture rising to the surface month after month. Species such as alders, ferns and willows are among these plants.

The graph shown below illustrates the baseline irrigation profile for native plants that have plant moderate to high plant factors and fit into irrigation group one that follows the ETo curve throughout the year. It is possible to combine these more water needy species into plantings with other natives that have lower moisture needs. This involves organizing plants into hydrozones with different irrigation systems to fit the needs of each group of plants. Often, it is possible to place plants with higher water needs in swales and low areas where rainfall and irrigation runoff will collect for additional moisture.

## Plant Lists

# California Native Plants

Many California native plants grown in ornamental landscapes and gardens are well adapted to Mediterranean climate patterns with winter moisture and summer drought. Most plants on this list are well suited to reduced levels of summer moisture similar to cycles in their natural habitat.

The graph shown below illustrates the full range of supplemental moisture for native plants that have reduced summer water needs. Species such as western sycamore do best with high amounts of water in winter and spring; others such as toyon and coffeeberry grow with moderate to low amounts of moisture during this time. Native grasses and agaves can survive on natural rainfall and may not require supplemental water once established.

Natives with similar moisture needs can be combined into hydrozones with dedicated irrigation systems. This approach can accommodate a planting layout that integrates a variety of species in both creative and water efficient ways.

## Plant Lists

# Mediterranean Garden Plants

Gardening in Europe's Mediterranean region has been practiced for more than 2,000 years. Over this time, many plants from the native flora were incorporated into ornamental plantings. Many of these plants are still highly popular today, including the olive tree, Italian stone pine, Italian cypress, sweet bay, rockrose, lavender and the common myrtle.

These classical Mediterranean gardens reflect a rich history of botanical trade and exchange with other areas around the world. Citrus trees were introduced from Asia, pines and palms from the Canary Islands, bougainvilleas from South America and roses from Arabia. Gardening was a serious and much celebrated pursuit. There are many excellent examples of beautiful Mediterranean gardens throughout California that possess an abundant diversity of plants and that require low water use.

Coastal cities in California, including Carmel, Monterey, Santa Barbara, Los Angeles and San Diego have embraced Mediterranean style architecture and gardens from the earliest days of statehood. While the majority of the plants on this list come from Europe, others are native to California, Australia, South America and Asia. These additional plants are well adapted to the horticultural requirements and the aesthetic character of Mediterranean landscapes and gardens. A number of horticultural palettes that include plants from this list are found in Section Three - Plant Palettes, which provides examples of compatible species for various design situations.

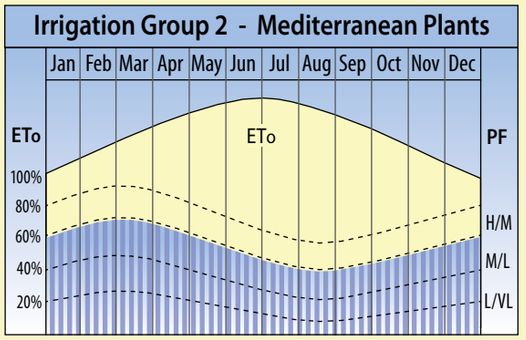
## Plant Lists

# Mediterranean Garden Plants

This list is comprised of plants that are widely adapted to California's Mediterranean climate conditions, particularly Plant Climate Zones 8-9 and 14-24. Moisture needs of these plants range from moderate to very low. Most species are well adapted to reduced moisture levels during summer, but a few grow best with regular moisture throughout the year. Grouping plants into hydrozones with compatible needs and in microclimates with separate irrigation systems should be recognized when combining these plants in landscapes and gardens.

The chart shown below illustrates the seasonal range of supplemental moisture for plants included in this list. The upper end of the range applies to many trees and shrubs while the lower part of the range applies to agaves, aloes, cacti and succulents.



Below: *Nerium oleander*

## Plant Lists

# Southwestern Garden Plants

The southwestern garden plants list presents a broad range of species that have become widely used in arid climate zones of the southwestern United States, particularly within the Coachella Valley of southern California. In recent years, efforts have been made to embrace a landscape palette that reflects the natural character of the southwest and is well adapted to the high levels of aridity, summer heat and water conservation goals. Many of these species are native to the southwestern United States, Mexico, Baja California and arid climate zones of South America and Australia. Not only have these plants proven to be highly adaptable to landscape and garden uses in low desert communities, but many are popular and successful choices for warm coastal, inland and valley zones of southern and central California.

This list contains a number of signature species such as agaves, cacti and date palms. There are also many colorful flowering shrubs and perennials that provide interest at different times of the year. However, ground cover choices are quite limited. As a result, it is common to incorporate a dry wash feature, strategically place large boulders and to use various mixes of gravel, sand and decomposed granite to serve as a ground cover and as an inorganic 'mulch' around plants. Several horticultural plant palettes that include plants from this list are found in Section Three - Plant Palettes, which provides examples of compatible species for various design situations.

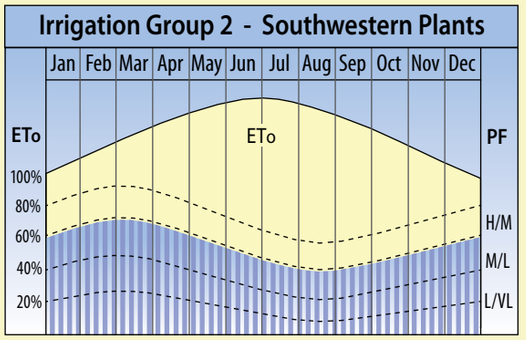
## Plant Lists

# Southwestern Garden Plants

This list is comprised of plants that are adapted to high levels of heat, aridity and drought. Many are native to the southwestern United States and Mexico and are among the best choices for landscapes and gardens in low and intermediate desert climate zones. They are also well suited for planting in dry inland and valley zones throughout southern California.

The chart below illustrates the range of supplemental moisture needed by plants in this palette. This range varies from moderate to very low and indicates reduced amounts of moisture during the summer months. Tree species on this list naturally grow near washes and grow better with moderate to low amounts of moisture when grown in ornamental landscapes and gardens. Agaves, cacti and yuccas store moisture that helps endure long periods of drought. These plants can be organized into hydrozones and be sustained with separate irrigation systems for many successful planting combinations.



Below: *Parkinsonia* 'Desert Museum'

## Plant Lists

# Subtropical Garden Plants

This list contains plants from many regions of the world. In spite of this large geographic range, most are adapted to mild climate zones where there is little winter frost and often many months of warm and sunny summer conditions. They are commonly referred to as subtropical plants to indicate their sensitivity to cold.

This list includes many brightly flowering trees, shrubs and vines that are recognized as some of the most colorful landscape plants available for ornamental gardens. A closer review, reveals a diverse range of foliage size and color that often produces a lush impression. Such plants are commonly grouped into tight planting arrangements to produce multiple layers of color and shade.

Subtropical plants are well suited to central and southern California's coastal zones where warm summer temperatures are common. They do best with protection from salt spray and wind, and thrive in rich soils with regular moisture. They are also highly successful in mild inland and valley zones when planted in microclimates that receive shelter them from cold winter temperatures. Some are tough enough to grow in low desert zones that experience high levels of heat and aridity when provided with good protection from the hot sun and regular water. Several horticultural palettes that include plants from this list are found in Section Three - Plant Palettes, which provides examples of compatible species for various design situations.

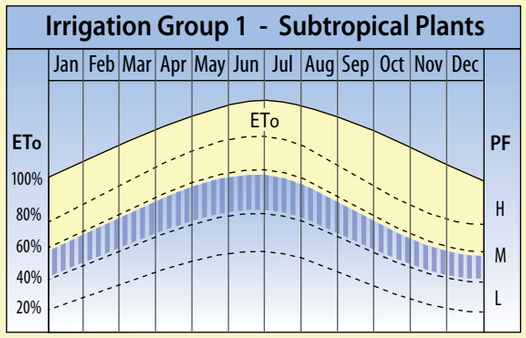
## Plant Lists

# Subtropical Garden Plants

Many subtropical plants in ornamental landscapes and gardens maintain good year round character and grow best with regular moisture. This moisture is critical for sustaining the most active spring through summer growing stages. Flowering often begins when daylight hours are long and warm temperatures are consistent.

Irrigation for these plants should be reduced by mid to late summer to avoid encouraging late season growth that can be sensitive to frost. This is particularly desirable for plants grown in cooler climate zones. Additionally, some species with late flowering seasons such as the silk floss tree, bougainvillea and lantana will produce more intensive floral displays with less water from mid to late summer while warm daytime temperatures are still common. The majority of plants in this list have a moderate plant factor, indicating supplemental moisture requirements from 40-60% of ETo. Seasonal distribution of moisture is shown in the chart below.



Below: *Howea forsteriana*

## Plant Lists

# Woodland Garden Plants

A large number of ornamental plants commonly grown in California are native to cooler and wetter climate zones and habitat conditions. Not only are winters cooler and have greater precipitation, but summers are shorter and the growing season is ended by cool temperatures in early fall. A number of plants included on this list are among the best known for fall foliage color; others have colorful berries and early spring flowering. Many popular trees including sweet gum, Southern magnolia and sawleaf zelkova are widely planted for their stately character. All of these plants can be combined to achieve woodland style plantings with tall overstory trees, abundant shade and distinctive seasonal character.

Plants on this list are highly adapted to inland and valley climate zones across California. They thrive in deep soils and with regular moisture. Many species that are grown in southern California show signs of leaf burn after a long, dry and warm summer season that often extends into fall. The use of organic mulch works well on top of the soil around plants to retain moisture, reduce surface soil temperatures and release nutrients. A number of horticultural palettes that include plants from this list are found in Section Three - Plant Palettes, which provides examples of compatible species for various design situations.

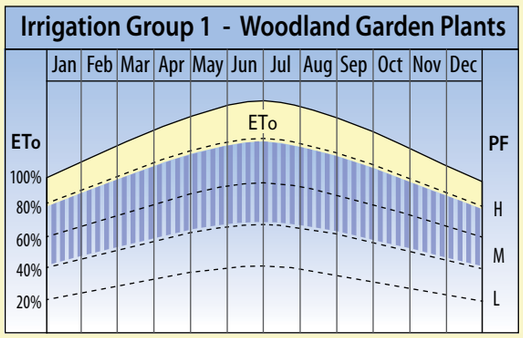
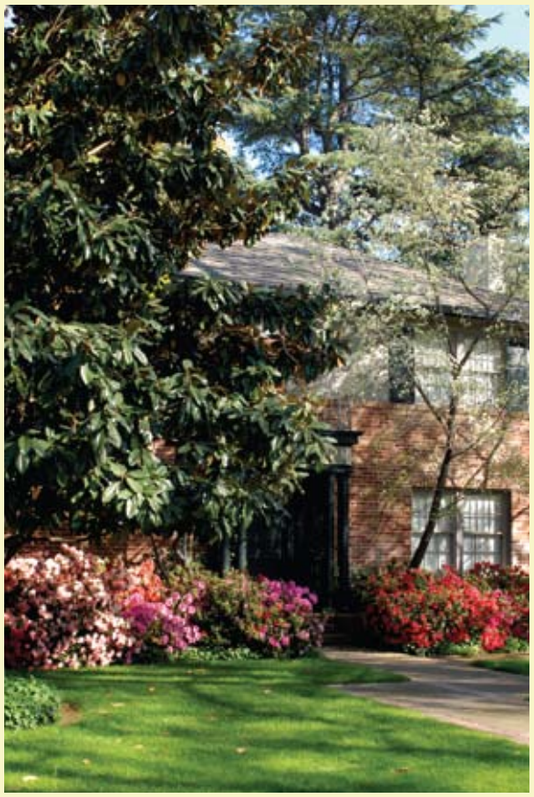
# Woodland Garden Plants

Woodland garden plants included in this list grow best with regular moisture throughout the year. This results in an irrigation schedule that closely follows the monthly reference evapotranspiration in order to replace soil moisture as it is depleted. Most species have a moderate plant factor, indicating supplemental moisture needs ranging from 40-60% of ETo; a few do best with high amounts of moisture. This moisture range is illustrated in the chart shown below.

Plants adapted to cooler climate zones with higher levels of precipitation often benefit from soils with higher organic content to facilitate moisture retention and nutrient exchange. Additionally, surface mulches can help retain soil moisture and decompose to release nutrients into the soil.



Below: A woodland planting, including *Magnolia grandiflora*, *Cornus florida* and *Rhododendron* Southern Indica cultivars



## Plant Lists

# Asian Garden Plants

The Asian garden plants list brings attention to the abundance of garden plants that come from various regions throughout Asia. Like any large geographic area, there are several different climate zones; plants included in this list are adapted to temperate climate conditions with cool and moist winters and warm, but short summer seasons. These plants have been used in Asian style gardens around the world and are highly popular in California. There is a pleasing balance of evergreen and deciduous plants on this list, as well as many choices providing flowers, berries and fall color. This can be seen by the presence of such plants as camellias, barberries and maidenhair trees. Some of the finest shade tolerant plants such as liriope, mondo grass and bamboo are found among these plants. Additionally, sweet olive and *Michelia* species add unforgettable fragrance to many plantings.

Asian garden plants are adaptable to a number of climate zones throughout California. They are naturally adapted to zones with clearly defined seasons, particularly in the central and northern parts of the state. However, these plants grow remarkably well in warmer and dryer zones when they are planted in shady microclimates with regular moisture. As in many landscape plantings, trees are essential in bringing scale and structure to the design, and in providing shade for understory plants.

Several horticultural plant palettes that include plants from this list are found in Section Three - Plant Palettes, which provide examples of compatible species for various design situations.

## Plant Lists

# Asian Garden Plants

Asian garden plants included in this list grow best with regular soil moisture throughout the year. This results in an irrigation schedule that closely follows monthly climate conditions and replaces soil moisture as it becomes depleted. Most species have a moderate plant factor, indicating supplemental moisture needs ranging from 40-60% of ETo; a few do best with high amounts of moisture from 60-80% and should be grouped into hydrozones with appropriate irrigation. The moisture range for this group of plants is illustrated in the chart shown below.

Asian garden plants benefit from soils with higher organic content to enhance moisture retention, achieve lightly acid conditions and increase levels of nutrient exchange and biological activity. They also grow well with organic mulches that reduce evaporation and release nutrients into the soil through decomposition.

# Coastal Garden Plants

Landscapes and gardens in coastal zones are exposed to a combination of climate conditions that deserve special attention. On one hand, seasonal temperatures are moderated by the influence of the Pacific Ocean; winter temperatures are milder and summer heat is lower. Frost in Plant Climate Zones 17 and 24 is infrequent, averaging two to five days per year. Areas in southern California have a potential year round growing season. ETo levels in these zones are the lowest in the state. This reflects the combined influence of reduced temperatures with increased humidity and summer fog. Seasonal precipitation is more frequent and highest in northern coastal areas and can often meet the moisture needs of plants throughout winter months. Southern latitudes are drier; some supplemental moisture during winter is desirable, particularly during extended dry spells and drought cycles.

Plants in coastal zones are exposed to salt and sand laden air and winds that can damage foliage and impact soil conditions. Plants along the immediate coastal edge are often shaped into lower growing forms and inundated with layers of sand. These extreme conditions are quickly mitigated by the presence of buildings, walls and large trees which produce sheltered microclimates that greatly improve growing conditions. This list brings attention to plants that are well adapted to coastal zones. Some of these plants can tolerate extreme coastal edge conditions while most are well adapted to coastal humidity, moderated temperatures and little frost.

### Coastal Exposure Legend

1 = Coastal Edge with salt spray and sand
2 = Sheltered from salt spray and sand

## Plant Lists

# Invasive Plants

The challenge of invasive plants should be of concern to all people who work with landscapes and gardens. The widespread growth of exotic plants contribute significantly to the loss of species diversity and natural habitats on a worldwide basis. This issue is particularly important in California where many endemic and rare native species that are vulnerable to invasive plants. And, the challenge is not simply limited to plants. Habitats for native wildlife are also impacted by the loss of native plants as well as the introduction of exotic wildlife species. A review of the plants on these pages brings attention to a number of popular ornamental plants that have escaped cultivation and have become invasive in different regions of the state. More species will be added in the future as better information is gathered on other plants.

Several organizations and publications currently exist to provide information and education regarding invasive plants on national and statewide scale. Organizations and sources of information include:

California Native Plant Council (Cal-IPC)
http://www.cal-ipc.org/

Invasive Species Council of California (ISCC)
http://www.iscc.ca.gov/

United States Department of Agriculture
http://www.invasivespeciesinfo.gov/plants/main.shtml

## Plant Lists

# Flowering Trees

A colorful variety of flowering trees are available for use in California where they are valued in public and private spaces alike. Trees are commonly the largest and most visible features in landscapes and gardens, and their seasonal display of flowers can be highly prominent. This list contains species that grow well in many climate zones and plant palettes. Trees from cool and moist climate zones bring springtime color into woodland and Asian style gardens. Redbuds, dogwoods and magnolias are among the most notable. Species such African tulip, coral, floss silk, jacaranda and trumpet trees are adapted to subtropical conditions in coastal and mild inland zones. California buckeye, madrone, palo verde and red-flowering gum trees grow well in Mediterranean and arid climate zones.

A number of trees commonly grown for smaller areas, such as in patios and large containers are included in this list. Good soils and careful watering are highly important to their success when planted in confined areas with limited root space and extensive paving.

## Plant Lists

# Flowering Shrubs

Shrubs have many important uses in landscapes and gardens. They are commonly planted to define and enclose spaces by providing perimeter screening and background layers. They are also essential in complementing the choice of trees and in providing accent and color value in small and large spaces alike. This list of colorful flowering shrubs brings attention to the dominance of evergreen species that can be selected for a variety of situations. These evergreen plants offer colorful choices for every climate zone and habitat condition, from temperate to subtropical, and moist to dry. They range in habit from low and spreading to mounding and upright, and include species that can grow into trees as they mature.

A review of the deciduous flowering shrubs reveals traditional choices such as lilacs, rhododendrons and roses. Each of these groups alone contain many species and cultivars that have made them among the most popular and widely planted of all shrubs in California.

## Plant Lists

# Vines

Vines are among the most versatile and adaptable of all landscape and garden plants. They grow to many sizes, cover a variety of surfaces and offer many flower types and colors. A few vines such as Boston ivy and creeping fig are recognized for their capacity to cover very large surfaces. However, both vines attach permanently to these surfaces and cause damage when removed. Other vines provide pleasing fragrances, including jasmine, star jasmine and wisteria. Stems become quite large and bold on some species such as bougainvillea, wisteria and Easter lily vine, adding additional ornamental value.

Regardless of their character, all vines do best with attention to pruning to manage size and coverage. It is also notable that these plants can be irrigated in highly efficient ways and be used to produce abundant shade and microclimate benefits.

Above/Below: Photographs of the Glendora Bougainvillea. This planting of *Bougainvillea glabra* and *Bougainvillea spectabilis* is a state historic landmark in recognition of the largest planting of bougainvillea in the United States. Some 25 vines were planted around 1900 at the base of 10 year old *Washingtonia robusta* palms. Together they continue to grow today.

## Plant Lists

# Ground Covers

Many plants can be grown as ground covers. They range from spreading shrubs and sprawling vines to mass plantings of clumping species such as mondo grass and day lilies. This list organizes plants into different categories to help see the choices that can be made for ground cover uses.

Some ground covers grow best when irrigated with rotor type nozzles that provides uniform moisture distribution throughout the planting area. Plants such as Hall's honeysuckle, snow-in-summer and trailing African daisy do best with such coverage and can root along the ground as they grow. Other plants are ideally suited to drip and bubbler irrigation systems where moisture patterns can be targeted to a more dispersed and natural planting pattern. Large spreading shrubs such as Carmel creeper and sprawling vines, including bougainvillea and primrose jasmine can be irrigated efficiently with this type of irrigation.

As shown in the photograph below, it is desirable to think about organic mulches for use as an interim or long term cover. Many types of organic mulches are available that provide the added advantage of decomposing and releasing nutrients into the soil. Also, decomposed granite, decorative gravel and river stone provide long lasting ground cover value and are particularly useful in arid climate zones.

### Scale of Planting Area

S = Small Planters: 1 ft. - 5 ft.
M = Medium Size: 5 ft. - 15 ft.
L = Large Size: 15 ft. and larger

Below: Organic mulch used as a ground cover during the establishment stages of a new landscape.

## Plant Lists

# Flowering Perennials

This list of plants brings attention to a wide range of species that are highly popular for their fast growth and high impact flowering value. These plants demonstrate the quick results and performance needed during the first months after a new landscape or garden has been planted. They provide important visual impact while shrubs and trees are establishing themselves and beginning to grow. Importantly, many are attractive to butterflies and hummingbirds.

Some perennials are small shrub-like plants that combine herbaceous foliage with woody stems. Species such as hummingbird mint, penstemon and Russian sage possess such characteristics. These plants benefit from attentive pruning during and following their flowering cycle. Pruning prolongs the flowering season in many instances and helps to manage the plant's size and shape. These perennials grow quickly, provide intensive flowering and perform well for three to four years before it is best to remove and replant. They are among the most dynamic garden plants and serve as a reminder of how fast gardens grow and change.

Other perennials have mostly herbaceous foliage such as day lilies, fortnight lilies and lily-of-the-Nile. These are long-lived plants that grow for many years and provide garden stability through their consistent growth and enduring nature. They perform well along borders, in mass planting situations and add structure to the ground plane.

## Plant Lists

# Palms, Cycads and Ferns

This group of plants includes a number of species commonly associated with lush and exotic plantings. Species such as lady palm, pigmy date palm, sago palm and maidenhair fern bring to mind shady spaces comprised of refined, delicate and moist plantings. These images fit into woodland, Asian and subtropical planting themes and add a dimension of richness and diversity that many people enjoy. On a larger scale, palms often provide visible and striking silhouette value against the skyline and background areas of a garden or landscape. They are among the most popular for planting around swimming pools due to their relatively low litter production.

A second look at this list leads to the discovery of many palms and ferns that are native to Mediterranean climates. The Mediterranean fan palm and Canary Island date palm are signature species of this botanical group. Interestingly, a number of ferns native to California are adapted to moist winters and reduced moisture during summer. The western sword fern and giant chain fern, both California natives, will become dormant and die back when conditions become too dry; other native species only occur in microclimates and habitats that have moisture throughout the year. Ferns are often appreciated for their fine texture and light green foliage colors.

# Bamboos, Grasses, Sedges, Restios and Rushes

This list of plants includes species from several highly complex families of plants, including *Poaceae, Cyperaceae, Juncaceae* and *Restionaceae.* The most familiar species belong to the *Poaceae* family, including grasses such as the ground hugging Korean grass to the giant timber bamboo. A number of sedges and rushes are popular accent and ground cover plants that belong to the *Cyperaceae and Juncaceae* family respectively. Less well known are the restios and rushes that include the genera of *Chondropetalum* and *Rhodocoma*.

Bamboos are among the most widely recognized plant species on this list. They are commonly used among Asian and subtropical plantings, and are appreciated for their range of size, texture and growth habit. In contrast, many grasses, rushes and sedges are unfamiliar. However, these plants are becoming increasingly popular as accent plants and for use in meadows, bioswales and along seasonal streambeds. Some sedges are even planted and maintained as lawns. Interest in these plants is increasing as a result of a number of recent publications and interest among specialty growers.

## Plant Lists

# Agave, Cacti and Yucca

A wide variety of agaves, aloes, cacti and yuccas are commonly found in California gardens and landscapes where they are valued in many roles. Older gardens sometimes have the good fortune to feature a mature dragon tree, candelabra tree, or specimen yucca. These succulent-type plants often mature into stately specimens with striking character. They can also be effectively displayed as younger specimens in pots and raised planters where they add sculptural and artistic interest in courtyards and specialty plantings.

Many of these plants are members of the *Agavaceae* and *Cactaceae* family and are well adapted to heat, aridity and drought. They are among the best choices for use in low and intermediate desert climate zones where they can withstand intense exposure to sunlight and grow with low to very low amounts of supplemental water throughout the year.

This list of species does not contain plants suitable for use as traditional ground covers. Decomposed granite and various combinations of boulders stone and gravel is often used to cover the soil and to complement the character of these plants.

# Aloes and Succulents

Aloes and other succulent-type plants included on this list are almost universally adapted to coastal zone climates where the sun and mild winter temperatures seldom damage their foliage. Contrary to popular opinion, many of these varieties can be damaged if they are not sheltered from hot sun in inland and desert climate zones. Otherwise, they all have the ability to retain moisture in their foliage and stems, making them highly suited to container plantings where warm days and infrequent watering can easily result in dry soil conditions.

These plants do best in loose, fast draining soils. Planting on mounds, slopes and in raised planters are helpful ways to achieve good drainage. Low amounts of supplemental water is recommended during spring through summer; frost-sensitive succulents are prone to greater cold damage if they are watered too much during late fall and enter winter with moisture filled stems and leaves.

## Plant Lists

# Street Trees

Street trees provide much value in urban and suburban environments. They provide a refreshing contrast to streets and buildings, and add identity and character to communities. They provide shade and reduce temperatures during summer and seasonal color at different times of the year.

Although street trees have become an integral part of communities throughout California, the fundamental planting requirements that are needed to achieve long term success have been widely underestimated. From a horticultural perspective, many street trees have been planted in paved areas that are far too small for good root and trunk development. Additionally, these areas are often difficult to irrigate and there are many problems associated with litter, roots, damaged pavement and branches that grow into vehicular lanes. Ironically, when these issues and difficulties arise, the tree is viewed as the source of the problem.

While it is important to continue the practice of planting street trees, better planning and adequate space is necessary. The lists of suggested street trees include the minimum size planting area recommended for each species.

**Street Tree Legend**

S = Small - Minimum 5 ft. x 5 ft.
M = Medium - Minimum 10 ft. x 10 ft.
L = Large - Minimum 12 ft. and more

# Street Trees

Like all plants, trees depend upon their roots to obtain moisture, nutrients and oxygen to sustain growth. Trees become diminished in size and are more vulnerable to drought and pollution when root growth is restricted by compacted soils and limited space.

Roots develop best in soils that have a balance of moisture, nutrients and oxygen; they do not grow in areas where any one of these conditions are lacking. Roots will grow under paving or adjacent to structures when poor conditions are present. Over time such roots can become quite large and cause damage to paving or structures.

The use of root barriers to help prevent root damage by street trees can be successful under some conditions. Barriers placed continuously along the edge of a sidewalk in a linear parkway can be a deterrent to root growth of smaller trees by redirecting the direction of the roots away from the pavement. Encircling trees with root barriers is not recommended; trees become rootbound and even lead to the failure of the root barrier itself.

The use of structural soils holds promise for trees planted in many urban and suburban areas to reduce damage by tree roots and increase the health and vigor of the trees. Structural soils consist mostly of crushed gravel with some topsoil. These soils enable sufficient compaction to support sidewalks and pavement, while providing increased space and structure to hold moisture, oxygen and room for root development. Even with structural soils, it is necessary to excavate the largest area possible for each street tree to have the greatest soil volume to sustain healthy growth.

## Plant Lists

# Parkway and Median Trees

Parkways and medians often provide an opportunity to establish some of the most significant plantings throughout urban communities. These areas can be planned to have more space where the use of larger sized trees can achieve dense visual screening and a forested landscape quality. Importantly, these landscapes offer some of the best opportunities to function as carbon banks and to capture airborne pollutants. Areas that are richly planted with large growing trees will sequester more carbon from the atmosphere than sparsely planted ground covers and shrubs. Additionally, more particulate matter carried in the air can become collected on leaf surfaces of such abundantly planted landscapes. Additionally, these environmental benefits will be optimized when such trees are selected according to their natural adaptability to the local climate conditions. Once established, these trees can often survive and grow without reliance on high amounts of supplemental water.

# Monumental Scale Trees

Monumental scale trees often become the most distinguishing feature of both natural and ornamental landscapes. They can mature into landmarks and become celebrated as heritage elements that several generations of people can enjoy. Perhaps more than any other landscape choice, the selection of monument trees challenges the sense of vision and desire to create a lasting landscape legacy. Some of the best opportunities to use these trees includes government, institutional and public space settings. Such trees can often become the cornerstone of a sacred space as well as become a symbol of community values to celebrate the lives of people and historic events.

Most communities in California have monumental scale ornamental trees. Some are highly recognized, such as the Moreton Bay figs in Santa Barbara and San Diego, or the dawn redwood in Palo Alto. A walk in the capital mall in Sacramento reveals an array of large and mature stone pines, deodar cedars, oaks and palms; each of these trees is a testament to the wonderful growing conditions in these valley regions.

## Plant Lists

# Courtyard and Patio Trees

Trees are commonly used to provide shade and special character in courtyards and patios. Since these spaces vary in size and specific microclimate conditions, it is important to assess the scale and sun exposure when selecting a particular species of tree. Some trees can be grown with multiple trunks, while others develop canopy branch structures that can be pruned to reveal handsome branching character. Deciduous trees provide summer shade and let in winter sun. Many deciduous trees also offer striking flowering character and fall color.

Care should be taken to provide a large enough planter area within paved courtyards and patios to accommodate the eventual size and root systems. Larger planter areas make it easier to encourage good root development and to provide supplemental water without working with root barriers.

Anyone who has taken care of trees in a paved area can describe the challenge of leaf, fruit and pod cleanup. Maintenance will vary from daily to weekly throughout most of the year; Evergreen trees are not necessarily cleaner than deciduous varieties; in general, the larger the tree, the greater the total amount of organic material produced.

**Patio Size Legend**

S = Small - 25 ft. x 25 ft.
M = Medium - 50 ft. x 50 ft.
L = Large - 100 ft. x 100 ft.

# Special Interest Plants

Many landscapes and gardens achieve special quality and interest when they have plants with unique character. Often, this unique character comes from older trees and shrubs that have developed twisting branches, swollen trunks and interesting bark as they age. In contrast, some plants have interesting foliage, flowering and growth habits at earlier ages that draw special attention. This list brings attention to a variety of species that can provide such interest.

It is also common to see a variety of plants that were planted as foundation shrubs close to the base of walls and buildings that have grown large and been pruned to become unique specimens. These plants are often found in historic or institutional settings where they have been part of the landscape for many years. Older parks and gardens are among the best places to observe the value of mature plants that have attained specialty size and character. Many people come to respect these plants as a valued part of the landscape heritage of a community.

Very often plants that provide specialty character are slower growing, or are shrubs and vines that grow into unique forms and sizes. It can take a special commitment to use these plants or even preserve them when the priority is often placed upon attaining an instant landscape or garden. On the other hand, any plant can provide special interest and character when planted in the right location or pruned and fitted to become a unique specimen.

## Plant Lists

# Hedges and Screens

One of the basic uses of plants is to enclose and define the boundaries of outdoor spaces. This is achieved by planting hedges and screens to divide areas into rooms. Often, plants are placed side by side and clipped into geometric shapes to fit narrow planters. Many times the first idea is to achieve dense and total screening treatments. However, another strategy can also be effective. Plants are arranged in layers and left to grow natural and to varying heights until a separation is achieved. This separation does not have to be total; sometimes a partial view through a screen is more effective and enjoyable.

Screen planting is also done to improve the character of a space. The creation of privacy and blocking poor views are important improvements. From another perspective, hedges and screens can be strategically placed to frame and emphasize views as well as provide low boundaries to further define interior garden areas and circulation.

Hedge and screen planting can often be efficiently watered with drip irrigation systems. Tubing can be placed along the sides of the plants to reduce runoff and provide moisture close to the roots. This approach is particularly useful for hedges that need regular water that are planted in Mediterranean gardens.

# Fragrant Flowers and Foliage

Flower fragrance is commonly associated as part of the essential character and experience in many landscapes and gardens. Roses offer many sweet fragrances that are both light and heavy. Mediterranean gardens combine sweet and spicy fragrances of lavender and sage. Flowers of wild lilacs in the California flora often fill the air with a musky fragrance. Some of the most popular and widely recognized fragrances are associated with citrus flowers and the sweet olive.

Flower fragrances are often highly ephemeral and of limited range as well as elusive and challenging to predict. This often makes them more appreciated. They are strong reminders of the seasons of the year and stages of growth among plants in gardens. Overall, flower fragrances add a dimension of experience that transcend the basics of colors, textures and shapes.

A number of plants also have distinctive foliage fragrance. Many of these species are listed on the opposite page and include a wide variety of trees, shrubs and perennials. Some well known plants such as lavender have both flower and foliage fragrance.

Not all plant fragrances are pleasant. The society garlic has strongly pungent foliage and is not well suited to entries or small scale spaces. Flowers of carob trees and crushed fruit of maidenhair trees are objectionable to many people. The foliage of colorful plants such as lantana and lion's tail have leaves that emit strong odors that can be disagreeable.

# Foliage Color: Olive to Silver

It is a popular design practice to punctuate landscapes and gardens at any scale with plants that have light foliage color. Such plants can provide colorful contrast and variety to the various shades of greens that all too easily dominate the color scheme of many designs. Plants with contrasting foliage color can also provide year round value and outlast the short-term impact of flowers.

Plants included on this list have light foliage colors that range from olive and gray to silver and blue-green. Not all of the colors combine well together and it is often best to avoid mixing too many of these colors in the same composition. Many of these plants are commonly used as solitary accent or specimen features. From a horticultural perspective, many of these plants grow best in sunny exposures and are adapted to less moisture during the summer months. This is in contrast to plants with variegated foliage that are often best adapted to shady conditions and do best with regular water throughout the year.

## Plant Lists

# Foliage Color: Red to Purple

A wide range of plants with red to purple foliage color are available for use in landscapes and gardens. These colors are often deeply saturated and stand out in striking contrast in many settings. As a result, plants with these colors are widely used as specimen and accent features.

In contrast to plants with olive to silver foliage, many plants with red to purple color are best suited to partial shade and regular moisture throughout the years. This horticultural preference is helpful when searching for plants that grow well in shady microclimates and can enhanced color value. In small spaces, these foliage colors can be layered and grouped among plants with dark green foliage to create at stronger sense of depth.

## Plant Lists

# Foliage Color: Fall and Spring

Seasonal color in landscapes can be one of its most striking features. The strongest impressions of foliage color are commonly associated with forests and trees such as aspen or maples that are signature plants of fall color. Ironically, there are few plants native to Mediterranean climates that are noted for fall color character. However, we do grow a wide variety of exotic plants that come from cooler climate zones of the Midwest and southeast USA, and from Asia that provide us with generous displays of fall color in the cool winter areas of our vast Mediterranean region. Many of these trees have proven to be well adapted to the mild winters and long season of summer heat and sun, particularly when provided with supplemental irrigation.

While fall foliage color is most often our first thought, do not overlook the value of new spring growth that helps mark the coming of spring. Listed to the left are the signature plants that provide fall and spring color for landscapes and gardens.

## Plant Lists

# Foliage Color: Variegated

This list of plants recognizes two groups of variegated foliage based upon yellow and white. Like other plants with distinctive foliage color, these plants are seldom used to dominate a planting scheme, rather they are used to provide relief and interest that can last year round. Both yellow and white colors lighten the overall foliage color of plants. The impact of this variegation is often enhanced when plants have backlighting to intensify the contrast between light and dark colors.

With the exception of the agaves, the majority of plants with variegated foliage do well with regular moisture and relief from hot sun exposures. Larger plants can provide important color contrast when placed in background areas; smaller ones can help define borders. All can be useful for accent and focal plantings.

## Plant Lists

# Foliage Texture: Bold and Fine

The aesthetics of planting design is often a study in contrast and harmony. This concept can be illustrated by looking at plants that have remarkably different foliage texture. One list brings attention to plants with bold and dramatic foliage texture, the other includes plants with fine texture. Many of these plants have similar horticultural needs and can easily grow together. However, the random mixing of plants with such diverse characteristics can lead to visual chaos and confusion.

In order to avoid visual confusion, it is important to purposely select some plants with similar textures to establish continuity and repetition. This establishes harmony among texture. Other plants are then selected to provide strategic contrast for visual impact. These choices form a visual rhythm among the textures between plants. Designs that emphasize harmony more than contrast often provide a quiet and stable experience; higher levels of contrast add diversity and a more dynamic experience.

The concept of contrast and harmony applies to all visual characteristics of plants. Color, shape and texture are among the most significant characteristics to study. The final composition of a landscape or garden can be seen as a rhythm between these attributes and is a major area of planting design aesthetics. It is important for a designer to understand and orchestrate plants into coherent visual compositions.

## Plant Lists

# Butterfly Plants

Attracting butterflies to landscapes and gardens can be one of the most fulfilling experiences, and one that embraces the concept of diversity. This list of plants provides nectar and larval value to butterflies. It has been compiled from a number of sources and shows a broad range of plants from trees and shrubs to vines and perennials that are of benefit to butterflies. Not all of the associations between plants and butterflies are perfectly understood, and this list suggests that many other species can be added.

The objective of attracting butterflies and sustaining their larvae not only encourages planting diversity, but the avoidance of chemicals and excessive deadheading and cutting of perennials. These practices are consistent with naturalized gardens and the combination of California native and recognized butterfly plants. These plants have different moisture needs and are adapted to many climate zones across the state, but can be successfully combined into appropriate hydrozones and microclimates.

## Plant Lists

# Hummingbird Plants

Hummingbirds bring the greatest attention to plants with red and orange tubular flowers with nectar. In warm climate zones, these birds can be found in landscapes and gardens many months of the year when these flowers occur. An initial review of this list confirms these basic observations. Plants such as hummingbird mint, penstemon and honeysuckles are traditional favorites. Aloes produce a remarkably rich supply of nectar for both hummingbirds and song birds during the winter months.

On second review, many other flower colors and shapes are included in this list and indicate the availability of nectar for these birds. It is interesting to note how some flowers are mostly comprised of stamens such as bottlebrush, eucalyptus and grevilleas. Plants in the *Ericaceae* family including manzanitas, strawberry trees and summer holly with small urn-shaped flowers are included. And, the bright yellow flowers of palo verde trees in desert regions are noted for their attraction to hummingbirds. These plants grow in a variety of habitats and climate zones and provide are range of choices for use in many planting situations.

## Plant Lists

# Bioswale Plants

The design of catchment basins and retention ponds to capture and infiltrate surface runoff can be enhanced with plants. Additionally, surface runoff can be directed to bioswales where it is directed through a surface drainage channel lined with plants. In these situations, plants can help reduce the velocity of water flow as well as filter particulates and absorb some of the dissolved elements in the water. These benefits contribute to the cleanup and reuse of water close to the source. This also leads to improved quality and reduced volume of water that flows off site.

Runoff commonly contains both particulate matter and dissolved elements that have been deposited on surfaces of the catchment or watershed area. The greatest concentration of contaminants usually exists following the first rain of the season. It is usually desirable to capture runoff in catch basins with a filtering system from urban pavement areas before it flows into a catchment basin or bioswale to begin the process of cleanup. Currently, the extent of remediation of pollution by plants is not completely known, particularly in terms of biological assimilation of heavy metals and toxic chemicals. This is an emerging area of study and learning.

This list of plants includes species that are widely used in retention ponds and bioswales. Most species are adapted to short periods of inundation and saturated soils. Sedges and rushes are commonly placed in low areas and where the highest moisture conditions are anticipated. Grasses are often placed in an intermediate zone that is seldom under water. A few trees and shrubs are listed for use in perimeter areas that are adapted to both wet and dry conditions.

# Plants for Shade

Shade of some type is a common occurrence in most landscapes and gardens. It can range from deep and virtually year round as in the case of spaces confined by tall buildings, or ephemeral on a daily basis as the angle of the sun changes throughout the day. Shade often increases as trees mature, impacting the understory plants that were adapted to greater levels of sun.

This list includes plants that show moderate to high adaptation to shade and often do best with regular moisture throughout the year. Not too many species grow in deep shade with only indirect light to sustain their growth. Instead, most plants on this list do well in partial shade during the day and throughout the year. While direct sunlight may be absent, brightly lit spaces from reflected and filtered light is needed by such plants. These plants often adapt well to sun when grown in cooler climate zones and in coastal zones with higher levels of humidity. Virtually all of these plants will suffer sun burn in warm climate zones when exposed to intense summer sun and heat after months without such exposure.

### Shade Plant Legend

## Plant Lists

# Container Plants

Virtually any plant can be grown in a container. However, there are many considerations that often lead to practical choices for landscapes and gardens. Perhaps the principal condition to address is limited volume of soil to sustain plants. This limitation impacts the absorption and retention of moisture and nutrients, and profoundly restricts many plants from achieving their potential size. Good drainage and effective watering techniques are also essential to the growth and success of container plants.

Succulent plants that can store moisture and need less organic matter in the soil often do best in containers. This is particularly true during warm weather conditions that easily leads to the depletion of soil moisture on a daily basis. Such plants are better adapted to endure moisture stress and can grow with unique character with the limitations of soil and space. Many of the small species of *Aloe, Agave, Dudleya, Echeveria* and *Sedum* also have good potential for use on green roofs. These plants provide many interesting colors, shapes and textures, as well as grow slowly enough to last for several years before needing replacement.

In comparison, non-succulent plants are more susceptible to wilting, loss of foliage and stem dieback when acute moisture stress occurs in containers. These plants require diligent attention to watering throughout the year, as well as fertilizing to sustain flowering or fruit production. Often it is desirable to select smaller growing cultivars that do not mature at large sizes.

# Section Three
## Plant Palettes

There are many steps and considerations to be taken when selecting and combining plants for landscapes and gardens. Horticultural steps involve careful evaluation of climate zone conditions, microclimate influences, soil, sun, moisture and wind. Design steps involve the evaluation and selection of plants to perform environmental, functional and aesthetic roles regarding the organization and human use of outdoor spaces and built environments. With these steps and considerations in mind, a plant palette is developed for landscape or garden use.

Observations made in nature provide a rich foundation for developing horticultural and design based planting palettes. Plants in nature naturally evolve and establish self-sustaining associations as they adapt to different climate and habitat conditions, particularly temperature and moisture. These associations contain a high level of species diversity and have rich symbiotic relationships between plant roots and mycorrhizal fungi, bacteria, oxygen, moisture and soil nutrients. These observations suggest that plant palettes for ornamental landscapes and gardens will be more successful when they are comprised of a diverse range of species having similar habitat adaptations.

This section presents a series of horticultural palettes for different landscape and garden situations. These palettes are organized into basic climate categories, including woodland, subtropical, Mediterranean and southwestern to emphasize plants with compatible adaptations and characteristics. Each palette is briefly described in terms of its design purpose, climate zone suitability, aesthetic character, and moisture needs. The objective is to provide examples that work with different combinations of climate zones, plant factors, irrigation groups and plant lists that are presented in Sections One and Two. A total of 27 palettes are presented. Each palette includes plants with a range of moisture needs that can be organized into hydrozones and successfully combined into landscapes and gardens. The Mediterranean and southwestern palettes provide many examples that particularly suited to conserving water. Each palette is also intended to be flexible and adaptable tor other design needs and climate zones reflecting an individual's horticultural knowledge, design skill and understanding of varying project situations.

# Contents

## Irrigation Group 1 - Regular Water

### Woodland Palettes

Crape Myrtle 104-105
Eastern Redbud 106-107
Japanese Black Pine 108-109
Japanese Maple 110-111
Southern Magnolia 112-113
Trees and Turf Grass 114-115

### Subtropical Palettes

Giant Bird of Paradise 116-117
Jacaranda 118-119
Natal Coral Tree 120-121
Queen Palm 122-123
Trumpet Tree 124-125

## Irrigation Group 2 - Reduced Summer Water

### Mediterranean Palettes

Canary Island Palm 126-127
Coast Live Oak 128-129
Italian Cypress and Stone Pine 130-131
Lemon-scented Gum 132-133
New Zealand Christmas Tree 134-135
Oak 136-137
Olive 138-139
Prickly Paperbark 140-141
Pomegranate 142-143
Sugar Gum 133-145
Torrey Pine 146-147
Western Sycamore 148-149

### Southwestern Palettes

California Fan Palm 150-151
Palo Verde 152-153
Southwestern Chaparral 154-155
Thornless Mesquite 156-157

*Cycas revoluta*

## Plant Palette

# Crape Myrtle

The crape myrtle palette is designed to include a selection of plants that add bright colors and traditional planting character to landscapes and gardens with an emphasis on the summer season. A wide range of crape myrtle cultivars are available that offer a variety of sizes, shapes and flower colors. These are useful in courtyards, entry ways and garden spaces, and easily grow with a single or multiple trunks. They grow with a high degree of uniformity and are suited as individual focal elements as well as for use in large numbers to frame streets and plaza areas. Increasingly, petite and shrub sized cultivars are integrated into understory and background plantings to add flowering impact and winter deciduous character.

Two groups of companion plants can be seen in this palette. The first group includes attractive foliage plants ranging from the carrot wood, fern pine, mayten trees to pittosporum and shiny xylosma. These plants provide handsome texture and quiet leaf colors to function in background, foundation and framework areas. The second group of plants adds more more choices for detail and variety. Lily-of-the-Nile, coreopsis and common geranium provide intense flower colors; grasses provide contrasting texture and attractive inflorescences from mid summer to late fall. Palms bring strong accent and focal impact to plantings throughout the year. All plants are widely grown and form a cosmopolitan palette that is common to both commercial and residential landscapes. For other plants compatible with this palette, see the Woodland Garden Plants list on pages 54-55.

### Horticultural Preferences

Plants in the crape myrtle palette prefer sunny exposures, loam soils and regular moisture throughout the year. The greatest limitation is posed by powdery mildew fungus that damages crape myrtles when planted in coastal zones and areas with high levels of humidity. The occurrence of powdery mildew restricts the planting of this palette to inland, foothill and valley zones, where the air is drier. As a result, this palette is suited for Plant Climate Zones 7-9, 14 and 18-20.

These plants tolerate average soil conditions, routine maintenance and have moderate moisture needs. They are considered among the easiest and most reliable plants to grow.

## Aesthetic Character

Plants included in this palette provide a diverse range of colors and textures with many flowers occurring during late spring and summer. Many of the popular ornamental grasses are included to provide fine texture and attractive inflorescences. Shrubs include floribunda roses, butterfly bush and sweet olive that add fragrance as well as color. Colorful perennials such as day lilies, coreopsis and rudbeckias can be planted in large masses and focal areas for bold impact.

This palette is well suited to achieve cottage style and traditional garden plantings with many colorful trees, shrubs, perennials and grasses.

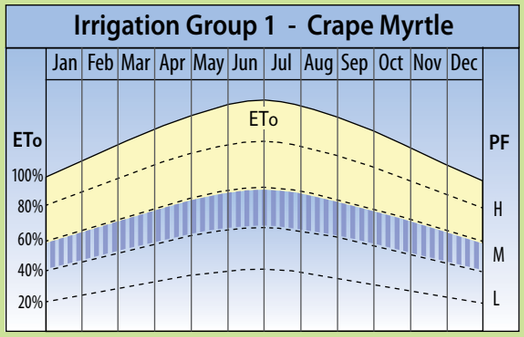
## Plant Palette

# Crape Myrtle

### Seasonal Moisture and Irrigation Schedules

The crape myrtle palette grows well in inland and valley areas of California in Plant Climate Zones 7-9, 14 and 18-20 where reference evapotranspiration ranges from 44-57 in. each year. Winter rainfall can often meet the moisture needs of this palette from December to February in these zones. However, some wintertime irrigation may be desirable during winter dry spells and drought years. The susceptibility of powdery mildew to crape myrtles prevents this palette from being used along the coast.

The chart below illustrates a supplemental moisture range based on moderate plant factors of 40-60% of ETo as a baseline for setting irrigation schedules. The upper part of this range can be used to meet moisture needs for newer landscape plantings and for those grown in warmer climate zones or in full sun exposures. The lower part of this range is often appropriate for established plants and during the shorter and cooler days in fall.



Below: *Prunus cerasifera* 'Krauter Vesuvius'

## Plant Palette

# Eastern Redbud

The eastern redbud palette brings attention to plants that are commonly grown for woodland character and suitability for use in and around lawns. This style of planting often includes dense groupings of evergreen and deciduous trees with shade adapted shrubs and ground covers growing below. The signature species selected for this palette is the eastern redbud. It grows to medium sizes, 25-35 ft. tall, produces deep magenta flowers in spring, has rich yellow fall color and displays an intricate branching character during winter. One distinctive cultivar, ***C. c.* 'Forest Pansy'** has deep purple new foliage each spring that provides striking garden color.

This palette includes several other deciduous trees that have canopy growth habits and provide attractive fall color. All can be planted in lawns as well as mixed shrub plantings where they receive regular moisture. Their deciduous habit provides generous summer shade and winter sunlight.

This palette is balanced by the presence of evergreen trees and shrubs that are also compatible with the character and needs of woodland garden plantings. These plants are needed to enclose spaces, add garden structure and support the special interest value of the trees. For other plants compatible with this palette, see the Woodland Garden Plants list on pages 54-55.

This chart shows the common plant climate zones for this palette; individual plants may grow in other zones.

Below: *Chionanthus retusus*

Above: *Cercis occidentalis*

Above: *Cercis canadensis*, fall color

### Horticultural Preferences

This palette is adapted to Plant Climate Zones 8-9 and 14-21. Most species do best in areas with moist winters and where cool temperatures begin in early fall and establish a clear end to the growing season. All tolerate regular frost.

Plants are well adapted to sun and partial shade exposures, loamy soils and regular moisture throughout the year. Prolonged summer heat with intense sun and aridity in southern California can lead to foliage damage. Deciduous trees are well suited for planting in turf grass areas that receive regular irrigation. Organic mulch can be used to cover the soil in shrub beds to help retain moisture and add nutrients.

### Aesthetic Character

A natural landscape character is often achieved with the use of this palette that includes an abundance of spring flowers, distinctive fall foliage color and wintertime berries on cotoneasters, hollies and heavenly bamboo. Understory shrubs can be arranged in masses and layers in areas of partial shade to define outdoor spaces for pathways and seating and add to a sense of discovery and natural character. This type of planting character is very refreshing during the warm months of summer.

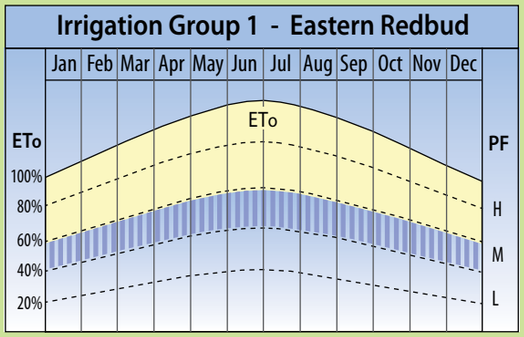
## Plant Palette

# Eastern Redbud

### Seasonal Moisture and Irrigation Schedules

The eastern redbud palette is highly adapted to climate zones with cool and moist winters in combination with warm summers. These conditions are common in many parts of northern and central California where precipitation can often meet the moisture needs from December to February. Protection from extreme sun exposures is desirable when this palette is used in southern California.

Reference evapotranspiration in Plant Climate Zones 8-9 and 14-21 ranges from 44-57 in. each year. Most plants on this list grow well with moderate amounts of moisture on a regular basis throughout the year. The upper part of this range can be followed to accommodate moisture needs for plantings in warmer climate zones with sunny exposures. Scheduling irrigation towards the lower part of this range is often appropriate for established plants and climate zones with shorter summers and reduced periods of heat.



Below: *Betula nigra*

## Plant Palette

# Japanese Black Pine

Japanese black pine is a highly adaptable conifer that combines well with a wide range of plants for use in climate zones with cool and moist winters and short and warm summers. This palette is designed to include plants that are often used in Asian and woodland style gardens. The role of the pine is to add dark green needle-type foliage which provides stability and contrast to deciduous trees and broad-leafed foliage plants. Its dark and dense foliage character and rigid branching habit creates a classic pine tree image. It can become a tall tree with a strong central leader and pyramidal shape, or be pruned to grow as a medium to large size specimen and banzai plant.

This palette includes a large number of the most popular species coming from Asia's cool and moist climate zones. Deciduous trees such as Chinese pistache, maidenhair tree and sawleaf zelkova provide striking fall color. Cycads, palms and bamboo are stable choices in Asian gardens. Plants such as sweet olive, star jasmine and wisteria provide sweet fragrances. Colorful berries are produced on cotoneasters, heavenly bamboos and hollies for winter display. For other plants compatible with this palette, see the Asian Garden Plants list on pages 56-57.

| Nandina domestica + cvs | Heavenly Bamboo | M | 1 |
| Osmanthus fragrans | Sweet Olive | M | 1 |
| Photinia x fraseri | NCN | M | 1 |

Above: *Ilex aquifolium*

### Horticultural Preferences

The Japanese black pine palette does best in areas with cool winter temperatures, regular rainfall and warm, not hot, summers. However, all can be grown in Plant Climate Zones 8-9 and 14-24 where they tolerate warmer and drier conditions, particularly when provided with regular moisture and shelter from hot sun exposures.

Trees are essential in providing filtered light and reducing intense sun conditions for understory shrubs and ground covers. Concentrations of bamboos, grasses, rushes and sedges do best in areas with the highest moisture, particularly in low areas and microclimates where moisture can collect.

Below: *Osmanthus fragrans*

Above: *Camellia japonica* 'Elizabeth'

### Aesthetic Character

This palette contains many of the classic woodland garden plants such as camellias, hollies and jasmine. Camellias are prized for their flowers, hollies have notable berries and jasmine provides strong garden fragrance. All are well liked for their glossy dark green foliage.

A strong woodland character can be achieved when pines are combined with deciduous trees and evergreen shrubs. The addition of bamboos, cycads and palms brings about a clearer Asian garden emphasis.

These plants combine well in informal and natural type plantings. A deep sense of peace and quietness filled with shade, fragrance and dark green foliage colors can be achieved.

## Plant Palette

# Japanese Black Pine

### Seasonal Moisture and Irrigation Schedules

The Japanese black pine plant palette does best with regular moisture throughout the year. Plants are naturally adapted to climate zones with cool and moist winters in combination with warm summers. These conditions are common in many parts of northern and central California where precipitation can often meet the moisture needs from December to February. Relief from extreme sun exposures and heat is desirable when this palette is used in southern California.

The majority of plants on this list need moderate amounts of supplemental moisture. The chart below illustrates 40-60% of ETo as a baseline for setting irrigation schedules. The upper part of this range can be used to accommodate moisture needs for plantings in warmer climate zones with sunny exposures. The lower part of this range is often appropriate for established plants and climate zones with shorter summers and reduced periods of heat.

## Plant Palette

# Japanese Maple

The Japanese maple plant palette can be used to achieve one of the most refreshing and refined garden plantings of all. This tree and its many cultivars are widely noted for their foliage color, fine texture and intricate branching character. It is also identified as the signature plant of Asian style gardens and is greatly appreciated when it matures into specimen sizes.

Many other plants work well with the Japanese maple that provide a diversity of textures, flower colors and fragrances. Most are native to Asia and have similar horticultural preferences for organic soils, regular moisture and shelter from hot and drying conditions. This planting palette is typically combined with large boulders, water features comprised of pools and streams and container plants. This palette is characterized by plants with delicate branching, fine and soft textures and subtile detail that combine well in small and quiet spaces.

The Japanese maple and its companion plants have become so popular in California, that extreme efforts are often made to improve soils and provide supplemental moisture to achieve survival and success in difficult areas. When this is done, it becomes a test of microclimate design and diligent gardening skills, as well as a challenge to use water resources wisely. For other plants compatible with this palette, see the Asian Garden Plants list on pages 56-57.

### Horticultural Preferences

Most of the plants within this palette come from cool and moist climate zones with a long fall through spring dormant season. The can be ground in many Plant Climate Zones, including 8-9 and 14-24, but they are not well adapted to extended periods of heat and aridity, or hot sun exposures. They are therefore best adapted to northern California climate zones and areas with coastal influences. When planted in warmer valley areas and in southern California, plants need more microclimate protection from overstory trees or should be planted in sheltered spaces such as courtyards for optimal performance. Regular year round moisture is critical to success.

### Aesthetic Character

The Japanese maple palette includes many plants having a combination of fine texture, fresh foliage colors and pleasing small scale detail. These plantings often include the use of water in basins, pools and streams that add humidity and natural sounds to small spaces. Shade with dappled light is frequently dominant. Bright springtime flowers are complemented by fall color, bright berries and deciduous branching. These many qualities provide year round interest.

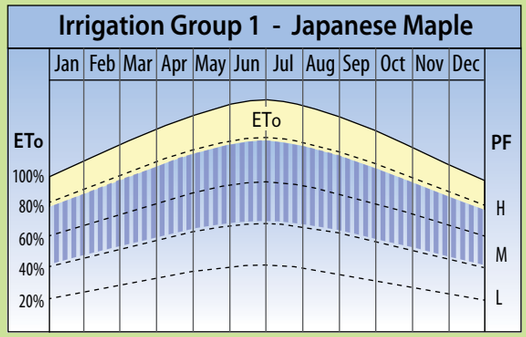
## Plant Palette

# Japanese Maple

### Seasonal Moisture and Irrigation Schedules

The Japanese maple plant palette does best with regular moisture throughout the year. This moisture sustains optimal growth during spring and helps to avoid drying and tip-burning of leaves during summer. Plants with high water needs can be used around pools and streams, and in low lying areas where runoff from precipitation and irrigation collects.

Plants on this list show a range of moisture needs from moderate to high. These differences can be addressed by organizing plants into hydrozones and microclimates. The chart below illustrates a supplemental moisture range of 40-80% of ETo as a baseline for setting irrigation schedules. The upper part of this range can be used to accommodate moisture needs for plants with high plant factors and landscapes and gardens in warmer climate zones of southern California. The lower part of this range is often appropriate for plants with moderate plant factors, established plants and those grown in climate zones with shorter summers and reduced periods of heat.



Below: *Acer palmatum* 'Bloodgood'

## Plant Palette

# Southern Magnolia

The southern magnolia is one of the principal woodland tree species of the southeastern United States. It is recognized throughout its natural range for its handsome evergreen foliage and remarkably large and fragrant white flowers. It is highly popular as a shade and lawn tree, and is the state tree of Mississippi, as well as the state flower of Louisiana.

Introduced into California in the 1860s, southern magnolia has been planted across the state in parks, along streets and in commercial landscapes and residential plantings alike. Mature trees are often some of the most notable and monumental scale plants in California landscapes. It is noted for its extensive root system and almost continual production of leaf, flower and seed pod litter.

This plant palette includes many of the well known tree species native to the southeastern United States, including sweet gum, tulip tree and pecan, and from similar Asian climates, including maidenhair tree, Chinese pistache and sawleaf zelkova. These trees can be combined together in large landscapes to establish attractive woodland and forest-type plantings. A rich palette of understory shrubs, ground covers and vines grow well with these trees. Regular water is the key to success, particularly when grown in warmer and drier valley zones and throughout southern California. For other plants compatible with this palette, see the Woodland Garden Plants list on pages 54-55.

Below: *Liriodendron tulipifera*

Above: *Magnolia grandiflora*

Above: *Magnolia grandiflora*

### Horticultural Preferences

This palette is adapted to Plant Climate Zones 7-9 and 14-24. Most species do best in areas with moist winters and where cool temperatures begin in early fall, establishing a clear end to the growing season. All tolerate regular frost.

Plants on this list are adapted to sun and partial shade exposures, loamy soils and regular moisture throughout the year. Prolonged summer heat with intense sun and aridity in southern California can lead to foliage damage. Deciduous trees are well suited for planting in turf grass areas that receive regular irrigation. Organic mulch can be used to cover the soil in shrub beds to help retain moisture and add nutrients.

### Aesthetic Character

This southern magnolia plant palette can be combined in ways to produce rich and abundant woodland-type landscapes. Mature trees have the scale to fill large spaces and produce generous shade. Many plants have deep green foliage that adds a cooling touch that can be highly enjoyable in warm climate areas.

Deciduous trees and vines in this palette offer bright fall foliage color; a number of understory shrubs provide colorful springtime flowering. Plantings can be organized into formal and informal patterns to achieve more traditional or natural style plantings.

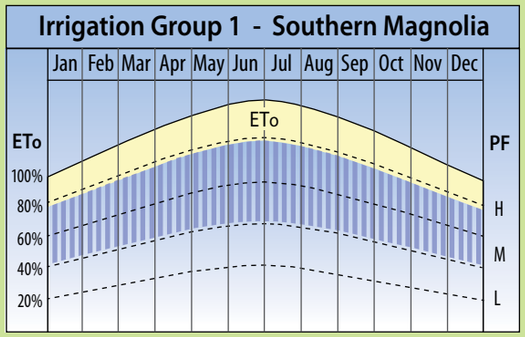
## Plant Palette
# Southern Magnolia

### Seasonal Moisture and Irrigation Schedules

The southern magnolia plant palette will grow best with regular moisture throughout the year. These plants are naturally adapted to climate zones with cool and moist winters in combination with warm summers. These conditions are common in many parts of northern and central California where precipitation can often meet the moisture needs from December to February.

Reference evapotranspiration in Plant Climate Zones 7-9 and 14-24 ranges from 44-57 in. each year. Plants on this list show a range of moisture needs from moderate to high. These differences can be addressed by organizing plants into hydrozones and microclimates. The chart below illustrates a supplemental moisture range of 40-80% of ETo as a baseline for setting irrigation schedules. The upper part of this range can be used to meet moisture needs when this palette is used in southern California. The lower part of this range is often appropriate for established plants and climate zones with shorter summers and higher levels of precipitation.



Below: *Pistacia chinensis*

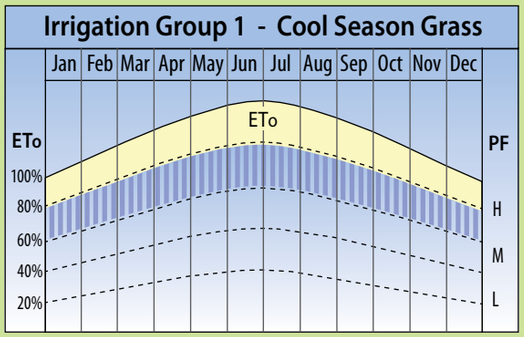
## Plant Palette

# Cool Season Turfgrass

One of the most common and long standing landscape practices in California is the planting of turf grass and trees. This practice is coming under increased scrutiny with the lasting need to conserve water and energy.

These pages provide a listing of commonly used grass species that are grown as turf grasses for commercial and residential uses. They are organized into cool season and warm season species, and combined with lists of compatible tree species. Moisture compatibility is the primary basis for these groupings; however, issues regarding heat, shade, roots and durability also require careful consideration.

The chart below illustrates the baseline supplemental moisture range for cool season turf grass throughout the year. The actual irrigation schedule should be adjusted through field observation and in consideration of seasonal climate and microclimate conditions.



Below: *Ulmus parvifolia*

| Ulmus parvifolia | Evergreen Elm | M | 1 |
| Zelkova serrata | Sawleaf Zelkova | M | 1 |

### Horticultural Preferences

Cool season turf grasses are highly adapted to regular moisture and temperatures that range between 60-75°F. Their seasonal growth cycle begins in late winter, and many species will continue to grow actively through summer as long as moisture is available. This is particularly true of tall fescue grass. Growth will diminish during the shorter and cooler days of fall, however regular moisture helps sustain good appearance and root systems during this season. Irrigation is scheduled to follow the reference evapotranspiration curve throughout the year. Established cool season grasses can grow well with 80-90% of ETo. Most species are clumping plants with dense, fibrous roots that are highly efficient in absorbing moisture from the upper zones of soil.

Trees that grow well in cool season turf grasses come from cool and moist climate zone. Most are adapted to moderate amounts of moisture on a regular basis. They will grow faster and to larger sizes with the extra moisture that comes from turf grass irrigation. The regularity of irrigation encourages tree roots to remain shallow where moisture, oxygen and nutrients exist in the best combination. Different cool season grasses have different tolerances of shade.

Below: *Cinnamomum camphora*

## Horticultural Preferences

Warm season turf grasses are adapted to warm air and soil temperatures, ranging between 70-90°F. Their seasonal growth begins in late spring and becomes most active during long summer months of sunlight and heat. This growth will continue into fall as long as temperatures remain warm and soil moisture is available. When cool temperatures and short days of fall coincide, warm season grasses become dormant and are inactive through winter. Established plantings of warm season turf grasses can grow well with 50-60% of ETo. These species grow from undergound rhizomes that enables them to have a spreading growth habit and to help resist moisture stress.

Warm season grasses strongly prefer full sun exposure conditions and regular moisture during the summer. Shade from trees often leads to sparse coverage and reduced growth. Roots from trees will also develop near the surface in response to the regular summer irrigation provided to the turf grass. Trees included on this will adapt to additional summer moisture. They will continue to grow during the summer and to larger sizes as a result of receiving more moisture.

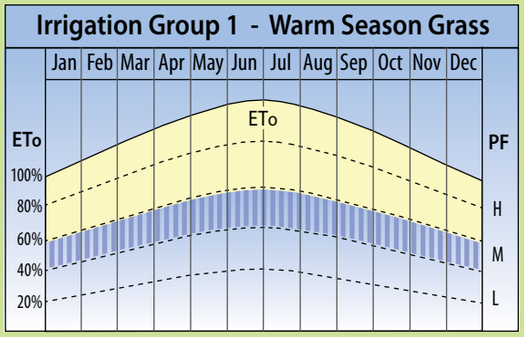
## Plant Palette

# Warm Season Turf Grass

Warm season grasses look their best during their active summer growing season. They are dormant in the winter and become pale in color. They are tough in dry climate zones and need less moisture than cool season turf grasses.

Both warm and cool season grasses provide the most uniform and durable planting surface for foot traffic and recreation uses. None of the turf grass substitutes can endure the same level of heavy use without becoming bare. Many innovative plantings combine the use of grasses, annuals, wildflowers and sedges to achieve an alternative to turf grass that requires low maintenance and low water. However, when it comes to density and durability, turf grass species are the best. Choosing the best size of turf grass planting when it is needed is a key strategy in conserving water and energy.

The chart below illustrates the baseline supplemental moisture range for warm season turf grass throughout the year. The actual irrigation schedule should be adjusted through field observation and in consideration of seasonal climate and microclimate conditions.



Below: *Ficus rubiginosa* with surface roots

## Plant Palette

# Giant Bird of Paradise

Giant bird of paradise is one of the largest perennial plants grown in California landscapes and gardens. It exhibits all of the key characteristics and adaptations associated with subtropical plants. It has very large and herbaceous foliage, grows quickly with regular moisture and is damaged by cold temperatures below 28°F. Its size and bold character along with its horticultural adaptations make it well suited as a feature plant for use in coastal zones in central and southern parts of the state. It can also grow well in sheltered inland zones where it adapts to full sun and high levels of heat, but requires a warm winter microclimate for survival.

This palette is designed for the purpose of achieving lush and tropical character in residential gardens and commercial plantings. Many of the plants produce very large leaves to add to this character; all should be protected from wind to avoid damage. These plants are often used in courtyard and entry spaces to feature bold foliage plants in combination with understory plants of small scale, bright color and simple detail. Several species of palms and cycads also complement the aesthetic and horticultural range of this palette.

For additional plants compatible with the giant bird of paradise palette, see the Subtropical Garden Plants list on pages 52-53.

Above: *Strelitzia nicolai*

### Horticultural Preferences

This planting palette is best adapted to southern California's warm coastal areas in Plant Climate Zones 22-24 where winter temperature fall below 32°F for only two to three days each year. Most plants can also grow in areas with cooler coastal conditions and milder inland Plant Climate Zones including 17, 19-20, when placed in warm microclimates and provided with shelter from frosts. Large leaved plants need protection from wind.

Most plants grow well in loamy soils with regular moisture. These conditions help produce lush growth almost year round.

## Aesthetic Character

The giant bird of paradise palette emphasizes the use of plants with bold foliage character and warm tropical flower colors. These plants can be combined into an abundant and crowded planting scheme that produces a sense of the South Pacific Islands or resort-style gardens, having a remarkably dense and vibrant character. This aesthetic character is made possible through the combination of an abundant range of flowering shrubs, vines and perennials.

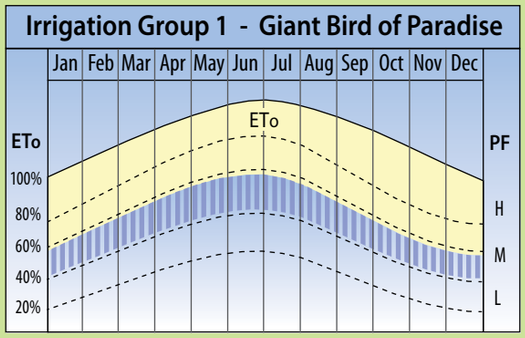
### Seasonal Moisture and Irrigation Schedules

Reference evapotranspiration for Plant Climate Zones 22-24 ranges from 44-52 in. each year. Normal winter rainfall can often meet most of the moisture needs of this palette from December to February. However, some wintertime irrigation can be desirable to provide moisture during winter dry spells and drought years. Regular supplemental irrigation is recommended throughout spring and summer to sustain seasonal growth and flowering, but can be reduced by mid to late summer to avoid late season growth that can be sensitive to frost.

The chart below illustrates a supplemental moisture range of 40-60% of ETo as a baseline for setting irrigation schedules for this palette. The moisture curve follows the profile of reference evapotranspiration until late summer and then it is reduced to bring an end to active growth for most plants before the occurrence of seasonal frosts.



Below: *Tibouchina heteromalla*

## Plant Palette

# Jacaranda

The jacaranda tree is native to South America and is a highly colorful flowering tree with many uses in California landscapes and gardens. It is well suited to parks, greenbelts and urban medians. Additionally, it is widely planted in residential yards and school grounds where its late spring floral display is greatly admired. However, in contrast to its much valued flowers, regular maintenance is needed to contend with the shower of fine twigs, leaflets and spent flowers. A balance between virtues and dilemmas is often achieved by planting this tree in lawns where it receive regular moisture and mowing activities pick up fallen litter.

The jacaranda palette brings attention to plants that are well suited for large landscape spaces. Many trees are listed that provide flowering, shade and stately character as they mature. Shrubs, vines, perennials and ground covers have also been selected for their reliable nature, basic care requirements and contribution of flower color or attractive foliage. These plants are well adapted to inland and valley zones where they respond to summer heat and tolerate occasional winter frosts. All of these plants have been selected from the Subtropical Garden Plants list located on pages 52-53. They represent species that can be damaged by frost, but are hardy enough to recover the following growing season.

### Horticultural Preferences

Plants included in this palette are all adapted to Plant Climate Zones 15-24. These zones fall within the heartland of Mediterranean climate conditions, with moist winters and long and dry summers. Throughout this range, winter temperatures fall below 25°F for 10-30 days each year.

Moderate levels of moisture are needed throughout the year; seasonal rains often meet moisture needs during winter months. Supplemental water is essential during spring and summer to sustain healthy and attractive growth.

## Aesthetic Character

The jacaranda palette is characterized by a full array of flowering trees, shrubs, perennials and vines. Virtually all plants on this list are noted for their bright flower colors and are widely planted in large and small landscapes and gardens alike. This range and diversity of flowering plants are often used in mixed plantings where variety and flower interest are combined in casual masses, layers and borders.

It is important to establish control and continuity with foliage plants and to balance colors among flowers in order to avoid an overly eclectic design composition.

## Plant Palette

# Natal Coral Tree

The natal coral tree palette is designed to bring attention to plants that thrive in warm coastal climate zones of southern California. This coral tree is native to South Africa and it provides dramatic flower color in late spring and summer. All other plants included in this palette come from parts of South Africa to acknowledge the diverse and abundant botanical contributions from this region of the world to California landscapes and gardens. Many of these plants are highly popular and widely planted. New species are being discovered and evaluated for future landscape use. Impressively, there is enough diversity and depth to this palette to work with landscapes and gardens of many sizes.

The flora of South Africa not only enjoys an abundance of flowering foliage plants, but includes other well know species of *Aloe, Crassula, Kalanchoe, Euphorbia* and *Kalanchoe.* These plants are widely used in California's coastal areas to create special interest gardens, serve as focal elements and to be planted in containers. Most species in these genera flower during winter and provide nectar for birds.

### Horticultural Preferences

The natal coral tree palette is suited to Plant Climate Zones 22-24 where winter temperatures seldom fall below 32°F. These mild conditions enable a remarkably long growing season when adequate moisture is provided. Regular irrigation is most helpful during spring and summer to sustain seasonal growth and flowering. Watering can be reduced by mid to late summer to avoid late season growth that can be sensitive to frost. These plants are well adapted to loamy soils, sunny exposures and humid conditions.

## Aesthetic Character

Plants from South Africa are highly varied in character. Many species offer bright flower colors and can be grown in large masses as well as small groups. A number of species are adapted to wet environments and provide unique grass-like foliage.

The aloes combine succulent foliage into attractive rosette patterns and are widely used as sculptural plants to stand out in high contrast to other plantings. This range and diversity can lead to many interesting plantings with both botanical and aesthetic interest.

## Plant Palette

# Natal Coral Tree

### Seasonal Moisture and Irrigation Schedules

The natal coral tree palette is comprised of two different groups of plants. The first group is comprised of trees, shrubs and perennials that do best with regular moisture throughout the year. The second group includes aloes, jade plants and other succulents that are adapted to lower levels of moisture particularly during summer. The chart below illustrates two moisture profiles. The upper profile illustrates a supplemental moisture range of 40-60% of ETo as a baseline for setting irrigation schedules for trees, shrubs and perennials. This moisture curve follows the profile of reference evapotranspiration to late summer before being reduced to bring an end to active growth for most plants. The lower moisture curve addresses the needs of aloes, jade plants and other succulents. It shows a reduction in supplemental water to very low levels during summer.

These plants can be incorporated into landscapes and gardens by grouping them into different hydrozones with separate irrigation systems.

## Plant Palette

# Queen Palm

The queen palm is native to Brazil and has become a staple choice for landscapes and gardens of all types and sizes throughout central and southern California, from coastal, adjacent inland and valley areas. While it is a hardy subtropical species, it reaches its limit of tolerability in zones where temperatures consistently drop below 25°F each year. It has proven quite easy to grow, is robust and attractive in character and can fit large and tight spaces alike. All of these qualities have contributed to its popularity and widespread use.

The queen palm is an ideal tree for subtropical plantings. The combination of soft deep green foliage and picturesque form produces a lush and distinctive character. Many other plants adapted to mild climate conditions can be combined with this palm to enhance the subtropical theme as well as add color and detail in understory and small planter spaces.

This palette has been designed to use the queen palm as a focal element in landscapes and gardens. It is suited to large scale and residential spaces alike. Its upright habit, clean solitary trunks and 30-40 ft. height range makes it useful for group plantings as well as for sentry and solitary accent uses. All of these plants have been selected from the Subtropical Garden Plants list located on pages 52-53.

**California Plant Climate Zones**

Above: *Syagrus romanzoffianum* (above), *Phoenix roebelenii* (below)

Above: *Syagrus romanzoffianum*

### Horticultural Preferences

The queen palm plant palette is naturally adapted to mild temperatures and warm conditions found throughout Plant Climate Zones 19-24. Cold temperatures seldom fall below 32°F and there is sufficient summer heat to produce strong flowering. Shrubs and perennials need protection from hot sun exposures in inland locations. All plants respond well to humidity when planted near the ocean. The best growth occurs with regular moisture and in loamy, well-drained soils. The queen palm is also well adapted to lawns.

Below: *Dioon edule*

Below: *Schefflera elegantissima*

## Aesthetic Character

The plants assembled in this palette bring a combination of soft and bold textures into landscapes and gardens. The feathery-type fronds of the queen palm dominates these plantings and stands out in bold contrast to the giant bird of paradise, philodendrons and cup-of-gold vines. Their tall and clean trunks provide distinctive and refined character to plantings as well.

Many companion plants are available to combine with the queen palm that bring rich flower colors, dark green foliage and dense growth habits. These characteristics contribute to a subtropical planting theme that appears abundant and lush.

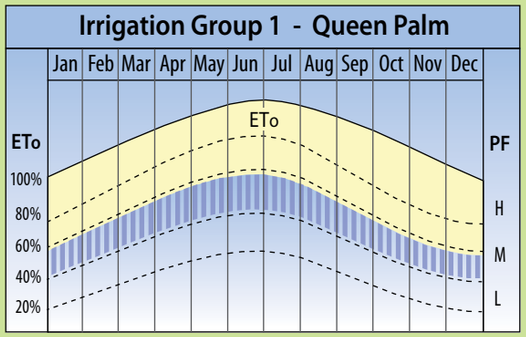
### Seasonal Moisture and Irrigation Schedules

The annual ETo range for Plant Climate Zones 19-24 varies from 44-52 in. each year. Normal winter rainfall can often meet most moisture needs of this palette from December to February. However, wintertime irrigation is often desirable to provide moisture during winter dry spells and drought years. Regular supplemental irrigation is recommended through spring and summer to sustain seasonal growth and flowering. Irrigation can be reduced by mid to late summer to avoid late season growth that can be sensitive to frost.

The chart below illustrates a supplemental moisture range of 40-60% of ETo as a baseline for setting irrigation schedules for this palette. The moisture curve follows the profile of reference evapotranspiration until late summer and then it is reduced to bring an end to active growth for most plants before late fall.



Below: *Syagrus romanzoffianum*

## Plant Palette

# Trumpet Tree

The trumpet tree palette is designed to explore ideas regarding the influence of flower color in selecting plants for landscapes and gardens. Flowers are often a dominant reason for selecting plants. They can easily have a disproportionate influence in planting design, sometimes resulting in horticultural and aesthetic conflicts. Horticultural issues can be addressed by reviewing lists of native, Mediterranean, subtropical and southwestern plants to observe the range of flower colors and to check for climate zone and moisture compatibility. From an aesthetic perspective, it is desirable to select a hue that provides continuity and harmony. Other complementary colors can be added to provide variety and contrast without being incongruent and chaotic.

The trumpet tree palette comes from the Subtropical Garden Plants list located on pages 54-55 to choose plants with similar temperature and moisture requirements. Two species of trumpet tree have been selected; one offers deep pink flowers and the other lemon-yellow. These colors are not congruent and species should be planted in separate areas where each can provide a basis for selecting companion plants. Pink trumpet tree can be combined with plants having blended and pastel flower colors, while golden trumpet tree can be complemented by pure, primary colors, including white, blue and red. Many of the companion shrubs and perennials in this palette such as bougainvillea, kangaroo paw, lantana and lily-of-the-Nile have cultivars with flower colors that work with either color theme.

Below: *Tabebuia impetiginosa*

### Horticultural Preferences

Plants included in this palette are all adapted to Plant Climate Zones 19-24. Winter temperatures occasionally fall below 25°F and summers bring long periods of warmth to sustain robust flowering.

Most species do well with moderate amounts of supplemental water into summer and then can adapt to less water during fall and early winter. This enables new foliage growth to harden off and tolerate cool winter temperatures.

The best growth occurs in loamy soils with good drainage. Organic mulches can be used throughout the understory to cover soils and help retain moisture.

## Aesthetic Character

This palette is filled with many plants that are widely appreciated for their flower color. Not all of these colors are compatible and should not be used in the same planting area. Harmony and continuity is needed when selecting various hues, values and seasons of flower color.

The pink trumpet tree flower color combines best with blended and pastel colors. Golden trumpet tree can bring additional emphasis to primary flower colors that are richly saturated. Some colors work well in both schemes and the final combination is often a matter of personal choice and experience. Color theory and ideas have unclear boundaries and are not absolute.

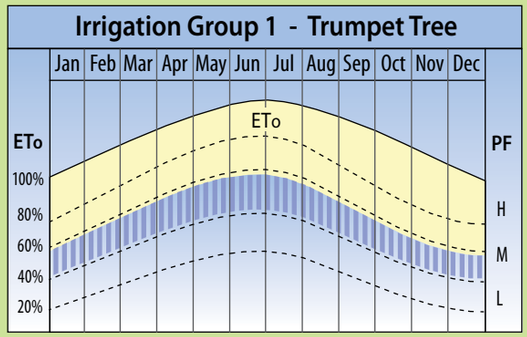
# Trumpet Tree

### Seasonal Moisture and Irrigation Schedules

Reference evapotranspiration for Plant Climate Zones 19-24 ranges from 44-52 in. each year. Normal winter rainfall in these zones can often meet most of the moisture needs of this palette from December to February. However, wintertime irrigation is often desirable during winter dry spells and drought years. Regular supplemental irrigation is recommended through spring and summer to sustain seasonal growth and flowering. Irrigation can be reduced by mid to late summer to avoid late season growth that can be sensitive to frost.

The chart below illustrates a supplemental moisture range of 40-60% of ETo as a baseline for setting irrigation schedules for this palette. The moisture curve follows the profile of reference evapotranspiration until late summer and then it is reduced to bring an end to active growth for most plants before fall. Species with long flowering seasons such as bougainvillea and lantana produce more intensive floral displays with less water in mid to late summer.



Below: *Tabebuia chrysotricha*

## Plant Palette

# Canary Island Palm

Canary Island palms grow into tall and massive trees that easily establish a towering presence upon maturity. Introduced into California by 1800, many of these palms have matured into well-known specimens among Mediterranean style plantings and for use in plazas and along streets and promenades throughout the state. Their large trunks and heavy fronds serve as the foundation of a planting scheme that emphasizes the use of bold and coarse textured plants with striking shapes and distinctive silhouette character.

This palette includes three different groups of plants. The first group consists of palms, aloes, agaves and yuccas, which have strong architectural character and rosette leaf patterns. The second group includes subtropical plants such as bougainvilleas and lantanas, which provide bright and warm seasonal color. The third group consists of Mediterranean plants such as lavenders, rockroses and rosemary, which bring additional fragrance and color.

All three groups are well adapted to mild coastal climates of southern California in Zones 19-24. Architectural plants are used as focal elements and in special interest plantings, flowering vines add bold color impact and flowering shrubs and perennials provide finer texture and detail in smaller spaces. This is a very rich plant palette that shows a good crossover between Mediterranean, California native and subtropical plants.

Above: *Agave attenuata*

### Horticultural Preferences

The Canary Island palm palette is well adapted to Mediterranean climate conditions that commonly occur along California's coastline and adjacent inland and valley areas that experience occasional frost. These conditions are commonly found within Plant Climate Zones 19-24. Plants thrive in sunny locations with warm summer temperatures and are adapted to reduced moisture by the end of summer. All plants do best in well-drained soils, lacking high levels of organic matter.

While this palette includes a number of ground covers, the surface area around plants can be covered with inorganic materials such as decomposed granite, gravel and stone.

## Aesthetic Character

The aesthetic success of this palette relies on working with contrast and repetition. Many plants have bold shape and large scale. Others have soft foliage color and texture. There is a range of warm and bright flower colors to use. All of these elements can be organized into formal and informal compositions that achieve year round interest and striking visual character.

Bold plants with rosette leaf patterns can be massed and layered as well as highlighted through the strategic placement of bright, flowering shrubs. The use of clipped myrtle and rosemary hedges and low walls can provide a geometric frame around pathways and planting areas, adding structure to informal plant groupings.

### Seasonal Moisture and Irrigation Schedules

The annual ETo for Plant Climate Zones 19-24 ranges from 44-52 in. each year. Winter rainfall can often meet the moisture needs of this palette from December to February. However, some wintertime irrigation may be desirable to provide moisture during winter dry spells and drought years.

Plants on this list have a range of moisture needs from moderate to very low that can be addressed by organizing them into hydrozones and microclimates. The chart below illustrates the full range of supplemental moisture needs for this palette. The higher end of the range applies mostly to trees and shrubs, as well as for newer plantings. The lower part of the range represents the needs of agaves, aloes, cacti and yuccas as well as for plantings in coastal areas with lower summer temperatures. Reduced irrigation is recommended during the summer months to enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth.

## Plant Palette

# Coast Live Oak

The coast live oak is a widely recognized and valued native tree that can be found growing in large numbers from north to south throughout California's coastal ranges. In recent years, cities and counties have established ordinances to prevent the widespread loss of native oaks due to urban development. This palette is designed to work with existing coast live oaks that occur in developed areas and when additional landscape plantings are needed. Some plants are adapted to understory conditions within the dripline where they grow with limited summer water and adapt to shade. Others are best suited for perimeter locations. Many of these plants naturally occur in association with coast live oaks.

While there are many plant types that grow well around established oaks, new planting should always be approached with care. In many instances planting within the canopy is not recommended in order to avoid disturbance to roots and the introduction of supplemental water during summer months. This zone can be covered with fallen oak leaves and be left alone. Perimeter plantings outside the dripline can often provide a good balance of design character around existing trees to reduce the need for understory plants. When new plants are placed within the dripline they should be adapted to low amounts of summer water and be placed in areas of sun and shade according to their adaptation.

Again, this palette addresses existing coast live oaks and compatible native species. The Oak Palette on pages 136-137 presents other combinations of oak trees and associated plants.

Below: *Ribes viburnifolium* is one of the best understory ground covers for use inside the dripline of existing coast live oak

Above: A mature coast live oak grouping growing without understory plants or supplemental irrigation within their canopies. These trees have been preserved in place without attempting to landscape around them.

Above: *Quercus agrifolia* acorns

### Management Practices

Often the best management practice for existing oaks is to leave the understory area within their dripline undisturbed. Altering the natural soil level and adding new plantings that need supplemental irrigation during summer months can pose significant threats to a tree's health. Fallen leaf litter can be used as a surface mulch, seasonal rains can provide the best balance of moisture and for nutrient exchange with reduced risk from harmful fungus and diseases. Grading and compactions should not occur within the dripline.

Below: *Ribes viburnifolium*

Above: *Rhamnus californica*

### Grading Practices

Changing drainage patterns or existing grades near mature oaks, particularly within the canopy area where roots obtain essential nutrients and moisture, is not advised. Additionally, avoid soil compaction during construction. Decomposed granite and pea gravel are recommended for walkways. Permeable pavements and raised decks are encouraged for larger areas. Avoid trenching for drainage, irrigation lines or lighting conduits throughout the dripline of trees. Roots over 2 in. in dia. should not be cut and surface feeder roots should be protected.

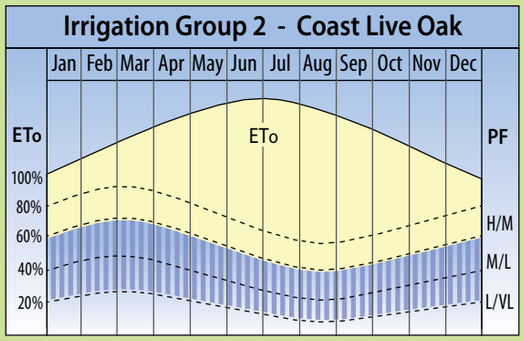
## Plant Palette

# Coast Live Oak

### Seasonal Moisture and Irrigation Schedules

Existing oaks have often grown and adapted to climate and soil conditions of their site without the influence of supplemental irrigation. However, when development occurs, historic moisture patterns above and below ground are likely to change. Additionally, there is often a desire to add new plantings within the understory and surrounding area of these trees. This palette contains native plants with two sets of plant factors; moderate to low, and low to very low. Plants in each set should be organized into separate hydrozones with dedicated irrigation systems.

Supplemental watering should be scheduled mostly for fall and winter months with the goal of subsidizing the natural rainfall season during dry spells and drought cycles. Spring and summer irrigation should be minimal; mostly in support of newer ground cover and shrub plantings until they are established. A baseline irrigation schedule is shown below that illustrates seasonal irrigation around existing oaks.



Below: *Vinca major,* a member of Irrigation Group 1 is planted within the dripline of established coast live oaks, resulting in conflicting water requirements.

## Plant Palette

# Italian Cypress and Stone Pine

The Italian cypress and stone pine rank as two of the most visible signature trees of Mediterranean style gardens around the world. This observation holds true in California where these trees are grown in landscapes and gardens in coastal, valley and foothill climate zones across the state.

The Italian cypress typically grown in ornamental gardens and landscapes is an upright and narrow columnar selection that has a long history of being used for colonnades and sentry features in both formal and informal settings. It starts out ramrod straight in shape and eventually matures with relaxed edges and tips. The Italian stone pine matures with one of the tallest and broadest evergreen canopy forms among all ornamental trees. It easily reaches monumental scale with proportions that often dominate the landscape.

The Italian cypress and stone pine palette incorporates a combination of Mediterranean and California native species that are highly compatible together. This list also includes a number of well known flowering subtropical plants such as bougainvillea and lantana, which offer bright flower colors. These frost sensitive species cannot grow in inland and valley zones like many of the other plants in this palette. As a result, this combination of plants is mostly suited to coastal and low frost inland Plant Climate Zones 19-24 of southern California. Additional Mediterranean plants are listed on pages 48-49.

### Horticultural Preferences

The plants that comprise this palette are best suited to climate zones that have mild, frost-free winters and long, warm summers. These conditions are typically found within Plant Climate Zones 19-24 of southern California, from the coast to adjacent inland and valley areas. The majority of species are adapted to summer heat with reduced amounts of moisture.

Most plants prefer soils that range from sandy loams to loams with fast draining conditions. They can adapt to heavier clayey loam soils, but overwatering and saturated conditions need to be avoided.

Below: *Nerium oleander* 'Sister Agnes'

Above: *Bougainvillea* 'Barbara Karst'

### Aesthetic Character

The Italian cypress and stone pine set the stage for plantings that combine large scale and bold character with diverse understory plantings comprised of colorful and fragrant shrubs, perennials and grasses. Agaves, aloes, cacti and other succulents are commonly used for accent character and in containers.

Designs often incorporate formal planting areas and pathways with clipped hedges. This provides a framework for trees to be used as sentry elements, or to be organized into rows and or orchard patterns. Smaller plants can reinforce this formality or be grouped in mixed plantings with less order.

### Seasonal Moisture and Irrigation Schedules

Reference evapotranspiration for Plant Climate Zones 19-24 ranges from 44-52 in. each year. Winter rainfall can often meet the moisture needs of this palette from December to February. However, some wintertime irrigation may be desirable during winter dry spells and drought years.

The chart below illustrates the full range of supplemental moisture needs for this palette. The higher end of the range applies mostly to trees and shrubs, as well as for newer plantings. The lower part of the range represents the needs of agaves, aloes, cacti and yuccas as well as for plantings in coastal areas with lower summer temperatures. Reduced irrigation is recommended during the summer months to enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth. These plants can grow together when they are organized into hydrozones with separate irrigation systems.

## Plant Palette

# Lemon-scented Gum

Lemon-scented gum is considered by many people to be the most elegant evergreen tree grown in California. This is due to its tall and elegant trunk and slender branches that are covered with smooth cream colored bark. Mature trees provide good skyline character with an open canopy of foliage that allows both the branching and background to be visible. Its common name comes from the distinctive fragrance exuded by crushed leaves.

Like other species of eucalyptus native to Australia, the lemon-scented gum is widely adapted to Mediterranean climate conditions found in many parts of California. It grows best with regular moisture during winter and spring, and easily adapts to reduced summer moisture. It becomes a large tree over time, requiring ample space.

This plant palette is comprised of plants suited to large scale spaces in parks, greenbelts and on slopes. Many of the trees become prominent skyline features when they mature and are very effective in creating a strong landscape presence throughout most communities. Associated shrubs and understory plants are selected for their usefulness in large masses to cover expansive spaces and tolerate the abundance of leaves, bark and needles that fall from the trees.

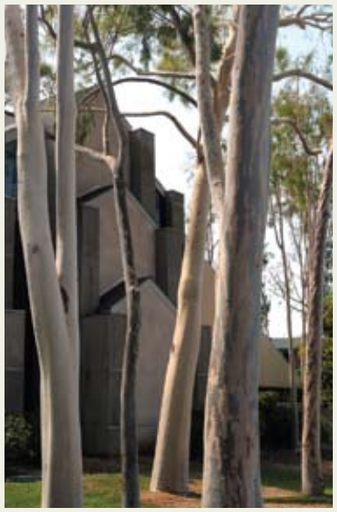
Above: *Eucalyptus citriodora*



Above: *Eucalyptus citriodora*

### Horticultural Preferences

This plant palette is well adapted to Mediterranean climate conditions that are found in Plant Climate Zones 15-24, including areas with temperatures to 25°F during winter. All do best in well-drained soils, sunny exposures and with reduced amounts of summer moisture.

Most plants need ample space to grow and seasonal pruning to maintain appropriate shapes and sizes. Shrubs and ground covers are well adapted to large slope plantings in green belts and along highways where they receive little care or attention.

| **Trees** | | **PF** | **IG** |
|---|---|---|---|
| Brachychiton discolor | Queensland Lacebark | M/L | 2 |

Above: *Acacia redolens*

## Aesthetic Character

The primary design purpose of this palette is to fit large scale spaces with bold and simple plantings. Trees such as lemon-scented gum, Canary Island pine and silky oak can achieve imposing size and help give enclosure and definition to big areas while providing distinctive skyline character. Understory and background areas on slopes and perimeters are to be treated with large scale mass plantings. Ground covers are selected for their capacity to cover large areas and further add to the functional simplicity of this palette.

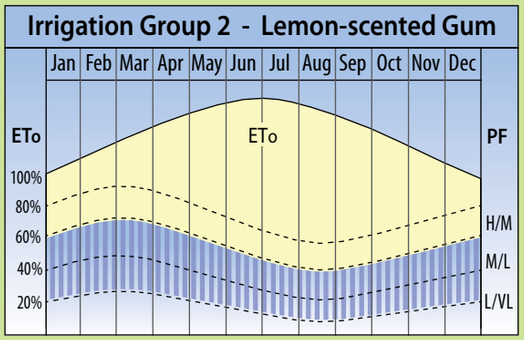
## Plant Palette

# Lemon-scented Gum

### Seasonal Moisture and Irrigation Schedules

The average ETo for Plant Climate Zones 15-24 ranges from 44-52 in. each year. Winter rainfall can often meet moisture needs of this palette from December to February, particularly in Zones 15-17. However, some wintertime irrigation may be desirable during winter dry spells and drought years.

Plants listed in the lemon-scented gum palette have a range of moisture needs from moderate to low that can be addressed by organizing them into hydrozones and microclimates. As shown by this chart, reduced irrigation is recommended during summer months; this will enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth.



Below: *Grevillea robusta*

## Plant Palette

# New Zealand Christmas Tree

This palette is designed to bring attention to plants that are highly suited for use in landscapes and gardens in Plant Climate Zones 17 and 24. The New Zealand Christmas tree is endemic to New Zealand where it often grows on cliffs and along shorelines adjacent to ocean waters where it is fully exposed to salt spray, sand and wind. Under these conditions it shows good adaptability to moist winters and cool summers with frequent fog.

There are a variety of plants that are well adapted to such immediate coastal conditions including many succulents. This palette provides choices for virtually every need. Trees can be used for color, shade and screening. Many shrubs are noted for their flowers, while others are used to direct views or to be clipped into hedges. Perennial and succulent plants are highly suited to add detailed interest in small spaces and containers.

When viewed as a whole, this palette fits coastline areas ranging from central to southern California, where humidity and summer fog helps plants retain a fresh and lush character. Most species grow in warmer and drier inland areas, however, such conditions cause these plants to have shorter flowering cycles and drier foliage character. Additional plants for coastline gardens can be seen within the Coastal Garden Plants list on pages 58-59.

This chart shows the common plant climate zones for this palette; individual plants may grow in other zones.

Below: *Melaleuca nesophila*

Above: *Metrosideros excelsus*

Above: *Metrosideros excelsus*

### Horticultural Preferences

This planting palette is well adapted to coastline conditions in Plant Climate Zones 17 and 24, including moist winters, summertime fog and mild year round temperatures. Most trees and large shrubs adapt to daily wind and salt air and are helpful in creating microclimates that offer shelter to smaller plantings.

The best growth occurs in well-drained soils. Raised planters and elevated beds can be used to provide better soils and good drainage in areas that have clayey or compacted soils. Coastal zones have relatively low evapotranspiration conditions; most plants in this palette will do well with reduced levels of summer water.

### Aesthetic Character

Plants listed for use along with the New Zealand Christmas tree include a diverse range of species that offer year round color and interest. This palette is well suited to cottage style plantings with the strong use of shrubs, perennials and ornamental grasses. These plantings flourish during spring and summer and provide a diverse and informal character.

Trees and shrubs exposed to daily winds can take on a windswept profile that adds a unique quality to their character. Succulents exposed to salt spray take on richer shades of color and spotted foliage.

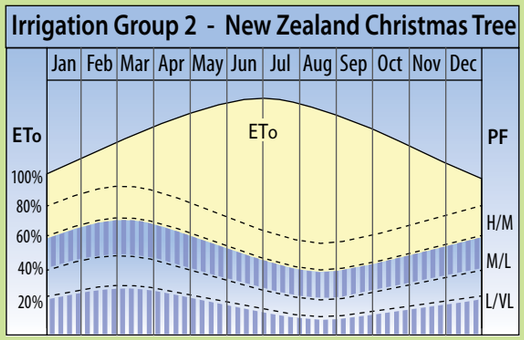
## Plant Palette

# New Zealand Christmas Tree

### Seasonal Moisture and Irrigation Schedules

The average ETo for Plant Climate Zones 17 and 24 are the lowest in California, ranging from 33-44 in. each year. Moisture needs for plantings along the coastal edge, particularly in Zone 17, can easily be met by rainfall during winter months and can experience a very long growing season, ranging from 10-12 months. Some wintertime irrigation may be desirable during winter dry spells and drought years, particularly in southern California. Irrigation should be reduced through spring to enable plants to harden off and adapt to drier soils and summer temperatures.

The chart below contains two baseline irrigation schedules. The top curve shows a range of supplemental moisture from moderate to low that reflects the needs of trees and shrubs. The lower curve shows a moisture range from low to very low which represents the needs of agaves, aloes and succulents. These plants can grow together when they are organized into hydrozones with separate irrigation systems.



Below: A combination of *Aeonium, Agave, Aloe* and *Kalanchoe*

## Plant Palette

# Oak Tree

The oak tree palette has been designed to recognize a number of California and Mediterranean oak species that have been widely used in ornamental landscapes and gardens over the years. It also brings attention to the great compatibility between California native and Mediterranean shrubs and ground covers that can be planted around oaks.

Oaks are among the most celebrated trees in California. Many monumental scale specimens have become heritage trees in communities across the state to acknowledge their age and connection to the regional history and ecology. New oaks are often planted with the intention of giving something to the future, knowing these trees take many years to reach maturity.

The goal of this palette is to present planting suggestions that work for mature and young oaks alike. Many established trees such as the valley oak seen in the picture to the right, provide a bold landscape presence. And, it is possible to add new plantings grouped in hydrozones that add diversity and interest without placing older trees at risk. Landscapes that do not have mature trees often take many years to evolve and go through several stages of composition. The earlier stages are often filled with sun tolerant plants and the greatest diversity; trees assert increasing influence in older stages by dominating more space, adding shade and becoming visually prominent.

### Horticultural Preferences

Good drainage is perhaps the most essential soil preference for species listed in the oak tree palette. When clayey soils are encountered, it is advisable to work with elevated topography or to position trees and shrubs on slopes to improve drainage. Low amounts of organic amendments can be added to the backfill mix at the time of planting for additional nutrients.

Plants included in this list tolerate periodic winter frosts and temperatures to 25° F. They are well adapted to Plant Climate Zones 8-9, and 15-24 where they grow with sun, heat and reduced amounts of summer moisture.

Below: *Eriogonum fasciculatum* 'Dana Point'

Above: *Arbutus unedo* 'Compacta'

## Aesthetic Character

These images of landscape plantings around oaks show great diversity and a natural landscape appearance. When mature trees are present they provide dominance and establish a point of focus within the landscape or garden.

Young trees in new plantings take many years to mature and establish their visual dominance. Until this occurs, the associated shrubs and ground covers grow in bright and sunny exposures and provide many colors and textures. These plantings often show more diversity than order and need the help of pathways, walls and topography to define spaces and organization.

# Oak Tree

## Seasonal Moisture and Irrigation Schedules

Reference evapotranspiration for Plant Climate Zones 8-9 ranges from 56-58 in. each year, and 44-52 in. in Zones 15-24. Average winter rainfall can meet most the moisture needs of this palette in all of these zones from December to February. However, some wintertime irrigation may be desirable during winter dry spells and drought years.

The chart below illustrates a supplemental moisture range from moderate to low relative to ETo. Reduced irrigation is recommended during the summer months; this will enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth. These plants can grow together when they are organized into hydrozones with separate irrigation systems. The higher end of this range is suggested for newer plantings and warmer zones; the lower end is suggested for established plantings and areas with lower summer temperatures.

## Plant Palette

# Olive

The olive is one of the most widely recognized trees around the world. It has a rich and varied history since the earliest days of civilization and continues to be one of the most symbolic and enduring plants in Mediterranean regions where it has been cultivated for centuries to obtain oils from its fruit.

The olive is grown extensively in California's coastal, inland, valley and desert zones, where it is used as a specimen plant in courtyards, entry planters and along edges of drives and fields. It is widely adapted to a variety of soil types, including calcareous, as well as sun, heat, cold and drought. Established plants require low amounts of supplemental water; young plants grow more quickly if watered regularly.

Olive trees exhibit a number of characteristics of plants having evolved in Mediterranean climates with warm summers and long periods of drought. Leaves are thick and leathery and do not wilt under moisture stress. The pale color and dense covering of hairs on the undersides helps leaves absorb less heat and reduce moisture loss. It can develop extensive root systems and swollen trunks that can capture and store moisture, and sprout new growth if it is burned in a fire. A combination of California native and Mediterranean trees, shrubs and succulents are listed with the olive that share many of the same adaptations and characteristics. Additional Mediterranean plants are listed on pages 48-49.

Above: *Olea europaea*

Above: *Cistus purpureus*

### Horticultural Preferences

This plant palette is well suited for Plant Climate Zones 8-9 and 19-24. Plants are adapted to frost that can occur over 40 times each year in Zone 8. The average annual ETo for Zones 8-9 ranges from 56-58 in., and 44-52 in. in Zones 19-24, which results in different annual water budgets. Plants in this list fit into two hydrozones and are adapted to reduced amounts of summer moisture.

Plant growth is best in well-drained soils. Most species thrive in warm and sunny exposures. Established plants can endure periods of drought and recover when moisture becomes available.

## Aesthetic Character

The olive tree commonly provides the foundation of color and composition in Mediterranean gardens. The pale green foliage provides an opportunity to plant sage, rosemary, rockroses and yarrow to harmonize and reinforce a subdued foliage aesthetic. This soft color combines well with the bright springtime flower colors these plants offer, which also offer distinctive flower and foliage fragrances.

Olives are placed where they can provide visual dominance and a point of focus within landscapes or gardens. Mature trees have bold trunks and low branching habits that can be pruned to reveal striking year round character.

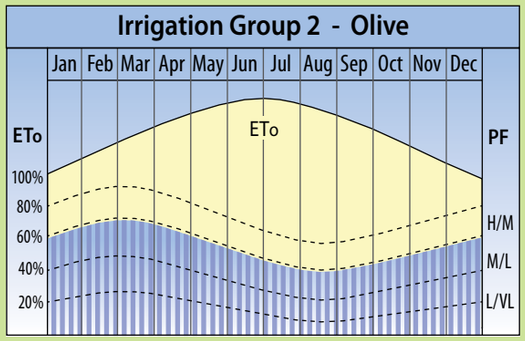
### Seasonal Moisture and Irrigation Schedules

The average annual ETo for Plant Climate Zones 8-9 ranges from 56-58 in. and 44-52 in. in Zones 19-24, resulting in different water budgets for these zones. Winter rainfall can often meet the moisture needs of this palette from December to February. However, some wintertime irrigation may be desirable during winter dry spells and drought years.

The chart below illustrates the full range of supplemental moisture needs for this palette. Reduced irrigation is recommended during summer months to enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth. These plants can grow together when they are organized into hydrozones with separate irrigation systems. The higher end of the range applies mostly to trees and shrubs, as well as for newer plantings. The lower part of the range represents the needs of agaves, aloes, cacti and succulents as well as for plantings in coastal areas with lower summer temperatures.



Below: *Rosmarinus officinalis* 'Prostratus' (foreground), *Agave salmiana* 'Ferox' (background)

## Plant Palette

# Prickly Paperbark

This palette brings attention to plants that are highly adapted to warm climate conditions found throughout Plant Climate Zones 19-24 in southern California. The emphasis is placed on paperbark and bottle brush tees from Australia that are naturally adapted to coastal habitats and both wet and dry conditions. This range of temperature and moisture tolerance makes them well suited for areas around warm season turf grasses in traditional landscape and garden plantings. At the same time, the combination of shade, litter and surface root growth makes these trees best suited to perimeter areas and among shrubs and ground covers.

The list of trees is complemented with a variety of shrubs, ground covers, perennials and vines that are also adapted to planter areas around turf grass. These plants provide good foliage and seasonal color variations that can be grouped in layers and foundation type plantings.

A review of the plant factors indicates variations in moisture needs among the plants in this palette. These plants can grow together when they are organized into hydrozones and microclimates, and sustained with separate irrigation systems. The charts on the opposite page show the baseline supplemental moisture profile for these groups of plants that can be used as a guide to set irrigation schedules.

Above: *Melaleuca styphelioides*

Above: *Melaleuca styphelioides*

### Horticultural Preferences

This group of plants is adapted to Plant Climate Zones 19-24. The harshest conditions occur in Zone 24 with more than 20 days of frost each year, and 70-100 days when temperatures exceed 90°F. Conditions near the coast are not as cold or warm, and the air is more humid.

Most species can tolerate heavy soils and short periods of both wet and dry conditions. Summer moisture varies among plants and they should be grouped into microclimates and hydrozones to reflect their seasonal needs.

## Aesthetic Character

The prickly paperbark palette reflects traditional landscape aesthetics based upon turf grass and perimeter planters. This combination of fresh green lawn and colorful trees and shrubs represents a highly popular landscape style for many suburban communities. There is a strong sense of order, purpose and regularity to this planting approach.

Foundation planters placed along buildings and walls are commonly seen in this style of landscape. Today, there are many examples where shrubs have grown into trees and provide striking character when they are well pruned.

## Plant Palette

# Pomegranate

The pomegranate can become the perfect focal plant for a mixed garden planting. It commonly grows as a dense shrub for many years, but eventually can be pruned into a very handsome multi-trunk tree. Red to orange flowers provide attractive accent value in the spring and large red fruit provides colorful contrast to the leaves that are turning yellow in the fall. This fruit itself is edible or can be processed into jellies, jams and drinks.

This palette is designed to bring attention to a number of plants grown in Mediterranean climates for their fruit, fragrance and culinary value, such as rosemary, sage and thyme. Many of these plants attract birds and butterflies. Trees such as the pomegranate, olive and edible fig can all be pruned as they mature into very sculptural specimens with interesting bark and branching character.

A review of the plant factors indicates differences among moisture needs of plants in this palette. These plants can grow together when they are organized into hydrozones and microclimates, and sustained with separate irrigation systems. Clipped hedges and border plants can be efficiently irrigated with drip lines. Bubbler irrigation can also be used to provide moisture to fruit bearing trees to meet their needs. The charts on the opposite page show the baseline supplemental moisture profile for these groups of plants that can be used as a guide to set irrigation schedules.

**California Plant Climate Zones**

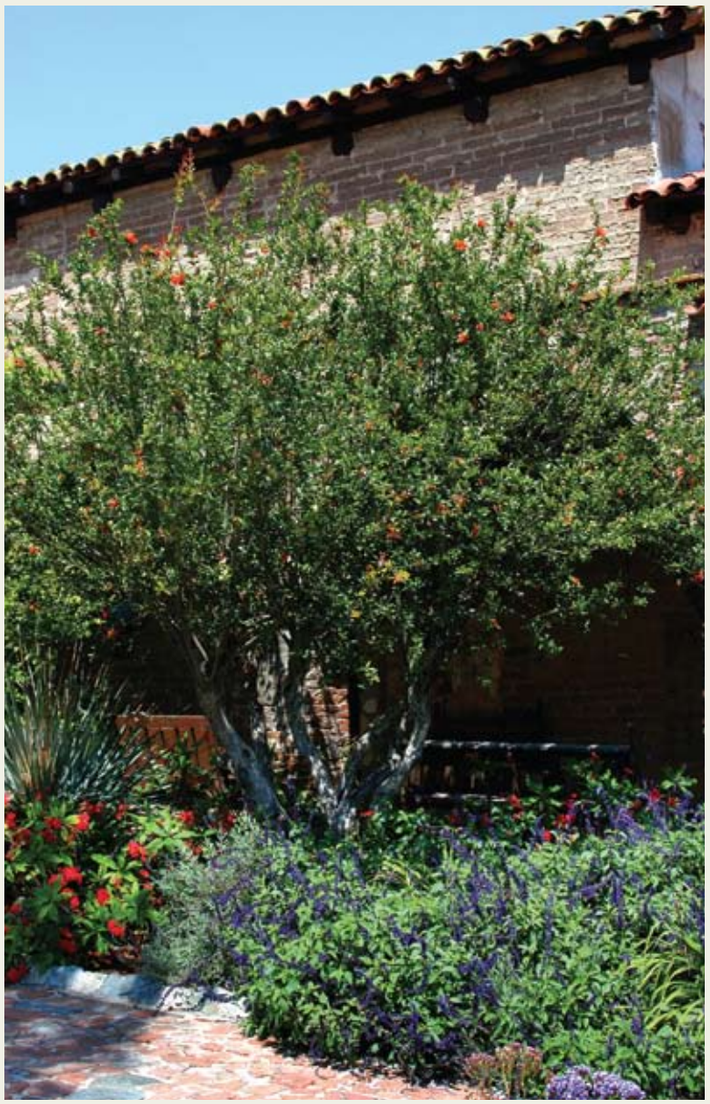
Below: *Laurus nobilis* in a formal garden, LA County Arboretum



Above: *Punica granatum,* Mission San Juan Capistrano

Above: *Punica granatum* 'Wonderful'

### Horticultural Preferences

This plant palette is suited for Plant Climate Zones 8-9 and 19-24. Frost can occur over 40 times each year in Zone 8. The average annual ETo for Zones 8-9 ranges from 56-58 in., and 44-52 in. in Zones 19-24, which results in different annual water budgets. Plants in this list fit into three hydrozones; some plants need regular moisture throughout the year, others adapt to reduced summer moisture, and succulents have the lowest annual and seasonal need of all.

Plant growth is best in loamy and well-drained soils. Warm summer temperatures and sunny exposures help fruit bearing trees achieve best productivity. Herbs and perennials do well with a mixture of sun and shade.

### Aesthetic Character

The pomegranate palette can lead to a carefully organizes and crafted garden design with formal walkways and planting areas. This design aesthetic reflects a long standing tradition to grow culinary and fruit bearing plants in beds that can have improved soils and regular moisture for optimum productivity. Trees are often a focal element within these planters; smaller shrubs and clipped hedges help define borders and perimeter screening.

In contrast to a formal design approach, many plants are easy to grow along meandering pathways, to cascade over low walls and be interspersed among other plants.

## Plant Palette

# Sugar Gum

The sugar gum eucalyptus native to Australia has been one of the most commonly planted and enjoyed eucalyptus species for use in coastal and inland zones from central to southern California since its introduction into the state before 1900. One of the greatest concentration of this species occurs at the University of San Diego campus near La Jolla where extensive forests have been planted. Ironically, it naturally occurs in just three relatively limited and disjunct areas in South Australia, yet, it has become widely popular as a landscape species in other parts of Australia and California.

This palette has been designed to fit large scale planting areas and includes only species and cultivars of plants native to Australia. Many of these are widely grown in California, particularly in warm and dry climate zones. The intent of this list is to bring attention to plants such as acacias and grevilleas that are particularly well suited for understory locations around eucalyptus trees where they are adapted to filtered sunlight, eucalyptus leaf litter and dry summer conditions. All are useful for park, highway and greenbelt plantings, and can grow for many years with relatively low maintenance. Understory plantings grow best in combination with widely spaced trees to obtain sun, moisture and soil nutrients. Dense stands of these trees mature and produce heavy shade and extensive roots, resulting in a bare understory covered mostly by leaf litter.

Above: *Eucalyptus cladocalyx,* Santa Barbara

Above: *Eucalyptus cladocalyx*

### Horticultural Preferences

Plants within this palette are adapted to Mediterranean climate conditions that are found in Plant Climate Zones 8-9 and 14-24. Most species are adapted to average soils that are low in nutrients and organic matter and have a 6.5-7.5 pH range. Phosphorous in fertilizers harms plants in the *Proteaceae* family such as grevilleas, banksias and net bushes and should not be used for this palette.

Most species grow to large sizes and do best with generous space. Moderate amounts of supplemental moisture is recommended during the winter; established plants easily adapt to reduced moisture during the summer months.

## Aesthetic Character

Sugar gum is one of the finest trees for background and silhouette uses in large scale spaces. This character and value is enhanced when groves of trees are planted in locations that can be visible over long distances. Mature stands of sugar gum produce dense shade and abundant bark and leaf litter. Pathways through large stands provide a powerful woodland experience comprised of enclosed spaces, filtered views, shafts of light and pungent fragrance from eucalyptus oils.

Among widely spaced trees, a wide range of colorful shrubs, ranging from grevilleas, coast rosemary and grass trees can fill large spaces and thrive for years. This is a palette that works best to achieve natural landscape character.

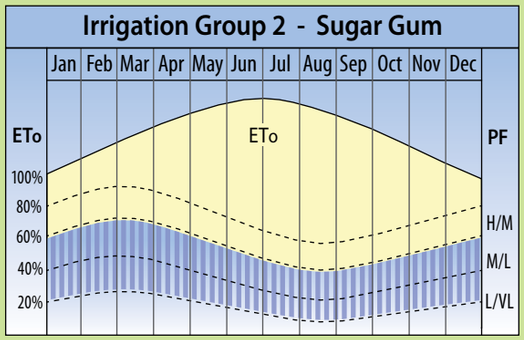
# Sugar Gum

### Seasonal Moisture and Irrigation Schedules

Reference evapotranspiration for Plant Climate Zones 7-9 ranges from 49-58 in. each year, and 44-52 in. in Zones 19-24. Average winter rainfall can meet most moisture needs of this palette from December to February; some wintertime irrigation may be desirable during winter dry spells and drought years. Irrigation should be reduced through spring to enable plants to harden off and adapt to drier soils and warmer summer temperatures. However, low amounts of summer moisture can enable plants retain good character without stimulating high levels of growth.

The chart below illustrates a supplemental moisture range from moderate to low. This addresses the majority of plants listed in this palette. All of the plants can be used in the same landscape area when they are organized into hydrozones with separate irrigation systems. The higher end of this range is suggested for newer plantings and warmer zones; the lower end is suggested for established plantings and areas with cooler summer temperatures.



Below: *Grevillea* 'Robyn Gordon'

## Plant Palette

# Torrey Pine

Torrey pine is an attractive California native conifer with a limited range of distribution. Its greatest concentration occurs on sandstone slopes and bluffs along the coast near La Jolla. Some trees occur further from the coast and others occur on Santa Rosa Island. In contrast to its natural range, this pine has been widely planted in ornamental landscapes in many parts of California and has proven to be highly adaptable to Mediterranean climates and varying amounts of moisture.

This palette brings attention to plants that are members of the sage scrub and chaparral plant communities of southern California. It is a native plant palette highly suited for open space and green belt plantings for the southern coastal region. The intent is to achieve landscapes of locally adapted species that can become self sustaining within 2-3 years after they are planted. This will result in a landscape that has habitat value for wildlife and requires lower amounts of maintenance and water.

Plant palettes comprised of local native species is a key basis for many open space and revegetation projects. This approach to establishing landscapes often involves greater care in seeking out appropriate species, nursery sources and planting practices, but it is an important alternative to traditional planting projects that require more care and resources for survival and growth.

### Horticultural Preferences

This planting palette is best suited to Plant Climate Zones 23-24 of southern California. Many of these plants are native to these zones in the coastal sage scrub and chaparral plant communities. They grow with seasonal rains that average of 8-14 in. each year; annual reference evapotranspiration ranges from 44-50 in. per year. Once established, this palette can grow without supplemental irrigation.

Most species grow best in well-drained soils, sunny exposures and adjacent to the Pacific Ocean that brings fog and humidity to these zones. These plants are also adapted to warmer and drier inland Zones 18-19 and require low to very low amounts of summer moisture.

### Aesthetic Character

This group of plants takes on the appearance of the southern coastal sage scrub and chaparral plant communities. Trees can be placed in stands to help define areas of focus and to frame views. Otherwise, there is a random mixture of colors, textures, shapes and patterns among the understory shrubs, perennials and grasses. A variety of flowers occur during spring; muted foliage colors dominate most of the year. Plantings of Shaw's agave, our Lord's candle and bear grass can be planted on rocky outcroppings for additional visual interest and diversity.

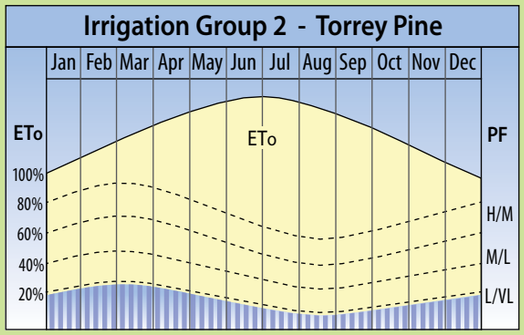
# Torrey Pine

### Seasonal Moisture and Irrigation Schedules

Annual ETo for Plant Climate Zones 23-24 ranges from 49-58 in. each year. Average winter rainfall can meet most the moisture needs of this palette from December to February; some wintertime irrigation may be desirable during winter dry spells and drought years. Landscapes comprised of exotic plants commonly need supplemental irrigation to offset this potential moisture loss. Native species are highly adapted to survive and grow within the limits of seasonal rainfall, and over time can mature into stable associations with many large trees and shrubs.

The chart below illustrates a supplemental moisture range up to 20% of ETo. The higher end of this range is suggested for newer plantings for the first 1-2 years. Once established, plants in this palette can survive without additional irrigation.



Below: *Galvezia juncea*

## Plant Palette

# Western Sycamore

Western sycamore is one of the most widely recognized California native plants that is found growing near seasonal and perennial streams in coastal, inland and valley areas across most of the state. Like other species adapted to riparian conditions in Mediterranean climate zones, western sycamore survives on winter rains as well as moisture obtained from streams during the dry summer months common to its natural range. It often grows into a highly sculptural and picturesque tree in both native and ornamental landscapes with its twisting trunk and branches. Bark flakes off in patches to produce a mottled pattern of colors; fall foliage takes on a golden hue when backlit by low angle sunlight. Large trees can drop an abundant amount of leaves during fall that overwhelm garden spaces and necessitate several weeks of diligent removal.

The Western Sycamore Plant Palette is well suited for riparian and woodland-type plantings. The shady understory area can be filled with a diverse selection of flowering evergreen and deciduous shrubs, perennials, ferns and grasses. Many of the most popular and easy to grow California native plants are included in this palette, including western redbud, spice bush, bush anemone, coral bells and Douglas iris.

Above: *Platanus racemosa*, fall color

### Horticultural Preferences

The western sycamore plant palette includes plants that are well adapted to Plant Climate Zones 8-9 and 14-24. Some of these zones experience regular winter frost as well as high levels of summer heat. The best growth occurs in well-drained soils with a layer of organic mulch covering the soil to reduce surface evaporation, retain moisture and add organics to the soil.

Many understory plants and perimeter plants are adapted to microclimate conditions created by trees, preferring a combination of moisture and intermittent shade. Plants adapted to less water can be grouped into a perimeter hydrozone that is drier and has increased sun exposure.

| **Trees** | | **PF** | **IG** |
|---|---|---|---|

## Aesthetic Character

This palette is ideal for achieving landscape and garden plantings that have a natural character. Western sycamores provide abundant shade and help reduce warm summer temperatures. At maturity they have a bold and rugged character. Understory shrubs provide colorful flowers during spring and become inactive from summer through fall.

Plantings are enhanced by creating stream-like topography with boulders and places for surface water to collect and create moist pockets. Meandering pathways and quiet spaces for sitting under trees are recommended design elements.

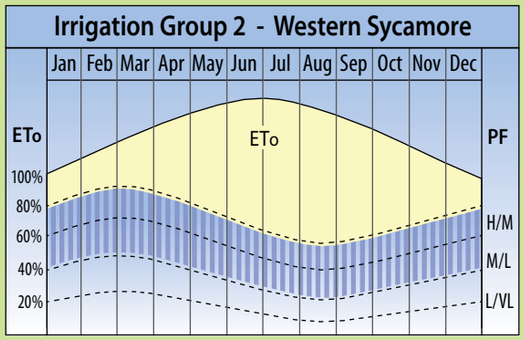
## Plant Palette

# Western Sycamore

### Seasonal Moisture and Irrigation Schedules

The western sycamore is naturally adapted to habitats where moisture is often available year round. Young trees planted in ornamental landscape and gardens grow best with regular water during winter and spring, and can adapt to less during summer. Two groups of companion plants are included in this palette; one group grows best with some shade and more moisture, the second group grows well in perimeter areas with more sun and drier conditions. These groups should be organized into two hydrozones with separate irrigation systems. Additionally, plants with the greater moisture needs can be placed in low lying areas where surface runoff from rainfall and irrigation collects.

The chart below illustrates a supplemental moisture range from 80-40% of ETo. The higher end of this range is suggested for trees and plants with higher plant factors; the lower end can fit established plantings and plants adapted to less summer moisture.



Below: A western sycamore provides partial shade to *Iris douglasiana* and *Heuchera* species, as required by these plants. *Sisyrinchium bellum* is placed in a sunnier part of the planter.

## Plant Palette

# California Fan Palm

California fan palm is one of the signature trees for desert and southwestern style landscapes. It is a robust species that can develop a massive crown of fronds and a stout trunk. This palm naturally grows along seeps, springs and streams that occur across the Sonoran Desert in southern California, southeast Arizona and northern Baja California. Annual reference evapotranspiration can reach 69-72 in., leading palms to the naturally grow near water in order to survive prolonged heat, aridity and wind.

The objective of this palette is to focus on plants that use different strategies to survive in hot and dry climates, but can be combined and successfully grown together. For example, the palms in this palette do best with a regular supply of moisture to thrive in the desert. Deciduous trees such as the desert willow, palo verde and mesquite need good winter and spring moisture, and adapt to drier conditions by loosing their foliage and becoming inactive. Perennials such as penstemon and desert marigold also grow during winter and spring, and complete their growth, flowering and seed production cycles as moisture declines. Evergreen shrubs such as desert encelia and creosote endure high levels of moisture stress by shedding some leaves and becoming inactive.

It is possible to work with topography, hydrozones, microclimates and low volume irrigation systems to bring these plants together. Irrigation systems in particular can vary the quantity and location of moisture of the many plants.

**California Plant Climate Zones**

### Horticultural Preferences

Plants that comprise the California fan palms palette are highly adapted to warm and arid climate zones of the low deserts in Plant Climate Zone 13. Most species are tolerant of full sun, intense winds and high summer temperatures, however, they do need water. Annuals and perennials grow and bloom after winter rains, then dieback. Palms need continual access to soil moisture; they survive in desert areas only where there is shallow ground water to sustain them. Deciduous trees will loose foliage under drought stress and become inactive.

Such adaptations enable this palette to successfully grow in southern California's inland Climate Zones 18-19.

## Aesthetic Character

This palette combines many bold and sculptural plants with large boulders, mounding topography and artistic pathways to achieve the structure of the garden. These features are visible year round and are essential for defining spaces and microclimates to accommodate people and plants.

The use of perennials, grasses and flowering shrubs increases diversity and natural character. These plants add springtime color and interest, but loose their impact during summer. Palms are commonly associated with water features; perennials and deciduous trees easily combine to work along a desert wash. Cacti and succulents can be grouped in geometric patterns and used as specialty accent elements.

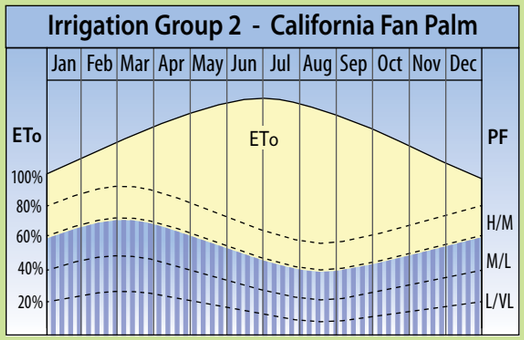
## Plant Palette

# California Fan Palm

### Seasonal Moisture and Irrigation Schedules

The annual ETo for Plant Climate Zone 13 is the highest in California, ranging from 69-72 in. each year. Winter rainfall averages 3-4 in. and both winter and summer irrigation is needed to sustain plants in this palette.

The chart below contains the supplemental moisture curve in comparison to reference evapotranspiration. Some plants need low to moderate amounts of water and others require low to very low supplemental moisture. These plants can grow together when they are organized into hydrozones and microclimates with separate irrigation systems. Low volume irrigation systems can be designed to vary the location and amount of water to meet the annual and seasonal needs of this palette. Careful field observation is needed to adjust the irrigation schedule to respond to harsh heat spells and drying winds. It is also very easy to provide too much water that often results in the overgrowth of desert plants, adding maintenance and branch failure.



Below: *Brahea armata,* Palm Desert

## Plant Palette

# Palo Verde

The palo verde is one of the signature plants for landscapes and gardens in low desert regions throughout California and Arizona. This is due to its many aesthetic qualities and widespread adaptability to such dry, hot and wind-prone regions.

Many of the desert trees included in this palette such as acacia, mesquite and other palo verdes are naturally low branching and shrub-like in habit. This growth habit helps trees resist strong winds, cool the root zone and contribute modest amounts of mulch within the drip line of the canopy. Additionally, in nature, these trees typically grow along washes and adjacent to rock outcroppings where scant rainfall collects and is concentrated for plants to use. Such trees will develop deep or extensive root systems, or both, as they harvest water within reach. Larger trees are a good indication of more moisture availability. Leaves are often dropped under moisture stress, but quickly regrow when available. Flowering is most common in early spring following winter rains.

The palo verde plant palette illustrates a combination of colorful foliage type plants that can be used for aesthetic value and water conservation in warmer and drier climate zones of southern California. There are also many agaves, cacti, palms and perennials in this palette. Since many of the species included on this list are native to the southwest, they are well adapted to native soils and extreme climate conditions.

### Horticultural Preferences

The palo verde palette consists of plants that are highly adapted to low desert conditions in Plant Climate Zone 13. Summer heat in this zone reaches well over 100°F throughout summer, with very little frost during winter. The lack of cold enables many plants from arid and subtropical climates to grow throughout this zone as long as supplemental water is provided year round and where there is shelter from hot sun exposures. High temperatures during the summer months limits the annual growing season to 8-9 months. Soils are low in organic content and have a pH of 7.0 and higher.

## Aesthetic Character

This palette brings attention to plants of the southwest that have many attractive ornamental characteristics. A number of the trees and shrubs produce colorful flowers; some have attractive bark. An abundant list of agaves, cacti, yuccas and succulents provide accent character and sculptural interest.

Late winter to early spring is the season of color and new growth. High summertime temperatures cause most plants to become inactive; many trees and shrubs shed leaves during this time of year and are sparse in character. Plants are often arranged in natural patterns with walls, decomposed granite and boulders adding to the aesthetic feeling.

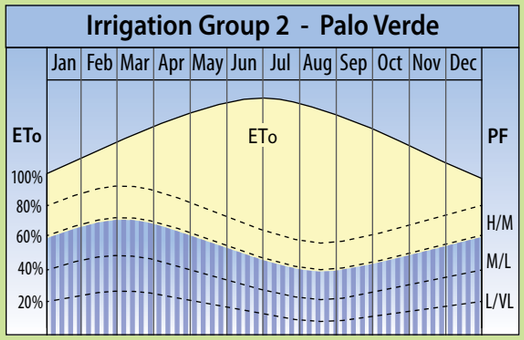
Plant Palette

# Palo Verde

## Seasonal Moisture and Irrigation Schedules

The annual ETo for Plant Climate Zone 13 is the highest in California, ranging from 69-72 in. each year. Winter rainfall averages 3-4 in. and both winter and summer irrigation is needed to sustain ornamental plantings.

The chart below contains baseline irrigation schedules for this plant palette. Reduced irrigation is recommended during summer months to enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth. These plants can grow together when they are organized into hydrozones with separate irrigation systems. The higher end of each range is suggested for newer plantings; for established plants and in protected microclimate areas. Plants with similar moisture needs should be grouped together in the same hydrozone. Drip and low volume irrigation systems can be selectively located to provide moisture to different areas as well as provide more moisture to trees in this type of mixed planting.



Below: *Dasylirion wheeleri*

## Plant Palette

# Southwestern Chaparral

This palette combines a diverse mixture of plants that are native to the dry climates and habitats found in many parts of southern California and the southwestern United States. The result is a list of drought tolerant plants that are rich in character, attractive to wildlife and suggestive of the chaparral, sage scrub and low desert plant communities.

The effort to identify and select plants from dry climate zones for use in ornamental landscapes and gardens has been a long standing goal of many people and organizations. This reflects a full range of values associated with sustainable landscapes. These include the protection and conservation of natural habitats and species, efficient and appropriate use of water, celebration of species diversity and desire to use plants from the region.

This landscape example reflects these values and illustrates one of many planting possibilities for use in southern California. It features several spectacular flowering species such as the flannel bush, our Lord's candle and bush poppy. It also relies on the use of boulders, stone walls, decomposed granite and topography for additional interest and spatial definition. Rainfall provides all moisture during winter; drip irrigation is used to provide low amounts of supplemental moisture to selected plants during summer. A wide variety of birds, butterflies, native honeybees and lizards are seen in this landscape.

### Horticultural Preferences

This palette is adapted to Plant Climate Zones 18-24 with plants showing a high tolerance to sun and heat. The best growth occurs in well-drained soils with little organic matter. Most plants need very little summer moisture; plants with moderate water needs can be grouped into microclimates and hydrozones, and be sustained with drip irrigation. Surfaces can be covered with decomposed granite and gravel to help control weeds.

## Aesthetic Character

The southwestern chaparral palette is dominated by winter and summer conditions. Plants come to life during winter and spring in response to seasonal rains. New growth and fresh foliage fragrances are prominent in January and February. Flowers occur from March to mid summer. Springtime in this garden is full of activity and color.

The garden becomes inactive and subdued during summer and fall months. Heat and reduced soil moisture brings about a stage of dormancy for many plants. Few flowers occur, except for dudleya and California fuchsias.

This annual cycle is part of the inherent aesthetic rhythm for many plants of the chaparral, sage scrub and low desert habitats.

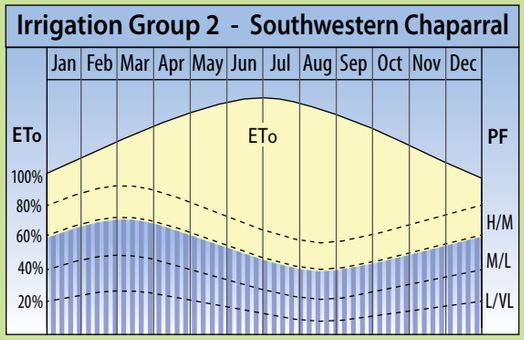
## Plant Palette

# Southwestern Chaparral

### Seasonal Moisture and Irrigation Schedules

The ETo for Plant Climate Zones 18-24 ranges from 49-58 in. per year. Average winter rainfall can meet the moisture needs of this palette from December to February.

The chart below illustrates a supplemental moisture range from medium to very low. Reduced irrigation is recommended for all plants during summer months. This moisture will enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth. A few plants in this palette will grow better with more moisture. These can be grouped together in the same hydrozone and in microclimate areas with a separate irrigation system. Drip irrigation can be selectively located to provide moisture to different areas in this type of mixed planting. Species of agaves, dudleya, hesperoyucca and nolina can do well with very little or no summer water once established, particularly along the coast.



Below: A seasonal streambed to collect and infiltrate rain water

## Plant Palette

# Thornless Mesquite

The intermediate deserts of California represented by Plant Climate Zone 11 is one of the most challenging for landscapes and gardens. It is even more challenging when the goal is to work with native and southwestern plants that fit the regional character. With these thoughts in mind, mesquite has been selected to anchor a palette of plants that come from arid climate zones and intermediate deserts with heat, aridity and cold.

Mesquite trees are widely distributed throughout the southwestern United States, Mexico and dry climate zones of South America. Several species occur across this vast range and several have been selected for ornamental use in desert climate zones where they are valued for their endurance of harsh climate conditions.

Many of these plants also grow in the low deserts of Climate Zone 13, and in sunny and warm climate areas of Zones 8-9, 18-19. This range is explained by their preference for heat and tolerance of cold. Even with these adaptations and tolerances, a diverse and colorful palette of plants is available for spaces of many sizes.

**California Plant Climate Zones**

Above: *Prosopis alba*

### Horticultural Preferences

This plant palette is well adapted to intermediate desert conditions in Plant Climate Zone 11. Winter frost occurs with regularity. Plants in this palette have been selected due to their cold tolerance as well as for heat and aridity.

Evapotranspiration is very high in the summer, however, most plants will experience excessive growth and weakened trunks and branches. The best growth occurs in well-drained soils with careful summer irrigation. Many of these plant are adapted to low desert climates as well as warm foothill and valley areas of central and southern California.

Above: *Justicia californica*

## Aesthetic Character

This palette produces alternating cycles of fresh and colorful character contrasted with periods of inactivity and survival. Color and character is dominant from winter to mid spring. This reflects the combination of cooler temperatures, seasonal precipitation and longer days.

Once summer heat starts to peak and last day after day, flowers disappear and foliage becomes hardened and sparse. Plants such as fairy duster and Texas ranger can also have a second flowering cycle in late summer when moisture is provided. The use of agaves and yuccas provide year round visual interest when foliage plants are struggling.

## Plant Palette

# Thornless Mesquite

### Seasonal Moisture and Irrigation Schedules

Reference evapotranspiration in Plant Climate Zone 11 averages 64-68 in. per year. Winter rainfall averages 3-4 in. and does not provide reliable moisture to meet the needs of ornamental landscapes and gardens. The thornless mesquite palette is comprised of plants that are adapted to high levels of heat, aridity and wind with moderate to low amounts supplemental moisture throughout the year. Both winter and summer irrigation is needed

The chart below illustrates a supplemental moisture range from moderate to very low. Reduced irrigation is recommended during summer months to enable plants in ornamental landscapes and gardens to retain good character without stimulating excessive levels of growth. These plants can grow together when they are organized into hydrozones with separate irrigation systems.

CNPS California Native Plant Society

# The Rare, Threatened, and Endangered Plants of California

## Glossary of Terms and Field Descriptions (Adopted and modified from the CNPS Inventory, 6th Edition, 2001)

The heart of the CNPS *Inventory* is our assessment of the current conservation status of each of our state's rare, threatened, and endangered plants. We present these assessments together with a summary of current information on the distribution and ecology of each taxon. We also include entries for plants that were considered but rejected for one or more reasons, as well as other scientific names that have been used in the standard literature or in previous editions of this *Inventory*.

### Basis for Inclusion

The vast majority of the taxa in this *Inventory* are vascular plants (ferns, fern allies, gymnosperms, and flowering plants). We also present our evaluation of rarity and endangerment of California's bryophytes (mosses, liverworts, and hornworts). Algae, fungi, and lichens are not treated here.

A plant must be native to California to be included. Ornamentals, plants escaped from cultivation, and naturalized plants are excluded. So are the sporadic hybrids that sometimes occur under natural conditions. The relatively trivial color variants and occasional departures from typical vegetative or floral conditions, referred to by botanists as "forma," are similarly excluded.

This *Inventory* focuses on plants that are rare in California. A very small number of plants that are still somewhat common in California are included because they are in decline and face further immediate threats. We recognize that extensive habitat alteration and pervasive human impacts pose serious threats to many other species that are still common. However, evaluation of threats to species that are neither rare nor imminently becoming so is outside the scope of this *Inventory*. By limiting our scope in this way, we in no way imply that these species are not of concern.

### Scientific Names

The plants in this *Inventory* are presented by their scientific names which have been properly published according to the *International Code of Botanical Nomenclature*. See Shevock (1993)[10] for a general discussion of nomenclature.

In its simplest form, a scientific name has three parts. The first is the genus name. It is always capitalized. The second part is the specific epithet, often incorrectly called "the species name." Together, these two components make up the species name. If a scientific name is presented in its most complete form, these two words will be followed by the names of one or more persons, often in an abbreviated form, who first published the specific epithet or subsequently published a taxonomic modification of the plant. These names are the authorities. If a portion of an authority occurs within parentheses, then the author in parentheses originally placed the epithet in a different genus or species, or once assigned it to a different taxonomic rank. The name cited outside the parentheses is that of the person who published the combination as it now appears.

Often the scientific name is more complex because botanists have recognized categories below the level of species. The two most useful are the subspecies (abbreviated ssp.) and the variety (abbreviated var.) These names are also displayed according the *International Code* and they have their own authorities.

Consider the example *Penstemon newberryi* Gray var. *sonomensis* (Greene) Jeps. *Penstemon* is the genus name; *newberryi* is the specific epithet; Gray, for Asa Gray, is the author of the specific epithet; var. is the abbreviation for variety; *sonomensis* is the subspecific epithet; (Greene), for Edward L. Greene, first described the var. *sonomensis* as a full species; and Jeps., for Willis Lynn Jepson, modified its taxonomic position and made it a variety of *P. newberryi*. Following the general practice for foreign words and phrases, Latin portions of the name (genus, species, and infraspecific epithet) are typically distinguished from surrounding text with underlining or italic typeface.

## Nomenclatural Usage

We use what we consider to be the current, best nomenclature based on the recommendations of the Rare Plant Program Committee and consultation with taxonomic authorities. Many names in this *Inventory* have been in use for a long time, appearing in Munz (1959, 1968, 1974)[7][8][9] and Abrams (1923-1960)[1]. Others have been introduced or reintroduced to us in The Jepson Manual (1993)[4] and The Jepson Online Interchange, or described new to science in the last several years.

The usage in this *Inventory* does not follow any single published source, though if other considerations are equal, we use the names found in The Jepson Manual and/or on their Online Interchange. When the nomenclature we use varies from that of The Jepson Manual, we include information in the Notes section of each entry describing the situation. See Skinner and Ertter (1993)[11] for a discussion of taxonomic coordination between the *Inventory* and The Jepson Manual.

Where there is disagreement among experts on taxonomic distinctiveness, we lean towards recognizing doubtfully distinct taxa. Such taxa are typically assigned to List 3. By encouraging protection until taxonomic questions are resolved, we hope to reduce ex post facto regret over taxa that have been shown to be distinct only after their disappearance.

We do not include taxa that lack formally published scientific names.

## Common Names

Each of the plants has a common or vernacular name. Although the majority of the plants in the *Inventory* have no real common name, we include them because it is often easier for many of us to refer to a plant by a more familiar sounding name. Most of the common names were coined by Leroy Abrams for his Illustrated Flora of the Pacific States. In other instances, we simply follow his lead by contriving names, usually by translating the Latin or Greek roots into English or by selecting an appropriate geographical reference or person's name. We attempt to follow Kartesz and Thieret (1991) [6] in matters of capitalization, spelling, and hyphenation of common names.

## Family Names

Each entry includes the technical name of the family to which the plant belongs. Note that all of these names end with the suffix "-aceae." A few plant families have older, alternative names that the *International Code* allows to be used because their widespread acceptance predates formal nomenclature. Gramineae is a perfectly acceptable alternative for Poaceae; Compositae for Asteraceae; Cruciferae for Brassicaceae; Umbelliferae for Apiaceae; Leguminosae for Fabaceae; and Labiatae for Lamiaceae. However, these old names are gradually losing favor, so we use the standardized, modern names for these families.

## The CNPS Ranking System

### California Rare Plant Rank 1A: Plants Presumed Extirpated in California and Either Rare or Extinct Elsewhere

Plants with a California Rare Plant Rank of 1A are presumed extirpated or extinct because they have not been seen or collected in the wild in California for many years. A plant is extinct if it no longer occurs anywhere. A plant that is extirpated from California has been eliminated from California, but may still occur elsewhere in its range.

All of the plants constituting California Rare Plant Rank 1A meet the definitions of the California Endangered Species Act of the California Department of Fish and Game Code, and are eligible for state listing. Should these taxa be rediscovered, and impacts proposed to individuals or their habitat, they must be analyzed during preparation of environmental documents relating to the California Environmental Quality Act (CEQA), or those considered to be functionally equivalent to CEQA, as they meet the definition of Rare or Endangered under CEQA Guidelines §15125 (c) and/or §15380.

### California Rare Plant Rank 1B: Plants Rare, Threatened, or Endangered in California and Elsewhere

Plants with a California Rare Plant Rank of 1B are rare throughout their range with the majority of them endemic to California. Most of the plants that are ranked 1B have declined significantly over the last century. California Rare Plant Rank 1B plants constitute the majority of taxa in the CNPS *Inventory*, with more than 1,000 plants assigned to this category of rarity.

All of the plants constituting California Rare Plant Rank 1B meet the definitions of the California Endangered Species Act of the California Department of Fish and Game Code, and are eligible for state listing. Impacts to these species or their habitat must be analyzed during preparation of environmental documents relating to CEQA, or those considered to be functionally equivalent to CEQA, as they meet the definition of Rare or Endangered under CEQA Guidelines §15125 (c) and/or §15380.

### California Rare Plant Rank 2A: Plants Presumed Extirpated in California, But Common Elsewhere

Plants with a California Rare Plant Rank of 2A are presumed extirpated because they have not been observed or documented in California for many years. This list only includes plants that are presumed extirpated in California, but more common elsewhere in their range.

All of the plants constituting California Rare Plant Rank 2A meet the definitions of the California Endangered Species Act of the California Department of Fish and Game Code, and are eligible for state listing. Should these species be rediscovered, any impacts proposed to individuals or their habitat must be analyzed during preparation of environmental documents relating to CEQA, or those considered to be functionally equivalent to CEQA, as they meet the definition of Rare or Endangered under CEQA Guidelines **§**15125 (c) and/or **§**15380.

### California Rare Plant Rank 2B: Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

Except for being common beyond the boundaries of California, plants with a California Rare Plant Rank of 2B would have been ranked 1B. From the federal perspective, plants common in other states or countries are not eligible for consideration under the provisions of the Federal Endangered Species Act. With California Rare Plant Rank 2B, we recognize the importance of protecting the geographic range of widespread species. In this way we protect the diversity of our own state's flora and help maintain evolutionary processes and genetic diversity within species.

All of the plants constituting California Rare Plant Rank 2B meet the definitions of the California Endangered Species Act of the California Department of Fish and Game Code, and are eligible for state listing. Impacts to these species or their habitat must be analyzed during preparation of environmental documents relating to CEQA, or those considered to be functionally equivalent to CEQA, as they meet the definition of Rare or Endangered under CEQA Guidelines **§**15125 (c) and/or **§**15380.

### California Rare Plant Rank 3: Plants About Which More Information is Needed - A Review List

Plants with a California Rare Plant Rank of 3 are united by one common theme - we lack the necessary information to assign them to one of the other ranks or to reject them. Nearly all of the plants constituting California Rare Plant Rank 3 are taxonomically problematic. For each California Rare Plant Rank 3 plant we have provided the known information and indicated in the "Notes" section of the CNPS *Inventory* record where assistance is needed. Data regarding distribution, endangerment, ecology, and taxonomic validity are welcomed and can be submitted by emailing the Rare Plant Program at rareplants@cnps.org.

Many of the plants constituting California Rare Plant Rank 3 meet the definitions of the California Endangered Species Act of the California Department of Fish and Game Code, and are eligible for state listing. Impacts to these species or their habitat should be analyzed during preparation of environmental documents relating to CEQA, or those considered to be functionally equivalent to CEQA, as they may meet the definition of Rare or Endangered under CEQA Guidelines **§**15125 (c) and/or **§**15380.

### California Rare Plant Rank 4: Plants of Limited Distribution - A Watch List

Plants with a California Rare Plant Rank of 4 are of limited distribution or infrequent throughout a broader area in California, and their status should be monitored regularly. Should the degree of endangerment or rarity of a California Rare Plant Rank 4 plant change, we will transfer it to a more appropriate rank.
Some of the plants constituting California Rare Plant Rank 4 meet the definitions of the California Endangered Species

Act of the California Department of Fish and Game Code, and few, if any, are eligible for state listing. Nevertheless, many of them are significant locally, and we strongly recommend that California Rare Plant Rank 4 plants be evaluated for impact significance during preparation of environmental documents relating to CEQA, or those considered to be functionally equivalent to CEQA, based on CEQA Guidelines §15125 (c) and/or §15380. This may be particularly appropriate for:

- The type locality of a California Rare Plant Rank 4 plant,
- Populations at the periphery of a species' range,
- Areas where the taxon is especially uncommon,
- Areas where the taxon has sustained heavy losses, or
- Populations exhibiting unusual morphology or occurring on unusual substrates.

## Threat Ranks

- 0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
- 0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
- 0.3-Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

Notes:

1. The above Threat Rank guidelines only represent a starting point in the assessment of threat level. Other factors, such as habitat vulnerability and specificity, distribution, and condition of occurrences, are also considered in setting the Threat Rank.
2. Many of the Threat Ranks have not been reassessed since the time they were first designated after implementation of the Rare Plant Status Review Process, and therefore may not represent the current level of threats associated with a given taxon.
3. The Threat Ranks do not designate a change of environmental protections. For instance a CRPR 1B.3 plant has the same environmental protections as a CRPR 1B.1 plant, and it is mandatory that both be fully considered during preparation of environmental documents relating to CEQA.

## State and Federal Status

For each taxon with official status under the California Endangered Species Act (CESA), the Federal Endangered Species Act (FESA), and/or the Native Plant Protection Act (NPPA), the plant's status is presented. Our definitions conform to those found in California state law and federal regulations.

# CNDDB ELEMENT RANKING[3]

### Global Ranking

The *global rank* (G-rank) is a reflection of the overall status of an element throughout its global range. **Both Global and State ranks represent a letter+number score that reflects a combination of Rarity, Threat and Trend factors, with weighting being heavier on Rarity than the other two.**

**Species or Natural Community Level**

- **G1** = **Critically Imperiled** — At very high risk of extinction due to extreme rarity (often 5 or fewer populations), very steep declines, or other factors.
- **G2** = **Imperiled** — At high risk of extinction due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.
- **G3** = **Vulnerable** — At moderate risk of extinction due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.
- **G4** = **Apparently Secure** — Uncommon but not rare; some cause for long-term concern due to declines or other factors.
- **G5** = **Demonstrably Secure** — Common; widespread and abundant.

### Subspecies Level

Subspecies receive a **T-rank** attached to the G-rank. With the subspecies, the G-rank reflects the condition of the entire species, whereas the T-rank reflects the global situation of just the subspecies or variety. For example: *Chorizanthe robusta* var. *hartwegii*. This plant is ranked G2T1. The G-rank refers to the whole species range i.e., *Chorizanthe robusta.* The T-rank refers only to the global condition of var. *hartwegii*.

### State Ranking

The *state rank* (S-rank) is assigned much the same way as the global rank, but state ranks refer to the imperilment status only within California's state boundaries.

- **S1** = **Critically Imperiled** — Critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province.
- **S2** = **Imperiled** — Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province.
- **S3** = **Vulnerable** — Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
- **S4** = **Apparently Secure** — Uncommon but not rare; some cause for long-term concern due to declines or other factors.
- **S5** = **Secure** — Common, widespread, and abundant in the state.

### Notes:

- Other considerations used when ranking a species or natural community include the pattern of distribution of the element on the landscape, fragmentation of the population/stands, and historical extent as compared to its modern range. It is important to take a **bird's eye or aerial view** when ranking sensitive elements rather than simply counting element occurrences.
- Uncertainty about the rank of an element is expressed in two major ways:
  - By expressing the ranks as a **range** of values: e.g., S2S3 means the rank is somewhere between S2 and S3.
  - By adding a ? to the rank: e.g., S2? This represents more certainty than S2S3, but less certainty than S2.
- Other symbols:
  - GH - All sites are **historical**; the element has not been seen for at least 20 years, but suitable habitat still exists (SH = All California sites are historical).
  - GX - All sites are **extirpated**; this element is extinct in the wild (SX = All California sites are extirpated).
  - GXC - Extinct in the wild; exists in cultivation.
  - G1Q - The element is very rare, but there are **taxonomic questions** associated with it.
  - T - Rank applies to a subspecies or variety.

## Occurrence Data from DFG California Natural Diversity Database[2]

**Element Occurrence (EO)**

- **Element:** A plant, animal, or natural community tracked by the natural heritage program.
- **Occurrence:** The specific location(s) where an element is known to occur.

**Definition of plant EOs in California:** A population or group of populations found within 0.25 miles and not separated by significant habitat discontinuities.

### Total # of Known Element Occurrences / Occurrence Count

The current number of occurrences for a particular element.

### Element Occurrence Ranks

An element's *Occurrence Rank* is a ranking of the quality of the habitat and the condition of the population at that location. The possible values for Occurrence Rank are:

- **A** - Excellent
- **B** - Good
- **C** - Fair
- **D** - Poor
- **X** - None (extirpated or possibly extirpated element occurrences)
- **U** - Unknown

### Population Status

Displays number of element occurrences that have been seen and/or not seen within the past 20 years. Element occurrences that have not been seen within the past 20 years are considered historic.

### Presence

*Presence* refers to the condition of the occurrence at the site when it was last observed. The possible values for Presence are:

- **Presumed Extant:** The most common entry. An occurrence is presumed to still be in existence until evidence to the contrary is received by the CNDDB.
- **Possibly Extirpated:** Evidence of habitat destruction or population extirpation has been received by the CNDDB for this site, but questions remain as to whether the element still exists.
- **Extirpated:** Only used when the element has been searched for but not seen for many years or when the habitat is destroyed at this site.

## Biology

### Life Form

A brief description of plant duration and life form. The information is primarily developed from published and unpublished literature and from herbarium material. Our simplified classification system is as follows:

**Duration**:

- **Annual**: Grows from seed and reproduce within a single year.
- **Perennial**: Lives more than one year.
  (Annual/Perennials are variable depending on environment and conditions.)

**Growth Form**:

- **Herbs**: Plants that are herbaceous and lack above-ground woody tissue.
  - **Bulbiferous herb**: Plants have fleshy underground storage organs typically derived from scale leaves (this category includes cormiferous and other similar plants in which storage organs have other origins).
  - **Rhizomatous herb**: Plants have underground stems (rhizomes), typically bearing shoots which develop into new plants.
  - **Stoloniferous herb:** Plants have above-ground runners (stolons) which typically root and produce new plants.
- **Shrubs:** Smaller woody perennials that retain most of their above-ground woody tissue and are typically many-stemmed.
  - **Leaf succulents:** Succulents with thick, fleshy leaves.
  - **Stem succulents:** Succulents with thick, fleshy stems and reduced or absent leaves.
- **Trees:** Larger woody perennials that retain all of their above-ground wood tissue and are typically single-stemmed.
- **Vines:** Twining woody perennials requiring external support for growth.
- **Mosses:** Small green plants (one of three groups of bryophytes) with structures that resemble miniature leaves and stems. The leaves generally have a midrib called a costa. The sporophyte (the spore-bearing structure) is persistent for weeks.
- **Liverworts:** Small green plants (one of three groups of bryophytes). There are both leafy and thalloid types - leafy liverworts lack a midrib on the leaves, while thalloid liverworts have no leaves. The sporophyte is short-lived.
- **Leaf Condition (for shrubs, trees, vines only):**
  - **Deciduous**: Plants shed their leaves for part of the year.
  - **Evergreen:** Plants retain their leaves for an entire year.
- **Special Habitat**:
  - **Aquatic:** Plants are submerged or floating on the water surface.
  - **Emergent:** Plants are rooted in water but bear some foliage out of the water.
- **Mode of Nutrition**:
  - **Achlorophyllous:** Plants lack chlorophyll and live on existing organic matter in the soil.
  - **Hemiparasitic:** Plants are connected to host plants and derive energy, water, and minerals from them, but also maintain their own functional root systems or photosynthetic surfaces.
  - **Parasitic:** Plants are connected to host plants and rely solely on them for energy, water, and nutritional requirements.
  - **Carnivorous:** Plants trap insects and other small animals and derive nourishment from them.

As in most classifications, some of the above distinctions are somewhat arbitrary, particularly the divisions between growth forms. Furthermore, plant growth form can vary depending on geography and local environmental conditions. Perennials that are often referred to as either suffrutescent herbs or subshrubs present special difficulties. Generally, if these plants die back seasonally to the ground or to a small crown of woody tissue we classify them as herbs, and if they retain much or all of their woody above-ground tissue we call them shrubs.

## Blooming Period

The month(s) when each rare plant is typically in bloom. For ferns and other spore-bearing plants, we give the months when spores are released and spore-bearing structures such as sori are typically present on the plant. We do not included any comparable information for gymnosperms and nonvascular taxa.
Note: Months in parentheses are uncommon.

## Habitats

One or more habitats in which a rare, threatened, or endangered plant is typically found. This information is compiled from field survey forms, unpublished reports, original descriptions, floras, and herbarium material. Note that for habitats which typically occur within a broader matrix of another habitat, we usually list both. For example, a rare plant from Meadows and Seeps occurring in a matrix of Upper Montane Coniferous Forest would typically have its habitat presented as "Meadows and Seeps, Upper Montane Coniferous Forest."

Habitats follow brief characterizations outlined by Robert F. Holland and John O. Sawyer, Jr. and are presented in taxonomic rather than alphabetical order. Please refer to Holland (1986)[5] for a more complete discussion of the types and their classification.

Habitats:

- **Coastal Dunes:** Herbs or shrubs on coastal sand deposits from Del Norte to San Diego counties. Cover usually low near the beach, increasing with distance from salt spray and blowing sand.
- **Desert Dunes:** Sand accumulations east of the Pacific Crest from Modoc to Imperial counties. Vegetation on desert dunes varies considerably. Active dunes usually support only sparse herbs and grasses, but partially stabilized or stabilized dunes often will support shrubs, including mesquite and creosote bush.
- **Inland Dunes:** Mostly herbs, although shrubs may be locally important. Sand accumulations in and around the Great Valley.
- **Coastal Bluff Scrub:** Dense shrubs, prostrate to 1-2 meters tall. Typically on fairly steep, rocky sites exposed to considerable wind and salt spray because of proximity to the ocean. Many plants succulent, especially to the south. Found from Del Norte to San Diego counties.
- **Coastal Scrub:** Dense shrubs 0.5 to 2 meters tall with scattered grassy openings. Many plants dormant, even deciduous, during periods of water stress. Most sites have shallow rocky soils, frequently with a southern or western exposure. Many taxa adapted to fire by stump sprouting or high seed production.
- **Sonoran Desert Scrub:** Widely scattered creosote bushes with the considerable space between them sometimes occupied by ephemeral, colorful shows of annuals following particularly wet winters. Succulents and microphyllous trees conspicuous, especially in rocky environments. The part of Munz's (1959)[7] "Creosote bush scrub" found roughly south of the San Bernardino / Riverside county line.
- **Mojavean Desert Scrub:** Widely scattered creosote bushes with the considerable space between them sometimes occupied by ephemeral, colorful shows of annuals following particularly wet winters. At elevations of 600 meters or higher, succulents or microphyllous trees lacking. This habitat type constitutes most of Munz's (1959)[7] "Creosote bush scrub" found north of the San Bernardino / Riverside county line.
- **Great Basin Scrub:** Shrubs, ranging in height from very short, <20 centimeters, on very cold sites or shallow soils to 1 or 2 meters tall on warmer sites where soils are deeper. Perennial grasses occupy much of the space between shrubs. Found on the Modoc Plateau, high Cascade Range, Warner Mountains, High Sierra Nevada, and North Coast Ranges.
- **Chenopod Scrub:** Usually gray, intricately branched, microphyllous shrubs most commonly on fine-textured, alkaline and/or saline soils in areas of impeded drainage. Diversity usually low to monotonous. Saltbushes and greasewood frequently dominate. This vegetation occurs from Modoc County south to Mexico, including parts of the Great Valley and Inner South Coast Ranges.
- **Chaparral:** Impenetrably dense, evergreen, leathery-leaved shrubs that are active in winter, dormant in summer, and adapted to frequent fires either through resprouting or seed carry-over. There is a characteristic florula of fire-following annuals and short-lived perennials. Mature stands may exceed 3-4 meters in height. It occurs on diverse substrates, many of which support distinctive suites of edaphic indicators. Chaparral may be successional to conifer forests or oak woodlands, as tree seedlings can be found beneath the shrub canopies.
- **Coastal Prairie:** Dense, fairly tall (<1 meter) perennial sod- and tussock-forming grasses and grass-like herbs. They occur in two distinct settings: sandy marine terraces within the zone of coastal fog (usually <350 meters elevation, within a matrix of Northern Coastal Scrub), or on fine-textured soils of ridgetops beyond coastal fogs (usually >750 meters, within a matrix of Mixed Evergreen or North Coastal Conifer Forests). Intermittent from the Santa Cruz area north to southern Oregon.
- **Great Basin Grassland:** Perennial sod-forming and bunch grasses. Presumed to have once been widespread on the Modoc Plateau and northeastern California. Currently represented as scattered, mostly small, islands in areas where grazing pressure has been low and fire frequencies higher than surrounding scrubs. Both upland and bottom-land forms occur.
- **Valley and Foothill Grassland:** Introduced, annual Mediterranean grasses and native herbs. On most sites the native bunch grass species, such as needle grass, have been largely or entirely supplanted by introductions. Stands rich in natives usually found on unusual substrates, such as serpentinite or somewhat alkaline soils.
- **Vernal Pools:** Seasonal amphibious environments dominated by annual herbs and grasses adapted to germination and early growth under water. Spring desiccation triggers flowering and fruit set, resulting in colorful concentric bands around the drying pools.
- **Meadows and Seeps:** More or less dense grasses, sedges, and herbs that thrive, at least seasonally, under moist or saturated conditions. They occur from sea level to treeline and on many different substrates. They may be

surrounded by grasslands, forests, or shrublands.

- **Playas:** Non-vascular plants and sparse, gray shrubs on poorly drained soils with usually high salinity and/or alkalinity, due to evaporation of water from closed basins. Found from the Modoc Plateau to Sonoran Desert and in the San Joaquin Valley.
- **Pebble or Pavement Plain:** Herb- and grass-dominated openings of low cover, dominated by several cushion-forming plants endemic to dense, clay soils armored by a lag gravel of quartzite pebbles. Many of the dominant taxa are themselves rare plants. Found only in the San Bernardino Mountains.
- **Bogs and Fens:** Wetlands, typically occupying sites sub-irrigated by cold, frequently acidic, water. Plant growth dense and low growing, dominated by perennials herbs or low shrubs. Saturated soils frequently allow substantial accumulations of "peat." From the Klamath Ranges to North Coast Ranges, along the North Coast and in the northern Sierra Nevada.
- **Marshes and Swamps:** Emergent, suffrutescent herbs adapted to seasonally or permanently saturated soils. These include salt, brackish, alkali, and fresh water marshes, as well as swamps, with their woody dominants and hydrophytic herbs. Found throughout California.
- **Riparian Forest:** Broadleaved, winter deciduous trees, forming closed canopies, associated with low- to mid-elevation perennial and intermittent streams. Most stands even-aged, reflecting their flood-mediated, episodic reproduction. These habitats can be found in every county and climate in California.
- **Riparian Woodland:** Broadleaved, winter deciduous trees with open canopies associated with low- to mid-elevation streams. Most stands even-aged, reflecting their flood-controlled, episodic reproduction. This type tends to occupy more intermittent streams, often with cobbly or bouldery bedloads.
- **Riparian Scrub:** Streamside thickets dominated by one or more willows, as well as by other fast-growing shrubs and vines. Most plants recolonize following flood disturbance.
- **Cismontane Woodland:** Trees deciduous, evergreen, or both, with open canopies. Broadleaved trees, especially oaks, dominate, although conifers may be present in or emergent through the canopy. Understories may be open and herbaceous or closed and shrubby. This type occurs on a variety of sites below the conifer forests in Mediterranean California.
- **Pinyon and Juniper Woodland:** Open stands of round-topped conifers to 5 meters. Understories frequently comprised of shrubs and herbs seen in adjacent stands lacking trees. They often form broad ecotones between higher elevation forests and lower elevation scrublands or grasslands.
- **Joshua Tree Woodland:** Joshua trees with open canopies are usually the only arborescent species present. Shrubstories typically are diverse mixtures of microphyllous, evergreen shrubs, semi-deciduous shrubs, semi-succulents, and succulents.
- **Sonoran Thorn Woodland:** Succulents, microphyllous herbs and shrubs, especially of rocky environments. Tree-like plants the visual dominant.
- **Broadleaved Upland Forest:** Stands of evergreen or deciduous, broadleaved trees 5 meters or more tall, forming closed canopies. Many, but not all, with very poorly developed understories. Several are seral to montane conifer forests. It includes the "mixed evergreen forest" of the Coast Ranges.
- **North Coast Coniferous Forest:** Needle-leaved evergreen trees in usually quite dense stands that may attain impressive heights. Usually on well-drained, moist sites within the reach of summer fogs, but not experiencing much winter snow. This type occurs in the wetter parts of the North Coast Ranges.
- **Closed-cone Coniferous Forest:** Dense, even-aged stands dominated by serotinous-coned conifers. Most stands are even-aged due to fire establishment. Usually associated with sterile, rocky soils, strong and steady winds, and impaired drainage. Many open stands have understories composed of chaparral or coastal scrub species from surrounding areas. Found in most areas, except for the Great Valley or deserts.
- **Lower Montane Coniferous Forest:** Open to dense stands of conifers found at lower and middle elevations in the mountains. Broadleaved trees may be present in the understory. Shrubstories may be dense assemblages of chaparral species, especially in seral stands. The upper limit of lower montane coniferous forests more or less coincides with the elevation of maximum annual precipitation.
- **Upper Montane Coniferous Forest:** Open to dense conifer forests, found at high elevations in the mountains. Trees tend to be somewhat shorter than at lower elevations. Shrubstories tend to be open, drawn from adjacent montane chaparral species, or lacking. Above the elevation of maximum precipitation, with growing seasons curtailed by winter snow accumulations.
- **Subalpine Coniferous Forest:** Conifer forests and associated clearings of highest elevations of tree establishment. This type occurs in areas where substantial snowpack accumulation and cold temperatures limit the growing season to three months or less.

- **Alpine Boulder and Rock Field:** Fell-fields, talus slopes, and meadows found above forest line. Favorable sites may develop continuous turf, but in most areas plants are tucked between large nurse rocks that provide protection from harsh winter conditions.
- **Alpine Dwarf Scrub:** Compact, woody subshrubs above forest line, adapted to short growing seasons resulting from snow accumulation or harsh winter winds.

### Habitat Modifiers

Descriptors that denote substrate type, hydrological information, etc., are often used to modify habitat types as follows:

- "**(descriptor)**" pertains only to the habitat type immediately preceding
- "**descriptor**" prior to habitat types pertains to *all* habitats

### Typical Modifiers

| | | | |
|---|---|---|---|
| sandy | serpentinite | burned areas | bajadas |
| gravelly | granitic | disturbed areas | lake margins |
| rocky | carbonate | roadsides | streambanks |
| scree | gabbroic | openings | |
| talus | volcanic | edges | freshwater (used for Marshes and Swamps) |
| | metamorphic | mesic | coastal salt (used for Marshes and Swamps) |
| alkaline | clay | vernally mesic | maritime (used for Chaparral) |
| acidic | pumice | seeps | coastal |
| | loam | | |

## Distribution

The distribution of the taxon is described by county or island within California, together with other states and countries where we know the plant to exist. We record only natural occurrences of rare plants, or occurrences that have been reestablished within the species' historic range as part of an approved recovery plan. For example, although both Northern California black walnut (*Juglans hindsii*) and Monterey pine (*Pinus radiata*) are widely planted within the state, we track only the few natural occurrences of these taxa. When we indicate that a particular plant occurs in a particular county, we are making a positive statement that is based upon specimens, photographs, the literature, or field observations. In no way does this imply that a plant does not occur in other counties in California or in other states. Our understanding of plant distribution constantly improves, and new localities for rare plants are discovered often in unpredicted circumstances.

The following symbols are used as modifiers preceding counties, quads, and/or states to express extirpation and/or uncertainty:

- * Presumed extirpated
- ? Uncertain about distribution or identity
- ?* Uncertain about distribution, but presumed extirpated if once present
- (?) Occurrence confirmed, but possibly extirpated

### Counties and Islands

Three letter codes have been attributed for each county and island within California to maintain and manage swift data control of the *Inventory*. In turn, these codes are used as abbreviations in the "Notes" section on the plant detail page for some taxa.

**County and Island Codes:**

| | | |
|---|---|---|
| **ALA** Alameda | **MEN** Mendocino | **SIE** Sierra |
| **ALP** Alpine | **MER** Merced | **SIS** Siskiyou |

| | | |
|---|---|---|
| **AMA** Amador | **MOD** Modoc | **SJQ** San Joaquin |
| **ANA** Anacapa Isl. | **MNO** Mono | **SLO** San Luis Obispo |
| **BUT** Butte | **MNT** Monterey | **SMI** San Miguel Isl. |
| **CAL** Calaveras | **NAP** Napa | **SMT** San Mateo |
| **CCA** Contra Costa | **NEV** Nevada | **SNI** San Nicolas Isl. |
| **COL** Colusa | **ORA** Orange | **SOL** Solano |
| **DNT** Del Norte | **PLA** Placer | **SON** Sonoma |
| **ELD** El Dorado | **PLU** Plumas | **SRO** Santa Rosa Isl. |
| **FAR** Farallon Isl. | **RIV** Riverside | **STA** Stanislaus |
| **FRE** Fresno | **SAC** Sacramento | **SUT** Sutter |
| **GLE** Glenn | **SBA** Santa Barbara | **TEH** Tehama |
| **HUM** Humboldt | **SBD** San Bernardino | **TRI** Trinity |
| **IMP** Imperial | **SBR** Santa Barbara Isl. | **TUL** Tulare |
| **INY** Inyo | **SBT** San Benito | **TUO** Tuolumne |
| **KNG** Kings | **SCL** Santa Clara | **VEN** Ventura |
| **KRN** Kern | **SCM** San Clemente Isl. | **YOL** Yolo |
| **LAK** Lake | **SCT** Santa Catalina Isl. | **YUB** Yuba |
| **LAS** Lassen | **SCR** Santa Cruz | |
| **LAX** Los Angeles | **SCZ** Santa Cruz Isl. | **BA** Baja California |
| **MAD** Madera | **SDG** San Diego | **GU** Isla Guadalupe, Baja |
| **MPA** Mariposa | **SFO** San Francisco | **SA** South America |
| **MRN** Marin | **SHA** Shasta | **SO** Sonora, Mexico |

## Quadrangles

To provide more detailed location information, we cite the U.S. Geological Survey (USGS) 7.5 minute quadrangle (quad) map for all plants on CNPS Lists 1, 2, and 3, as well as some plants on List 4 (please see warning about quad maps for List 4's below). We employ a modified version of the quad numbering system previously used by the California Department of Water Resources. Please follow this link to translate this system's quad numbers into USGS topographic map names or vice versa. In those few cases where a quad is listed without a letter following the number, this indicates that our occurrence data are too vague to pinpoint its location on a 7.5 minute quadrangle. As with counties, this is positive siting information - when we indicate that a plant has been reported from an area on a topographic quad, it is based on hard data. In no way does this imply that a plant does not occur on a topographic quad we have not listed; rather, it may be there but botanists have yet to find it. As with distribution, quads are also often modified with the symbols "*" and "?", which respectively express extirpation and uncertainty (see above).

Quad data is not available for all List 3 and 4 plants. For those that do contain this data, it has not been quality controlled and is potentially incomplete, inaccurate, and/or out of date. Please use caution when referencing this information. We are currently working hard to maintain this data and hope to provide accurate and up to date information in the near future.

A complete list of California USGS quads is available here. Alternatively, an abbreviated index of only quads occupied with taxa included in the *Inventory* is available here.

### Elevation

An elevational range is provided for each taxon in meters. The stated range is for the California portion of a plant's range only (if the taxon also occurs outside the state). These elevational range data are accumulated from literature, herbarium specimens, and field survey information.

## Notes

Many entries include additional notes on distribution, endangerment, relationship to names in The Jepson Manual, or important literature citations. We again include information about legal status and endangerment in neighboring states in the notes; official state designations are specifically indicated as such and capitalized, as in "State-listed as Endangered in OR". We make a special effort to indicate missing information about distribution, endangerment, or taxonomy for each entry, in the hope that knowledgeable users will fill in the gaps.

Abbreviations that are commonly used in the notes include:

| | | | |
|---|---|---|---|
| **ACEC** | Area of Critical Environmental Concern | **NA** | North America |
| **AFB** | Air Force Base | **NF** | National Forest |
| **BA** | Botanical Area | **NM** | National Monument |
| **BLM** | Bureau of Land Management | **NP** | National Park |
| **CalTrans** | California Department of Transportation | **NS** | National Seashore |
| **Cyn.** | Canyon | **Pk.** | Peak |
| **DFG** | California Department of Fish and Wildlife | **Pt.** | Point |
| **DOD** | United States Department of Defense | **RNA** | Research Natural Area |
| **ER** | Ecological Reserve | **SP** | State Park |
| **Ft.** | Fort | **SR** | State Reserve |
| **HCP** | Habitat Conservation Plan | **TNC** | The Nature Conservancy |
| **Mt.** | Mount | **USFS** | United States Forest Service |
| **Mtn.** | Mountain | **USFWS** | United States Fish and Wildlife Service |
| **Mtns.** | Mountains | **WA** | Wildlife Area |

## Threats: Includes information on *significant* threats to the plant over its range in California. Typical threats provided in the notes section include, but are not limited to the following:

development
urbanization
agriculture
logging

vehicles
horticultural collecting
illegal dumping

road construction
road maintenance
road widening

grazing
overgrazing
innappropriate grazing
trampling
feral herbivores
feral pigs
feral goats

recreational activities
foot traffic (i.e. from people)

energy development
pipeline construction

mining
sand mining
gravel mining
carbonate mining
limestone mining

flood control projects
hydrological alterations
inundation
water diversions
waterway channelization
groundwater pumping
flood control

military activities
Border Patrol activities

alteration of fire regimes
fire suppression
frequent wildfires

competition
non-native plants
introgression with...
hybridization with...

meadow succession
erosion
habitat loss
habitat alteration
habitat disturbance

# Vegetable Gardening Glossary

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| A | B | C | D | E | F | G | H | I | J | K | L | M |
| N | O | P | Q | R | S | T | U | V | W | X | Y | Z |

*A*

**Acid soil**—A soil with a pH value below 7.0. A soil that has a preponderance of hydrogen over hydroxyl ions in the soil solution.

**Aeration**—To be exposed to air; to cause air to circulate through a medium.

**Aerobic**—In the presence of oxygen.

**Aggregate, soil**—A group of soil particles cohering so as to behave as a unit; includes mineral soil and organic matter.

**Alkaline soil**—A soil for which the pH reading is above 7.0.

**Amendment**—Any material, such as lime, gypsum, compost, sawdust, or synthetic conditioner, that is worked into the soil to make it more productive. Strictly speaking, a fertilizer is also an amendment, but the term amendment is used more commonly for added materials other than fertilizer.

**Anaerobic**—Able to live and grow where there is no air or free oxygen.

**Anion**—A negatively charged ion, such as sulfate ($SO_4$-) and phosphate ($PO_4$-).

**Annual**—A plant that germinates, grows, flowers, produces seed, and dies in the course of a single growing season.

**Anthocyanin**—Any of a class of water-soluble pigments, including most of those imparting red or blue color to fruits or flowers.

**Available nutrient**—That quantity of a nutrient element or compound in the soil that can be readily absorbed and assimilated by growing plants.

**Available water**—The amount of water held in the soil that can be extracted by plants.

**Axil**—The angle formed by a leaf or branch with the stem.

*top*

*B*

**Bacillus thuringiensis (B.t.)**—A bacterium that produces a protein crystal that damages the gut of insects (mostly caterpillars), formulations of which are used as insecticides.

**Band application**—An application in which a material such as fertilizer or herbicide is applied in a narrow line along a row of plants or in a circle around individual plants.

**Biennial**—Plant that completes its life cycle in two years or growing seasons, with a dormant period in between. It produces leaves the first year and flowers and seeds the second.

**Biodegradation**—The breaking down of a chemical by organisms in the environment.

**Biological control**—The action of parasites, predators, or pathogens in maintaining another organism's population density at a lower average level than would occur in their absence. Biological control may occur naturally or from manipulation or introduction of biological control agents by people.

**Blanch**—Protecting plant stems (leeks), bulbs (fennel), or heads (cauliflower) from sunlight and the elements. This enhances succulence and prevents discoloration.

**Blight**—A disease characterized by sudden, severe, and extensive spotting, discoloration, wilting, or destruction of leaves, flowers, stems, or entire plants, usually attacking young, growing tissues (in disease names, often coupled with the name of the affected part of the host, e.g., leaf blight, blossom blight, shoot blight).

**Bolting** (going to seed)—Flowering prematurely, usually due to unsuitable climatic conditions at certain stages of growth. Spinach, lettuce, celery, broccoli, and endive are plants that are prone to bolting.

**Bone meal**—Cooked bones ground to a meal without any of the gelatin or glue removed. Steamed bone meal has been steamed under pressure to dissolve part of the gelatin.

**Bramble**—Any shrub with thorns in the rose family; usually refers to blackberries and raspberries.

**Broadcast application**—The application of a fertilizer or herbicide to the entire surface of a bed or field, or the sowing of seed by scattering it uniformly or randomly over the soil or container surface, rather than sowing in rows.

**Buffer capacity of soils**-The ability of the soil to resist a change in its pH (hydrogen ion concentration) when acid-forming or base-forming materials are added to the soil.

**Button**—The small heads of broccoli or cabbage that form as a result of seedlings being exposed to freezing temperatures.

*top*

## C

**Cane**—The flexible stem of a plant such as raspberry, blackberry, or grape.

**Carbon dioxide ($CO_2$)**—A colorless, odorless gas found in the air that is absorbed by plants and exhaled by animals.

**Carbon:nitrogen ratio**—The ratio of the weight of organic carbon to the weight of total nitrogen (mineral plus organic forms) in soil or organic matter.

**Carotenoid**—Any of a number of orange-red or yellow pigments similar to carotene found in leaves, fruits, and flowers.

**Caterpillar**—The larva of a butterfly, moth, sawfly, or scorpionfly.

**Catfacing**—Disfigurement or malformation of fruit, caused by low temperature at flowering, insects, and other factors.

**Cation**—An ion carrying a positive charge of electricity. Soil cations include calcium Ca++ and sodium Na++.

**Cation exchange capacity (CEC)** –The capacity of a soil to exchange cations with the soil solution. Often used as a measure of potential soil fertility.

**Certified seed or planting stock**-Seeds, tubers, or young plants certified by a recognized authority to be free of or to contain less than a minimum number of specified pests or pathogens.

**Chlorophyll**—The green pigment of plants that captures the energy from sunlight necessary for photosynthesis.

**Clay**—A minute, mineral soil particle less than 0.002 millimeter in diameter.

**Cloche**—A portable glass or plastic cover for a plant or row of plants to protect plants from cold temperatures.

**Cold frame**—A low structure with a translucent top, used for protecting plants from the weather and for hardening-off young seedlings.

**Cole crops**—Member of the species Brassica oleracea, including cabbage, broccoli, cauliflower, and Brussels sprouts.

**Compaction**—A state where soil particles are forced closely together, reducing pore space.

**Companion planting**—The practice of interplanting different plant species to reduce pest problems or improve plant growth.

**Complete fertilizer**—A fertilizer that contains nitrogen, phosphorus, and potassium.

**Compost**—The stable, earthy smelling end-product of animal and plant decomposition.

**Compost tea**—A low-nutrient liquid fertilizer that results from hanging a mesh bag of compost in water for 1 to 2 days.

**Cool-season crop**—A crop that grows best during the cool temperatures of spring and fall.

**Cotyledon**—The leaf or leaves of the embryo, also called seed leaf or first leaf. The "true leaves" are the larger leaves that emerge next.

**Cover crop**—A crop that covers and improves the soil in which it is grown; usually grasses and legumes sown in late summer or fall.

**Crop rotation**—Growing crops of a specific family in different areas of the garden each year to avoid soil-borne diseases and nutrient depletion.

**Cross-pollination**—The movement of pollen from one flower to another, either on the same plant, between different plants of the same cultivar, between plants of different cultivars, and sometimes between plants of different species.

**Crown**—The part of a plant where the roots and stem meet, usually at soil level. Also used to refer to the shortened stem of a strawberry plant, from which roots, leaves, and fruit arise. On a tree, all the branches that hold the leaves are collectively called a crown.

**Cultivar**—Cultivated variety; a subdivision of a species; a result of human selection.

**Cultivation**—Preparation of the soil for growing plants; tilling or hoeing soil to eliminate weeds.

**Cultural control**—The use of gardening techniques to control pest populations.

**Curing**—Holding potato tubers or sweet potato roots under warm, humid conditions that favor wound healing.

*top*

## D

**Damping-off**—A complex of water molds (fungi) that attacks seedlings, causing them to wilt and die. These fungal pathogens—Phytophthora, Pythium, and Rhizoctonia—thrive in wet, humid conditions and are the causal agents.

**Day-neutral plant**—A plant that will flower under any day length.

**Days to maturity**—The number of days between planting and first harvest.

**Determinate**—Growth that is limited; "self-topping" type of tomato plant having a terminal point that stops growing and sets fruit.

**Direct sow** ("in situ")—Sowing seed in the ground where the plant will grow to maturity.

**Dolomite**—A natural material used for liming soils in areas where both magnesium and calcium are needed. Made by grinding dolomitic limestone, which contains magnesium carbonate, $MgCO3$, and calcium carbonate, $CaCO3$.

**Double-dig**—Method of soil preparation used by bio-intensive gardeners. Requires removing the soil to the depth of one spade blade and then digging down an equal distance, breaking up and mixing organic matter into the subsoil.

**Drill**—A shallow furrow in which seeds are sown.

**Drip irrigation**—A water-conserving irrigation system of plastic tubing with small holes that allows water to drip out and reach the root zone of plants.

**Drainage**—The movement of water through the soil.

$E$

**Erosion**—The gravitational loss of soil by the action of wind, water, and ice.

**Eutrophication**—Nutrient enrichment and oxygen depletion of a water body.

**Evapotranspiration**—The combined evaporation of water from soil, water, and plant surfaces, and the transpiration of water through the plant and out through leaf stomata.

**Eye**—A collection of several buds on the surface of a potato tuber, one of which will sprout and form a new stem when conditions are favorable.

$F$

**Fallow**—Cultivated land that is allowed to lie idle to accumulate moisture and restore nutrients.

**Family**—A taxonomic division of an order. Usually a family comprises two or more genera, but one genus possessing sufficiently distinctive characters may form a family.

**Feeder roots**—The youngest roots with root hairs, important in absorption of water and minerals.

**Fertilizer**—Any natural or manufactured material added to the soil in order to supply one or more plant nutrients.

**Fertilizer burn**—The browning or wilting, and in extreme cases, killing of plants from exposure to excessive fertilizer salts on the leaves or roots.

**Fertilizer grade**—An expression that indicates the weight percentage of plant nutrients in a fertilizer. Thus a 10-20-10 grade contains 10 percent nitrogen (N), 20 percent phosphoric acid ($P2O5$) and 10 percent potash ($K2O$).

**Floating row covers**—Lightweight, gauzy, polyester fabric laid directly over a crop to accelerate growth and give protection.

**Floret**—A small flower, usually one of a dense cluster.

**Floricane**—Two year-old cane on raspberries and blackberries that flowers, fruits, and then dies.

**Foliage**—Leaves in general, such as on a branch.

**Foliar**—Applied to or affecting the foliage (i.e., foliar fertilizers, foliar

nematodes).

**Frass**—Plant tissue mixed with excrement produced by boring insect larvae. It often resembles wet sawdust.

**Frost pocket**—A depression in the terrain into which cold air drains, but cannot escape, thereby subjecting plants to freeze injury.

**Fruiting wood**—On grapevines, the one-year-old cane that will produce the current year's fruit.

**Full sun**—A site that receives at least six to eight hours of direct sun each day during the growing season.

**Furrow**—A shallow trench made in garden soil for planting seeds or transplants.

*top*

## *G*

**Genus** (pl. genera)—1) Groups of closely related species clearly distinguished from other plants. 2) The first name of an organism in the binomial system of classification.

**Germination**—The initiation of active growth by the embryo, resulting in the rupture of seed coverings and the emergence of a new seedling plant capable of independent existence.

**Glycoalkaloid**—A bitter-tasting compound present in potato foliage and in the epidermis of potato tubers.

**GMO**—A genetically modified organism.

**Green manure**—A cover crop that is turned into the soil before it flowers and is allowed to decay and enrich the soil.

**Greensand**—A natural source of potassium containing about 7% potash plus 32 trace elements.

**Growing season**—The period from the last spring freeze until the first freeze in the fall.

**Guano**—The decomposed, dried excrement of birds and bats, used as a fertilizer.

**Gypsum** ($CaSO_4 \bullet 2H_2O$)—The common name for calcium sulfate, also called landplaster, a mineral used in the fertilizer industry as a source of calcium and sulfur.

## *H*

**Hardening off**—The process of gradually acclimatizing a plant that has been raised indoors to lower temperatures or more severe conditions, so that it is not severely checked when planted out.

**Heavy metals**—The heavy metals of concern to gardeners are lead, zinc, nickel, arsenic, copper, and cadmium. These metals can be toxic to plants (and a potential risk to humans) when they accumulate to high levels in the soil.

**Heeling in**—Covering the roots of dormant plants with soil or mulch for short periods.

**Heirloom plants**—Cultivars of flowers, fruits, and vegetables that are open-pollinated, in use prior to 1945, and preserved by farmers and gardeners.

**Hilling-up**—The process of periodically putting soil around the stems of plants to encourage rooting and protect plant parts from the sun. Examples: Potato, leeks.

**Horticultural oil**s—Highly refined petroleum-based or seed-derived oils that are

manufactured specifically to control pests on plants.

**Hotbed**—A cold frame with soil heated by electric cables or decomposing animal manure, used for raising plants and forcing vegetables early in the year.

**Humus**—A complex colloid resulting from the end-state of organic matter decomposition in the soil. Humus holds relatively large amounts of water and nutrients.

**Hybrid**—Plant or animal derived from a cross between genetically different parents. F1 hybrids are seeds harvested from the crossing of two pure inbred lines, to produce plants with desirable traits, such as increased vigor, uniformity, and disease resistance.

*top*

## *I*

**Indeterminate**—Often used to describe a type of tomato plant with a vegetative, terminal growing-point that does not set fruit and continues to grow through the season.

**Inoculant**—A microorganism that is introduced into the soil to improve growth of legume crops.

**Inorganic**—Being or composed of matter other than plant and animal (carbon-based); often of mineral origin.

**Instar**—The stage in the life of an arthropod between molts. These are usually numbered, such as "2nd instar."

**Integrated pest management (IPM)**—A pest management strategy that focuses on long-term prevention or suppression of pest problems through a combination of techniques such as biological, physical, cultural, and chemical control practices.

**Invasive**—A species of plant, animal or insect that is 1) alien to an ecosystem, and 2) whose introduction causes or is likely to cause economic or environmental harm or harm to human health.

**Ion**—An electrically charged particle. In soils, an ion refers to an electrically charged element or combination of elements.

## *J*

**Juglone**—A toxic, natural, chemical defense mechanism of certain trees, e.g., walnut, butternut, to reduce competition for resources. Plants such as tomato, potato, blackberry, blue- berry, azalea, mountain laurel, rhododendron, red pine, and apple may be injured or killed within one to two months of growth within the root zone of these trees.

## *K*

**Kelp**—Any of several species of seaweed harvested for use as a fertilizer or plant-growth activator.

## *L*

**Landscape fabric**—A loosely intertwined fabric that is placed over the soil as a mulch to inhibit weed growth.

**Larva** (pl. larvae)—The immature form of insect that develops through the process of complete metamorphosis, including egg, several larval stages, pupa, and adult. In mites, the first-stage immature is also called a larva.

**Leaching**—The movement of salts, nutrients, and other materials in water through the soil profile.
Leaching accounts for nutrient losses but can also be beneficial in ridding a soil of excess salts.

**Legume**—A dry fruit with two seams in the outer wall. Example: Black locust.

**Lime**—A white or grayish mineral compound (limestone) used to reduce soil acidity and to supply calcium for plant growth. Ground limestone (calcium carbonate), hydrated lime (calcium hydroxide), and burned lime (calcium oxide) are types of lime.

**Loam**—The textural class name for soil having a moderate amount of sand, silt, and clay. Loam soils contain 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand.

**Lodging**—When high winds push over tall, unsupported plants like corn or hollyhock.

**Long-day plant**—A plant that requires a night shorter than its critical dark period, usually 12 hours or less, to flower.

*top*

## *M*

**Macroclimate**—30-year weather patterns that are independent of soils or topography (state and regional level). Example: Average spring and fall frost-dates.

**Macronutrient**—A nutrient needed in large amounts by plants: oxygen, hydrogen, nitrogen, phosphorous, potassium, magnesium, calcium, and sulfur.

**Mature** (plant)-Able to produce flowers (reproduce); contrasts with juvenile, which is unable to produce.

**Mesoclimate**—Affected by bodies of water, impervious surfaces, and topography (neighborhood and town/city level). Example: Heat sinks in cities; dry, southern slopes.

**Microbe**—Microorganism; an organism of microscopic size.

**Microbial pesticide**—Pesticide that consists of bacteria, fungi, viruses, or other microorganisms and is used for control of weeds, invertebrates, or plant pathogens.

**Microclimate**—Environmental conditions around a plant- from 2 feet down in the soil to 3 - 4 times the height of the plant. Example: Plants shading one another.

**Microorganism**—An organism of microscopic size, such as a bacterium, virus, fungus, viroid, or mycoplasma.

**Micronutrient**—A nutrient needed in small amounts by plants; also called a trace or minor element.

**Midrib**—The central or main vein of a leaf.

**Mulch**—A material applied to the surface of a soil to conserve moisture, stabilize soil temperature, suppress weed growth, protect plant roots from heat or cold, or to keep fruit clean.

*top*

## *N*

**Natural enemies**—Predators, parasites, or pathogens that are considered beneficial because they attack and kill organisms that we normally consider to be pests.

**Natural selection**—The natural process in which individuals best suited to the environment are more likely to survive and reproduce.

**Nematodes**—Microscopic, unsegmented, parasitic round- worms that live in water, soil, and plants; usually not visible to the naked eye.

**Nitrogen fixation**—In soils, the conversion of free nitrogen from the air by soil organisms to nitrogen compounds that eventually become available to plants.

**Nodules**—Swellings on the roots of legumes where nitrogen-fixing bacteria live.

**Nutrient**—Substance needed by an organism for growth and reproduction.

**Nutrient cycle**—Path of a chemical through the environment.

*O*

**Offset**—Plant produced at the base of the parent plant and easily detached from it.

**Open-pollinated**—Seed produced from natural, random pollination. Open-pollinated cultivars come true to type when seed is saved and replanted.

**Organic**—Of plant or animal origin; containing carbon compounds.

**Organic matter**—Plant and animal residues, such as leaves, trimmings, and manure, in various stages of decomposition.

**Organic soil**—A general term applied to a soil or to a soil horizon that consists primarily of organic matter, such as peat soils, muck soils, and peaty soil layers.

**Ovary**—Swollen bottom part of the pistil that contains the ovules or immature seeds.

**Ovipositor**—The egg-laying apparatus; the external genetalia of the female.

**Oxygen**, $O_2$—A colorless, tasteless, odorless gas that is 1/5 of the volume of the atmosphere and shields the earth from UV radiation.

*top*

*P*

**Parasite, parasitoid**—An organism that lives on or in another living organism (called a host) and obtains its food supply from the host.

**Parthenocarpic**—Species or cultivar that produces fruits without pollination and fertilization.

**Pathogen**—A disease-causing organism.

**Pelletized**—1) The coating and forming into pellets of very small seed so they are easier to handle. 2) Coating and forming lime into pellets for ease and safety of distribution.

**Pesticide**—Any substance or mixture intended for preventing, repelling, or killing insects, rodents, weeds, nematodes, fungi, or other pests.

**Pesticide resistance**—The genetically acquired ability of an organism to survive a pesticide application at doses that once killed most individuals of the same species.

**Petiole**—1) The leafstalk that connects the blade(s) to the twig. 2) The narrow stalk or stem by which the abdomen is attached to the thorax (Hymenoptera, wasps). 3) In ants, the node-like first segment of the abdomen.

**pH**—A measure of acidity or alkalinity of a medium. A pH value of 7.0 indicates neutral; lower values indicate acid, higher values indicate alkaline.

**Pheromone**—A substance secreted by an organism to affect the behavior or development of other members of the same species; sex pheromones that attract the opposite sex for mating are used in monitoring certain insects.

**Photosynthesis**—The chemical process that green plants use to produce sugars (and oxygen) from carbon dioxide and water, thereby capturing solar energy for use in other chemical processes and tissue building activities of the plant.
$6\ CO_2 + 6\ H_2O$----------> SUGAR ($C_6H_{12}O_6$) + $6\ O_2$

**Physiological disorder**—A disorder caused by factors other than a pathogen; an abiotic disorder.
Phytochemical—A chemical found in plants that provides human health benefits, including disease prevention.

**Pistil**—The female seed-bearing organ of a flower consisting of ovary, style, and stigma.

**Pollen**—Dust-like male bodies capable of fertilization of ovules. Each pollen grain contains two cells: the vegetative cell, from which the pollen tube develops and the generative cell, which produces sperm.

**Pollination**—The transfer of pollen from the anther to the stigma.

**Pollinator**—An insect or other source by which pollen is carried from one flower to another.

**Pollinizer**—The producer of pollen or the cultivar used as a source of pollen for cross-pollination.

**Polytunnel**—A structure covered with plastic films used for plant protection. Walk-in polytunnels (high tunnels) are approximately 6- to 8-ft. high at the ridge; low polytunnels are rarely more than 18-in. high.

**Potting medium** (pl. media)—Material used for growing plants in containers. It may include vermiculite, perlite, coir, sand, peat, compost, bark, and/or soil.

**Predator**—Any animal (including insects and mites) that kills and feeds on other animals (prey).

**Pre-sprout**—Germinating seeds indoors between moist paper towels, rolled up and placed inside a perforated plastic bag. The sprouts are planted in the garden after radicles develop.

**Pricking out**—Transferring thickly sown seedlings from the pot, pan, or seed tray in which they were sown into a larger container, giving them more space to develop.

**Primocanes**—New, first-year canes on raspberries and blackberries.

**Puparium** (pl. puparia)—A case formed by the hardening of the next to last larval skin, in which the pupa is formed (true flies, Diptera).

*top*

## *R*

**Raised bed**—A technique where the soil in the planting bed is elevated above ground level; it is often used where drainage is poor.

**Rhizome**—Horizontal underground stems that serve as storage organs and a means of vegetative reproduction. An underground stem, unlike a root, may have nodes, buds, and primitive leaves, and may give rise to new plantlets.

**Root**-Vegetative plant part that anchors the plant, absorbs water and minerals in solution, and often stores food. It is distinguished from a rhizome by not having nodes.

**Row-cover fabric**—A spun-bonded polyester fabric used to protect plants from pest damage or harsh climate.

**Runner**—1) A slender stolon with elongated internodes that grows vigorously across the ground. These root at the nodes that touch the ground, e.g.,

strawberries. 2) Stems (vine) of certain types of vegetable plants that grow vigorously across the ground, e.g., runner beans.

**Russeting**—Thickening of the periderm on tubers of russet potato cultivars that occurs after vine senescence.

*S*

**Sand**—Individual rock or mineral fragments in soils having diameters ranging from 0.05 millimeter to 2.0 millimeters. Usually sand grains consist chiefly of quartz, but they may be of any mineral composition.

**Sanitation**—Any activity that reduces the spread of pathogen inoculum, such as removal and destruction of infected plant parts or cleaning of tools and field equipment.

**Scarification**—The chemical (soaking in buttermilk) or physical treatment (rasping with file or sandpaper) given to some seeds to break or weaken the seed coat sufficiently for germination to occur.

**Scientific name**—A Latinized name, internationally recognized, of a species or subspecies. The scientific name of a species consists of the generic and specific names and the name of the describer of the species.

**Seed**—Plant embryo with associated stored food encased in a protective seed coat.

**Seed piece**—Portion of a potato tuber containing at least one eye that is planted to produce a new potato plant.

**Self-fertile** (self-fruitful)– Plants that will set seed without cross-pollination.

**Self-pollination**—The process by which pollen is transferred from the pollen-producing section of the plant to the pollen-receiving part of the plant of the same flower.

**Senescence**—Natural process of decline and death of an entire plant or plant part.

**Side-dress**—To apply fertilizer to the soil on the side(s) of growing plants to promote fruiting or more vigorous plant growth.

**Silt**—(1) Individual mineral particles of soil that range in diameter between the upper size of clay, 0.002 mm, and the lower size of very fine sand, 0.05 mm. (2) Soil of the textural class silt containing 80 percent or more silt and less than 12 percent clay. (3) Sediments deposited from water in which the individual grains are approximately the size of silt, although the term is sometimes applied loosely to sediments containing considerable sand and clay.

**Skeletonize**—To remove leaf tissue between the veins, leaving the network of veins intact.

**Slow-release fertilizer**—A fertilizer that is made by coating the particles with a wax, clay, or other material to provide a predictable, slow release of the encapsulated nutrients.

**Soil**—The outer, weathered layer of the earth's crust that has the potential to support plant life.

**Soil block**—A cube of compressed soil (or growing medium) made with a blocking tool. A single seed or sometimes a group of seeds is sown in the block.

**Soilless mix**—Potting medium that contains a mixture of peat, vermiculite, perlite, compost, or other materials, but no mineral soil.

**Soil structure**—The arrangement of individual soil particles.

**Soil texture**—The relative proportions of sand, silt, and clay of a mass of soil.

**Solarization**—The practice of heating soil to levels lethal to pests and pathogens through application of clear plastic to the soil surface for 4 to 6 weeks during sunny, warm weather.

**Soluble salt**—Salts from fertilizers and tap water that are dissolved in water.

**Stamen**—The male, pollen-bearing part of the flower consisting of the anther and the slender filament that holds it in position.

**Staminate flower**—Flower in which only the stamens (male reproductive parts) are present.

**Stolon**—An aboveground stem that reclines or becomes prostrate and may form roots where nodes come into contact with the ground.

**Storage root**—A root modified to store large amounts of water, carbohydrates, or starch. Example: Carrot.

**Subsoil**—Soil layers of varying consistencies found beneath the topsoil. They contain little or no humus.

**Sucker**—A shoot arising from the root or lower part of the stem of a plant. If suckers grow from stumps or around the bottom of the trunk, they are called stump sprouts. Common with species such as oak, elm, and birch.

**Systemic**—Capable of moving throughout a plant or other organism, usually in the vascular system.

*top*

*T*

**Tender**—Plants that can be injured by cold weather or frost.

**Thinning**—1) Pulling or clipping the weak seedlings in a pot or row in order to leave the others room enough to develop. 2) Removing a branch or water sprout at the point where it joins a main stem, branch, or trunk. Watch this video that includes a clip on how-to thin seedlings.

**Tilth**—The physical condition of a soil, e.g., aggregation, porosity, etc., and its ability to support seed germination and plant growth.

**Top dressing**—A fertilizer or soil amendment applied to the soil or surface; usually incorporated by raking or irrigating.

**Topsoil**—Uppermost layer of soil, usually darker and richer than the subsoil and with a higher content of nutrients and organic matter.

**Toxin**—A poisonous substance produced by a living organism.

**Translocation**—The movement of food or other materials from one part of a plant to another.

**Transpiration**—The process in which water vapor is lost through the leaves, pulling water up from the roots.

**Trap crop**—A crop or portion of a crop intended to attract pests so they can be controlled by treating a relatively small area or by destroying the trap crop and the pests together.

**Tuber**—A short, thick, usually but not always, subterranean stem or branch bearing buds or "eyes" and serving as a food- storage organ.

*U*

*V*

**Variety**—An identifiable strain within a species, usually referring to a strain that arises in nature as opposed to a cultivar, which is specifically bred for particular properties; sometimes used synonymously with cultivar.

**Vegetable**—The edible portion of an herbaceous garden plant.

**Viable**—The ability of a seed to germinate, which diminishes with age.

**Volunteer crop**—The emergence of a stand of a self-seeded, previously-planted crop in a garden or field.

*W*

**Warm-season crops**—Crops that are harmed by frost and do not grow well until average daily temperatures are in the 70s.

**Weed**—A plant growing where it is not wanted. A plant that grows in a disturbed site.

**Wet feet**—A condition where plants are exposed to excess soil moisture caused by flooding, a high water table, or compacted soil.

**Wilt**—Loss of rigidity and drooping of plant parts caused by dry soil conditions or interference with water conduction inside the stems, e.g., boring insects, pathogens.

**Winter annual**—A plant that germinates at the end of the summer and overwinters as a small, dormant, but green, plant. It usually completes its life cycle by mid-summer. Examples: Henbit, hairy bittercress.

# A Guide to Flowers on Our Preserves

## Love our lands? Help us to care for them by donating today. ovlc.org/giving

### You can also access this guide and more flowers online at ovlc.org/native-flowers

Danny's Skullcap
*Scutellaria tuberosa*

Fiesta Flower
*Pholistoma auritum*

Hairy-Leaf Ceanothus
*Ceanothus oliganthus*

Large Flowered-Phacelia
*Phacelia grandiflora*

Lupine
*Lupinus spp.*

Common Phacelia
*Phacelia distans*

Prickly Phlox
*Leptodactylon californicum*

Purple Clarkia
*Clarkia purpurea*

Purple Nightshade
*Solanum xanti*

Wishbone Bush
*Mirabilis laevis*

Purple Owl's-Clover
*Castilleja exserta*

Red Maids
*Calandrinia ciliata*

Twining Snapdragon
*Antirrhinum kelloggii*

Elegant Clarkia
*Clarkia unguiculata*

Fleabane Daisy
*Erigeron foliosus*

Bush Mallow
*Malacothamnus fasciculatus*

Woolly Blue Curls
*Trichostema lanatum*

Chia
*Salvia columbariae*

Chinese-Houses
*Collinsia heterophylla*

Punch Bowl Godetia
*Clarkia bottae*

Baby Blue Eyes
*Nemophila menziesii*

Black Sage
*Salvia mellifera*

Blue Dicks
*Dichelostemma capitatum*

Western Blue-Eyed-Grass

CLEFT (OR TOP WEDGE) GRAFT

# Plants That Naturally Repel Pests

| Plant | To repel |
| --- | --- |
| Marigolds | Mosquitoes, aphids |
| Nasturtiums | Whiteflies, cabbage loopers, aphids, many beetles, squash bugs |
| Petunias | Aphids, asparagus beetles, leafhoppers, squash bugs, tomato hornworms |
| Basil | Houseflies, mosquitoes |
| Lavender | Moths, fleas, flies, mosquitoes |
| Lemongrass, lemon thyme, lemon balm, mint, rosemary | Mosquitoes |
| Thyme | Whiteflies, cabbage loopers, cabbage maggots, corn earworms, whiteflies, tomato hornworms |
| Dill | Aphids, squash bugs, spider mites, cabbage loopers, tomato hornworms |
| Fennel | Aphids, slugs, snails |
| Allium family (chives, onions, leeks, shallots) | Slugs, aphids, carrot flies, cabbage worms |
| Chrysanthemums | Roaches, ants, Japanese beetles, ticks, silverfish, lice, fleas, bedbugs, spider mites, harlequin bugs, root-knot nematodes |

# rose troubles

# 15 HERBAL TEAS
## *for Every Ailment*

HELLONATURAL.CO

### GREEN TEA

*High in antioxidants
*Reduces bad cholesterol
*Promotes healthy cell growth
*Has a relaxing and calming effect

### BLACK TEA

*Lowers the risk of heart disease and diabetes
*Regulates blood sugar levels
*Has anti-inflammatory properties

### OOLONG TEA

*Aids weight management
*Helps alleviate skin conditions

### WHITE TEA

*Has the highest antioxidant properties
*Low in caffeine
*Can lower cholesterol and blood pressure
*It's antibacterial

### ROOIBOS

*It's naturally caffeine-free
*Has benefits for skin irritations
*Contains cancer fighting properties

### PEPPERMINT

*Decongestant
*Anti-inflammatory
*Helps suppress the appetite

### DRIED GINGER

*Has antihistamine properties
*Anti-inflammatory
*Eases motion sickness
*Great flavor booster

### STINGING NETTLE

*Recommended remedy for seasonal allergies
*Energy booster
*Great for treating arthritis

### YERBA MATE

*Helps open up respiratory passages
*Lowers lipids, leading to reduced cholesterol and lower blood pressure

### LEMON BALM

*Has calming effects
*Helps with the common cold and other respiratory issues
*Alleviates digestive problems
*Helps treating headaches and toothaches

### CHAMOMILE

*Great for treating sleep and stomach troubles
*Antibacterial

### HIBISCUS

*Refreshing
*Helps lower blood pressure
*Naturally high in vitamins
*Diuretic

### RED CLOVER

*Lessens menopausal symptoms
*Can help protect against cardiovascular disease
*Can reduce the Prostate-specific antigen

### DANDELION

*Stimulate digestion
*Can be used to treat hepatitis, jaundice and dyspepsia
*Lessens hot flashes
*Combats the formation of kidney stones.

### CINNAMON

*Lowers cholesterol
*Fights viruses
*Increases antioxidants
*Alleviates arthritis symptoms

# HERBAL First Aid Kit

**Calendula Extract**
Cuts & scrapes, minor burns, inflamed rashes

**Chamomile Flowers**
Calming, indigestion, wounds, rashes

**Fennel Seeds**
Indigestion, gas, bloating, increase breast milk

**Ginger Root**
Nausea, vomiting, menstrual cramps

**Lavender**
Stress, anxiety, sleep, minor burns, cold sores

**Lemon Balm Leaf**
Restlessness, irritability, indigestion, sleep

**Marshmallow Root**
Mouth & throat sores, heartburn, cough, indigestion

**Oatmeal**
Itchy rashes, anxiety, sleep, stress

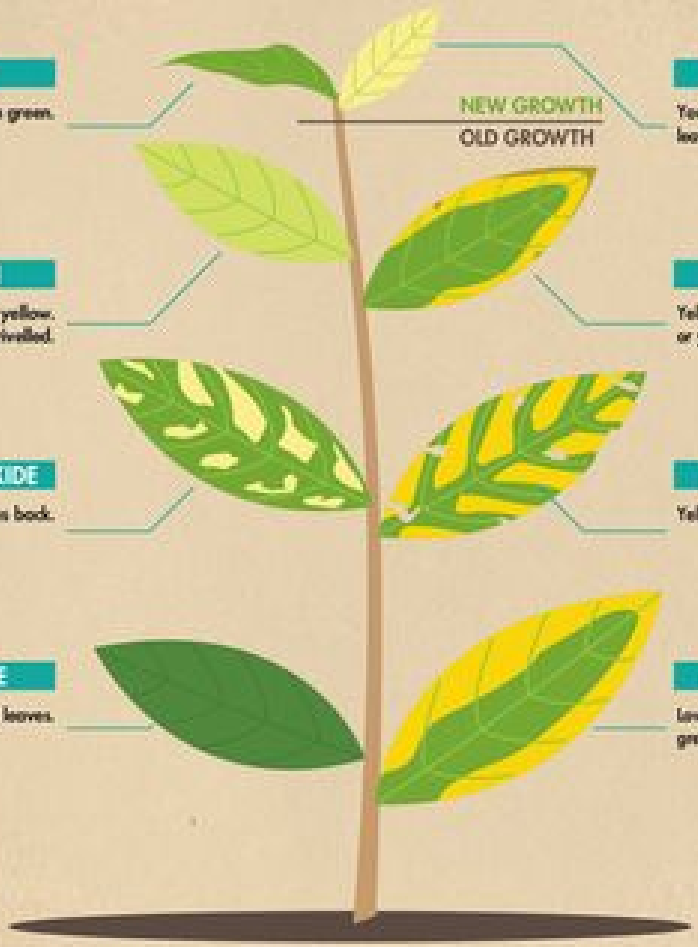
**Peppermint Leaf**
Nausea, indigestion, gas, congestion

**Red Raspberry Leaf**
Uterine tonic, pregnancy nausea, diarrhea

**Stinging Nettles Leaf**
Iron-rich, seasonal allergies, water retention

Earth Mama Angel Baby® ORGANICS

# PLANT DEFICIENCY GUIDE



### CALCIUM
New leaves misshaped or stunted. Existing leaves remain green.

### IRON
Young leaves are yellow and white with green veins. Mature leaves are normal.

### NITROGEN
Upper leaves are light green where lower leaves are yellow. Bottom or older leaves are yellow and shrivelled.

### POTASSIUM
Yellowing at the tips and edges, usually in younger leaves. Dead or yellow patches develop on leaves.

### CARBON DIOXIDE
White deposits on leaves. Stunted growth, and the plant dies back.

### MANGANESE
Yellow spots and elongated holes between veins.

### PHOSPHATE
Leaves are darker than normal and loss of leaves.

### MAGNESIUM
Lower leaves turn yellow from outside going in, veins remain green.

# Signs of Nutrient Deficiency

**Calcium:** New leaves misshapen or stunted. Existing leaves remain green.

**Iron:** Young leaves are yellow and white with green veins. Mature leaves are normal.

**Nitrogen:** Upper leaves are light green where lower leaves are yellow. Bottom or older leaves are yellow and shrivelled.

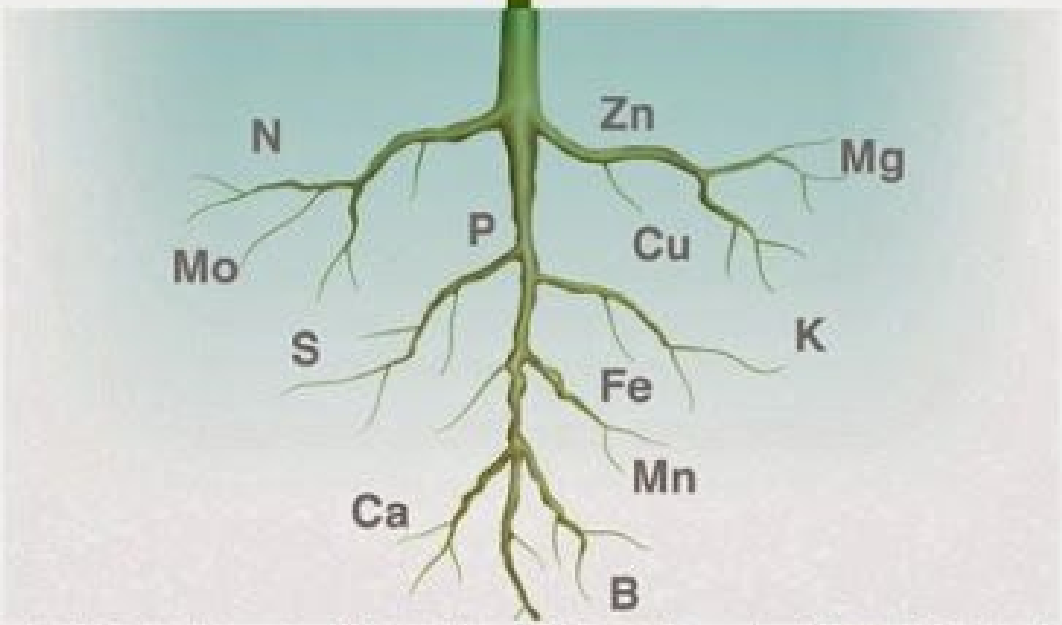
**Potassium:** Yellowing at the tips and edges, usually in younger leaves. Dead or yellow patches develop on leaves.

**Carbon Dioxide:** White deposit on leaves. Stunted growth, and plants die back.

**Manganese:** Yellow spots and or elongated holes between veins.

**Phosphate:** Leaves are darker than normal and loss of leaves.

**Magnesium:** Lower leaves turn yellow from outside going in. Veins remain green.



**Macro Elements**
**N** - Nitrogen
**P** - Phosphorous
**K** - Potassium

**Secondary Elements**
**Ca** - Calcium
**Mg** - Magnesium
**S** - Sulphur

**Micro Elements**
**Fe** - Iron
**B** - Boron
**Zn** - Zinc
**Cu** - Copper
**Mn** - Manganese
**Mo** - Molybdenum

# Easy, Safe, Kitchen Remedies
## to Get a Handle on Garden Pests

| Remedy | Pest | Process |
|---|---|---|
| • Cinnamon | • Fungus | • Sprinkle on seedlings affected by damping-off disease (a fungus that proliferates in the damp seedling environment and attacks and kills the young stems and roots). |
| • Garlic | • All insect pests | • Make a garlic plant spray by pureeing two bulbs of garlic. Pour 1/2 cup boiling water over garlic, cover, and steep overnight. Strain, put in a spray bottle. Spray the bottoms of leaves daily, every few days, or once per week. |
| • Orange and banana peels | • Ants and aphids | • Orange peels contain d-Limonene, which breaks down the waxy coating on ants and aphids and kills them. Cut up peels and bury one to two inches deep in soil. Alternatively, scatter peels around stems or hang from branches. |
| • Milk | • Mildew | • Mix with equal parts water and apply to tomatoes, cucumbers, lettuce, and other plants to control mildew. |
| • Apple cider vinegar | • Aphids and fruit flies | • Put a small amount of apple cider vinegar in a jar next to plants. Aphids and fruit flies will be attracted, fall in, and drown. |
| • Hot peppers or ginger | • All insect pests (also deters rodents) | • Both contain capsaicin, which burns insects. Combine 1 quart of water, 1 squirt of castile soap, and 1 tablespoon of cayenne pepper or ginger. Try on a small portion of plant first. Dilute further if it causes leaf damage. |
| • Baking soda | • Fungus | • Mix 3 tablespoons in a quart of water and put in a spray bottle. Spray plants every few days until the fungus is gone. |
| • Beer | • Snails and Slugs | • Put a little beer in a shallow container and place it in the garden. Slugs and snails crawl in, but can't crawl out. |
| • Castile soap | • Aphids, spider flies, white flies | • Mix 5 tablespoons soap with 1 gallon of water. Test on small portion. If the solution damages the foliage, dilute further. |
| • Eggshells | • Slugs, cutworms, other insects | • Crush shells and sprinkle them on top of the soil around stems. Slugs, cutworms, and other insects are repelled by the sharp edges. |

# Deficiency Chart of Micronutrients

**Boron:** Discoloration of leaf buds. Breaking and dropping of buds

**Sulphur:** Leaves light green. Veins pale green. No spots.

**Manganese:** Leaves pale in color. Veins and venules dark green and reticulated

**Zinc:** Leaves pale, narrow and short Veins dark green. Dark spots on leaves and edges.

**Magnesium:** Paleness from leaf edges. No spots Edges have cup shaped folds. Leaves die and drop in extreme deficiency.

**Phosphorus:** Plant short and dark green. In extreme deficiencies turn brown or black. Bronze colour under the leaf.

**Calcium:** Plant dark green. Tender leaves pale. Drying starts from the tips. Eventually leaf bunds die.

**Iron:** Leaves pale. No spots. Major veins green.

**Copper:** Pale pink between the veins. Wilt and drop.

**Molybdenum:** Leaves light green/ lemon yellow/ornge. Spots on whole leaf except veins. Sticky secretions from under the leaf.

**Potassium:** Small spots on the tips, edges of pale leaves. Spots turn rusty. Folds at tips.

**Nitrogen:** Stunted growth. Extremely pale color. Upright leaves with light green/yellowish.Appear burnt in extreme deficiency.

**THE COLOUR REPRESENTED ARE INDICATIVE.**
**THEY MAY VARY FROM PLANT TO PLANT**

# Ways to Identify Wildflowers - By Flower Color

## BLUE FLOWERS

*Bellflower (Creeping)* *Blue Flag* *Blue-eyed Grass* *Bluebells (Virginia)* *Bluets* *Chicory* *Lobelia (Great)*

## BROWN FLOWERS

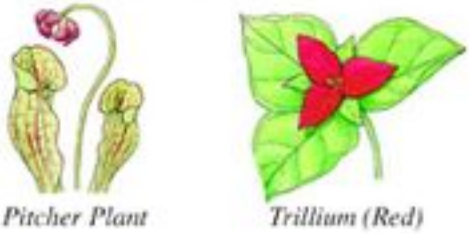
*Cattails* *Ginger (Wild)*

## GREEN FLOWERS

*Fairy Bells* *Green Dragon* *Poison Ivy* *Ragweed*

*Twisted-stalk* *Sarsaparilla (Wild)* *Solomons Seal (Great)* *Stinging Nettle* *Virginia Creeper*

## MAROON FLOWERS



*Pitcher Plant* *Trillium (Red)*

## ORANGE FLOWERS

*Hawkweed* *Tiger Lily* *Touch-me-not (Spotted)*

## PINK FLOWERS

*Clover (Rabbit-foot)* *Clover (Red)* *Deptford Pink* *Fireweed* *Joe-Pye Weed (Eastern and Spotted)* *Lady Slipper (Pink)*

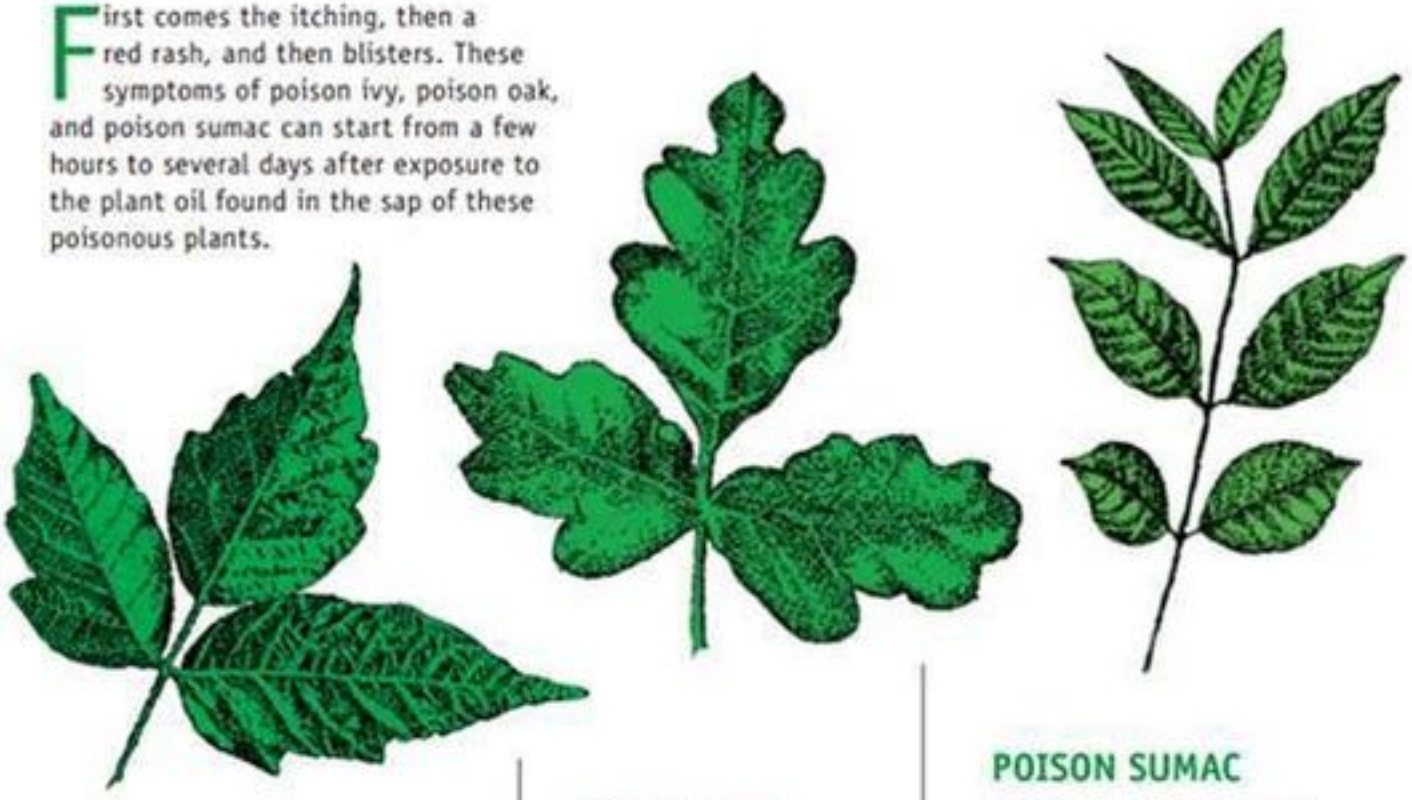
*Lapland Rosebay* *Laurel (Sheep)* *Meadow Rue* *Meadowsweet* *Milkweed* *Rosybells* *Smartweed (Water)* *Steeplebush*

©Sheri Amsel

Put any of these plants in your garden or on your patio this summer. Mosquitoes absolutely hate them!

# Outsmarting Poison Ivy and Other Poisonous Plants

First comes the itching, then a red rash, and then blisters. These symptoms of poison ivy, poison oak, and poison sumac can start from a few hours to several days after exposure to the plant oil found in the sap of these poisonous plants.



## POISON IVY

Found throughout the United States except Alaska, Hawaii, and parts of the West Coast. Can grow as a vine or shrub. Each leaf has three glossy leaflets, with smooth or toothed edges. Leaves are reddish in spring, green in summer, and yellow, orange, or red in fall. May have white berries.

## POISON OAK

Grows as a low shrub in the eastern United States, and in tall clumps or long vines on Pacific Coast. Fuzzy green leaves in clusters of three are lobed or deeply toothed with rounded tips. May have yellow-white berries.

## POISON SUMAC

Grows as a tall shrub or small tree in bogs or swamps in Northeast, Midwest, and parts of the Southeast. Each leaf has clusters of seven to 13 smooth-edged leaflets. Leaves are orange in spring, green in summer, and yellow, orange, or red in fall. May have yellow-white berries.

*Sources: National Park Service; Occupational Safety and Health Administration.*

# POTASSIUM DEFICIENCY

## THE SIGNS

Edges & tips of leaves become yellow

## HOW TO FIX

Bury citrus rinds in soil at base of plant. Add compost rich in fruit or veggie waste.

# ZINC DEFICIENCY

## THE SIGNS

Leaves show signs of light discoloration between large veins

## HOW TO FIX

Spray with kelp extract.

# NITROGEN DEFICIENCY

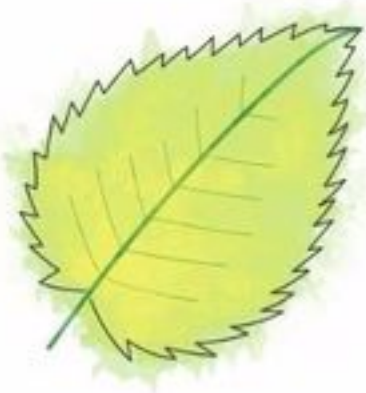
## THE SIGNS

Tips & center vein in leaves become yellow

## HOW TO FIX

Add organic compost like manure or coffee grounds to the soil.

# IRON DEFICIENCY



## THE SIGNS

Leaves become yellow & have small, green veins

## HOW TO FIX

Determine the pH level of your soil & lower the pH to under 7. Then reduce the amount of phosphorus in the soil.

# CALCIUM DEFICIENCY

## THE SIGNS

Leaves become misshapen

## HOW TO FIX

Determine if your soil is acidic or alkaline. For alkaline soil use gypsum & for acidic soil use lime.

# MAGNESIUM DEFICIENCY

## THE SIGNS

Leaves show signs of white stripes along veins

## HOW TO FIX

Add organic compost rich in magnesium, or add Epsom salts or lime to the soil.

# Evaluate & Improve Your Soil

Your Guide to Soil Amendments

## What type of soil do you have?

### loam

Loam is an ideal soil composed of sand, silt, clay and organic matter. It retains nutrients and water while allowing excess water to drain away. Loam soil feels soft and crumbly and is easy to work over a wide range of moisture conditions. A handful of loam holds its shape when squeezed, and crumbles when squeezed harder.

### clay

Clay is slow draining, slow to warm in the spring, and compacts easily (making it difficult for plant roots to grow). It has a tendency to be alkaline and retain water. This heavy, poorly draining soil forms into a sticky, hard mass when squeezed.

### sand

Sand has a lower moisture holding capacity (must be watered more frequently), lower nutrient holding capacity (must be fertilized more often), subject to wind and water erosion, tills easily, and warms up quickly. A handful crumbles and wont form a ball.

## Suggested Soil Amendments

### LOOSENS HEAVY SOILS

### IMPROVES DRAINAGE

### ABSORBS & RETAINS MOISTURE

### ENRICHES POOR SOIL

## Soil Maintenance & Gardening Tips

- Mix plant food with the top 1-3" of soil every season and every time you plant.
- To maintain a sustainable garden, feed your soil, not your plants.
- Don't dig when soil is too wet or too dry. You will compact your soil (if it's too wet) and destroy its beneficial qualities.
- Avoid overtilling - the churning of the soil also awakens weed seeds buried in the soil, and charging the soil with air increases the activity of soil microorganisms, burning up valuable organic matter.
- Always plant in a weed-free garden. If you eliminate weeds from the start, you will have an easier time managing them during the growing season.

# SHAPE & ARRANGEMENT

**Acicular**
needle shaped

**Falcate**
hooked or sickle shaped

**Orbicular**
circular

**Rhomboid**
diamond-shaped

**Acuminate**
tapering to a long point

**Flabellate**
fan shaped

**Ovate**
egg-shaped, wide at base

**Rosette**
leaflets in tight circular rings

**Alternate**
leaflets arranged alternately

**Hastate**
triangular with basal lobes

**Palmate**
resembles a hand

**Spatulate**
spoon-shaped

**Aristate**
with a spine-like tip

**Lanceolate**
pointed at both ends

**Pedate**
palmate, divided lateral lobes

**Spear-shaped**
pointed, barbed base

**Bipinnate**
leaflets also pinnate

**Linear**
parallel margins, elongate

**Peltate**
stem attached centrally

**Subulate**
tapering point, awl-shaped

**Cordate**
heart-shaped, stem in cleft

**Lobed**
deeply indented margins

**Perfoliate**
stem seeming to pierce leaf

**Trifoliate/Ternate**
leaflets in threes

**Cuneate**
wedge shaped, acute base

**Obcordate**
heart-shaped, stem at point

**Odd Pinnate**
leaflets in rows, one at tip

**Tripinnate**
leaflets also bipinnate

**Deltoid**
triangular

**Obovate**
egg-shaped, narrow at base

**Even Pinnate**
leaflets in rows, two at tip

**Truncate**
squared-off apex

**Digitate**
with finger-like lobes

**Obtuse**
bluntly tipped

**Pinnatisect**
deep, opposite lobing

**Unifoliate**
having a single leaf

**Elliptic**
oval-shaped, small or no point

**Opposite**
leaflets in adjacent pairs

**Reniform**
kidney-shaped

**Whorled**
rings of three or more leaflets

# What is Grafting?

Grafting is the process of combining two different plants to create a single one

It requires lots of skill and practice, but has been successfully achieved by providing a clean cut on the two plants and taping the ends together until theyheal

The purpose is to combine one plant's qualities of flowering or fruiting with the roots of another that offers vigour and resilience

Most plants need to be grafted within their own genus - such as potatoes and tomatoes - but it is sometimes possible to graft those of a differing makeup

# Key to Leaf Morphology

## Shape

**Acicular**
needle shaped

**Falcate**
hooked or sickle shaped

**Orbicular**
circular

**Rhomboid**
diamond-shaped

**Acuminate**
tapering to a long point

**Flabelate**
fan shaped

**Ovate**
egg-shaped, wide at base

**Rosette**
leaflets in tight circular rings

**Alternate**
leaflets arranged alternately

**Hastate**
triangular with basal lobes

**Palmate**
like a hand with fingers

**Spatulate**
spoon-shaped

**Aristate**
with a spine-like tip

**Lanceolate**
pointed at both ends

**Pedate**
palmate, divided lateral lobes

**Spear-shaped**
pointed, barbed base

**Bipinnate**
leaflets also pinnate

**Linear**
parallel margins, elongate

**Peltate**
stem attached centrally

**Subulate**
tapering point, awl-shaped

**Cordate**
heart-shaped, stem in cleft

**Lobed**
deeply indented margins

**Perfoliate**
stem seeming to pierce leaf

**Trifoliate/Ternate**
leaflets in threes

**Cuneate**
wedge shaped, acute base

**Obcordate**
heart-shaped, stem at point

**Odd Pinnate**
leaflets in rows, one at tip

**Tripinnate**
leaflets also bipinnate

**Deltoid**
triangular

**Obovate**
egg-shaped, narrow at base

**Even Pinnate**
leaflets in rows, two at tip

**Truncate**
squared-off apex

**Digitate**
with finger-like lobes

**Obtuse**
bluntly tipped

**Pinnatisect**
deep, opposite lobing

**Unifoliate**
having a single leaf

**Elliptic**
oval-shaped, small or no point

**Opposite**
leaflets in adjacent pairs

**Reniform**
kidney-shaped

**Whorled**
rings of three or more leaflets

## Margin

**Ciliate**
with fine hairs

**Crenate**
with rounded teeth

**Dentate**
with symmetrical teeth

**Denticulate**
with fine dentition

**Doubly Serrate**
serrate with sub-teeth

**Entire**
even, smooth throughout

**Lobate**
indented, but not to midline

**Serrate**
teeth forward-pointing

**Serrulate**
with fine serration

**Sinuate**
with wave-like indentations

**Spiny**
with sharp stiff points

**Undulate**
widely wavy

## Venation

**Arcuate**
secondary veins bending toward apex

**Cross-Venulate**
small veins connecting secondary veins

**Dichotomous**
veins branching symmetrically in pairs

**Longitudinal**
veigns aligned mostly along long axis of leaf

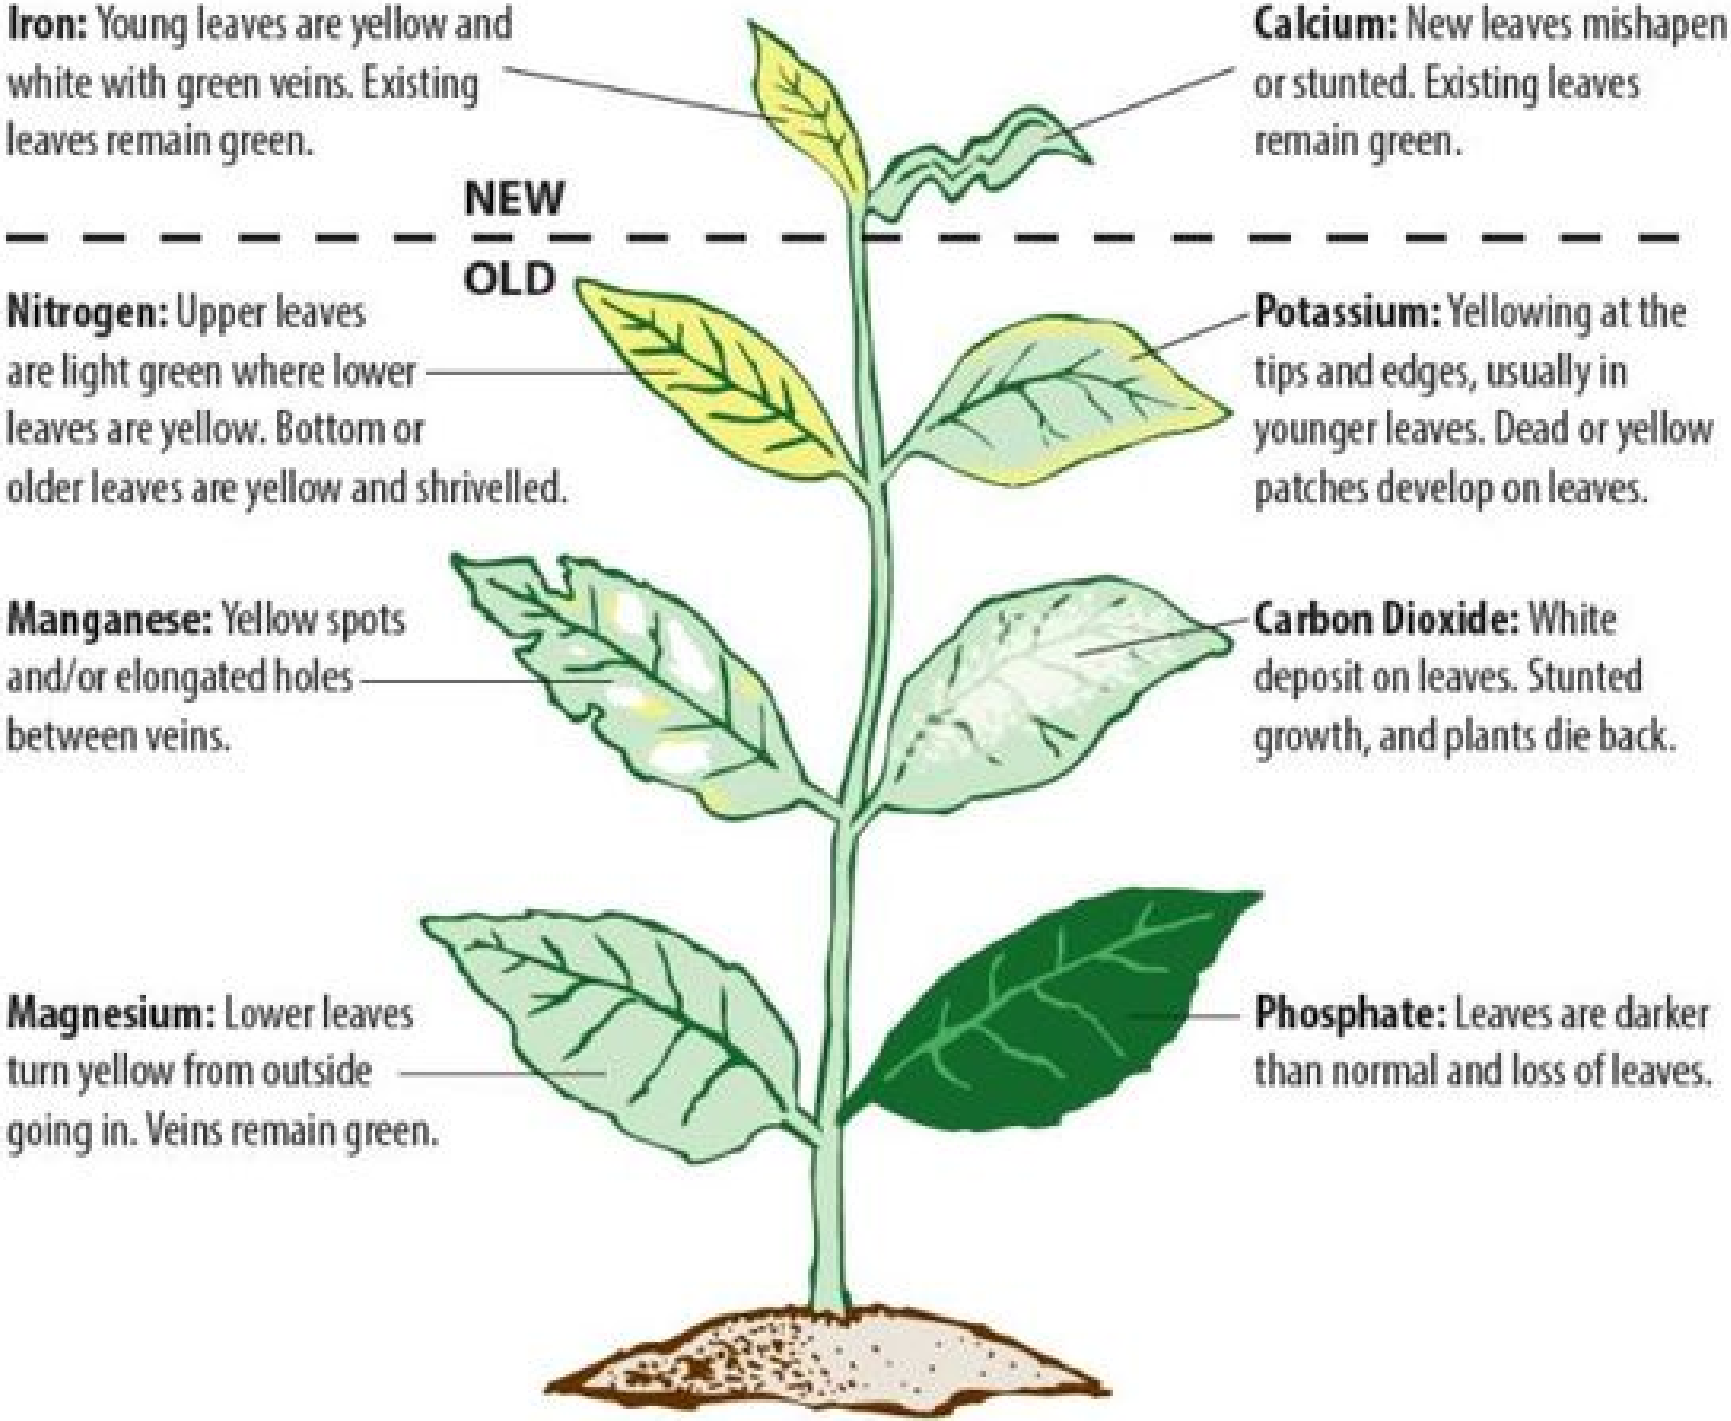
**Palmate**
several primary veins diverging from a point

**Parallel**
veins arranged axially, not intersecting

**Pinnate**
secondary veins paired oppositely

**Reticulate**
smaller veins forming a network

**Rotate**
in peltate leaves, veins radiating



**Iron:** Young leaves are yellow and white with green veins. Existing leaves remain green.
**Calcium:** New leaves mishapen or stunted. Existing leaves remain green.
NEW
OLD
**Nitrogen:** Upper leaves are light green where lower leaves are yellow. Bottom or older leaves are yellow and shrivelled.
**Potassium:** Yellowing at the tips and edges, usually in younger leaves. Dead or yellow patches develop on leaves.
**Manganese:** Yellow spots and/or elongated holes between veins.
**Carbon Dioxide:** White deposit on leaves. Stunted growth, and plants die back.
**Magnesium:** Lower leaves turn yellow from outside going in. Veins remain green.
**Phosphate:** Leaves are darker than normal and loss of leaves.
